

MSS Post Pregnancy Risk Factor Clarification Table

Risk Criteria	Clarification notes																
<p>Maternal Race: Client (woman) identifies herself as:</p> <ul style="list-style-type: none"> American Indian, Alaska Native, non-Spanish speaking indigenous women from the Americas (i.e. Mam or Kanjobal speaking women from Guatemala and Mixtecas from Oaxaca, Mexico) Black or African American Pacific Islander 	<ul style="list-style-type: none"> The intent of this risk factor is to identify women of African American, Pacific Islander, and American Indian descent. Birth certificate outcome data may include Alaska Native, Pacific Islander or Non-Spanish speaking indigenous women from the Americas. At the current time due to budgetary conditions and mandates from the WA State Legislature to focus on certain groups of high risk women, this risk factor does not apply to women who are Spanish speaking only, or to women who are monolingual in other languages. This risk factor is focused on the race of the mother only. 																
<p>Prenatal Care: No prenatal care established in pregnancy.</p>	<ul style="list-style-type: none"> See Post Pregnancy Risk Factor matrix. 																
<p>Food Insecurity: Runs out of food before the end of the month or cuts down on the amount eaten to feed others.</p>	<ul style="list-style-type: none"> Refer to prenatal clarification notes. Families stretching food costs, for example: watering down formula; using mother's WIC voucher to feed others, impacting health of breastfeeding mother or infant. 																
<p>Pre-pregnancy BMI: IOM = Institute of Medicine</p> <ul style="list-style-type: none"> Pre-pregnancy BMI 25.0 to 29.9 Pre-pregnancy BMI greater than or equal to (\geq) 30.0 and pregnancy weight gain within IOM guidelines Pre-pregnancy BMI greater than or equal to (\geq) 30.0 and weight gain outside of the IOM guidelines. 	<ul style="list-style-type: none"> See prenatal clarification notes. Determine if pregnancy weight gain was within the guidelines: Singleton Pregnancy: <table style="margin-left: 20px;"> <tr> <td><18.5 BMI</td> <td>28-40 lbs</td> </tr> <tr> <td>18.5 to 24.9 BMI</td> <td>25-35 lbs</td> </tr> <tr> <td>25.0 -29.9 BMI</td> <td>15-25 lbs</td> </tr> <tr> <td>\geq30.0 BMI</td> <td>11-20 lbs</td> </tr> </table> <p>*Women with the highest pre-pregnancy BMI (34+) should be at lower level of recommended weight gain</p> <p>Multiple Pregnancy: <table style="margin-left: 20px;"> <tr> <td><18.5 BMI</td> <td>~40 lbs plus</td> </tr> <tr> <td>18.5 to 24.9 BMI</td> <td>37 to 54 lbs</td> </tr> <tr> <td>25.0 -29.9 BMI</td> <td>31 to 50 lbs</td> </tr> <tr> <td>\geq30.0 BMI</td> <td>25 to 42 lbs</td> </tr> </table> </p> <ul style="list-style-type: none"> Clients are sensitive about weight in most circumstances so being cautious of the words you use and providing positive messages will be important. Clients who start out overweight and obese and then become pregnant are at higher risk of weight retention post pregnancy that can lead to a lifetime of obesity and chronic disease. 	<18.5 BMI	28-40 lbs	18.5 to 24.9 BMI	25-35 lbs	25.0 -29.9 BMI	15-25 lbs	\geq 30.0 BMI	11-20 lbs	<18.5 BMI	~40 lbs plus	18.5 to 24.9 BMI	37 to 54 lbs	25.0 -29.9 BMI	31 to 50 lbs	\geq 30.0 BMI	25 to 42 lbs
<18.5 BMI	28-40 lbs																
18.5 to 24.9 BMI	25-35 lbs																
25.0 -29.9 BMI	15-25 lbs																
\geq 30.0 BMI	11-20 lbs																
<18.5 BMI	~40 lbs plus																
18.5 to 24.9 BMI	37 to 54 lbs																
25.0 -29.9 BMI	31 to 50 lbs																
\geq 30.0 BMI	25 to 42 lbs																

	<ul style="list-style-type: none"> • These clients are at high risk of infection, poor healing, depression, and breastfeeding complications. • Most clients have a decline in appetite post pregnancy and tend to be happy about this because they want to lose weight but it can cause problems with healing and coping with motherhood effectively without basic nutrition. Most moms need support in recognizing that they need to eat, how to balance weight loss with motherhood, and taking care of themselves. • If the client is concerned about weight loss this is a good time to support the client in options for eating healthy to support her goal and referral to WIC RD if she is unable to have ongoing support from the MSS RD (limited units).
<p>Inter-pregnancy interval: Current pregnancy conception less than (<) 9 months from the end of last pregnancy.</p>	<ul style="list-style-type: none"> • See prenatal clarification table RF matrix. • Good health teaching moment – inter-conception care. Even if she delivered a full term healthy infant, to have another shorten birth interval between this and next pregnancy puts her and that fetus at risk.
<p>Medical Risk Factors:</p> <p>Fetal death: Fetal death in this pregnancy- fetus greater than (>) 20 weeks gestation and died in utero or born dead.</p> <p>Diabetes:</p> <ul style="list-style-type: none"> • History gestational diabetes with last pregnancy • Pre-existing Diabetes- type 1 or 2 • Current gestational diabetes <p>Hypertension:</p> <ul style="list-style-type: none"> • Chronic Hypertension diagnosed prior to pregnancy or before 20 weeks gestation • Gestational Hypertension with current pregnancy • Postpartum Hypertension 	<p>Medical Risk Factors- this can be self-report but you must probe to ensure it was diagnosed by a health care provider and not just client diagnosed.</p> <ul style="list-style-type: none"> • Fetal death- Both parents may be experiencing grief. Mother and father should be supported with family planning, coping, and genetic testing if indicated and desired. Infant death in the MSS period (after birth to 2 months postpartum): Infant death as a risk factor during this period would fall under the category of Preterm/ LBW – infant was born premature/LBW and didn't survive; or Infant health problems – health issues which resulted in death. Currently Sudden Infant Death Syndrome (SIDS)/Sudden Unexplained Infant Death (SUID) are considered health issues of unknown cause. • Type 1 and 2 Diabetes and Chronic Hypertension: Clients with chronic disease will need to learn how to balance chronic disease management (diet, exercise, stress management, and medications) with motherhood. These moms are also at high risk for depression and postpartum healing. • Gestational Diabetes & Gestational Hypertension: MSS providers can support the medical care provider by providing health education and follow up. Generally these conditions resolve after delivery but may not. Providers should educate clients on long term risk of developing chronic disease and provide health messages regarding a healthy lifestyle. • Postpartum Hypertension: This is a leading cause of maternal mortality (although low in WA). Postpartum blood pressure (BP) may increase three to six days after birth when most women have been discharged home. A significant rise in BP may be dangerous (e.g., lead to stroke). MSS providers can further support the medical care provider in the postpartum period by:

<p>Medical Risk Factors cont'd:</p> <p>Multiples: Delivered more than one baby.</p>	<ul style="list-style-type: none"> ○ Communicating with the medical provider regarding protocol for when to refer woman back to provider for changes in hypertensive status or symptoms. ○ Reinforcing medical provider's health messages with client and supporting the woman in following through with postpartum visits and any medical treatment. ● Multiples: Multiple births can result in increased physical and psychological stress for mother/ both parents due to medical complications, C-section delivery, and infants born preterm or with medical problems. Clients with multiples will need support with infant care, coping, self-care and accessing community resources.
<p>Maternal Age:</p> <ul style="list-style-type: none"> ● 17 years of age or younger at the time of post pregnancy screening. 	<ul style="list-style-type: none"> ● See Post Pregnancy Risk Factor matrix. ● At the time of screening is referring to postpartum screening.
<p>Tobacco/Nicotine Use Maternal tobacco/nicotine use-</p> <ul style="list-style-type: none"> ● Currently smokes or uses tobacco or other nicotine products. <p>Second hand smoke exposure of infant- infant is exposed to active smoking in his/her living environment (i.e. inside the home, car, day care).</p>	<ul style="list-style-type: none"> ● Any maternal tobacco/nicotine use including type and amount post pregnancy. ● Second hand smoke exposure is focused on anyone actively smoking around the infant in the home or car. ● Relapse: If she quits but returns to smoking tobacco or using nicotine products, she can be moved into the B category.
<p>Alcohol and Substance Abuse/Addiction</p> <ul style="list-style-type: none"> ● Stopped substance use upon diagnosis of pregnancy. ● Used alcohol and substances during pregnancy but actively engaged in alcohol/drug treatment program and has not used for more than or equal to (\geq) 90 days. ● Used alcohol, illicit substances, or non-prescriptive use of prescription drugs during pregnancy or abstinent from use of alcohol, illicit substances, or non-prescriptive use of prescription drugs for less than ($<$) 90 days. 	<ul style="list-style-type: none"> ● See prenatal clarification table and post pregnancy risk matrix. ● If the woman is incarcerated, time spent incarcerated does not count toward ninety day criteria for abstinence.
<p>Mental Health</p> <ul style="list-style-type: none"> ● No history of mental health diagnosis, but answers “Yes” to “In the last month, have you felt down, depressed or hopeless?” or showing potential symptoms of depression, but has negative score on standardized depression screening tool. i.e. Edinburgh, CES-D ● History of mental health treatment but is stable, or history of postpartum depression with previous pregnancy, and negative score on standardized depression screening tool. ● Current mental health diagnosis and is engaged in a mental health treatment. 	<ul style="list-style-type: none"> ● See prenatal clarification table and post pregnancy risk matrix. ● If client falls into “A” criteria, providers should re-screen for mood disorder, if possible, and educate client and support person on signs and symptoms of postpartum mood disorders and resources available. ● A person actively engaged in treatment may continue to have mental health symptoms and MSS provider shall obtain release of information from client to exchange information with the mental health provider and coordinate care.

<ul style="list-style-type: none"> • Mental health symptoms are evidenced by positive score on standardized depression screening tool. • Client has a mental health diagnosis and is exhibiting active symptoms which are interfering with general functioning. 	
<p>Developmental Disability</p> <ul style="list-style-type: none"> • Severe developmental disability which could impact the woman’s ability to take care of herself or an infant, but has adequate social support and follows through with health care appointments/advice and infant or self-care. • Severe developmental disability which impacts the woman’s ability to take care for herself or an infant, and has inadequate social support or does not demonstrate evidence of follow through with health care appointments/advice and infant or self-care. 	<ul style="list-style-type: none"> • See prenatal clarification table and post pregnancy risk matrix. • Women who did well during pregnancy may have less support or more issues post pregnancy and should be reassessed.
<p>Intimate Partner Violence</p> <ul style="list-style-type: none"> • In the last year, the woman’s intimate partner or father of baby (FOB) has committed or threatened physical/sexual violence against her. 	<ul style="list-style-type: none"> • See Post Pregnancy Risk Factor matrix. • This risk factor focuses on the woman as the person at risk of violence. • Infants can be hurt directly and indirectly even when the abuser is not trying to harm the infant. For example, an infant is hurt when the abuser strikes the mother who is holding the infant. Other ways IPV impacts the infant is stress in the home that can cause slow weight gain, failure to thrive, and other issues.
<p>Child Protective Services (CPS)</p> <ul style="list-style-type: none"> • History of Child Protective Services involvement as the parent/caretaker and no current open/active case. • Client is identified as a caretaker within a family unit that has an open CPS case. 	<ul style="list-style-type: none"> • CPS = Child Protective Services within the Children’s Administration, Department of Social and Health Services, or an equivalent service in another state. http://www.dshs.wa.gov/ca/safety/abuseWhat.asp?2 • History must be as a parent or caretaker. Clients with CPS involvement where they were the child in need of protection or services do not screen in under this category.
<p>Infant</p> <ul style="list-style-type: none"> • LBW infant (less than (<) 5lb 8 oz) • Preterm infant (born less than (<) 37 weeks gestation) 	<ul style="list-style-type: none"> • LBW & Preterm birth infants: There are multiple potential long term risks for the low birth weight/ preterm infant. There are immediate potential risks in the first 28 days after delivery including: <ul style="list-style-type: none"> ○ Respiratory distress ○ Feeding issues ○ Maintaining body temperature ○ Infection

Infant cont'd

- **Slow weight gain-** i.e. loss of more than 7% of body weight since birth, has not gained back to birth weight by two weeks of age.
 - **Breastfeeding complication-** Inadequate transfer of milk/ ineffective suck or inadequate stools.
 - Infant with **birth defect and/or health problems.**
- **Slow weight gain:** This should be determined by a medical provider or clinician who is trained in child growth. Below are some examples:
 - Loss of more than 7% of body weight since birth.
 - Has not gained back to birth weight by two weeks of age.
 - Deceleration of growth passed 2 percentiles.
 - Growth remains below 5th percentile.
 - **Breastfeeding Complications:**
 - This risk criterion must be determined by staff trained in breastfeeding assessment- medical provider, IBCLC, or lactation consultant.
 - This risk criterion is not referring to breastfeeding moms who just need help with latch but to infants who are showing inadequate milk transfer.
 - This risk factor can stand alone from the other MSS risk factors or be in addition/result of one of the other MSS risk factors- preterm birth, LBW, or birth defect and/or health issue (cleft palate, cardiac issues, etc.).
 - Documentation must support the determination of inadequate milk transfer/ineffective suck. For example inadequate milk transfer as noted by
 - Test weighing of pre and post feeding indicates minimal intake and
 - Hypo or hypertonicity
 - **Inadequate stooling/bowel movements-** Infant who are not stooling properly can be a sign of inadequate milk transfer and/or hind milk issues. Frequency is an issue and if exclusively breastfeeding stool color is also an issue per AAP.
 - Meconium (tarry black) 24 hours
 - Transitional stools (black transitioning to green, then brown and yellow) up to first 4 days
 - 3 to 4 days: 3 to 4 stools per day
 - 5 to 7 days: 3 to 6 stools per day, yellow seedy stools
 - **Birth Defects and/or Health Problems:** This can be a long list and should be clearly documented a need for MSS interventions. This risk factor is referring to significant health problems needing medical follow up, case management and MSS intervention by a clinician. There is increased risk of maternal/parental depression when an infant has health issues.

Infant cont'd

- **Drug/alcohol exposed** newborn per definition on matrix.

- **Drug/Alcohol exposed infant:** Infant exposed to drugs and alcohol during pregnancy. See definition in post pregnancy risk matrix under Infant Risks. Infants who are withdrawing or affected by legitimate use of prescription drugs by mother during pregnancy, such as methadone, will be screened in under infant health problems.
