Appendix Table B1: PubMed Search Strategy for Lit Search.....	5
Appendix Table C1. List of Excluded Articles.....	7
Appendix Table D1. Definition of the risk of bias categories for individual studies of testing	15
Appendix Table D2: Assessment of ROB for Individual Randomized Control Trials	16
Appendix Table D3: Assessment of ROB for Individual Non-Randomized Studies of Interventions ..	16
Appendix Table D4. Assessment of Quality of Health Economic Studies Criteria	18
Appendix Table D5. Criteria for assessing systematic reviews based on AMSTAR-2.....	19
Appendix Table D6. Rating overall Confidence in the Results of the Review (Dettori 2020).	21
Appendix Table D7. Example methodology outline for determining overall strength of evidence (SoE):.....	24
Appendix Table G1. Data Abstraction for Economic Studies Comparing Endovascular Treatments to Medical Therapy.....	27
Appendix Table G2. Data Abstraction for Economic Studies Comparing Endovascular Treatments to Supervised Exercise Therapy.	30
Appendix Table G3. Data Abstraction for Economic Studies Comparing Angioplasty to Bypass.	36
Table I1. BA/Stent vs. SET: differential efficacy	58
Table I2. BA/Stent vs. SET: Subgroup Analyses of Limb Survival by Assigned Intervention, Stratified by Lesion Location and Preoperative Symptom Category after Median 4 years of Follow-up (Wolf, 1993)	61
Table J1. Evidence Base for Payer Policies.....	62
Table J2. Summary of Clinical Practice Guidelines for Endovascular Treatments in Patients with Peripheral Artery Disease.....	64
Table J3. Summary of Society for Cardiovascular Angiography and Interventions (SCAI) Clinical Practice Guidelines.....	85

Appendix Table K1. Definitions for Magnitude of Effects, Based on Mean Between-Group Differences	90
Appendix Table K2. Walking Outcome Definitions and Treadmill Protocols for Randomized Trials Comparing Endovascular Therapy Versus Medical Therapy or Supervised Exercised Therapy	91
Table L1. Devices Used Across Endovascular Revascularization Randomized Controlled Trials	93

Figures

Appendix Figure H1. Intermittent claudication distance (ICD) by longest follow-up (primary analysis): Endovascular intervention versus MT.....	38
Appendix Figure H2. Intermittent claudication distance (ICD) by timepoint using mean difference*: Endovascular intervention versus MT	39
Appendix Figure H3. Intermittent claudication distance (ICD) by longest follow-up using mean difference*: Endovascular intervention versus MT	39
Appendix Figure H4. Maximum walking distance (MWD) by longest follow-up (primary analysis): Endovascular intervention versus MT	40
Appendix Figure H5. Maximum walking distance (MWD) by timepoint using mean difference*: Endovascular intervention versus MT	40
Appendix Figure H6. Maximum walking distance (MWD) by longest follow-up using mean difference*: Endovascular intervention versus MT	41
Appendix Figure H7. Intermittent claudication distance (ICD) by timepoint excluding high risk of bias trial (Perkins 2009): Endovascular intervention versus SET	42
Appendix Figure H8. Intermittent claudication distance (ICD) by longest follow-up: Endovascular intervention versus SET	43
Appendix Figure H9. Intermittent claudication distance (ICD) by timepoint using mean difference*: Endovascular intervention versus SET	44
Appendix Figure H10. Intermittent claudication distance (ICD) by longest follow-up using mean difference*: Endovascular intervention versus SET	45
Appendix Figure H11. Maximum walking distance (MWD) by timepoint* excluding high risk of bias trial (Perkins 2009): Endovascular intervention versus SET	46
Appendix Figure H12. Maximum walking distance (MWD) by longest follow-up*: Endovascular intervention versus SET	47
Appendix Figure H13. Maximum walking distance (MWD) by timepoint using mean difference*: Endovascular intervention versus SET	48
Appendix Figure H14. Maximum walking distance (MWD) by longest follow-up using mean difference*: Endovascular intervention versus SET	49
Appendix Figure H15. SF-36 PCS and PF scores (0-100 scale) by longest follow-up: Endovascular intervention versus SET	50
Appendix Figure H16. SF-36 MCS and MH scores (0-100 scale) by longest follow-up: Endovascular intervention versus SET	50
Appendix Figure H17. VasculQoL (1-7 scale) by longest follow-up: Endovascular intervention versus SET	51
Appendix Figure H18. Maximum walking distance (MWD) by timepoint (excluding outlier trial): Combination endovascular intervention plus SET versus SET alone.....	51
Appendix Figure H19. SF-36 PCS and PF scores (0-100 scale) by longest follow-up: Combination endovascular intervention plus SET versus SET	52
Appendix Figure H20. Second intervention (endovascular) by time period: Endovascular intervention versus MT.....	52

Appendix Figure H21. Mortality by time period: Endovascular intervention versus MT	53
Appendix Figure H22. MI by time period: Endovascular intervention versus MT.....	54
Appendix Figure H23. Second intervention to the target vessel/lesion by time period: Endovascular intervention versus SET	54
Appendix Figure H24. Second intervention (endovascular) by time period: Endovascular intervention versus SET	55
Appendix Figure H25. Second intervention (surgical/bypass) by time period: Endovascular intervention versus SET	56
Appendix Figure H26. Mortality by time period: Endovascular intervention versus SET	57

APPENDIX A. Algorithm for Article Selection

APPENDIX B. Search Strategies

Below is the search strategy for PubMed. Parallel strategies were used to search other electronic databases listed below. Keyword searches were conducted in the other listed resources. In addition, hand-searching of included studies was performed.

Appendix Table B1: PubMed Search Strategy for Lit Search

Search period: inception to February 10, 2025

APPENDIX D. Risk of Bias, Strength of Evidence, QHES, and AMSTAR-2

Each included comparative study is rated against pre-set criteria that resulted in a Risk of Bias (ROB) assessment and presented in a table. Assessment of RCTs followed appropriate criteria based on methods described in *the Cochrane Handbook for Systematic Reviews of Interventions*⁴ and guidance from the Agency for Healthcare Research and Quality (AHRQ) *Methods Guide for Effectiveness and Comparative Effectiveness Reviews*.¹ In keeping with the AHRQ methods, each study was given a final rating of “good”, “fair”, or “poor” quality as described below in Table D1. Discrepancies in ratings between reviewers were resolved through discussion and consensus. Where blinding is not possible, studies will automatically be rated as “fair” given the potential for biased assessment of outcomes. The final quality assessments are provided in Appendix E.

Table D2 provides an example of the format used to assess ROB for comparative studies of testing/therapy. Additional criteria for non-randomized studies includes consideration of how patients are selected and appropriate control for confounding. Table D3 provides an example for non-randomized studies of interventions. Table D4 provides an example for evaluating administrative database studies. A “No” indicates that the criterion was not met; an “Unclear” indicates that the criterion could not be determined with the information provided or was not reported by the author. Risk of bias assessments were not conducted for case series; all were considered High risk of bias.

Appendix Table D1. Definition of the risk of bias categories for individual studies of testing

Rating	Description and Criteria
Good	<ul style="list-style-type: none"> Least risk of bias; study results generally considered valid Employ valid methods for selection, inclusion, and allocation of patients to testing; report similar baseline characteristics in different test groups; clearly describe attrition and have low attrition; use appropriate means for preventing bias (e.g., blinding of patients, care providers, and outcomes assessors); and use appropriate analytic methods (e.g., intention-to-treat analysis)
Fair	<ul style="list-style-type: none"> Study is susceptible to some bias but not enough to necessarily invalidate results May not meet all criteria for good quality, but no flaw is likely to cause major bias; the study may be missing information making it difficult to assess limitations and potential problems This category is broad; studies with this rating will vary in strengths and weaknesses; some fair-quality studies are likely to be valid, while others may be only possibly valid
Poor	<ul style="list-style-type: none"> Significant flaws that imply biases of various kinds that may invalidate results; the study contains “fatal flaws” in design, analysis, or reporting; large amounts of missing information; discrepancies in reporting or serious problems with intervention delivery Study results are at least as likely to reflect flaws in the study design or execution as the true difference between the compared interventions Considered to be less reliable than higher quality studies when synthesizing the evidence, particularly if discrepancies between studies are present

Appendix Table D2: Assessment of ROB for Individual Randomized Control Trials

Methodological Principle	Author 1, 2023	Author 2 2024	Author 3, 2021
Study design			
Randomized controlled trial	■	■	■
Random sequence generation			
Concealed allocation			
Groups comparable at baseline*			
Outcome assessors independent or blinded			
Care providers blinded			
Patients blinded			
Reporting of attrition			
Complete follow-up of $\geq 80\%$			
$<10\%$ difference in follow-up between groups			
Intention to treat			
Outcomes prespecified			
Risk of Bias			

Unclear indicates that the study had insufficient detail to determine whether criteria were met

*Groups must be comparable on a robust set of baseline characteristics or present evidence that controlling of confounding presented was performed.

Appendix Table D3: Assessment of ROB for Individual Non-Randomized Studies of Interventions

Methodological Principle	Author 1, 2024	Author 2, 2019	Author 3, 2020
Did the study attempt to enroll a random sample or consecutive patients meeting inclusion criteria (inception cohort) from same underlying population?			
Were the groups comparable at baseline on key prognostic factors?			
Did the article report attrition?			
Overall loss to follow up acceptable? ($\leq 20\%$) Differential loss to follow up acceptable? ($\leq 10\%$)			
Were the outcomes investigated prespecified and defined?			
Did the study clearly describe and use accurate methods for ascertaining outcomes, exposures, and potential confounders?			
Were outcome assessors and/or data analysts blinded to treatment?			
Did the study perform appropriate statistical analyses on potential confounders or otherwise control for confounding (e.g. restriction, stratification, matching)?			
Was the duration of follow-up reasonable for investigated events?			
Risk of Bias			

NA = not applicable (due to being a case series)

Unclear indicates that the study had insufficient detail to determine whether criteria were met

Assessment of Economic Studies

Full formal economic analyses evaluate both costs and clinical outcomes of two or more alternative interventions. The four primary types are cost minimization analysis (CMA), cost-utility analysis (CUA), cost-effectiveness analysis (CEA), and cost-benefit analyses (CBA). Each employs different methodologies, potentially complicating critical appraisal, but some common criteria can be assessed across studies.

No standard, universally accepted method of critical appraisal of economic analyses is currently in use. A number of checklists [Canadian, BMJ, AMA] are available to facilitate critique of such studies. The Quality of Health Economic Studies (QHEs) instrument developed by Ofman, et al. embodies the primary components relevant for critical appraisal of economic studies.⁵ It also incorporates a weighted scoring process which was used as one factor to assess included economic studies. This tool has not yet undergone extensive evaluation for broader use but provides a valuable starting point for critique. Table D4 below provides a template of the instrument.

In addition to assessment of criteria in the QHEs, other factors are important in critical appraisal of studies from an epidemiologic perspective to assist in evaluation of generalizability and potential sources of study bias.

Such factors include:

- Are the interventions applied to similar populations (e.g., with respect to age, gender, medical conditions, etc.)? To what extent are the populations for each intervention comparable and are differences considered or accounted for? To what extent are population characteristics consistent with “real world” applications of the comparators?
- Are the sample sizes adequate so as to provide a reasonable representation of individuals to whom the technology would be applied?
- What types of studies form the basis for the data used in the analyses? Data (e.g., complication rates) from randomized controlled trials or well-conducted, methodologically rigorous cohort studies for data collection are generally of highest quality compared with case series or studies with historical cohorts.
- Were the interventions applied in a comparable manner (e.g., similar protocols, follow-up procedures, evaluation of outcomes, etc.)?
- How were the data and/or patients selected or sampled (e.g., a random selection of claims for the intervention from a given year/source or all claims)? What specific inclusion/exclusion criteria or processes were used?

Were the outcomes and consequences of the interventions being compared comparable for each? (e.g., were all of the relevant consequences/complications for each intervention considered or do they primarily reflect those for one intervention?)

Appendix Table D4. Assessment of Quality of Health Economic Studies Criteria

Question	Possible Points*	Criteria For Credit*
1. Was the study objective presented in a clear, specific, and measurable manner?	7	Authors must fully describe the objective; is it measurable?
2. Were the perspective of the analysis (societal, third-party payer, etc.) and reasons for its selection stated?	4	Authors must state perspective, provide rationale AND have done the correct analysis corresponding to the perspective
3. Were variable estimates used in the analysis from the best available source (i.e., randomized controlled trial - best, expert opinion - worst)?	8	No credit if most of estimates are not from the best sources available
4. If estimates came from a subgroup analysis , were the groups prespecified at the beginning of the study?	1	-
5. Was uncertainty handled by (1) statistical analysis to address random events, (2) sensitivity analysis to cover a range of assumptions?	9	NO credit if they do not give details regarding type of sensitivity analysis, methods (e.g. what assumptions or factors were varied/why), AND the results (what factors are influential, what is the range of ICERs, etc.)
6. Was incremental analysis performed between alternatives for resources and costs?	6	-
7. Was the methodology for data abstraction (including the value of health states and other benefits) stated?	5	No credit if sources of model inputs and process of choosing model inputs not specified
8. Did the analytic horizon allow time for all relevant and important outcomes? Were benefits and costs that went beyond 1 year discounted (3% to 5%) and justification given for the discount rate?	7	No credit if time horizon is too short to allow for important outcomes
9. Was the measurement of costs appropriate and the methodology for the estimation of quantities and unit costs clearly described?	8	No credit if sources of cost data or methods of estimating costs not clearly described
10. Were the primary outcome measure(s) for the economic evaluation clearly stated and did they include the major short-term, long-term and negative outcomes included?	6	NO credit if major important outcomes are not included or if time horizon did not allow for important outcomes to be measured
11. Were the health outcomes measures/scales valid and reliable? If previously tested valid and reliable measures were not available, was justification given for the measures/scales used?	7	No credit if sources of outcome data or not clearly described or if outcome data is not appropriate for the study population/outcome of interest (i.e. using utility weights from QOL measures that aren't validated or apply to a different population)
12. Were the economic model (including structure), study methods and analysis, and the components of the numerator and denominator displayed in a clear, transparent manner?	8	Must provide explicit detail for methods and should be able to trace/identify specific components, how they were derived, etc.
13. Were the choice of economic model, main assumptions, and limitations of the study stated and justified?	7	NO credit if insufficient detail of model, assumptions AND limitations are provided (No credit if they do not provide justifications/rationale)
14. Did the author(s) explicitly discuss direction and magnitude of potential biases ?	6	NO credit if no discussion of direction and magnitude of biases
15. Were the conclusions/recommendations of the study justified and based on the study results?	8	NO credit if conclusions/recommendations are stronger than warranted based on findings
16. Was there a statement disclosing the source of funding for the study?	3	-
Total	100	-

ICER = Incremental Cost-Effectiveness Ratio; QOL = quality of life.

* Study must fit criteria in order to receive full points. Partial credit is not given. If criteria is not met, then the question receives no points.

Application of AMSTAR 2 to systematic reviews

Table D6 shows our criteria for RoB assessment based on the AMSTAR-2 tool. AMSTAR-2 is the revised and updated version of AMSTAR published in 2007 used for critical appraisal of systematic reviews (Shea, 2017).⁸ It is not intended to provide an overall score, as high scores may hide weaknesses in critical domains. In light of this, we used a modified AMSTAR tool as determined by Dettori et al (2020).³ Table D7 (adapted from Dettori 2020) describes how overall scores were determined considering critical domains.² Bold items in table 1 were considered as critical items. The original AMSTAR-2 guidance suggests grading each item as no or yes, with items 2, 4, 7, 8, and 9 allowing for a 'partial yes'. We considered a 'yes' or 'partial yes' as yes.

Appendix Table D5. Criteria for assessing systematic reviews based on AMSTAR-2.

Item	Criteria
1: Did the research questions and inclusion criteria for the review include the components of PICO?	<ul style="list-style-type: none"> • Yes if all components of PICO are described somewhere in the report. • No if any components of PICO are missing.
2: Did the report of the review contain an explicit statement that the review methods were established prior to the conduct of the review and did the report justify any significant deviations from the protocol?	<ul style="list-style-type: none"> • Yes if the protocol or review methods were established prior to review. • No if no protocol or discussion/description of methods decided prior to review.
3: Did the review authors explain their selection of the study designs for inclusion in the review?	<ul style="list-style-type: none"> • Yes if study design inclusion is justified or discussed. No penalty for restricting study designs. • No if no discussion of justification for inclusion.
4: Did the review authors use a comprehensive literature search strategy?	<ul style="list-style-type: none"> • Yes if 2 or more electronic databases were searched and key words are available in report or appendices. No penalty for language restrictions. • No if less than 2 electronic databases were searched or key words are unavailable.
5: Did the review authors perform study selection in duplicate?	<ul style="list-style-type: none"> • Yes if selection at title/abstract and full text reviews were performed by 2 authors with consensus upon disagreement or single author selecting with a second checking agreement on sample and a kappa reported of ≥ 0.80. • No if no second author involved or no kappa reported.
6: Did the review authors perform data extraction in duplicate?	<ul style="list-style-type: none"> • Yes if abstraction was performed by 2 authors with consensus upon disagreement or single author abstracting with a second checking agreement on sample and a kappa of reported of ≥ 0.80. • No if no second author involved or no kappa reported.
7: Did the review authors provide a list of excluded studies and justify the exclusions?	<ul style="list-style-type: none"> • Yes if a list of potentially relevant studies is reported in appendix or discussed in text with citations with justification for exclusion. List of references must be provided. • No if no list of references provided or not potentially relevant but excluded studies are discussed.

Item	Criteria
8: Did the review authors describe the included studies in adequate detail?	<ul style="list-style-type: none"> • Yes if study characteristics are reported in sufficient detail to determine whether the studies met PICO criteria and provides framework to judge heterogeneity. • No if study characteristics are not reported or table 1 does not include age, sex, (and #'s).
9: Did the review authors use a satisfying technique for assessing the RoB in individual studies that were included in the review?	<p>RCTS</p> <ul style="list-style-type: none"> • Yes if important domains similar to Cochrane. <p>Cohort studies</p> <ul style="list-style-type: none"> • Yes if it addresses all of the following: confounding, selection bias, measurement bias, and selective reporting of outcomes (Newcastle okay if all 8 questions included). <p>Case series (study of incidence, no direct comparison)</p> <ul style="list-style-type: none"> • Yes if selection bias, measurement bias, and selective reporting of outcomes met (Newcastle okay IF questions #1, 2, 3, 4, 6, 7, and 8 addressed). <p>For all studies</p> <ul style="list-style-type: none"> • No if there is obvious evidence that the authors misapplied an acceptable technique.
10: Did the review authors report on the sources of funding for the studies included in the review?	<ul style="list-style-type: none"> • Yes if authors report funding of individual studies. • No if authors do not report funding.
11: If meta-analysis was performed did the review authors use appropriate methods for statistical combination of results?	<ul style="list-style-type: none"> • Yes if all the following are present <ul style="list-style-type: none"> ○ Meta-analysis justified (e.g., studies comparable, direct comparison). ○ Explanation of fixed or random effects (must do more than merely report without explanation). ○ Pooled results reported separately for RCTs and cohort studies. ○ Assessment of heterogeneity (must address I^2). • No if one or more of the above are not present. • If no meta-analysis was done mark as NM (No meta-analysis)
12: If meta-analysis was performed, did the review authors assess the potential impact of RoB in individual studies on the results of the meta-analysis or other evidence synthesis?	<ul style="list-style-type: none"> • Yes if results are stratified by RoB or if the review only included the lowest RoB studies in the analysis. • No if results are not stratified by RoB and review includes a range of RoB outcomes in the analysis. No credit if RoB method from item #9 is not acceptable. • If no meta-analysis was done mark as NM (No meta-analysis)
13: Did the review authors account for RoB in individual studies when interpreting or discussing the results of the review?	<ul style="list-style-type: none"> • Yes if there is a discussion of the impact of RoB in the interpretation of results and/or accounting for differences between studies. • No if there is no discussion of the impact of RoB in the interpretation of results and/or accounting for differences between studies. No credit if method from #9 is not acceptable.
14: Did the review authors provide a satisfactory explanation for, and discussion of, any heterogeneity observed in the results of the review?	<ul style="list-style-type: none"> • Yes if I^2 demonstrates no heterogeneity (<50%) or authors explored reasons for heterogeneity if I^2 is $\geq 50\%$. • No if I^2 demonstrates heterogeneity (>50%) and authors do not explore reasons for heterogeneity.

Item	Criteria
15: If they performed quantitative synthesis did the review authors carry out an adequate investigation of publication bias (small study bias) and discuss its likely impact on the results of the review?	<ul style="list-style-type: none"> • Yes if there is an attempt to identify publication bias. Must also show awareness of likely impact of publication bias on results. Credit given if they acknowledge publication bias could be a problem but not enough data given or if they have fewer than 10 studies and show no evidence of publication bias. • No if there is no attempt to identify or discuss publication bias. • If no meta-analysis was done mark as NM (No meta-analysis)
16: Did the review authors report any potential sources of conflict of interest, including any funding they received for conducting the review?	<ul style="list-style-type: none"> • Yes if authors report no competing interests or how they managed potential conflicts of interest. • No if there is no discussion or reporting of potential conflicts of interest.

PICO = population, intervention, comparison, outcome; RoB = risk of bias.

Appendix Table D6. Rating overall Confidence in the Results of the Review (Dettori 2020).

High: No or 1 noncritical weakness	The systematic review provides an accurate and comprehensive summary of the results of the available studies that address the question of interest.
Moderate: More than 1 noncritical weakness*	The systematic review has more than 1 weakness but no critical flaws. It may provide an accurate summary of the results of the available studies that were included in the review.
Low: One critical flaw with or without noncritical weaknesses	The review has a critical flaw and may not provide an accurate and comprehensive summary of the available studies that address the question of interest.
Critically low: More than 1 critical flaw with or without noncritical weaknesses	The review has more than 1 critical flaw and should not be relied on to provide an accurate and comprehensive summary of the available studies.

* Multiple noncritical weaknesses may diminish confidence in the review, and it may be appropriate to move the overall appraisal down from moderate to low confidence.

Determination of Overall Strength (Quality) of Evidence

Following the assessment of the quality of each individual study included in the report, an *overall* “strength of evidence”/“quality of evidence” for all critical and important *primary* health outcomes and harms based on methods used by GRADE (Grading of Recommendation Assessment, Development and Evaluation) and the Agency for Healthcare Research and Quality (AHRQ) will be reported.¹

The overall strength of evidence is based on assessment of the following required domains: risk of bias, consistency, directness, and precision. The overall Strength of Evidence (SoE) ranges from high for a body of evidence if new studies are unlikely to change the effect estimates to low if estimates from the currently available body of evidence is very likely to change as new data become available or insufficient if evidence is unavailable or does not permit a conclusion. To evaluate differential efficacy and safety (heterogeneity of effect, interaction), we will focus on RCTs as they have the least potential for bias and confounding thus potentially allowing for causal inference. Further, only RCTs that formally test for interaction between subgroups will be reported. SOE for these studies is based on consideration of the overall study risk of bias (study quality) as well as whether subgroup variables and analyses were specified a priori, the hypothesized impact of a subgroup on the outcome/effect and sample size as evaluation of interaction requires greater sample size are based on recommendations from Oxman and Guyatt⁶ and the Instrument to assess the Credibility of Effect Modification (ICEMAN) criteria.⁷ The

overall strength of evidence reflects our confidence in the effects estimated in the included studies and how likely new studies are to change the estimates. If only poor-quality studies are available for an outcome, SOE will be graded as insufficient.

The strength of evidence for the overall body of evidence for all *critical health outcomes* was assessed by one researcher following the principles for adapting GRADE (Grades of Recommendation Assessment, Development and Evaluation) as outlined by the Agency for Healthcare Research and Quality (AHRQ). The strength of evidence was based on the highest quality evidence available for a given *primary* outcome. In determining the strength of body of evidence regarding a given *primary* outcome, the following domains were considered:

- **Risk of bias:** the extent to which the included studies have protection against bias.
- **Consistency:** the degree to which the included studies report results are similar in terms of range and variability.
- **Directness:** describes whether the evidence is directly related to patient health outcomes.
- **Precision:** describes the level of certainty surrounding the effect estimates.
- **Publication bias:** is considered when there is concern of selective publishing.

All AHRQ “required” and “additional” domains (risk of bias, consistency, directness, precision, and if possible, publication bias) were assessed. Bodies of evidence consisting of RCTs were initially considered as High strength of evidence (SoE), while those that comprised nonrandomized studies began as Low strength of evidence. The strength of evidence could be downgraded based on the limitations described above. There could also be situations where the *nonrandomized* studies could be upgraded, including the presence of plausible unmeasured confounding and bias that would decrease an observed effect or increase an effect if none was observed, presence of a dose-response relationship, and large magnitude of effect (strength of association) *if no downgrades for domains above*. Publication and reporting bias are difficult to assess. Publication bias is particularly difficult to assess with fewer than 10 RCTs (AHRQ methods guide). When publication bias was unknown in all studies and this domain is often eliminated from the strength of evidence tables for our reports. The final strength of evidence for each **primary** outcome was assigned an overall grade of high, moderate, low, or insufficient, which are defined as follows:

High— Very confident that effect size estimates lie close to the true effect for this outcome; there are few or no deficiencies in the body of evidence; we believe the findings are stable.

Moderate— Moderately confident that effect size estimates lie close to the true effect for this outcome; some deficiencies in the body of evidence; we believe the findings are probably stable but some doubt remains.

Low— Limited confidence that effect size estimates lie close to the true effect for this outcome; important or numerous deficiencies in the body of evidence; we believe that additional evidence is needed before concluding that findings are stable or that the estimate is close to the true effect.

Insufficient— We have no evidence, are unable to estimate an effect or have no confidence in the effect estimate for this outcome; OR no available evidence or the body of evidence has unacceptable deficiencies precluding judgment.

Similar methods for determining the overall quality (strength) of evidence related to economic studies have not been reported, thus the overall strength of evidence for outcomes reported in Key Question 4 was not assessed.

Appendix Table D7. Example methodology outline for determining overall strength of evidence (SoE):

All AHRQ “required” and “additional” domains* are assessed. Only those that influence the baseline grade are listed in table below.

Baseline strength: HIGH = RCTs. LOW = observational, cohort studies, administrative data studies.

DOWNGRADE: Risk of bias for the individual article evaluations (1 or 2); Inconsistency** of results (1 or 2); Indirectness of evidence (1 or 2); Imprecision of effect estimates (1 or 2); Sub-group analyses not stated *a priori* and no test for interaction (2)

UPGRADE (non-randomized studies): Large magnitude of effect (1 or 2); Dose response gradient (1) done for observational studies ***if no downgrade for domains above***

Outcome	Strength of Evidence	Conclusions & Comments	Baseline SOE	DOWNGRADE	UPGRADE
Outcome	HIGH	Summary of findings	HIGH RCTs	NO consistent, direct, and precise estimates	NO
Outcome	MODERATE	Summary of findings	LOW Cohort studies	NO consistent, direct, and precise estimates; high quality (moderately low ROB)	YES Large effect
Outcome	LOW	Summary of findings	HIGH RCTs	YES (2) Inconsistent Indirect	NO

RCT = randomized control trial; SOE = strength of evidence.

* Required domains: risk of bias, consistency, directness, precision. Plausible confounding that would decrease observed effect is accounted for in our baseline risk of bias assessment through individual article evaluation. Additional domains: dose-response, strength of association, publication bias.

** Single study = “consistency unknown”, may or may not be downgraded

Non-health costs: costs of supporting departments, housing, overhead, transportation costs, patient time costs.	Health state costs: asymptomatic PAD, mild claudication, moderate claudication, severe claudication, critical limb ischaemia (CLI), post major amputation and death Costs of interventions: Stent or SET

Component	Treesak 2004 USA	Mazari, 2013 UK	Reynolds 2014 USA	Van Reijin, 2022 Netherlands	Spronk, 2008 Netherlands	Van den Houten, 2016 Netherlands
Primary Findings (e.g., base case ICER)	3 months: BA more effective vs. SET; additional 38 meters walked, additional cost of \$6,719 for ICER = \$177/meter walked 6 months: Exercise more effective vs. PTA; additional 137 meters walked, cost savings with exercise \$61 less cost per meter gained	ICER: for PTA versus SET, €- 381,694.44/QALY and for PTA + SET vs. PTA alone, €152,529.50 PTA Cost/QALY: €11,777.00 (95% CI €11,198.99 to €12,417.92) SET Cost/QALY: €6,147.04 (95% CI €5,858.32 to €6,476.53) PTA+ SET Cost/QALY: €10,649.74 (95% CI €10,239.53 to €11,112.03)	Base Case: \$122 600/QALY	ICER: €20,805/QALY (95% bcaCI 11,053 to 45,561)	After adjusting for baseline variables, cumulative costs of PTA with selective stent were higher than SET (MD €2,318; 99% CI €2,130 to €2,506) at 12 months ICER: €231,800/QALY. Combining QALYs and costs using WTP of €50,000/QALY resulted in higher mean net-benefit per patients from SET group (€6,891; 99% CI €5,128 to 8,656) compared to PTA with selective stent group (€3,639; 99% CI €2,214 to 5,064).	5 years: Mean total costs of stent were €16,631 vs. SET €10,219. Mean total QALYs were 2.85 vs. 2.78. Overall, MD €6,412, 95% CrI 1,939 to 11,874. ICER: Stent associated with additional €91600/QALY gained compared to SET. No difference between groups in the number of secondary interventions.

Component	Treesak 2004 USA	Mazari, 2013 UK	Reynolds 2014 USA	Van Reijin, 2022 Netherlands	Spronk, 2008 Netherlands	Van den Houten, 2016 Netherlands
Sensitivity Analysis (SA) results, range of cost-effectiveness measure	NR	One way SA: Sensitivity analyses: QALYs gained did not change, no change in ICER; Use of MRA vs. angiography reduced ICER for PTA+SET vs. SET to €67,977.50/QALY	One way: durability of treatment effect over time horizon, impact on QOL; facility costs: Base Case (payer – excluding patient time costs): \$177,051/QALY SA Range: \$94,315/QALY to \$152,225/QALY Notes: Differences in durability of QoL over time for stent vs. SET could substantially impact cost-effectiveness; Uncertain whether stent increases QALYs by meaningful amount vs. SET relative to SET. Probabilistic SA: at WTP for ~\$30,000 to \$80,000/QALY, ~ 60% likelihood that SET is preferred option; at WTP>120,000 slightly greater proportion of iterations favored stent vs. SET	One-way SA: Cost of achieving MCID on VascuQol: [§] VascuQoL sum score 1.19 €3,423 (95% CI 1,893 to 6,637) VascuQoL sum score 1.66 €4,775 (95% CI 2,640 to 9,258) Probabilistic SA: 40% percent likely to be cost effective at €20,000 threshold;	One way: Probabilistic SA looking at larger effectiveness following PTA with selective stent decreased ICER to €75,208/QALY.	Monte Carlo, one way: Probabilistic SA looked at changes health state utilities, costs, interventions costs, and secondary interventions; SET-first approach remained most cost-effective in all scenarios except in the situation where patients start in a severe claudication state (data NR)

Component	Treesak 2004 USA	Mazari, 2013 UK	Reynolds 2014 USA	Van Reijin, 2022 Netherlands	Spronk, 2008 Netherlands	Van den Houten, 2016 Netherlands
Author conclusion	A program of supervised exercise provides clinical efficacy, cost-effectiveness, and probable cost-savings for improvement of claudication	SET is the most cost-effective treatment for IC as a first line treatment and that PTA plus SET is more cost-effective than PTA alone.	Stent is more costly, provides marginal additional benefit over SET, SET may provide better value, at least in the short term. Longer term results are uncertain.	Endovascular revascularization provides slightly better improvement in QALYs and QoL than SET, but cost is higher and the difference is not clinically relevant. Authors state support for current guidelines describing SET as first line treatment	No difference in effectiveness between stent and SET during 12-month follow-up; any gains with stent were non-significant, and stent costs more than the generally accepted threshold WTP value, which favors SET.	SET is more cost-effective than stent for IC.

Component	Treesak 2004 USA	Mazari, 2013 UK	Reynolds 2014 USA	Van Reijin, 2022 Netherlands	Spronk, 2008 Netherlands	Van den Houten, 2016 Netherlands
Limitations	<ul style="list-style-type: none"> Study was poorly reported SA was limited, not well reported Unclear modeling of AEs due to PTA with or without stent Limited data from 1 RCT Pre-PTA assessment, medications, PTA with stent placement not modeled Only short-term outcomes addressed 	<ul style="list-style-type: none"> Limited SA Possible limited applicability to a broader IC population Shorter follow-up (12 months) may not capture long term harms or benefits Generalizability to US system unclear 	<ul style="list-style-type: none"> RCT data only 6 months; extrapolation to 5 years, lifetime (survival, QOL, costs assumed to be equal for all groups at 5 years) Small sample size Patients from CLEVER trial may differ vs. those seen in routine practice on comorbidities, symptoms etc. which may impact QOL Unclear how modeling of harms for stent was done, impact on ICER 	<ul style="list-style-type: none"> SET adherence was poor Limited SA Crossovers may negatively affect revascularization outcomes Short follow-up does not capture long term harms Study stopped early due to slow patient enrollment and funding termination Generalizability to US system unclear 	<ul style="list-style-type: none"> PAD is a chronic condition; the impact of events beyond the 12 months is unclear Study may be underpowered to detect clinically-relevant differences in effectiveness between groups Difficult to confirm adherence to SET for anything not done in hospital Unclear how specific AEs were evaluated Generalizability to US system unclear 	<ul style="list-style-type: none"> Combined data from treatment arms of two RCTs with some differences in baseline prognostic factors Most input parameters were based on data for 12 months Model assumes that SET patients remain adherent. APPENDIX J. Payer Policies and Clinical Guidelines

Table J1. Evidence Base for Payer Policies

Payer (year)	Policy
<p>Premera Percutaneous Revascularization Procedures for Lower Extremity Peripheral Arterial Disease Number: 7.01.594 Last review: 5/26/2025</p>	<p>“For individuals who are adults with symptomatic lower extremity peripheral arterial disease who receive percutaneous revascularization with balloon angioplasty, stent procedures, or atherectomy, the evidence includes RCTs, observational studies, and systematic reviews. Multiple studies have demonstrated that percutaneous and surgical revascularization for chronic symptomatic PAD can improve symptoms and quality of life in individuals who have not responded to guideline directed medical treatment, including structured exercise. Guidelines recommend that the choice to proceed to revascularization and selection of procedure should be a shared decision-making process, based on clinical presentation, including severity of symptoms and anticipated natural history; degree of functional limitation and QOL impairment; response to medical therapy, including structured exercise; and the likelihood of a beneficial short- and longer-term outcome, balanced against potential short-term (e.g., bleeding, infection, major adverse cardiac events), and longer-term procedural risk. The evidence is sufficient to determine that the technology results in an improvement in the net health outcome.</p> <p>For individuals who are adults with chronic limb-threatening ischemia (CLTI) who receive percutaneous revascularization with balloon angioplasty, stent procedures, or atherectomy, the evidence includes RCTs, observational studies, and systematic reviews. Relevant outcomes are overall survival, morbid events, functional outcomes, and treatment-related mortality and morbidity. Revascularization is considered the standard treatment for individuals with CLTI to minimize tissue loss and preserve a functional limb and ambulatory status. Both endovascular and surgical revascularization have been demonstrated to be effective treatments for preventing amputation in CLTI. In a systematic review of 13 studies of individuals with CLTI enrolled in medical and angiogenic therapy trials who did not receive revascularization, a 22% all-cause mortality rate and a 22% rate of major amputation at a median follow-up of 12 months were observed. The evidence is sufficient to determine that the technology results in an improvement in the net health outcome.”</p> <p>See policy for relevant clinical practice guideline recommendations.</p>
<p>Aetna: Peripheral Vascular Stents Number: 0785 Last review: 11/12/24</p>	<p>“The American College of Cardiology/American Heart Association's guidelines for the management of patients with PAD (lower extremity, renal, mesenteric, and abdominal aortic) had the following statements (Hirsch et al, 2005):</p> <ul style="list-style-type: none"> • Stenting is effective as primary therapy for common iliac artery stenosis and occlusions • Stenting is effective as primary therapy for external iliac artery stenoses and occlusions • Provisional stent placement is indicated for use in the iliac arteries as salvage therapy for a sub-optimal or failed result from balloon dilation (e.g., persistent translesional gradient, residual diameter stenosis greater than 50 %, or flow-limiting dissection)

Payer (year)	Policy
	<ul style="list-style-type: none"> Stents can be useful in the femoral, popliteal, and tibial arteries as salvage therapy for a sub-optimal or failed result from balloon dilation (e.g., persistent translesional gradient, residual diameter stenosis greater than 50 %, or flow-limiting dissection) Primary stent placement is not recommended in the femoral, popliteal, or tibial arteries The effectiveness of stents for the treatment of femoral-popliteal arterial lesions (except to salvage a suboptimal result from balloon dilation) is not well-established The effectiveness of uncoated/uncovered stents for the treatment of infra-popliteal lesions (except to salvage a suboptimal result from balloon dilation) is not well-established." <p>"In a systematic review, Mwipatayi et al (2020) compared studies reporting the outcomes of the use of covered balloon-expandable (CBE) stents for the treatment of aorto-iliac occlusive disease. ... All studies showed high rates of technical success and patency over the course of 12 months. Long-term data were only available for the iCast/Advanta V12 device, which had a primary patency rate of 74.7 % at 5 years. The authors concluded that CBE stents are a viable therapeutic option for patients with complex aorto-iliac lesions because of their high rates of technical success and favorable patency across all devices at 12 months. However, long-term data are only available for a single device, the iCast/Advanta V12. The results of using this device were favorable over the course of 5 years. Moreover, these researchers stated that further robust comparative studies with long-term data will provide more information.</p> <p>"The National Institute for Health and Clinical Excellence's guideline on "Lower limb peripheral arterial disease: Diagnosis and management" (2012) recommended the use of bare metal stents where stenting is indicated for intermittent claudication because of a lack of evidence of superior clinical outcomes with DES."</p> <p>"Guidelines on management of peripheral artery disease from the American College of Cardiology (Hirsch et al, 2006), discussed in greater detail below, conclude that primary stent placement is not recommended in the femoral, popliteal, or tibial arteries. In addition, the guidelines state that the effectiveness of stents for the treatment of femoral-popliteal arterial lesions (except to salvage suboptimal results from balloon dilation) is not well established, and the effectiveness of uncoated/uncovered stents for the treatment of infra-popliteal lesions (except to salvage a suboptimal result from balloon dilation) is not well-established.</p> <p>... The Agency for Healthcare Research and Quality's technology assessment of "invasive interventions for lower extremity peripheral artery disease" and systematic review of "studies comparing stent placement to other interventions" (Balk et al, 2008) reached the following conclusions: (i)The cited aorto-iliac surgery studies did not describe the pre-operative anatomy and no clinically relevant outcomes were reported. The majority of the studies cited for endovascular treatment of the aorto-iliac segment did have anatomical descriptions of the studied patients; however, none used the Trans-Atlantic Society Consensus (TASC) classification; (ii) There is a dearth of trials of patients with either aorto-iliac or infra-popliteal disease. The newer nitinol stents were used by only 3 of the trials (plus 1 RCT of stent versus bypass and 2 RCTs comparing different stents). The predominant primary outcome of the trials remain patency (variously defined), which has not been adequately demonstrated to be an excellent predictor of clinical outcomes. True clinical outcomes have frequently been inadequately or incompletely reported and analyzed.</p>

Payer (year)	Policy
	<p>... An UpToDate review on "Percutaneous interventional procedures in the patient with lower extremity claudication" (Zaetta et al, 2016) states that 'Although PTA in the femoro-popliteal segment is associated with restenosis, a clear advantage to primary stenting has not been definitively demonstrated in meta-analyses of randomized trials. In general, longer lesions probably benefit from stenting, but whether a self-expanding metal stent or covered stents should be used remains debated. Local delivery of medical therapies aimed at preventing stenosis using drug-eluting stents has also been tried, as well as the use of biodegradable stents. The use of drug-eluting stents should be considered experimental therapy.'</p> <p>"Chu and colleagues (2017) examined the published literature on the use of biodegradable stents in the treatment of PAD. Technical success rates were 100 %. These studies had a short-to-medium follow-up period up to 58 months. The primary and secondary patency rates were 60.8 % (range of 32 to 77 %) and 88.4 % (range of 79 to 97 %) respectively. There were also 4 on-going studies internationally. The authors concluded that contemporary published literature suggested that biodegradable scaffold/stent is safe and effective in the treatment of PAD, but these studies were heterogeneous and were limited by their study design, relatively small sample size, and short follow-up period; and therefore did not produce a high enough level of evidence to show superiority that leads to a change in current treatment guidelines."</p>

ACC = American College of Cardiology; AHA = American Heart Association; AHRQ = Agency for Healthcare Research and Quality; BA = balloon angioplasty; CBE = covered balloon-expandable; CLTI = chronic limb-threatening ischemia; DES = drug-eluting stent; FDA = Food and Drug Administration; IC = intermittent claudication; NICE = National Institute for Health and Care Excellence; PAD = peripheral artery disease; PTA = percutaneous transluminal angioplasty; QOL = quality of life; RCT = randomized controlled trial; SDM = shared decision-making; TASC = TransAtlantic Inter-Society Consensus; USD = United States Dollar.

Table J2. Summary of Clinical Practice Guidelines for Endovascular Treatments in Patients with Peripheral Artery Disease

Developer/Guideline/Year	Clinical Subset of PAD or Endovascular Procedure	Evidence Base	Recommendation	Strength of Recommendation
Society for Vascular Surgery 2025 Society for Vascular Surgery Clinical Practice Guideline on the Management of Intermittent Claudication: Focused Update Conte et al United States	Intermittent claudication	None cited.	<ul style="list-style-type: none"> In patients with IC, we recommend a supervised exercise program consisting of walking a minimum of three times per week (30-60 min/session) for at least 12 weeks as first-line therapy. For patients who have undergone revascularization for IC, we suggest the continued use of exercise therapy post-intervention (supervised or home-based). 	Grade: 1 Level of evidence: A Grade: 2 Level of evidence: C

Developer/Guideline/Year	Clinical Subset of PAD or Endovascular Procedure	Evidence Base	Recommendation	Strength of Recommendation
			<ul style="list-style-type: none"> For patients who have undergone revascularization for IC, we suggest the continued use of exercise therapy post-intervention (supervised or home-based). We recommend against performing revascularization in patients with asymptomatic peripheral artery disease or IC based solely on hemodynamic measurements or imaging findings. There is no evidence to support the use of revascularization for modifying disease progression. In patients with IC who are selected for an endovascular intervention to treat femoropopliteal disease and have lesions exceeding 5 cm in length, we recommend the use of either bare metal stents or drug eluting devices (drug-coated balloons or drug-eluting stents) over plain balloon angioplasty to reduce the risk of restenosis and need for reintervention. 	<p>Grade: 2 Level of evidence: C</p> <p>Grade: 1 Level of evidence: C</p> <p>Grade: 1 Level of evidence: B</p>

SCAI guidelines on device selection in Aorto-Iliac arterial interventions 2020 Feldman et al United States	<p>lesion, Focal EIA lesion, ISR, focal lesion, ISR, diffuse lesion</p> <p>PTA with Uncoated Balloons - Aortoiliac bifurcation, Diffuse CIA lesion, Diffuse EIA lesion, Moderate to severe calcified, focal lesion, Moderate to severe calcified, diffuse lesion, Chronic total occlusion, focal lesion, Chronic total occlusion, diffuse lesion</p> <p>PTA with Specialty Balloons – (All lesions)</p> <p>Bare Metal Balloon Expandable Stents - Aortoiliac bifurcation, Focal CIA lesion, Diffuse CIA lesion</p> <p>Bare Metal Balloon Expandable Stents - Focal EIA lesion, Diffuse EIA lesion, Moderate to severe calcified, focal lesion, Moderate to severe calcified, diffuse lesion, Chronic total</p>		<p>Recommended as the intended definitive therapy in the aortoiliac interventions.</p> <p>Not recommended as the intended definitive therapy in the aortoiliac arterial intervention</p> <p>Recommended as the intended definitive therapy in the aortoiliac interventions.</p> <p>Recommended as the intended definitive therapy in the aortoiliac interventions.</p>	<p>Level of evidence: B-R, C-LD</p> <p>Class of recommendation: IIb (Weak) Level of evidence: B-R, B-NR, C-LD</p> <p>Class of recommendation: III (No benefit) Level of evidence: C-LD, C-EO</p> <p>Class of recommendation: I (Strong) Level of evidence: B-R, B-NR</p> <p>Class of recommendation: IIa (Moderate) Level of evidence: B-R, B-NR</p>

Developer/Guideline/Year	Clinical Subset of PAD or Endovascular Procedure	Evidence Base	Recommendation	Strength of Recommendation
	occlusion, focal lesion, Chronic total occlusion, diffuse lesion			
	Bare Metal Balloon Expandable Stents - ISR, focal lesion, ISR, diffuse lesion		Recommended as the intended definitive therapy in the aortoiliac interventions.	Class of recommendation: IIb (Weak) Level of evidence: C-LD
	Bare Metal Self-Expanding Stents - Diffuse CIA lesion, Focal EIA lesion, Diffuse EIA lesion		Recommended as the intended definitive therapy in the aortoiliac interventions.	Class of recommendation: I (Strong) Level of evidence: B-NR
	Bare Metal Self-Expanding Stents - Aortoiliac bifurcation, Focal CIA lesion, Moderate to severe calcified, focal lesion, Moderate to severe calcified, diffuse lesion, Chronic total occlusion, focal lesion, Chronic total occlusion, diffuse lesion		Recommended as the intended definitive therapy in the aortoiliac interventions.	Class of recommendation: IIa (Moderate) Level of evidence: B-R, B-NR
	Bare Metal Self-Expanding Stents - ISR, focal lesion, ISR, diffuse lesion		Recommended as the intended definitive therapy in the aorto-iliac interventions.	Class of recommendation: IIb (Weak) Level of evidence: C-LD
	Drug-Eluting Stents - (all lesions)		Not recommended as the intended definitive therapy in the aorto-iliac arterial intervention	Class of recommendation: III (No benefit) Level of evidence: C-EO

Developer/Guideline/Year	Clinical Subset of PAD or Endovascular Procedure	Evidence Base	Recommendation	Strength of Recommendation
	Drug Coated Balloons - ISR, focal lesion, ISR, diffuse lesion		Recommended as the intended definitive therapy in the aorto-iliac interventions.	Class of recommendation: IIb (Weak) Level of evidence: C-EO
	Drug Coated Balloons - Aortoiliac bifurcation, Focal CIA lesion, Diffuse CIA lesion, Focal EIA lesion, Diffuse EIA lesion, Moderate to severe calcified, focal lesion, Moderate to severe calcified, diffuse lesion, Chronic total occlusion, focal lesion, Chronic total occlusion, diffuse lesion		Not recommended as the intended definitive therapy in the aortoiliac arterial intervention	Class of recommendation: III (No benefit) Level of evidence: C-EO
	Covered Balloon Expandable Stents - Aortoiliac bifurcation, Focal CIA lesion, Diffuse CIA lesion, Moderate to severe calcified, focal lesion, Moderate to severe calcified, diffuse lesion		Recommended as the intended definitive therapy in the aortoiliac interventions.	Class of recommendation: I (Strong) Level of evidence: B-R, B-NR, C-LD
	Covered Balloon Expandable Stents - Focal EIA lesion, Diffuse EIA lesion, Chronic total occlusion, focal lesion, Chronic total occlusion, diffuse lesion, ISR, focal		Recommended as the intended definitive therapy in the aortoiliac interventions.	Class of recommendation: IIa (Moderate) Level of evidence: B-R, B-NR, C-LD

Developer/Guideline/Year	Clinical Subset of PAD or Endovascular Procedure	Evidence Base	Recommendation	Strength of Recommendation
	lesion, ISR, diffuse lesion Covered Self-Expanding Stents - Aortoiliac bifurcation, Focal CIA lesion, Diffuse CIA lesion, Focal EIA lesion		Recommended as the intended definitive therapy in the aortoiliac interventions.	Class of recommendation: IIb (Weak) Level of evidence: C-LD
	Covered Self-Expanding Stents - Diffuse EIA lesion Moderate to severe calcified, focal lesion, Moderate to severe calcified, diffuse lesion, Chronic total occlusion, focal lesion, Chronic total occlusion, diffuse lesion, ISR, focal lesion, ISR, diffuse lesion		Recommended as the intended definitive therapy in the aortoiliac interventions.	Class of recommendation: IIa (Moderate) Level of evidence: C-LD

CIA = common iliac artery; EIA = external iliac artery; ISR = in stent restenosis

APPENDIX K. Outcome Definitions

Appendix Table K1. Definitions for Magnitude of Effects, Based on Mean Between-Group Differences

Outcome	Slight/Small	Moderate	Large/Substantial
Symptoms	5–10 points on a 0-to 100-point VAS or the equivalent*	>10–20 points on a 0-to 100-point VAS or the equivalent*	>20 points on a 0-to 100-point VAS or the equivalent*
	0.5–1.0 points on a 0-to 10-point numerical rating scale or the equivalent	>1–2 points on a 0-to 10-point numerical rating scale or the equivalent	>2 points on a 0-to 10-point numerical rating scale or the equivalent
	1–2 points on 0–20 scale	2–4 points on 0–20 scale	>4 points on 0–20 scale
Function	5%–10% change in MWD	>10%–20% change in MWD	>20% change in MWD
	5%–10% change in ICD	>10%–20% change in ICD	>20% change in ICD
	5%–10% change in MWT	>10%–20% change in MWT	>20% change in MWT
	5%–10% change in COT	>10%–20% change in COT	>20% change in COT
	5%–10% change in WIQ Walking Distance	>10%–20% change in WIQ Walking Distance	>20% change in WIQ Walking Distance
	5– 10 points on SIP scale	>10– 20 points on SIP scale	>20 points on SIP scale
Pain or function	0.2–0.5 SMD	>0.5–0.8 SMD	>0.8 SMD
	1.2 to 1.4 RR/OR	1.5 to 1.9 RR/OR	≥2.0 RR/OR

COT = claudication onset time; ICD = intermittent claudication distance; MWD = maximum walking distance; MWT = maximum walking time; WIQ = walking impairment questionnaire; SIP = sickness impact profile; SMD = standardized mean difference; VAS = visual analogue scale

*Includes WIQ pain severity scale and PAQ symptoms scale

Appendix Table K2. Walking Outcome Definitions and Treadmill Protocols for Randomized Trials Comparing Endovascular Therapy Versus Medical Therapy or Supervised Exercised Therapy

Intervention, Comparator	Author, year	ICD definition	MWD definition	Treadmill protocol	Notes
Endovascular therapy vs. MT <i>and vs. SET</i>	Nylaende, 2007	The patients indicated when the onset of pain occurred (i.e., PFWD) during treadmill testing and then proceeded to walk up to MWD	The patients indicated when the onset of pain occurred (PFWD) and then proceeded to walk up to absolute claudication distance (MWD) during treadmill testing	fixed load treadmill test, 3 km/h at 10° incline	The PFWD and MWD were recorded for the primary limiting side up to a maximum of 600m (12min), although some patients were able to walk further. In these cases, the PFWD and MWD were equaled to 600m
	Whyman 1996, 1997	Time to onset of claudication, up to a maximum of 10 minutes; converted to distance: treadmill onset claudication distance	Time to cessation of walking due to claudication. Converted to distance: treadmill maximum walking distance	standard treadmill test, 4 km/h at 10° incline, up to a maximum of 10 minutes.	Significant improvement was arbitrarily taken as the ability to walk 667 m (10 min) on the treadmill free of pain where this was not possible before.
	Murphy 2012, 2015	Claudication onset time was defined as the treadmill time when calf muscle discomfort was first noticed	Peak walking time was defined as the maximal time a participant could walk during the graded treadmill test	graded treadmill test: Gardner protocol (not otherwise specified)	For those individuals who did not experience any claudication symptoms during follow-up testing, COT was considered to be the same as the PWT
	Nordanstig, 2014	Covered distance until onset of intermittent claudication symptoms	MWD on treadmill (no other information provided)	Treadmill test with increasing workload due to progressively increasing slope (0% to 12%) and speed	None
	Lindgren, 2018	NR	Absolute walking distance measured by a standardized treadmill test (no other information provided)	3 km/h, without incline, maximum duration 20 minutes or 1000 meters	Report on the proportion that walk the maximum distance (1000 m) on treadmill; no mention of symptoms (i.e., walking pain-free or with claudication pain)

Intervention, Comparator	Author, year	ICD definition	MWD definition	Treadmill protocol	Notes
Endovascular therapy vs. SET	Mazari 2010, 2012, 2017 <i>and combo endovascular + SET vs. SET alone</i>	ICD (not further defined)	MWD (not further defined)	fixed-load treadmill testing at 2.5km/h and 10° incline; maximum 215 m or 5 minutes	patient reported walking distance (PRWD, up to a maximum of 1000 m),
	Spronk, 2009; Fakhry, 2013	PFWD (not further defined) on treadmill testing	MWD (not further defined) on treadmill testing	3.5 km/h, no graded incline	None
	Perkins, 1996	Claudication distance (not further defined)	MWD (not further defined)	3 km/h and 10° incline, up to a maximum of 750 m (equivalent to 15 min walking)	None
	Koelemay, 2022	PFWD was defined as the distance covered on treadmill without any pain	MWD was defined as the maximum distance covered on treadmill testing	3 km/h and 10° incline; up to maximum of 800 m (15 minutes).	None
Combination endovascular therapy + SET vs. SET alone	Fakhry, 2015; Klaphake, 2022	PFWD (not further defined)	MWD (not further defined) had to be between 100 and 500 meters on treadmill	graded treadmill test: Gardner protocol (not otherwise specified).; maximum duration 30 minutes	A mean difference of 30% in treadmill MWD (corresponding to an approximately 150 m difference) between the 2 groups was considered as a relevant effect size.
	Greenhalg, 2008	ICD, defined as the distance the patient walks on the treadmill before onset of claudication pain.	Absolute walking distance (AWD) is defined as the maximum distance that patients can walk on the treadmill before they must stop either due to claudication pain or for any other reason such as breathlessness or fatigue	4 km/h and 10° incline, up to a maximum of 15 min (i.e., 1000 m).	None

ICD = intermittent claudication distance; MWD = maximum walking distance; PFWD = pain-free walking distance.

APPENDIX L. FDA Approved Devices

Table L1. Devices Used Across Endovascular Revascularization Randomized Controlled Trials

Type of Device	Device Name	Manufacturer	FDA Approval Date/Number	Indications for Use	Contraindications
Balloon Catheters	Amphirion Deep 0.014 OTW PTA Balloon Catheter	Medtronic	03/13/2009 K083919	<p>"The Amphirion™ Deep PTA Balloon Dilatation Catheter up to 120mm balloon length is intended to dilate stenoses in the iliac, femoral, iliofemoral, popliteal, infrapopliteal, and renal arteries, and for the treatment of obstructive lesions of native or synthetic arteriovenous dialysis fistulae.</p> <p>The Amphirion Deep PTA Balloon Dilatation Catheter in 150mm and 210mm balloon lengths is intended to dilate stenosis in the femoral, popliteal, and infra-popliteal arteries."</p>	Not specified.
	AngioSculpt PTA Scoring Balloon Catheters	Philips	02/14/2024 K150634	<p>"The AngioSculpt PTA scoring balloon catheter is intended for dilatation of lesions in the iliac, femoral, ilio-femoral, popliteal, infra-popliteal, and renal arteries, and for the treatment of obstructive lesions of native or synthetic arteriovenous dialysis fistulae. Not for use in the coronary or neuro-vasculature."</p>	"None known for percutaneous transluminal angioplasty (PTA) procedures."

Type of Device	Device Name	Manufacturer	FDA Approval Date/Number	Indications for Use	Contraindications
	Armada 35 Balloon Dilation Catheter	Abbott Laboratories (Chicago, IL, USA)	10/03/2011 K111899	“The device is intended for dilatation of lesions in the renal, iliac, femoral, popliteal, tibial, and peroneal arteries and for the treatment of obstructive lesions of native or synthetic arteriovenous dialysis fistulae. This device is also indicated for stent post-dilatation in the peripheral vasculature.”	<ul style="list-style-type: none"> • “Inability to cross lesion with a guide wire • Use in the coronary arteries”
	EverCross 0.035 OTW PTA Dilatation Catheter	Medtronic	04/23/2019 K190753	“The EverCross 0.035” OTW PTA dilatation catheter is intended to dilate stenoses in the iliac, femoral, ilio-femoral, popliteal, infrapopliteal, and renal arteries, and for the treatment of obstructive lesions of native or synthetic arteriovenous dialysis fistulae. This device is also indicated for stent post-dilatation in the peripheral vasculature.”	Not specified.
	Mustang Balloon Dilation Catheter	Boston Scientific (Marlborough, MA, USA)	03/22/2011 K103751	“The Mustang Balloon Dilatation Catheter is indicated for Percutaneous Transluminal Angioplasty (PTA) in the peripheral vasculature, including iliac, femoral, popliteal, tibial, peroneal, subclavian, and renal arteries and for the treatment of obstructive lesions of native or synthetic arteriovenous dialysis fistulae. The Mustang Balloon Dilatation Catheter is also indicated for post-dilatation of balloon expandable and self-expanding stents in the peripheral vasculature. Mustang Balloon Dilatation Catheters with balloons up to 120 mm in length are indicated for the treatment of biliary strictures.”	“None known.”

Type of Device	Device Name	Manufacturer	FDA Approval Date/Number	Indications for Use	Contraindications
	OPTA PRO PTA Dilatation Catheter	Cordis (Miami Lakes, FL, USA)	5/20/1998 K981407	"The OPTA PRO PTA catheter is intended to dilate stenoses in iliac, femoral, ilio-femoral, popliteal, infra popliteal and renal arteries and for the treatment of obstructive lesions of native or synthetic arteriovenous dialysis fistulae."	"None known for PTA procedure. The OPTA PRO PTA catheter is contraindicated for use in coronary arteries."
	Oscar Peripheral Multifunctional Catheter system	Biotronik	07/11/2024 K241711	"The Oscar Peripheral Multifunctional Catheter system is indicated for percutaneous transluminal interventions in the peripheral vasculature to provide support during access into and to dilate stenoses in femoral, popliteal and infrapopliteal arteries. The product is also intended for injection of radiopaque contrast media for the purpose of angiography."	"All general contraindications for percutaneous transluminal angioplasty (PTA) are contraindications for this device. Contraindications for this device and peripheral dilatation catheters in general are: <ul style="list-style-type: none"> • Lesions that cannot be reached or treated with the system • Uncorrected bleeding disorders • Sepsis Furthermore, all general PTA and procedure-related contraindications as described in the national and international guidelines of the respective medical associations apply."
	Passeo-18 Peripheral Dilatation Catheter	Biotronik (Berlin, Germany)	10/08/2015 K151744	"The Passeo-18 peripheral dilatation catheter is indicated to dilate stenosis in the femoral, popliteal and infrapopliteal arteries and for the treatment of obstructive lesions of native or synthetic arteriovenous dialysis fistulae."	"Contraindications for this device and peripheral dilatation catheters in general are: <ul style="list-style-type: none"> • Inability to cross the target lesion with a guide wire • Bleeding diathesis"

Type of Device	Device Name	Manufacturer	FDA Approval Date/Number	Indications for Use	Contraindications
	Passeo-35 Xeo Peripheral Dilatation Catheter	Biotronik	02/16/2023 K222065	“The Passeo-35 Xeo peripheral dilatation catheter is indicated to dilate stenosis in the iliac, femoral, popliteal and infrapopliteal arteries and for the treatment of obstructive lesions of native or synthetic arteriovenous dialysis fistulae. Passeo-35 is also recommended for post-dilatation of balloon expandable and self-expanding stents in the peripheral vasculature.”	<p>“Passeo-35 Xeo is contraindicated for use in patients with:</p> <ul style="list-style-type: none"> • A lesion that cannot be reached or treated with the dilatation catheter. • Large amounts of acute or sub-acute thrombus at the target lesion. • Perforated vessels. • A lesion that lies within or adjacent to an aneurysm. • Uncorrected bleeding disorders. • A renal insufficiency or an allergy to contrast media. <p>Furthermore, all general PTA and procedure-related contraindications as described in the national and international guidelines of the respective medical associations apply.”</p>
	PowerFlex Pro PTA Catheter	Cordis (Miami Lakes, FL, USA)	06/14/2012 K121442	“The PowerFlex Pro PTA catheter is intended to dilate stenoses in iliac, femoral, ilio-femoral, popliteal, infra popliteal and renal arteries and for the treatment of obstructive lesions of native or synthetic arteriovenous dialysis fistulae. The device is also indicated for post-dilation of balloon-expandable and self-expanding stents in the peripheral vasculature.”	“None known for PTA procedure. The PowerFlex Pro PTA catheter is contraindicated for use in coronary arteries.”

Type of Device	Device Name	Manufacturer	FDA Approval Date/Number	Indications for Use	Contraindications
	Serranator PTA Serration Balloon Catheter	Cagent Vascular (Wayne, PA, USA)	05/04/2022 K220704	"The Serranator® PTA Serration Balloon Catheter is intended for dilatation of lesions in the iliac, femoral, iliofemoral, popliteal, and infrapopliteal arteries and for the treatment of obstructive lesions of native or synthetic arteriovenous dialysis fistulae. Not for use in the coronary or neurovasculature."	"None known."
	VascuTrak PTA Dilation Catheter	Bard Peripheral Vascular, Inc. (Tempe, AZ, USA)	12/13/2010 K103459	"The Vascutrak™ PTA Dilation Catheter is intended to dilate stenoses in the iliac, femoral, ilio-femoral, popliteal, infra-popliteal and renal arteries and for the treatment of obstructive lesions of native or synthetic arteriovenous dialysis fistulae. The device is also recommended for post-dilation of balloon expandable stents, self-expanding stents, and stent grafts in the peripheral vasculature."	"The VASCUTRAK® PTA Catheter is contraindicated: <ul style="list-style-type: none"> • where there is the inability to cross the target lesion with a guidewire • for use in the coronary or neuro vasculature"

Type of Device	Device Name	Manufacturer	FDA Approval Date/Number	Indications for Use	Contraindications
Paclitaxel-coated Balloons	Chocolate Touch Paclitaxel Drug-Coated PTA Balloon Catheter	Genesis MedTech (Singapore)	08/16/2023 P210039/S001	"The Chocolate Touch® (Paclitaxel Coated PTA Balloon Catheter) is indicated for percutaneous transluminal angioplasty, after appropriate vessel preparation, of de novo or restenotic lesions up to 180 mm in length in native femoral or popliteal arteries with reference vessel diameters of 4.0 mm to 6.0 mm."	<ul style="list-style-type: none"> • "Use in the coronary arteries, renal arteries, and supra-aortic/cerebrovascular arteries • Lesion is unable to be crossed with a guidewire. • Patients who cannot receive recommended antiplatelet and/or anticoagulant therapy • Patients with known allergies or sensitivities to paclitaxel • Pregnant or breast-feeding women or women who are intending to become pregnant, or men intending to father children."

Type of Device	Device Name	Manufacturer	FDA Approval Date/Number	Indications for Use	Contraindications
	IN.PACT 018 Paclitaxel-Coated Percutaneous Transluminal Angioplasty (PTA) Balloon Catheter	Medtronic	11/22/2024 P140010/S086	"The IN.PACT Admiral Paclitaxel-coated PTA Balloon Catheter and IN.PACT 018 Paclitaxel-coated PTA Balloon Catheter are indicated for percutaneous transluminal angioplasty, after appropriate vessel preparation, of de novo, restenotic, or in-stent restenotic lesions with lengths up to 360 mm in superficial femoral or popliteal arteries with reference vessel diameters of 4–7 mm."	<p>"The IN.PACT Admiral DCB and IN.PACT 018 DCB are contraindicated for use in:</p> <ul style="list-style-type: none"> • Coronary arteries, renal arteries, and supra-aortic/cerebrovascular arteries • Patients who cannot receive recommended antiplatelet and/or anticoagulant therapy • Patients judged to have a lesion that prevents complete inflation of an angioplasty balloon or proper placement of the delivery system • Patients with known allergies or sensitivities to paclitaxel • Women who are breastfeeding, pregnant, or are intending to become pregnant or men intending to father children. It is unknown whether paclitaxel will be excreted in human milk and whether there is a potential for adverse reaction in nursing infants from paclitaxel exposure."

Type of Device	Device Name	Manufacturer	FDA Approval Date/Number	Indications for Use	Contraindications
	IN.PACT Admiral Paclitaxel-Coated Percutaneous Transluminal Angioplasty Balloon Catheter	Medtronic	10/21/2024 P140010/S085	"The IN.PACT Admiral Paclitaxel-coated PTA Balloon Catheter is indicated for percutaneous transluminal angioplasty, after pre-dilatation, of de novo or restenotic lesions up to 180 mm in length in native superficial femoral or popliteal arteries with reference vessel diameters of 4-7 mm."	<p>"The IN.PACT Admiral DCB is contraindicated for use in:</p> <ul style="list-style-type: none"> • coronary arteries, renal arteries, and supra-aortic/cerebrovascular arteries • patients who cannot receive recommended antiplatelet and/or anticoagulant therapy • patients judged to have a lesion that prevents complete inflation of an angioplasty balloon or proper placement of the delivery system • patients with known allergies or sensitivities to paclitaxel • women who are breastfeeding, pregnant or are intending to become pregnant or men intending to father children. It is unknown whether paclitaxel will be excreted in human milk and whether there is a potential for adverse reaction in nursing infants from paclitaxel exposure."

Type of Device	Device Name	Manufacturer	FDA Approval Date/Number	Indications for Use	Contraindications
	Lutonix Drug Coated Balloon PTA Catheter	BD (Franklin Lakes, NJ, USA)	09/07/2023 P130024/S043	"The Lutonix 035 Drug Coated Balloon PTA catheter is indicated for percutaneous transluminal angioplasty, after pre-dilatation, of de novo or restenotic lesions up to 150mm in length in native superficial femoral or popliteal arteries with reference vessel diameters of 4-6mm."	<p>"The LUTONIX® Catheter is contraindicated for use in:</p> <ul style="list-style-type: none"> • Patients who cannot receive recommended anti-platelet and/or anticoagulant therapy. • Women who are breastfeeding, pregnant or are intending to become pregnant or men intending to father children. It is unknown whether paclitaxel will be excreted in human milk and there is a potential for adverse reaction in nursing infants from paclitaxel exposure. • Patients judged to have a lesion that prevents complete inflation of an angioplasty balloon or proper placement of the delivery system."

Type of Device	Device Name	Manufacturer	FDA Approval Date/Number	Indications for Use	Contraindications
	Ranger™ Paclitaxel-Coated Balloon Catheter	Boston Scientific (Marlborough, MA, USA)	07/23/2024 P190019/S033	“The Ranger Drug-Coated Balloon (DCB) is indicated for percutaneous transluminal angioplasty (PTA) of <i>de novo</i> or restenotic lesions up to 180 mm in length located in native superficial femoral and proximal popliteal arteries (SFA/PPA) with reference vessel diameters of 4 mm to 7 mm.”	<p>“Use of the Ranger DCB is contraindicated in:</p> <ul style="list-style-type: none"> • Patients with known hypersensitivity to paclitaxel (or structurally-related compounds). • Patients who cannot receive recommended antiplatelet and/or anticoagulation therapy. • Women who are breastfeeding, pregnant or men intending to father children. • Patients judged to have a lesion that prevents complete inflation of an angioplasty balloon or proper placement of the delivery system. • Coronary arteries, renal arteries, and supra-aortic/cerebrovascular arteries.”

Type of Device	Device Name	Manufacturer	FDA Approval Date/Number	Indications for Use	Contraindications
	Stellarex 0.035 OTW Drug-Coated Angioplasty Balloon	Philips	08/07/2024 P160049/S025	“The Stellarex™ 0.035” OTW Drug-coated Angioplasty Balloon is indicated for percutaneous transluminal angioplasty (PTA), after appropriate vessel preparation of de novo or restenotic lesions up to 180 mm in length in native superficial femoral or popliteal arteries with reference vessel diameters of 4-6 mm.”	<p>“The Stellarex™ 0.035” OTW Drug-coated Angioplasty Balloon is contraindicated for use in:</p> <ul style="list-style-type: none"> • Patients with known hypersensitivity to paclitaxel or structurally related compounds. • Patients who cannot receive recommended antiplatelet and/or anticoagulation therapy. • Women who are breastfeeding, pregnant or are intending to become pregnant or men intending to father children. • Coronary arteries, renal arteries, and supra-aortic/cerebrovascular arteries. • Patients judged to have a lesion that prevents complete inflation of an angioplasty balloon or proper placement of the delivery system.”

Type of Device	Device Name	Manufacturer	FDA Approval Date/Number	Indications for Use	Contraindications
	Surmodics Surveil Drug-Coated Balloon	Surmodics (Eden Prairie, MN, USA)	08/20/2024 P210025	"The SurVeil DCB is indicated for percutaneous transluminal angioplasty, after appropriate vessel preparation, of de novo or restenotic lesions (0 mm in length) in femoral and popliteal arteries having reference vessel diameters of 4 mm to 7 mm."	"The SurVeil DCB is contraindicated for use in: <ul style="list-style-type: none"> • Patients who cannot receive recommended antiplatelet and/or anticoagulant therapy • Patients with known hypersensitivity to paclitaxel or structurally related compounds. • Patients judged to have a lesion that prevents complete inflation of an angioplasty balloon or proper placement of the delivery system. • Women who are breastfeeding, pregnant or are intending to become pregnant or men intending to father children. • Coronary, renal and supra-aortic/cerebrovascular arteries."
Bare Metal Stents	Absolute Pro Vascular Self-Expanding Stent System	Abbott Vascular	01/31/2023 P110028/S023	"The Absolute Pro™ Vascular Self-Expanding Stent System is indicated for improving luminal diameter in patients with de novo or restenotic atherosclerotic lesions in the native common iliac artery and native external iliac artery with reference vessel diameters between 4.3 mm to 9.1 mm and lesion lengths up to 90 mm."	"There are no known contraindications."

Type of Device	Device Name	Manufacturer	FDA Approval Date/Number	Indications for Use	Contraindications
	Astron Peripheral Self-Expanding Nitinol Stent System	Biotronik	07/20/2023 P140030/S016	"The Astron stent system is indicated for improving luminal diameter in patients with iliac atherosclerotic lesions in vessel reference diameters between 4.3mm and 9.5mm and lesion lengths up to 105 mm."	"There are no known contraindications."
	Astron Pulsar, Pulsar-18, Pulsar-18 T3	Biotronik	07/20/2023 P160025/S017	"The Astron Pulsar stent system is indicated for improving luminal diameter in patients with symptomatic de novo, restenotic or occlusive lesions located in the superficial femoral or proximal popliteal arteries in vessel diameters between 3.0 mm and 6.0 mm and lesion lengths up to 190 mm."	<ul style="list-style-type: none"> • "Patients with known hypersensitivity to nickel or amorphous silicon carbide. • Patients with uncorrected bleeding disorders and contraindication to antiplatelet and/or anti-coagulation therapy."
	E-Luminexx Vascular Stents	BD	11/23/2021 P080007/S026	"The Bard® E-LUMINEXX™ Vascular Stent is indicated for the treatment of iliac occlusive disease in patients with symptomatic vascular disease of the common and/or external iliac arteries up to 126 mm in length with a reference vessel diameter of 5 to 9 mm."	"There are no known contraindications."
	Epic Vascular Self-Expanding Stent System	Boston Scientific	03/13/2024 P110035	"Epic Vascular Self-Expanding Stent System is indicated for the improvement of luminal diameter in patients with de novo or restenotic symptomatic atherosclerotic lesions up to 120 mm in length In the common and/or external iliac arteries, with a reference vessel diameter between 5 and 11 mm."	"There are no known contraindications."

Type of Device	Device Name	Manufacturer	FDA Approval Date/Number	Indications for Use	Contraindications
	EverFlex Self-Expanding Peripheral Stent System	Covidien/Medtronic	05/09/2025 P110023	"The EverFlex Self-Expanding Peripheral Stent System is intended to improve luminal diameter in the treatment of symptomatic de-novo or restenotic lesions up to 180mm in length in the native Superficial Femoral Artery (SFA) and/or proximal popliteal arteries with reference vessel diameters ranging from 4.5-7.5mm."	<p>"Patients in whom anticoagulant and/or antiplatelet therapy is contraindicated.</p> <ul style="list-style-type: none"> • Patients with known hypersensitivity to nickel titanium. • Patients who are judged to have a lesion that prevents complete inflation of an angioplasty balloon or proper placement of the stent or stent delivery system."
	LifeStent Vascular Stent System	Bard	07/27/2023 P070014/S065	"The Bard® LifeStent® Vascular Stent System is intended to improve luminal diameter in the treatment of symptomatic de novo or restenotic lesions up to 240 mm in length in the native superficial femoral artery (SFA) and popliteal artery with reference vessel diameters ranging from 4.0 – 6.5 mm."	<p>"The LifeStent® Vascular Stent System is contraindicated for use in:</p> <ul style="list-style-type: none"> • Patients with a known hypersensitivity to nitinol (nickel, titanium), and tantalum. • Patients who cannot receive recommended anti-platelet and/or anti-coagulation"

Type of Device	Device Name	Manufacturer	FDA Approval Date/Number	Indications for Use	Contraindications
	LifeStent™ 5F Vascular Stent Systems	Bard	02/02/2023 P070014/S064	“The LifeStent™ 5F Vascular Stent System is intended to improve luminal diameter in the treatment of symptomatic de novo or restenotic lesions up to 240 mm in length in the native superficial femoral artery (SFA) and popliteal artery with reference vessel diameters ranging from 4.0 - 6.5 mm.”	<p>“The LifeStent™ 5F Vascular Stent System is contraindicated for use in:</p> <ul style="list-style-type: none"> • Patients with a known hypersensitivity to nitinol (nickel-titanium), and tantalum. • Patients who cannot receive recommended anti-platelet and/or anti-coagulation therapy. • Patients who are judged to have a lesion that prevents complete inflation of an angioplasty balloon or proper placement of the stent or stent delivery system.”

Type of Device	Device Name	Manufacturer	FDA Approval Date/Number	Indications for Use	Contraindications
	MISAGO RX Self-expanding Peripheral Stent System	Terumo Medical Corporation (Somerset, NJ, USA)	11/14/2024 P140002/S028	"The Misago RX Self-expanding Peripheral Stent is indicated to improve luminal diameter in symptomatic patients with de novo or restenotic native lesions or occlusions of the superficial femoral artery (SFA) and/or proximal popliteal artery with reference vessel diameters ranging from 4 mm to 7 mm and lesion length up to 150 mm."	<ul style="list-style-type: none"> • "Patients who exhibit angiographic evidence of severe thrombus in the target vessel or lesion site before/after undergoing Percutaneous Transluminal Angioplasty PTA procedure. • Patients with contraindication to antiplatelet and/or anticoagulation therapy. • Patients who are judged to have a lesion that prevents proper placement or deployment of the stent. • A lesion that is within an aneurysm or an aneurysm with a proximal or distal segment to the lesion. • A lesion through which a guide wire cannot pass."
	Omnalink Elite Vascular Balloon-Expandable Stent System	Abbott Vascular	09/20/2024 P110043/S014	"The Omnilink Elite Stent System is indicated for the treatment of atherosclerotic iliac artery lesions with reference vessel diameters of ≥ 5.0 mm and ≤ 11.0 mm, and lesion lengths up to 50 mm."	"There are no known contraindications."

Type of Device	Device Name	Manufacturer	FDA Approval Date/Number	Indications for Use	Contraindications
	PALMAZ GENESIS Peripheral Stent	Cordis (Miami Lakes, FL, USA)	12/20/2022 P890017/S023	"The PALMAZ GENESIS Peripheral Stent is indicated for use in the treatment of atherosclerotic disease of peripheral arteries below the aortic arch and for palliation of malignant neoplasms in the biliary tree."	<p>"Peripheral Artery Stent Implantation Generally, contraindications to percutaneous transluminal angioplasty (PTA) are also contraindications for stent placement. Contraindications include, but may not be limited to:</p> <ul style="list-style-type: none"> • Patients with highly calcified lesions resistant to PTA • Patients with a target lesion with a large amount of adjacent acute or subacute thrombus • Patients with uncorrected bleeding disorders or patients who cannot receive anticoagulation or antiplatelet aggregation therapy. • Patients with perforated vessels evidenced by extravasation of contrast media • A lesion that is within an aneurysm or an aneurysm with a proximal or distal segment adjacent to the lesion."

Type of Device	Device Name	Manufacturer	FDA Approval Date/Number	Indications for Use	Contraindications
	SMART Nitinol Self-Expanding Stent	Cordis	8/12/2003 P020036	"The S.M.A.R.T.™ Nitinol Stent System (hereinafter called the SMART stent system) and the S.M.A.R. T. TM Control™ Nitinol Stent System (hereinafter called the SMART Control stent system) are indicated for improving luminal diameter in patients with symptomatic atherosclerotic disease of the common and/or external iliac arteries up to 126 mm in length, with a reference vessel diameter of 4 to 9 mm, and angiographic evidence of a patent profunda or superficial femoral artery."	None known.
	Supera Peripheral Stent System	Abbott Vascular	1/17/2024 P120020/S031	"The Supera™ Peripheral Stent System is indicated to improve luminal diameter in the treatment of patients with symptomatic de novo or restenotic native lesions or occlusions of the superficial femoral artery (SFA) and / or proximal popliteal artery with reference vessel diameters of 4.0 to 7.5 mm, and lesion lengths up to 140 mm."	<p>"The Supera™ Peripheral Stent System is contraindicated in:</p> <ul style="list-style-type: none"> • Patients who are judged to have a lesion that prevents complete inflation of an angioplasty balloon or proper placement of the stent or stent delivery system. • Patients who cannot receive antiplatelet or anticoagulation therapy. Based on in vivo thrombogenicity testing, the device should not be used in patients who cannot be anticoagulated as there may be some thrombus formation in the absence of anticoagulation."

Type of Device	Device Name	Manufacturer	FDA Approval Date/Number	Indications for Use	Contraindications
Drug-eluting Stents	Eluvia Drug-Eluting Vascular Stent System	Boston Scientific	09/27/2024 P180011/S061	“The ELUVIA Drug-Eluting Vascular Stent System is indicated for improving luminal diameter in the treatment of symptomatic de-novo or restenotic lesions in the native superficial femoral artery (SFA) and/or proximal popliteal artery with reference vessel diameters (RVD) ranging from 4.0-6.0 mm and total lesion lengths up to 190 mm.”	<ul style="list-style-type: none"> • “Women who are pregnant, breastfeeding, or plan to become pregnant in the next 5 years should not receive an Eluvia Drug-Eluting Stent. It is unknown whether paclitaxel will be excreted in human milk, and there is a potential for adverse reaction in nursing infants from paclitaxel exposure. • Patients who cannot receive recommended anti-platelet and/or anti-coagulant therapy. • Patients judged to have a lesion that prevents proper placement of the stent or stent delivery system.”

Type of Device	Device Name	Manufacturer	FDA Approval Date/Number	Indications for Use	Contraindications
	Esprit™ BTK Everolimus Eluting Resorbable Scaffold System	Abbott	08/28/2024 P230036/S006	“The Esprit™ BTK Everolimus Eluting Resorbable Scaffold System is indicated for improving luminal diameter in infrapopliteal lesions in patients with chronic limb-threatening ischemia (CLTI) and total scaffolding length up to 170 mm with a reference vessel diameter of ≥ 2.5 mm and ≤ 4.00 mm.”	<p>“The Esprit™ BTK Everolimus Eluting Resorbable Scaffold System is contraindicated for use in:</p> <ul style="list-style-type: none"> • Patients who cannot tolerate, including allergy or hypersensitivity to, procedural anticoagulation or the post-procedural antiplatelet regimen. • Patients with hypersensitivity or contraindication to everolimus or structurally related compounds or known hypersensitivity to scaffold components poly(L-lactide), poly(D, L-lactide), and platinum.”

Type of Device	Device Name	Manufacturer	FDA Approval Date/Number	Indications for Use	Contraindications
	Zilver® PTX® Peripheral Drug- Eluting Stent	Cook Medical (Bloomington, IN, USA)	09/22/2023 P100022/S042	“The Zilver PTX Drug-Eluting Peripheral Stent is indicated for improving luminal diameter for the treatment of <i>de novo</i> or restenotic symptomatic lesions in native vascular disease of the above-the-knee femoropopliteal arteries having reference diameter from 4 mm to 7 mm and total lesion lengths up to 140 mm per limb and 280 mm per patient.”	<ul style="list-style-type: none"> • “Women who are pregnant, breastfeeding, or plan to become pregnant in the next 5 years should not receive Zilver PTX Drug-Eluting Peripheral Stent. It is unknown whether paclitaxel will be excreted in human milk, and there is potential for adverse reaction in nursing infants from paclitaxel exposure. • Patients who cannot receive recommended anti-platelet and/or anticoagulant therapy. • Patients judged to have a lesion that prevents proper placement of the stent or stent delivery system.”

Type of Device	Device Name	Manufacturer	FDA Approval Date/Number	Indications for Use	Contraindications
Covered (Endovascular Grafts) Stents	GORE® VIABAHN® Endoprosthesis	Gore Medical (Flagstaff, AZ, USA)	09/10/2024 P040037/S166	<p>“The GORE® VIABAHN® Endoprosthesis is indicated for improving blood flow in patients with symptomatic peripheral arterial disease in superficial femoral artery de novo and restenotic lesions up to 270 mm in length with reference vessel diameters ranging from 4.0 – 7.5 mm. The GORE® VIABAHN® Endoprosthesis is indicated for improving blood flow in patients with symptomatic peripheral arterial disease in superficial femoral artery in-stent restenotic lesions up to 270 mm in length with reference vessel diameters ranging from 4.0 – 6.5 mm. The GORE® VIABAHN® Endoprosthesis is indicated for improving blood flow in patients with symptomatic peripheral arterial disease in iliac artery lesions up to 80 mm in length with reference vessel diameters ranging from 4.0 – 12 mm. The GORE® VIABAHN® Endoprosthesis is also indicated for the treatment of stenosis or thrombotic occlusion at the venous anastomosis of synthetic arteriovenous (AV) access grafts.”</p>	<p>“The GORE® VIABAHN® Endoprosthesis with Heparin Bioactive Surface is contraindicated for non-compliant lesions where full expansion of an angioplasty balloon catheter was not achieved during pre-dilatation, or where lesions cannot be dilated sufficiently to allow passage of the delivery system. Do not use the GORE® VIABAHN® Endoprosthesis with Heparin Bioactive Surface in patients with known hypersensitivity to heparin, including those patients who have had a previous incidence of Heparin-Induced Thrombocytopenia (HIT) type II.”</p>

Type of Device	Device Name	Manufacturer	FDA Approval Date/Number	Indications for Use	Contraindications
	GORE VIABAHN VBX Balloon Expandable Endoprosthesis	Gore	06/27/2024 P160021/S045	"The GORE® VIABAHN® VBX Balloon Expandable Endoprosthesis is indicated for the treatment of de novo or restenotic lesions found in iliac arteries with reference vessel diameters ranging from 5 mm - 13 mm and lesion lengths up to 110 mm, including lesions at the aortic bifurcation."	"Do not use the GORE® VIABAHN® VBX Balloon Expandable Endoprosthesis in patients with known hypersensitivity to heparin, including those patients who have had a previous incident of Heparin-Induced Thrombocytopenia (HIT) type II."
	iCast Covered Stent System	Atrium Medical Corp (Hudson, NH, USA) (Getinge?)	08/07/2024 P120003/S005	"The iCast covered stent system is indicated for improving luminal diameter in patients with symptomatic atherosclerotic disease of the native common and/or external iliac arteries up to 110 mm in length, with a reference vessel diameter of 5 to 10 mm."	"The iCast covered stent is contraindicated for use in: <ul style="list-style-type: none"> • Patients with uncorrected bleeding disorders. • Patients who cannot receive recommended antiplatelet and/or anticoagulation therapy. • Patients who are judged to have a lesion that prevents full expansion of the implant. • Lesions in which the lumen diameter post-balloon angioplasty is insufficient for the passage of the endovascular system. • Lesion locations subject to external compression."

Type of Device	Device Name	Manufacturer	FDA Approval Date/Number	Indications for Use	Contraindications
	LifeStream™ Balloon Expandable Vascular Covered Stent	BD	08/23/2022 P160024/S012	"The LifeStream™ Balloon Expandable Vascular Covered Stent is indicated for the treatment of atherosclerotic lesions in common and external iliac arteries with reference vessel diameters between 4.5 mm and 12.0 mm, and lesion lengths up to 100 mm."	<p>"The LifeStream™ Balloon Expandable Vascular Covered Stent is contraindicated for use in:</p> <ul style="list-style-type: none"> • Patients with uncorrected bleeding disorders • Patients who cannot receive recommended antiplatelet and/or anticoagulation therapy • Patients who are judged to have a lesion that prevents full expansion of the implant • Lesions in which the lumen diameter post balloon angioplasty is insufficient for the passage of the endovascular system • Lesion locations subject to external compression."

AWD = absolute walking distance; FDA = Food and Drug Administration; ICD = intermittent claudication distance; km/h = kilometers per hour; MWD = maximum walking distance; NR = not reported; OTW = over-the-wire; PAD = peripheral artery disease; PFW = pain-free walking distance; PRWD = patient-reported walking distance; PTA = percutaneous transluminal angioplasty; PWT = peak walking time; QoL = quality of life; RCT = randomized controlled trial; SFA = superficial femoral artery; SET = supervised exercise therapy; USD = United States dollar.

APPENDIX M. Clinical Expert Peer Review

Rita Redberg, MD, MS
General and Preventative Cardiology
Professor of Medicine
UCSF Department of Medicine, Division of Cardiology

Matthew C. Smith, M.D., Ph.D.
Assistant Professor of Surgery
Section Head of Vascular Surgery, UWMC Northwest Hospital
Associate Program Director, Vascular Surgery Residency and Fellowship
Division of Vascular Surgery, University of Washington
