- In 2009, the FDA issued a MedWatch safety alert of inadvertent (secondary) testosterone exposure with topical testosterone gel (Testim and AndroGel), based on eight case reports of exposure in children, age nine months to five years old. Signs of virilization (development of male secondary sexual characteristics) and bone aging were observed. Boxed warnings are now required on all topical gel and solution formulations of testosterone, as well as educational REMS programs to reduce secondary exposure. [15]

Appendix 1: Lower Cost preferred Testosterone Replacement Therapy (TRT) Products [no PA required] [1]
Topical
testosterone topical gel 1.62% pump bottle
Injectable
testosterone cypionate
testosterone enanthate
Implant
Testopel (testosterone implant pellet 75mg)

[1] Note: all the TRTs in this table are FDA-approved products. *Use of compounded TRTs (non-FDA approved formulations such as creams, gels, implants) are subject to review as a "Compounded Medication"

Revision History

Revision Date	Revision Summary
9/19/2024	No criteria changes with this annual review.
9/14/2023	Added Testopel to Appendix 1 as a lower-cost preferred TRT product. Generic testosterone pellets are not listed as they are not FDA-approved products.
1/9/2023	• Updated products listed in Table 2. • Updated products in Appendix 1.
9/23/2022	• Added Tlando, Kyzatrex, Vogelxo, and testosterone transdermal gel (authorized generic for Vogelxo) to policy as non-preferred TRTs. • Removed Testopel and generic implants from policy. • Removed Striant from policy (discontinued as of 5/31/2020). • Updated COT language and tables to reflect changes.
3/18/2022	Updated policy to show Xyosted (testosterone enanthate) as a pharmacy benefit drug.
10/15/2021	• Moved Aveed from NMN to coverage criteria. • Updated COT language.
10/28/2020	Added investigational uses (use in post-menopausal women, including but not limited to infertility, sexual dysfunction; cognitive dysfunction, metabolic dysfunction, bone health or general well-being).
1/22/2020	Simplified policy to step therapy only. Removed most generic products from policy. Added COT language and updated references to compounded products.
10/24/2019	• Clarified coverage for new members established on TRT therapy; clarified definition of low testosterone level. • Removed brand Axiron and brand and generic Androxy from policy – no longer marketed. • Clarified that initial lab values provided for coverage must be within the last 12 months. Updated reauth criteria to clarify that lab values provided must be within the last 12 months of treatment.
4/4/2019	Added Jatenzo to policy (effective 6/3/2019).
10/19/2018	• Simplification of the criteria for gender dysphoria (effective 12/1/2018). • Removal of AndroGel 1.62% as a preferred product due to availability of a generic (effective 12/1/2018).
10/9/2018	Add Xyosted, a new branded reformulation of testosterone enanthate.
7/20/2018	New policy, effective 9/1/2018. Policy is a combination of previous separate policies for preferred and non-preferred products.

Drug names identified in this policy are the trademarks of their respective owners.

Medication Policy Manual

Policy No: dru549

Topic: Blood Factors for Hemophilia A, high-cost extended-half-life (EHL) products

- Adynovate, antihemophilic factor (recombinant), PEGylated
- Altuviiio, antihemophilic factor (recombinant), Fc-VWF-XTEN fusion protein-ehtl
- Eloctate, antihemophilic factor (recombinant), Fc fusion protein
- Esperoct, antihemophilic factor (recombinant), glycopegylated-exei
- Jivi, antihemophilic factor (recombinant), PEGylated

Date of Origin: January 1, 2019

Committee Approval Date: June 20, 2024

Next Review Date: 2025

Effective Date: September 1, 2024

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of medication policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

High-cost extended half-life (EHL) factor VIII (EHL FVIII) blood products are used for blood factor replacement in patients with hemophilia A when standard half-life (SHL) FVIII products or lower-cost EHL products are not a treatment option. They are used “on-demand” for bleeding episodes or perioperative management of bleeding, and as routine prophylaxis to reduce frequency of bleeding episodes.

Policy/Criteria

Most contracts require pre-authorization of high-cost extended half-life (EHL) blood factor VIII (EHL FVIII) products for hemophilia A prior to coverage (as listed in Table 1).

I. Continuation of therapy (COT): High-cost extended half-life (EHL) blood factor products for hemophilia A (EHL FVIII) (as listed in Table 1) may be considered medically necessary for COT when criterion A or B **AND** C below is met.

A. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

OR

B. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

AND

C. "Administration, Quantity Limitations, and Authorization Period" below applies, as well as "Not Medically Necessary" for combination therapy and Investigational Uses".

***Please note**: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): High-cost extended half-life (EHL) blood factor products for hemophilia A (EHL FVIII) (as listed in Table 1) may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) that criteria A and B below are met:

A. A diagnosis of **hemophilia A**, established by or in consultation with a hematologist.

AND

B. Lower-cost blood factor VIII products are not a treatment option, as defined by meeting one of the following criterion (1 or 2) below:

1. Lower-cost FVIII products have been ineffective as defined by the patient continuing to have documented (e.g., bleed diary or detailed provider notes) clinically significant bleeding events (such as target joint bleeds or other end organ damage) despite adherent use of lower cost FVIII products (dose and dose frequency, as listed in *Appendix 1*).

OR

2. There is a documented objective clinical reason that all available recombinant lower-cost FVIII blood factor products are not appropriate (as listed in *Appendix 2*).

PLEASE NOTE: On-demand ("PRN") use of a short half-life factor VIII product will not meet the intent of this efficacy criteria.

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers extended half-life (EHL) blood factor products for hemophilia A (EHL FVIII) coverable under the medical benefit or pharmacy benefit. Determination of coverage under the pharmacy or medical benefit is based on group-specific benefits, as defined in the group and member contract (as determined by the member contract with the health plan, regardless of self- or provider-administration).

B. Quantity Limits

1. High-cost extended half-life (EHL) blood factor products for hemophilia A (EHL FVIII) will be authorized up to FDA-recommended dose and frequency limits (*Table 1*).

2. Escalated dosing (quantities above FDA-recommended dose and frequency limits) may be covered when criteria a and b below are met:

a. There is documentation that the FDA-recommended dose is ineffective (clinically significant bleeding events such as target joint bleeds or other end-organ damage while adherent to therapy).

AND

b. Attestation that the escalated dosing is supported by a full or population-based pharmacokinetic (PK) studies.

C. Authorization Periods

1. Extended half-life (EHL) blood factor products for hemophilia A (EHL FVIII) will be authorized for up to one year.

2. Authorization shall be reviewed at least annually to confirm that the medication continues to be effective.

IV. The use of extended half-life (EHL) blood factor products for hemophilia A in combination with prophylactic Hemlibra (emicizumab-kxwh) use is considered not medically necessary.

V. The use of extended half-life (EHL) blood factor products for hemophilia A (EHL FVIII) for all other conditions not specified above is considered investigational.

Table 1. High-Cost EHL FVIII products: FDA-Recommended Dose and Frequency Limits

Product	FDA-recommended Dosing	Maximum Doses (per 28 days)
Adynovate[1]	Prophylaxis: - >12 years old: Up to 50 IU/kg two times per week. - <12 years old: Initially up to 55 IU/kg two times per week with a maximum of 70 IU/kg. On-demand: Up to 50 IU/kg every 8 to 24 hours until the bleeding is resolved. Perioperative: - Minor surgery: Up to 50 IU/kg every 24 hours for at least 1 day until bleeding is resolved. - Major surgery: Up to 60 IU/kg within one hour before the operation to achieve 100 IU/dL then every 8 to 24 hours until adequate wound healing.	Prophylaxis: - >12 years old: Up to FDA-labeled dose (+/-5%) for a total of 8 doses per 28 days. - <12 years old: Up to FDA-labeled dose (+/- 5%) for a total of 8 doses per 28 days. On-demand: Up to FDA-recommended dose (+/- 5%) for the number doses requested every 28 days. Perioperative: Up to FDA- recommended dose (+/- 5%) for the number doses requested every 28 days.
Altuviiio[2]	Prophylaxis: Up to 50 IU/kg per week every 28 days. On-demand: Up to 50 IU/kg. Additional doses every 2-3 days may be considered. Perioperative: - Minor surgery: Up to 50 IU/kg. One additional dose after 2-3 days may be considered. - Major surgery: Up to 50 IU/kg. Additional doses of up to 50 IU/kg every 2-3 days may be administered as clinically needed.	Prophylaxis: Up to 50 IU/kg per week every 28 days. On-demand: Up to FDA- recommended dose (+/- 5%) for the number doses requested every 28 days. Perioperative: Up to FDA- recommended dose (+/- 5%) for the number doses requested every 28 days.

Product	FDA-recommended Dosing	Maximum Doses (per 28 days)
Eloctate[3]	Prophylaxis: - >6 years old: Administer up to 65 IU/kg every 3 to 5 days. - <6 years old: Up to 65 IU/kg every 3 to 5 days. More frequent or higher doses (up to 80 IU/kg) may be required. On-demand: Up to 50 IU/kg every 12 to 24 hours (every 8 to 24 hours in patients <6 years old) until the bleeding is resolved. Perioperative: - Minor surgery: up to 40 IU/kg every 24 hours (every 12 to 24 hours for patients <6 years old) for at least 1 day until healing is achieved. - Major surgery: pre-operative up to 60 IU/kg followed by a repeat dose of up to 50IU/kg after 8 to 24 hours (6 to 24 hours for patients <6 years old), then every 24 hours until adequate wound healing, then continue therapy for at least another 7 days.	Prophylaxis: - >12 years old: Up to FDA-recommended dose (+/-5%) for a total of 9 doses per 28 days. - <12 years old: Up to FDA-recommended dose (+/-5%) for a total of 9 doses per 28 days. On-demand: Up to FDA- recommended dose (+/- 5%) for the number doses requested every 28 days. Perioperative: Up to FDA- recommended dose (+/- 5%) for the number doses requested every 28 days.
Jivi[4]	Prophylaxis: - >12 years old: Administer Up to 40 IU/kg twice weekly. - <12 years old: Not approved for use in this age group. On-demand: Up to 50 IU/kg every 8 to 24 hours until the bleeding is resolved. Perioperative: - Minor surgery: up to 30 IU/kg every 24 hours for at least 1 day until healing is achieved. - Major surgery: pre-operative up to 50 IU/kg every 12 to 24 hours until healing is achieved, then continue therapy for at least another 7 days.	Prophylaxis: - >12 years old: Up to FDA-recommended dose (+/-5%) for a total of 8 doses per 28 days. - <12 years old: Not approved for use in this age group. On-demand: Up to FDA- recommended dose (+/- 5%) for the number doses requested every 28 days. Perioperative: Up to FDA- recommended dose (+/- 5%) for the number doses requested every 28 days.

Product	FDA-recommended Dosing	Maximum Doses (per 28 days)
Esperoct[5]	Prophylaxis: - >12 years old: Administer Up to 50 IU/kg every 4 days. - <12 years old: Administer Up to 65 IU/kg twice weekly. On-demand: - >12 years old: Up to 50 IU/kg every 24 hours until the bleeding is resolved. - <12 years old: Up to 65 IU/kg every 24 hours until the bleeding is resolved. Perioperative: - Minor Surgery: up to 50 IU/kg (>12 years old) or up to 65 IU/kg (<12 years old) once, and then every 24 hours if necessary. - Major surgery: up to 50 IU/kg (>12 years old) or up to 65 IU/kg (<12 years old) every 24 hours for the first week, and then every 48 hours thereafter until wound healing.	Prophylaxis: - >12 years old: Up to FDA-recommended dose (+/-5%) for a total of 7 doses per 28 days. - <12 years old: Up to FDA-recommended dose (+/- 5%) for a total of 8 doses per 28 days. On-demand: - >12 years old: Up to FDA-recommended dose (+/- 5%) for the number doses requested every 28 days. - <12 years old: Up to FDA-recommended dose (+/- 5%) for the number doses requested every 28 days. Perioperative: - >12 years old: Up to FDA-recommended dose (+/- 5%) for the number doses requested every 28 days. - <12 years old: Up to FDA-recommended dose (+/- 5%) for the number doses requested every 28 days.

Position Statement

Summary

- The medications covered by this policy (as listed in Table 1) are high-cost extended half-life (EHL) blood factor VIII (FVIII) products used for the treatment of patients with hemophilia A. All are recombinant products.
- Hemophilia A is an X-linked congenital bleeding disorder caused by a deficiency of coagulation FVIII, part of the intrinsic coagulation pathway.[19]
- The intent of the policy is to allow for coverage of high-cost EHL FVIII products for patients with hemophilia A when lower-cost FVIII products [including standard half-life (SHL) products or lower-cost EHL products] are ineffective or not a treatment option, as detailed in the coverage criteria, for up to the quantities in the coverage criteria.
- In addition, the intent of the policy is to ensure ongoing use of high-cost EHL FVIII is effective for reduction of bleeding and used in doses up to the coverable amount.
- Therapy should be individualized based on age, bleeding phenotype, weight, inhibitor status, history of bleeding episodes, and availability of factor concentrates. Patients with a suboptimal response to factor concentrates should be assessed for inhibitors.[19]
- The primary goal of factor replacement therapy is to prevent and treat bleeding. A reduction in bleeding events and subsequent sequalae demonstrate the efficacy of treatment.
- Patients who continue to have spontaneous clinically significant bleeds (such as target joint bleeds or other end-organ damage) or cannot maintain optimal factor levels despite adherence to adequate (FDA-recommended) doses of standard half-life (SHL) factor products may see benefit from EHL FVIII products. However, there is no evidence that high-cost EHL FVIII products are more effective than lower-cost EHL FVIII products
- There is no evidence that high-cost EHL FVIII product prophylactic regimens are safer or more effective than lower-cost FVIII product prophylactic regimens in terms of annualized bleed rates (ABR). However, high-cost EHL FVIII product prophylactic regimens are more costly than lower-cost FVIII product prophylactic regimens (including SHL FVIII products and lower-cost EHL FVIII products).
- Recombinant factor replacement products are the recommended treatment of choice for hemophilia A patients.[20] Plasma-derived (pd) SHL FVIII products are used less frequently for long-term treatment in hemophilia A, given the availability of many recombinant SHL FVIII product options and lower-risk for infection. However, use of recombinant SHL FVIII products are considered safe and effective for management of hemophilia A and the standard of care first-line option for management. Therefore, high-cost EHL FVIII products are coverable only when recombinant SHL FVIII products are ineffective, or all are medically contraindicated. Inhibitor risk is greatest during the first 50 exposures to recombinant factor VIII products and greatly diminishes after 200 treatment days. At a minimum, inhibitor screening should be completed at baseline and yearly. Immune tolerance induction (ITI) should be started as soon as possible after a high titer FVIII inhibitors are identified (defined as greater than or equal to 5 Bethesda units. [19,21] Higher dose FVIII concentrate products can be used (SHL or EHL) with high

titer FVIII inhibitors, as well as emicizumab (Hemlibra), or bypassing agents such as rFVIIa (NovoSeven or SevenFact) or aPCC (FEIBA).

- The vast majority of published data regarding EHL FVIII products have been evaluated in previously treated patients (PTPs) with no history of inhibitory antibodies. There is currently a lack of studies that demonstrate the safety and efficacy of EHL FVIII products in previously untreated patients (PUPs). In addition, patients with a history of inhibitors have been excluded from clinical research trials of EHL FVIII products.[22]
- Pharmacokinetic (PK) dosing models can be used to individualize and improve response to therapy. Classic ("full individual") PK studies are difficult to perform due to the high number of blood samples required. Population-based PK models use data from manufacturers and hemophilia treatment centers, are easy to perform, and useful to determine FVIII product dose and require much fewer samples than classic PK studies.[23] PK studies are required at the first (initial) reauthorization period, to assess for over- or under-dosing of EHL FVIII product.

Clinical Efficacy

Hemophilia A

- The safety and efficacy of EHL FVIII products (Adynovate, Eloctate, Afstyla, Jivi, Esperoct, and Altuviiio) in hemophilia A were established based on one to two open-label, non-randomized trials in each. All were effective for reduction in annualized bleeding rate (ABR) when used prophylactically versus on-demand treatment.
- At this time, there is insufficient evidence to establish high-cost EHL FVIII products have a lower risk of inhibitor development as compared to other treatment options, such as lower-cost EHL FVIII products or SHL FVIII products. Eloctate was evaluated in clinical trials for inhibitor development. No patients developed inhibitors during either trial. However, there are cases of inhibitor formation, including in previously untreated patients, in clinical practice.
- All FVIII products (SHL and EHL) are effective for achieving hemostasis based on significant clinical experience. There are no head-to-head trials of high-cost EHL FVIII products versus SHL FVIII products or lower-cost EHL FVIII products to establish superior efficacy or safety.
- Both SHL and EHL factor VIII products are given via IV infusion. For patients unable to self-administer factor VIII, SHL FVIII may be given in the clinic setting or via home infusion services.
- In patients requiring surgery/invasive procedures, factor VIII repletion may be indicated peri-operatively. However, there is no evidence that high-cost EHL is superior to lower-cost EHL FVIII or SHL FVIII options for use in this setting.

Clinical Guidelines/Standard of Care Treatment

- Factor replacement products are effective for the prevention and control of bleeding versus no treatment based on years of significant clinical experience, systematic reviews, and are endorsed by clinical practice guidelines.

- A definitive diagnosis of hemophilia A depends on an assay that demonstrates a deficiency in Factor VIII levels. [19]
    * Mild Hemophilia A: 5-40 IU/dL
    * Moderate Hemophilia A: 1-5 IU/dL
    * Severe Hemophilia A: <1 IU/dL
- Prophylaxis is recommended as the optimal treatment modality for individuals with severe hemophilia by the National Hemophilia Foundation. The concept was conceived from the observation that moderate hemophiliacs (clotting factor level >1 IU/dL) seldom experience spontaneous bleeding and have much better preservation of joint function.[19]
- The two generalized prophylactic protocols currently in use with long-term data are the Malmö and the Utrecht protocols. These protocols should be individualized for each patient. [19]
    * Malmö protocol: 25-40 IU/kg per dose administered three times a week.
    * Utrecht protocol: 15-30 IU/kg per dose administered three times a week.
- Specific factor replacement products may recommend different dosing based on clinical trial experience.
- There is insufficient evidence that any factor product is superior to another due to a lack of comparative trial data.
- According to the Medical and Scientific Advisory Council (MASAC), the rate of inhibitors observed in PUPs in unacceptably high, and clinical trials are needed to direct clinical practice and reduce inhibitor formation. There is currently a lack of studies that demonstrate the safety and efficacy of EHL FVIII products in previously untreated patients (PUPs). Up to 30% of PUPs treated with FVIII products develop inhibitors.[24]
- Historically, patients with a history of inhibitors have been excluded from clinical research trials of EHL FVIII products.[22]
- The number of doses to reduce or manage bleeds and the dosage required varies greatly between patients. Dosage is dependent upon the level of severity, the presence of an inhibitor, prescribed regimen (on-demand, prophylaxis, perioperative), the number of bleeding episodes, individual pharmacokinetics, the products utilized, and the level of physical activity.[19]
- There is significant inter-patient pharmacokinetic variability after standard doses of FVIII. Using weight-based dosing may result in overdosing or underdosing of FVIII concentrate. The use of pharmacokinetic data facilitates individualization of FVIII dosing and may decrease the time patients are below the desired trough level (<1 IU/dL). Pharmacokinetic dosing models may lead to a reduction in treatment costs and better targeting of FVIII levels.[25]
- The pricing strategy for EHL FVIII products is based on the theory that use of EHL FVIII products reduces FVIII usage; and therefore, the cost will be similar to SHL FVIII products .[22] However, a small retrospective study of hemophilia A patients switching from SHL to EHL FVIII products showed an increase in factor usage by 33% in the 6 months immediately following the transition. This was also associated by large increase

in cost (2.36 times higher), without any proven clinical outcomes, such as a reduction in bleeding events, associated with the change.[26]

- Hemlibra (emicizumab-kxwh), a monoclonal antibody for use in patients with or without inhibitors for hemophilia A is being increasing utilized due to the ease of administration and dosing frequency.
- However, Hemlibra (emicizumab-kxwh) does not treat acute or breakthrough bleeding episodes, therefore there may still be a need for utilization of FVIII products in combination with Hemlibra (emicizumab-kxwh).
- There is insufficient evidence that utilization of EHL FVIII products for acute or breakthrough bleeding are more effective than lower cost FVIII products for use in combination with Hemlibra (emicizumab-kxwh). Thus, the lower cost FVIII products are more cost-effective and the use of EHL FVIII products in combination with Hemlibra (emicizumab-kxwh) is considered "not medically necessary."

Safety

- The most common adverse reactions reported with EHL FVIII products (Adynovate, Afstyla, Eloctate Jivi, and Esperoct) during trials included arthralgia, upper respiratory tract infection, cough, headache and injection site reactions.
- In clinical trials, use of Jivi was associated with a higher risk of hypersensitivity reactions in patients <12 years old, and therefore it is not indicated in this population.

Appendix 1: Lower-cost Factor VIII Concentrates for Hemophilia A

Product	Recombinant or Plasma-Derived	FDA-recommended Prophylactic Dosing
Standard Half-life (SHL) FVIII Products		
Advate[6]	Recombinant	Up to 40 IU/kg every other day
Kovaltry[7]	Recombinant	- >12 years old: Up to 40 IU/kg two to three times per week. - <12 years old: Up to 50 IU/kg every other day.
NovoEight[8]	Recombinant	- >12 years old: Up to 50 IU/kg every other day. - <12 years old: Up to 60 IU/kg every other day.
Nuwiq[9]	Recombinant	- >12 years old: Up to 40 IU/kg every other day. - <12 years old: Up to 50 IU/kg every other day.
Xyntha[10]	Recombinant	See FDA label for specifics of maximizing dosing.
Kogenate[11]	Recombinant	- Adults: Up to 25 IU/kg three times per week. - Children: Up to 25 IU/kg every other day.
Recombinate[12]	Recombinant	See FDA label for specifics of maximizing dosing.
Helixate[13]	Recombinant	- Adults: Up to 25 IU/kg three times per week. - Children: Up to 25 IU/kg every other day.
Hemofil M[14]	Plasma	See FDA label for specifics of maximizing dosing.
Monoclate-P[15]	Plasma	See FDA label for specifics of maximizing dosing.
Alphanate[16]	Plasma	See FDA label for specifics of maximizing dosing.
Koate-DVI[17]	Plasma	See FDA label for specifics of maximizing dosing.
Humate-P[18]	Plasma	See FDA label for specifics of maximizing dosing.
Lower-cost Extended Half-life (EHL) FVIII Products		
Afstyla [27]	Recombinant	- >12 years old: Up to 50 IU/kg 2 to 3 times per week. - <12 years old: Up to 50 IU/kg every other day.

Appendix 2: Clinical Reasons Standard Half-Life (SHL) Factor Products Are Not Appropriate
Pharmacokinetic (PK) studies demonstrate an inability to maintain factor levels within the desired range with **all** recombinant SHL factor products, dosed at FDA-recommended doses
History of bleeds despite adherence to FDA recommended doses of **all** recombinant SHL factor products
Documented medical contraindications to **all** recombinant SHL factor products
The patient is being treated for a short, defined duration (e.g. perioperative prophylaxis)

Codes	Number	Description
HCPCS	J7205	Injection, factor VIII Fc fusion protein (recombinant) (Eloctate), per IU
HCPCS	J7214	Injection, factor VIII, antihemophilic factor (recombinant) (Altuviiio), per IU
HCPCS	J7207	Injection, factor VIII, antihemophilic factor (recombinant), pegylated (Adynovate), 1 IU
HCPCS	J7208	Injection, factor VIII, antihemophilic factor (recombinant), pegylated-aucl (Jivi), 1 IU
HCPCS	J7204	Injection, factor VIII, antihemophilic factor (recombinant) glycopegylated-exei (Esperoct), per IU
HCPCS	J7199	Hemophilia clotting factor, not otherwise classified
ICD-10	D66	Hereditary Factor VIII Deficiency

R*evision History*

Revision Date	Revision Summary
6/20/2024	• Updated COT language, no change to intent. • Removed requirement for 50 exposure days to lower cost FVIII products. • Added combination use of EHL FVIII products with Hemlibra (emicizumab-kxwh) as “not medically necessary”
9/14/2023	Updated Altuviiio prophylaxis dosing to "Up to 50 IU/kg per week every 28 days.” No change to intent of criteria.
6/15/2023	Effective 7/15/2023: • Removed Afstyla, a lower-cost EHL FVIII product, from policy. • Renamed policy to reflect coverage of lower-cost EHL FVIII products (e.g. Afstyla) without prior authorization. • Added Altuviiio a newly-approved high-cost EHL FVIII product, to this policy. • Added coverage of high-cost EHL FVIII products for short, defined term use (e.g. perioperative prophylaxis).
6/17/2022	No changes to coverage criteria with this annual update.
7/16/2021	No changes to coverage criteria with this annual update.

Revision Date	Revision Summary
1/20/2021	• Updated COT language, no change to intent. • Removed requirements for inhibitor evaluation. • Made operational improvements to step therapy requirement language. • Updated QL language for operational efficiency. • Extended auth period from 24 weeks to one year. • Simplified reauthorization requirements.
10/28/2020	Minor formatting fixes, no changes to policy intent.
7/22/2020	Added continuation of therapy (COT) criteria. No other changes with this annual update.
10/23/2019	Effective 1/1/2020: • Added Esperoct, a newly-approved EHL FVIII product, to this policy. • Clarification of coverage criteria, for simplification and consistency of administration, including documentation needed for FVIII inhibitor status and addition of a definition of "ineffectiveness to standard half-life factor VIII" (no change to intent of coverage criteria). • Updated administration requirements to reflect coverage on either the pharmacy or medical benefit as dictated by group and member specific contract decisions. • Clarification of reauthorization criteria, to include documentation of efficacy and compliance with dosing regimen and clarification of requirements for approval of higher factor doses products.
4/25/2019	No changes to coverage criteria with this annual update.
11/16/2018	Added of Jivi, a newly-approved EHL product, to this policy (effective 1/1/2019).
8/17/2018	New policy, effective 1/1/2019

Drug names identified in this policy are the trademarks of their respective owners.

Medication Policy Manual **Policy No:** dru550

Topic: Blood Factors for Hemophilia B, extended-half-life (EHL) products

- Alprolix, coagulation factor IX (recombinant), Fc fusion protein
- Idelvion, coagulation factor IX (recombinant), albumin fusion protein
- Rebinyn, coagulation factor IX (recombinant), GlycoPEGylated

Date of Origin: January 1, 2019

Committee Approval Date: June 20, 2024 **Next Review Date:** 2025

Effective Date: September 1, 2024

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of medication policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Alprolix, Idelvion, Rebinyn are extended half-life (EHL) factor IX (FIX) replacement products for hemophilia B. They are covered when standard-half-life (SHL) FIX products at the optimal dose are ineffective or not a treatment option. These products are used “on-demand” for control of bleeding episodes or for perioperative management of bleeding. In addition, Alprolix and Idelvion are indicated for routine prophylaxis to reduce the frequency of bleeding episodes.

Policy/Criteria

Most contracts require pre-authorization of extended half-life (EHL) blood factor products for hemophilia B (FIX EHL factor) prior to coverage.

I. Continuation of therapy (COT): Extended half-life (EHL) blood factor products for hemophilia B (FIX EHL factor) may be considered medically necessary for COT when criterion A or B **AND** C below is met.

A. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

OR

B. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

AND

C. "Administration, Quantity Limitations, and Authorization Period" below applies, as well as "Investigational Uses".

***Please note**: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Extended half-life (EHL) blood factor products for hemophilia B (FIX EHL factor) may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) that criteria A and B below are met:

A. A diagnosis of **hemophilia B** established by or in consultation with a hematologist.

AND

B. Standard half-life (SHL) blood factor FIX (SHL FIX) products are not a treatment option, as defined by meeting one of the following (criterion 1 or 2 below):

1. SHL FIX products have been ineffective as defined by the patient continuing to have documented (e.g. bleed diary or detailed provider notes) clinically significant bleeding events (such as target joint bleeds or other end-organ damage) despite adherent use of SHL FIX products (dose and dose frequency, as listed in *Appendix 1*).

OR

2. There is a documented objective clinical reason that **all** available SHL FIX products are not appropriate (as listed in *Appendix 2*).

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers extended half-life (EHL) blood factor products for hemophilia B (FIX EHL factor) to be either self-administered medications or provider-administered medications. Determination of coverage under the pharmacy benefit or medical benefit is based on group-specific benefits, as defined in the group and member contract.

B. Quantity Limits

1. Extended half-life (EHL) blood factor products for hemophilia B (FIX EHL factor) may be authorized up to FDA-recommended dose and frequency limits (Table 1).

2. Escalated dosing (quantities above FDA-recommended dose and frequency limits) may be covered when criteria a and b below are met:

a. There is documentation that the FDA-recommended dose is ineffective (clinically significant bleeding events such as target joint bleeds or other end-organ damage while adherent to therapy).

AND

b. Attestation that the escalated dosing is supported by a full or population-based pharmacokinetic (PK) studies.

C. Authorization Periods

1. Extended half-life (EHL) blood factor products for hemophilia B (FIX EHL factor) will be authorized for up to one year.

2. Authorization **shall** be reviewed at least annually to confirm that the medication continues to be effective.

IV. The use of extended half-life (EHL) blood factor products for hemophilia B (FIX EHL factor) for all other conditions not specified above is considered investigational.

Table 1. FDA-Recommended Dose and Frequency Limits

Product	FDA-recommended Dosing	Maximum Doses (per 28 to 30 days)
Alprolix[1]	Prophylaxis: - >12 years old: Up to 50 IU/kg once weekly or 100IU/kg once every 10 days. - <12 years old: Up to 60 IU/kg once weekly. Although more frequent or higher doses may be required based on individual response. On-demand: Up to 100 IU/kg for the first dose then again every 6 to 10 hours for one additional dose. Dosing is then every 24 hours for 3 days, then every 48 hours until the healing is achieved. Perioperative: - Minor surgery: Up to 80 IU/kg as a single infusion, then every 24 to 48 hours if needed until bleeding stops (not to exceed one additional dose per 24 hours). - Major surgery: Up to 100 IU/kg as the initial dose, then repeat dose after 6-10 hours and then every 24 hours for the first 3 days. After day 3, the dosing may be extended to every 48 hours until healing is achieved.	Prophylaxis: - >12 years old: Up to FDA-labeled dosing (+/-5%) for a total of 4 doses per 28 days, based on every 7 day dosing OR up to FDA-labeled dosing (+/-5%) for a total of 3 doses per 30 days, based on every 10 day dosing. - <12 years old: Up to FDA-labeled dosing (+/-5%) for a total of 4 doses per 28 days. On-demand: Up to FDA-labeled dosing (+/-5%) for the number of doses requested every 28 days. Perioperative: Up to FDA-labeled dosing (+/-5%) for minor or major surgery the number of doses requested every 28 days.
Idelvion[2]	Prophylaxis: - >12 years old: Up to 40 IU/kg once weekly. Patients who are well controlled on this regimen may be changed to 50-75 IU/kg every 14 days. - <12 years old: Up to 55 IU/kg body weight every 7 days. On-demand: Up to 100 IU/kg every 48-72 hours for 7-14 days until bleeding stops (not to exceed one additional dose per 48 hours). Perioperative: - Minor surgery: Up to 80 IU/kg for at least 1 day, then every 48-72 hours until healing is achieved (not to exceed one additional dose per 48 hours). - Major surgery: Up to 100 IU/kg as the initial level then every 48-72 hours for 7-14 days until healing is achieved (not to exceed one additional dose per 48 hours, up to 7 doses per 14 days).	Prophylaxis: - >12 years old: Up to FDA-labeled dosing (+/-5%) for a total of 4 doses per 28 days. - <12 years old: Up to FDA-labeled dosing (+/-5%) for a total of 4 doses per 28 days. On-demand: Up to FDA-labeled dosing (+/-5%) for the number of doses requested every 28 days. Perioperative: Up to FDA-labeled dosing (+/-5%) for minor or major surgery the number of doses requested every 28 days.

Product	FDA-recommended Dosing	Maximum Doses (per 28 to 30 days)
Rebinyn[3]	On-demand: Up to 80 IU/kg for the initial dose, after which additional doses of 40 IU/kg can be given until bleeding stops. Perioperative: - Minor surgery: Up to 40 IU/kg as a single pre-operative dose. One additional dose may be given if needed. - Major surgery: Up to 80 IU/kg pre-operatively and as clinically needed for the perioperative management of bleeding, repeated doses of 40 IU/ kg (in 1-3 day intervals) within the first week after major surgery may be administered (not to exceed one additional dose per 24 hours, up to 7 doses per 7 days).	On-demand: Up to FDA-labeled dosing (+/-5%) for the number of doses requested every 28 days. Perioperative: Up to FDA-labeled dosing (+/-5%) for the number of doses requested every 28 days.

Appendix 1: Standard Half-life Factor IX Concentrates for Hemophilia B

Recombinant	Recombinant or Plasma-Derived	FDA-recommended Prophylactic Dosing
BeneFIX[4]	Recombinant	100 IU/kg once weekly (long-term prophylaxis).
Ixinity[5]	Recombinant	40 to 70 IU/kg twice weekly.
Rixubis[6]	Recombinant	>12 years: Up to 60 IU/kg twice weekly. <12 years: Up to 80IU/kg twice weekly.
AlphaNine SD[7]	Plasma	Specific prophylactic dosing based on factor IX level for each individual per FDA label.
Mononine[9]	Plasma	Up to 30 IU/kg, the frequency of administration will vary with each patient.
Profilnine[10]	Plasma	Specific prophylactic dosing based on factor IX level for each individual per FDA label.

Appendix 2: Clinical Reasons SHL Factor Products Are Not Appropriate
Pharmacokinetic (PK) studies demonstrate an inability to maintain factor levels within the desired range with **all** recombinant SHL factor concentrates
History of bleeds despite adherence to a maximum recommended dose of **all** recombinant SHL factor concentrates
Contraindications to **all** recombinant SHL factor concentrates

Position Statement

Summary

- Alprolix, Idelvion, and Rebinyn are extended half-life (EHL) blood factor IX (FIX) products used for the treatment of patients with hemophilia B. All are recombinant products.
- Hemophilia B is an X-linked congenital bleeding disorder caused by a deficiency of coagulation FIX, part of the intrinsic coagulation pathway.[11]
- The intent of the policy is to allow for coverage of EHL FIX products for patients with hemophilia B when standard-half life (SHL) FIX products are ineffective or not a treatment option, as detailed in the coverage criteria, for up to the quantities in the coverage criteria.
- In addition, the intent of the policy is to ensure ongoing use of EHL FIX is effective for reduction of bleeding and used in doses up to the coverable amount.
- Therapy should be individualized based on age, bleeding phenotype, weight, inhibitor status, history of bleeding episodes, and availability of factor concentrates. Patients with a suboptimal response to factor concentrates should be assessed for inhibitors.[11]
- The primary goal of factor replacement therapy is to prevent and treat bleeding. A reduction in bleeding events and subsequent sequalae demonstrate the efficacy of treatment.
- Patients who continue to have spontaneous clinically significant bleeds (such as target joint bleeds or other end-organ damage) or cannot maintain optimal factor levels despite adherence to adequate (FDA-recommended) doses of Standard Half-Life (SHL) factor products may see benefit from EHL FIX products.
- There is no evidence that EHL FIX product prophylactic regimens are safer or more effective than SHL FIX product prophylactic regimens in terms of annualized bleed rates (ABR). However, EHL FIX product prophylactic regimens are more costly than SHL FIX product prophylactic regimens.
- Inhibitors are seen less frequently in Hemophilia B than in Hemophilia A, with frequency of occurrence <5%. Inhibitor risk is greatest during the first 50 exposures to recombinant factor IX and greatly diminishes after 200 treatment days.[11]
- In Hemophilia B patients who develop inhibitors, up to 50% may have a severe allergic reaction to FIX administration.
- The vast majority of published data regarding EHL FIX products have been evaluated in previously treated patients (PTPs) with no history of inhibitory antibodies. There is currently a lack of studies that demonstrate the safety and efficacy of EHL FIX products in previously untreated patients (PUPs). In addition, patients with a history of inhibitors have been excluded from clinical research trials of EHL FIX products.[12]
- Recombinant factor IX products are considered the treatment of choice for Hemophilia B.[13] Use of SHL FIX products are considered safe and effective for management of hemophilia B and the standard of care first-line option for management. Therefore, EHL FIX products are coverable only when recombinant SHL FIX products are ineffective, or all are medically contraindicated.

- Pharmacokinetic (PK) dosing models can be used to individualize therapy and improve response to therapy. Classic ("full individual") PK studies are difficult to perform due to the high number of blood samples required. Population-based PK models use data from manufacturers and hemophilia treatment centers, as easy to perform, and useful to determine FIX product dose and require much fewer samples than classic PK studies. [14] PK studies are required at the first (initial) reauthorization period, to assess for over- or under-dosing of EHL FIX product.

Clinical Efficacy[1-3]

Hemophilia B

- The safety and efficacy of Alprolix, Idelvion, and Rebinyn in hemophilia B were established based on one to four open-label, non-randomized trials in each. Alprolix and Idelvion were effective for reduction in annualized bleeding rate (ABR) when used prophylactically versus on-demand treatment. Rebinyn demonstrated efficacy in stopping or preventing bleeding in the on-demand and perioperative settings.
- At this time, there is insufficient evidence to establish EHL blood factor products have a lower risk of inhibitor development. No patients developed inhibitors during clinical trials. However, there are cases of inhibitor formation, including in previously untreated patients, in clinical practice.
- All factor IX replacement products are effective for achieving hemostasis based on significant clinical experience. There are no head-to-head trials of EHL blood factor products versus SHL blood factor products to establish superior efficacy or safety.
- Both SHL and EHL factor IX products are given via IV infusion. For patients unable to self-administer factor IX, SHL FIX may be given in the clinic setting or via home infusion services
- In patients requiring surgery/invasive procedures, factor IX repletion may be indicated in the perioperative setting. However, there is no evidence that EHL is superior to SHL factor IX options for use perioperatively.

Clinical Guidelines/Standard of Care Treatment

- Factor replacement products are effective for the prevention and control of bleeding versus no treatment based on years of significant clinical experience, systematic reviews, and are endorsed by clinical practice guidelines.
- A definitive diagnosis of hemophilia B depends on an assay that demonstrates a deficiency in Factor IX levels. [11]
    * Mild Hemophilia B: 5-40 IU/dL.
    * Moderate Hemophilia B: 1-5 IU/dL.
    * Severe Hemophilia B: <1 IU/dL.
- Prophylaxis is recommended as the optimal treatment modality for individuals with severe hemophilia by the National Hemophilia Foundation. The concept was conceived from the observation that moderate hemophiliacs (clotting factor level >1 IU/dL) seldom experience spontaneous bleeding and have much better preservation of joint function.[11]

- The two generalized prophylactic protocols currently in use with long-term data are the Malmö and the Utrecht protocols. These protocols should be individualized for each patient. [11]
    * Malmö protocol: 25-40 IU/kg per dose administered two times a week.
    * Utrecht protocol: 15-30 IU/kg per dose administered two times a week.
- Specific factor replacement products may recommend different dosing based on clinical trial experience.
- There is insufficient evidence that any factor concentrate is superior to another due to a lack of comparative trial data.
- According to the Medical and Scientific Advisory Council (MASAC), the rate of inhibitors observed in PUPs in unacceptably high, and clinical trials are needed to direct clinical practice and reduce inhibitor formation. There is currently a lack of studies that demonstrate the safety and efficacy of EHL factor products in previously untreated patients (PUPs). [15]
- Historically, patients with a history of inhibitors have been excluded from clinical research trials of EHL factor products.[12]
- Unless clinically suspected, inhibitor testing in patients with hemophilia B is not necessary after 150 EDs to a specific factor replacement product.[11]
- The number of doses to reduce or manage bleeds and the dosage required varies greatly between patients. Dosage is dependent upon the level of severity, the presence of an inhibitor, prescribed regimen (on-demand, prophylaxis, perioperative), the number of bleeding episodes, individual pharmacokinetics, the products utilized, and the level of physical activity.[11]
- There is significant inter-patient pharmacokinetic variability after standard doses of FIX and using weight-based dosing may result in overdosing or underdosing of FIX concentrate. The use of pharmacokinetic data facilitates individualization of FIX dosing and may decrease the time patients are below the desired trough level (<1 IU/dL). Pharmacokinetic dosing models may lead to a reduction in treatment costs and better targeting of FIX levels.[14]
- A small retrospective study of hemophilia B patients switching from SHL to EHL factor concentrates showed a decrease in factor usage by 18% in the 6 months immediately following the transition. Although, this was associated by large increase in cost (1.97 times higher), without any proven clinical outcomes, such as a reduction in bleeding events, associated with the change. [16]

Safety[1-3]

- The most common adverse reactions reported with EHL FIX products during trials included headache and injection site reactions.

Codes	Number	Description
HCPCS	J7201	Injection, factor ix, fc fusion protein, (recombinant) (Alprolix), per IU
HCPCS	J7202	Injection, factor ix, albumin fusion protein, (recombinant) (Idelvion), 1 IU
HCPCS	J7203	Injection, factor ix, (antihemophilic factor, recombinant), glycopegylated (Rebinyn), 1 IU
ICD-10	D67	Hereditary Factor IX Deficiency

Revision History

Revision Date	Revision Summary
6/20/2024	• Updated COT language, no change to intent. • Removed requirement for 50 exposure days to SHL products.
6/15/2023	No criteria changes with this annual update
6/17/2022	No criteria changes with this annual update.
7/16/2021	No criteria changes with this annual update.
1/20/2021	• Updated COT language, no change to intent. • Removed requirements for inhibitor evaluation. • Made operational improvements to step therapy requirement language. • Updated QL language for operational efficiency. • Extended auth period from 24 weeks to one year. • Simplified reauthorization requirements.
10/28/2020	Minor formatting fixes, no changes to policy intent.
7/22/2020	Added continuation of therapy (COT) criteria. No other changes with this annual update.
10/23/2019	Effective 1/1/2020: • Clarification of coverage criteria, for simplification and consistency of administration, including documentation needed for FIX inhibitor status and addition of a definition of "ineffectiveness to standard half-life factor FIX" (no change to intent of coverage criteria). • Updated administration requirements to reflect coverage on either the pharmacy or medical benefit as dictated by group and member specific contract decisions. • Clarification of reauthorization criteria, to include documentation of efficacy and compliance with dosing regimen and clarification of requirements for approval of higher factor doses products.
4/25/2019	No criteria changes with this annual update.
8/17/2018	New policy, effective 1/1/2019

Medication Policy Manual **Policy No:** dru551

Topic: Medications for Phenylketonuria(PKU) **Date of Origin:** October 1, 2018

- Kuvan®, sapropterin
- Palynziq®, pegvaliase-pqpz

Committee Approval Date: August 17, 2018 **Next Review Date:** August 2019

Effective Date: October 1, 2018

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of medication policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Sapropterin (Kuvan) and pegvaliase (Palynziq) are medications used to decrease blood phenylalanine levels in patients with Phenylketonuria (PKU). Sapropterin (Kuvan) is orally administered and used in conjunction with a phenylalanine (Phe) restricted diet to reduce blood phenylalanine levels. Pegvaliase (Palynziq) is administered subcutaneously and coverable in patients with blood Phe levels greater than 600µmol/dL on existing management.

Policy/Criteria

I. Most contracts require pre-authorization approval of medications for Phenylketonuria prior to coverage.

A. **Sapropterin (Kuvan)** may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) showing that ALL criteria (1, 2 and 3) below are met.

1. A diagnosis of phenylketonuria (PKU) has been established by a metabolic specialist.

AND

2. Phenylalanine (Phe) levels cannot be maintained within the recommended maintenance range [120-360 µmol/dL (2 – 6 mg/dL)] with dietary intervention alone.

AND

3. Documentation of an elevated average baseline blood Phe level ≥ 360 µmol/L, prior to initiating therapy with sapropterin (Kuvan) and a current body weight.

B. **Pegvaliase (Palynziq)** may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) showing that ALL criteria (1, 2, and 3) below are met.

1. A diagnosis of phenylketonuria (PKU) has been established by a metabolic specialist.

AND

2. Documentation of an elevated average baseline blood Phe level ≥ 600 µmol/L over the last 6 months prior to starting pegvaliase (Palynziq).

AND

3. Treatment with sapropterin (Kuvan) has been ineffective, not tolerated, or is contraindicated. Ineffectiveness is defined as a decrease in blood Phe levels of less than 30% from baseline after one month of treatment.

II. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers sapropterin (Kuvan) and pegvaliase (Palynziq) to be self-administered medications.

B. **Initial Authorization:** When prior authorization is approved, medications for PKU may be initially covered in quantities as follows:

Kuvan

1. Up to 10 mg/kg/day for up to two months.

2. Up to 20 mg/kg/day for up to two months, when there is clinical documentation that **current** treatment with sapropterin (Kuvan) 10 mg/kg/day is not effective after at least 8 days of sapropterin (Kuvan) treatment, defined as less than a 30% decrease in blood Phe level from baseline (the Phe level provided in criterion I.A.3. above).

NOTE: Number of tablets (or powder packets for solution) authorized per month will be rounded to the nearest 100 mg. Doses exceeding 20 mg/kg/day are considered investigational.

Palynziq

1. Up to 20mg/day for up to six months

2. Up to 40 mg/day when there is clinical documentation that current treatment with pegvaliase (Palynziq) 20 mg/day is not effective after at least 24 weeks of pegvaliase (Palynziq) treatment, defined as less than a 20% decrease in blood Phe level from baseline (the Phe level provided in criterion I.B.1 above).

C. **Continued Authorization:** Authorization for medications for PKU shall be reviewed at least every six months. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met and that the medication is providing clinical benefit, with confirmation of ALL of the following:

Kuvan

1. The blood Phe level has decreased at least 30% from baseline (the Phe level provided in criterion I.A.3 above).

AND

2. The patient remains compliant with a phenylalanine-restricted diet, based on clinical documentation.

AND

3. The dose of sapropterin (Kuvan) does not exceed 20 mg/kg/day, based on the patient's recent weight (within the last 90 days). All doses will be rounded to the nearest 100 mg.

Palynziq

1. The blood Phe level has decreased from baseline (Phe level provided in criterion I.B.1. above)

AND

2. ***For patients on Palynziq 40mg for 16 weeks:*** The blood Phe level has decreased at least 20% from baseline (the Phe level provided in criterion I.B.1. above)

III. Medications for PKU) are considered investigational when used:

A. For any condition other than phenylketonuria, including, but not limited to autism and cirrhosis with portal hypertension.

B. In combination [concomitant use of sapropterin (Kuvan) and pegvaliase (Palynziq)].

Position Statement

- The current standard of care for patients with PKU is adherence to a Phe-restricted diet.
- Sapropterin (Kuvan) is approved for the reduction of blood phenylalanine (Phe) levels in patients with high Phe levels (hyperphenylalaninemia) due to tetrahydrobiopterin (BH4)-responsive phenylketonuria (PKU), despite dietary intervention. Sapropterin (Kuvan) is to be used in conjunction with a Phe-restricted diet.
- Pegvaliase (Palynziq) is approved to reduce blood phenylalanine (Phe) levels in adults with PKU that have blood Phe levels above 600 µmol/L on existing management. It is the first PKU drug approved that does not require the adherence of a Phe-restricted diet.
- There is no data that demonstrates that either medication for PKU is more effective than the other in the treatment of PKU.
- Untreated PKU is associated with severe mental retardation, reduced IQ scores, behavioral difficulties and other symptoms. However, there is no consensus concerning the optimal blood Phe level. In addition, the blood Phe concentration associated with optimal central nervous system outcomes is uncertain.
- Although there is evidence that sapropterin (Kuvan) and pegvaliase (Palynziq) lower blood Phe levels in patients with PKU, the long-term impact on neurological development and clinically relevant outcomes is unknown. There is no evidence to indicate that sapropterin (Kuvan) or pegvaliase (Palynziq) improve long-term patient outcomes.
- There is no evidence to indicate that sapropterin (Kuvan) or pegvaliase (Palynziq) are safe or effective when used in combination for treatment of PKU.
- In clinical trials, patients were considered responders to sapropterin (Kuvan) if blood Phe levels decreased at least 30% from baseline. A response was seen as early as eight days after initiating treatment. If blood Phe levels do not decrease after one month of treatment ("non-responders"), treatment with sapropterin (Kuvan) should be discontinued.
- In clinical trials, patients were considered responders to pegvaliase (Palynziq) if blood Phe levels decreased at least 20% from baseline. If blood Phe levels do not decrease after injecting 40mg daily for 16 weeks, treatment with pegvaliase (Palynziq) should be discontinued.
- The recommended starting dose of sapropterin (Kuvan) is 10 mg/kg/day taken once daily. For patients who do not respond, the dose can be increased to 20 mg/kg/day. The efficacy and safety of higher doses has not been established.
- The recommended dose of pegvaliase (Palynziq) is 20 mg subcutaneously once daily. For patients who do not respond after 24 weeks of therapy, the dose can be increased to 40 mg subcutaneously once daily. The efficacy and safety of higher doses has not been established.
- Sapropterin (Kuvan) has an established safety profile in the treatment of PKU. Due to the risk of anaphylaxis, pegvaliase (Palynziq) has a REMS program.

Clinical Efficacy

- Sapropterin (Kuvan) The efficacy of sapropterin (Kuvan) was established based on five clinical trials: one open-label trial with a follow-on randomized controlled trial and open-label extension trial, as well as two additional Phase 3 trials.[1-5]
    - Sapropterin (Kuvan) was dosed at 10 to 20 mg/kg/day.
    - The study duration ranged from eight days to 22 weeks.
    - The primary efficacy endpoint was the change in blood Phe concentration from baseline.
    - "Responders" were defined as patients who achieved at least a 30% decrease in blood Phe levels with sapropterin (Kuvan) treatment.
- Based on the clinical trial evidence, two high quality systematic reviews concluded treatment with sapropterin (Kuvan) decreases Phe blood levels.[6,7]
    - One systematic review found Phe levels were reduced by at least 30% in up to half of sapropterin (Kuvan) treated patients (32 to 50%). [7]
    - The other systematic review found a decrease in Phe levels versus baseline in sapropterin (Kuvan) treated patients. The average reduction in those on a Phe-restricted diet was a non-statistically significant change of -51.90 µmol/L. The average reduction in those on a relaxed or abandoned Phe-restricted diet, was a statistically significant change of -238.80 µmol/L.[6]
    - PKU treatment aims to maintain blood Phe levels within recommended ranges (120-360 µmol/L), to prevent neurologic damage; however, the blood Phe concentration associated with optimal neurodevelopmental outcome is uncertain.[6,8,9]
    - There are no studies comparing the use of sapropterin (Kuvan) to a Phe-restricted diet.
- There is insufficient data to make a conclusion regarding the impact of sapropterin (Kuvan) for improving clinically meaningful outcomes such as executive function (i.e. cognition).[6,7]
    - One small case series, sited within a systematic review, reported on intelligence quotient (IQ) and nutritional outcomes. After 1 year on sapropterin (Kuvan) 5mg/kg/day, the 11 participants discontinued use of a medical food and began a normal diet. IQ scores after 12 months on sapropterin (Kuvan) were similar to scores before treatment and development quotients were within normal limits. [7]
- There are no studies which evaluate sapropterin (Kuvan) treatment for quality-of-life outcomes.[6,7]
- There is insufficient data to make a conclusion regarding the impact of sapropterin (Kuvan) in the treatment of severe PKU.[6]
- Given the variability of genetic deficiency found with hyperphenylalaninemia, patients whose blood Phe does not decrease after 1 month despite the maximum sapropterin (Kuvan) daily dose of 20 mg/kg/day are "non-responders," and treatment with sapropterin (Kuvan) should be discontinued in these patients.[5]

Pegvaliase (Palynziq)

- The safety and efficacy of pegvaliase (Palynziq) was established based off 2 low confidence, phase 3, randomized, multicenter trials (PRISM-1, PRISM-2). They were conducted in patients with PKU and baseline blood Phe levels ≥600mol/L and showed a large reduction in blood Phe compared to baseline at all time points.[10,11]
    - Use of pegvaliase (Palynziq) was associated with a reduction in cognitive and mood assessment scores from baseline while receiving treatment.
    - Treatment with pegvaliase was not compared to the standard of care, a Phe-restricted diet, or against the only other approved PKU treatment, sapropterin (Kuvan). Thus, the magnitude of benefit compared to prior therapies is unknown.
    - There are no studies of pegvaliase (Palynziq) when used in combination with sapropterin (Kuvan).

Treatment Guidelines/Standard of Care

- To achieve metabolic control, PKU guidelines recommend a life-long Phe-restricted diet, including medical foods and low-protein products, as the standard of care for PKU. [9,12]
- The primary goal of therapy is to lower blood Phe and improve psychosocial and neurocognitive function. Any interventions, including dietary restrictions, medical foods, or pharmacotherapy that helps achieve that goal without other negative consequences, should be considered appropriate therapy. Patient response to each intervention is variable and choice of treatment should be individualized. [9]
- Two systematic reviews evaluated the overall treatment of patients with PKU. [6,7]
    - The mainstay of PKU treatment is a Phe-restricted diet, ideally continued into adult life, with regular monitoring of blood Phe levels. Patients often require dietary supplements in the form of medical foods containing low-Phe protein sources.
    - Non-compliance to the restricted diet in teenagers and adults show subtle cognitive impairments relative to controls and is associated with an increase in the rate of eczema, asthma, mental disorders, headache, hyperactivity, and hypoactivity.
    - There are no definitive studies on the effects of dietary treatment in adults, but individual case reports have documented deterioration of adult PKU patients after diet discontinuation.
    - In addition, there is a lack of information on how much improvement might be expected on Phe levels with such a diet.
    - Treatment guidelines have not been updated since the approval of pegvaliase (Palynziq)

Investigational Uses

- Sapropterin (Kuvan) did not improve hepatic venous pressure gradient in subjects with cirrhosis and portal hypertension.[13]
- Sapropterin (Kuvan) did not improve Clinical Global Impressions Improvement (CGI-I) or Severity (CGI-S) in patients with autism spectrum disorders.[14]

Safety[5,15]

Kuvan

- The most common side effects observed in clinical trials include headache, upper respiratory infection, rhinorrhea, pharyngolaryngeal pain, diarrhea, nausea and vomiting.
- Children less than 7 years of age should be started on lower doses of sapropterin (Kuvan) of 10 mg/kg/day to prevent abnormally low blood Phe levels. Doses may be titrated to 20 mg/kg/day, as needed, for blood Phe level reduction.

Pegvaliase (Palynziq)

- Adverse events in the clinical trials included injection site reactions, arthralgia, hypersensitivity reactions, headache, pruritus, nausea, abdominal pain, cough, diarrhea, and fatigue.
- Immunogenicity concerns exist, and elevations in various IgM and IgG levels were noted during the trials.
- Due to the risk of anaphylaxis, pegvaliase is only available through a restricted distribution program as part of a REMS requirement. During clinical trials, 9% of patients experienced an anaphylactic event.

Medication Policy Manual **Policy No:** dru563

Topic: Non-preferred pegfilgrastim products **Date of Origin:** July 1, 2019

- Neulasta, pegfilgrastim
- Neulasta Onpro, pegfilgrastim
- Fylnetra, pegfilgrastim-pbbk
- Nyvepria, pegfilgrastim-apgf
- Stimufend, pegfilgrastim-fpgk
- Udenyca, pegfilgrastim-cbqv

Committee Approval Date: September 23, 2022 **Next Review Date:** June 2023

Effective Date: January 1, 2023

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

All forms of pegfilgrastim are long-acting granulocyte-colony stimulating factors (G-CSF) that helps reduce the risk of infections in patients undergoing strong chemotherapy which depletes the number of white blood cells available in the body. All forms of pegfilgrastim work by stimulating the production of white blood cells which are an essential component in the body's ability to fight infections.

PLEASE NOTE: This policy and the coverage criteria below do not apply to preferred pegfilgrastim products [Fulphila (pegfilgrastim-jmdb) or Ziextenzo (pegfilgrastim-bmez)]. Preferred pegfilgrastim products do not require pre-authorization.

Policy/Criteria

Most contracts require pre-authorization approval of non-preferred pegfilgrastim products (as listed in Table 1) prior to coverage.

I. Continuation of therapy (COT): Non-preferred pegfilgrastim products (as listed in Table 1) may be considered medically necessary for COT when full policy criteria below are met, including quantity limit.

Please note: *Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Non-preferred pegfilgrastim products (as listed in Table 1) may be considered medically necessary when there is clinical documentation (including chart notes) that criterion A, B, or C below are met.

A. For **non-preferred biosimilar pegfilgrastim pre-filled syringe (PFS) products (Fylnetra, Nyvepria, Stimufend, Udenyca)**: Treatment with all preferred biosimilar pegfilgrastim PFS products have been ineffective, not tolerated, or contraindicated (as listed in Table 1).

OR

B. For **pegfilgrastim pre-filled syringe (Neulasta PFS)**: Treatment with all biosimilar pegfilgrastim PFS products (preferred AND non-preferred) have all been ineffective, not tolerated, or all are contraindicated (as listed in Table 1).

OR

C. For **pegfilgrastim pre-filled autoinjector device (Neulasta Onpro)**: Criteria 1 and 2 below are met.

1. Patient or patient's caregiver is not able to self-administer any of the pegfilgrastim PFS products (as listed in Table 1) due to significant behavioral issues, physical difficulties, and/or cognitive impairment including, but not limited to, those associated with developmental delay, down syndrome, dementia, or excessive anxiety such as severe needle phobia.

AND

2. Patient lives greater than 10 miles from the providers office, such that it is not possible to return for administration of any of the pegfilgrastim PFS products (as listed in Table 1).

Table 1. Reference and Biosimilar Pegfilgrastim Products

	Product name	Formulary status	PA required?
Pre-filled Syringe (PFS) Products			
Reference Product	Neulasta PFS (pegfilgrastim)	Non-preferred	Yes
Biosimilars	Fulphila (pegfilgrastim-jmdb)	Preferred	No
	Fylnetra (pegfilgrastim-pbbk)	Non-preferred	Yes
	Nyvepria (pegfilgrastim-apgf-bvzr)	Non-preferred	Yes
	Stimufend (pegfilgrastim-fpgk)	Non-preferred	Yes
	Udenyca (pegfilgrastim-cbqv)	Non-preferred	Yes
	Ziextenzo (pegfilgrastim-bmez)	Preferred	No
Autoinjector Device Products			
Reference Product	Neulasta Onpro (pegfilgrastim)	Non-preferred	Yes
Biosimilars	none	n/a	n/a

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers all the pegfilgrastim pre-filled syringe (PFS) products (as listed in Table 1) coverable under the pharmacy benefit (as self-administered medications) OR coverable under the medical benefit (as provider-administered medications).

B. Regence Pharmacy Services considers pegfilgrastim (Neulasta Onpro) coverable only under the medical benefit (as a provider-administered medication).

C. Authorization may be reviewed at least annually. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, such as disease stability or improvement.

Position Statement [1-5]

Summary

- The intent of this policy is to promote the use of biosimilar products that are the lowest overall cost. All pegfilgrastim products are considered safe and effective options.
- The policy allows for:
  * Coverage of the non-preferred pre-filled syringe (PFS) pegfilgrastim products when the preferred PFS pegfilgrastim products are ineffective, not tolerated, or contraindicated.

* Coverage of pegfilgrastim pre-filled autoinjector device (Neulasta Onpro) when the member lives too far from their provider's office to return for administration of a pre-filled syringe (PFS) product and there is documented medical rationale that a member is unable to self-administer themselves with all the PFS pegfilgrastim product options.

- There is no evidence that any one pegfilgrastim product is safer or more effective than another. Among these products, preferred PFS pegfilgrastim products provide the best value for members.
- The FDA reaffirmed the lack of superiority of one dosage form of pegfilgrastim over others. In July 2021, the FDA issued a warning to the manufacturer of Neulasta Onpro for misleading promotional material, based on an observational study. In short, the FDA determined claims of superiority of pegfilgrastim via the on-body injector Onpro over pegfilgrastim delivered through a prefilled syringe are not supported due to limitations of the available data. "The promotional communication's misleading claims and presentations could cause healthcare providers to conclude that pegfilgrastim delivered through the Onpro on-body injector is more effective than pegfilgrastim delivered through a prefilled syringe or that it is more effective than FDA-licensed biosimilar pegfilgrastim products, which are only delivered through a prefilled syringe."
- Hospitals and health-systems have medication formularies developed independent of the health plan. The health plan is unable to cover more expensive products for the convenience of the hospital, health-system, provider, or member. Preferred biosimilar products represent the lowest cost to members and the plan; the use of more expensive products without evidence of superior efficacy or safety is not medically necessary per the member's contract.

Revision History

Revision Date	Revision Summary
9/23/2022	• Effective 1/1/2023, updated preferred products to Fulphila and Ziextenzo. Udenyca will be non-preferred and require PA. • Added newly approved biosimilar Stimufend (pegfilgrastim-fpgk) to policy as non-preferred.
6/17/2022	• Modified criteria wording, for operational clarity (no change to intent of the criteria with this annual update). • Addition of a product table, to delineate the preferred/non-preferred, pre-filled syringe/autoinjector, and reference product/biosimilars. • Added Fylnetra (pegfilgrastim-pbbk) to policy.
7/16/2021	No criteria changes with this annual update.
10/28/2020	Added Nyvepria (pegfilgrastim-apgf) to policy.
7/22/2020	No criteria changes with this annual update.
4/22/2020	Added COT language. Added pegfilgrastim-bmez (Ziextenzo) as a preferred pegfilgrastim product.
1/31/2019	New policy. Effective 7/1/2019.

Drug names identified in this policy are the trademarks of their respective owners.

Medication Policy Manual | **Policy No:** dru564

Topic: Lumoxiti, moxetumomab pasudotox-tdfk | **Date of Origin:** April 1, 2019

Committee Approval Date: April 21, 2021 | **Next Review Date:** April 2022

Effective Date: July 1, 2021

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Moxetumomab pasudotox-tdfk (Lumoxiti) is an intravenously (IV) infused medication used in the treatment of patients with hairy cell leukemia (HCL) after standard front-line therapies.

Policy/Criteria

Most contracts require pre-authorization approval of moxetumomab pasudotox-tdfk (Lumoxiti) prior to coverage.

I. Continuation of therapy (COT): Moxetumomab pasudotox-tdfk (Lumoxiti) may be considered medically necessary for COT when criterion A, B, or C below is met.

A. For diagnoses NOT listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND there is documentation that the medication was covered by another health plan. Examples of documentation include the coverage approval letter from the previous health plan or paid claim.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

B. For diagnoses listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

C. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

Please note*: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Moxetumomab pasudotox-tdfk (Lumoxiti) may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) that all criteria A, B, and C below are met:

A. A diagnosis of relapsed or refractory hairy cell leukemia (HCL).

AND

B. At least two prior systemic therapies for HCL have been ineffective or not tolerated, including treatment with cladribine or pentostatin (purine nucleoside analog).

AND

C. Moxetumomab pasudotox-tdfk (Lumoxiti) will be used as monotherapy.

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services does not consider moxetumomab pasudotox-tdfk (Lumoxiti) to be a self-administered medication.

B. When pre-authorization is approved, moxetumomab pasudotox-tdfk (Lumoxiti) will be authorized for up to a total of 18 infusions (six cycles) over a 12-month period, based on a dose of 0.04 mg/kg on days 1, 3, and 5 every 28-day cycle, for six cycles total.

C. **Continued Authorization:** No dose beyond a total of 18 infusions (six cycles) will be authorized.

IV. Moxetumomab pasudotox-tdfk (Lumoxiti) is considered investigational when used for all other conditions not stated above.

Position Statement

Summary

- Moxetumomab pasudotox-tdfk (Lumoxiti) is an intravenous (IV) targeted therapy used for the treatment of relapsed or refractory hairy cell leukemia (HCL).
- The intent of this policy is to cover moxetumomab pasudotox-tdfk (Lumoxiti) for the indications and regimen for which it has been shown to be safe and effective, as detailed in the coverage criteria.
- The evidence is limited to one low quality single-arm, open-label trial.
  - All subjects in the trial had relapsed or refractory hairy cell leukemia (HCL) despite at least two prior therapies, including treatment with cladribine or pentostatin (purine nucleoside analog).
  - The trial reported durable complete response rate as a surrogate endpoint in patients who received moxetumomab pasudotox-tdfk (Lumoxiti) as a monotherapy. This surrogate endpoint has not been shown to correlate with improved survival or quality of life in relapsed or refractory HCL.
- The National Comprehensive Cancer Network (NCCN) HCL guideline lists moxetumomab pasudotox-tdfk (Lumoxiti) as a treatment option for relapsed or refractory HCL that has progressed on two prior systemic therapies, including treatment with cladribine or pentostatin.
- Moxetumomab pasudotox-tdfk (Lumoxiti) can be covered for a maximum of 18 doses, based on the dose studied in the trial (0.04 mg/kg of on days 1,3, and 5 of 28-day cycles for a maximum of six cycles).

Regence Pharmacy Services performs independent analyses of oncology medication evidence. NCCN clinical practice guidelines assignment of a category 2a/b recommendation does not necessarily establish medically necessity. The Regence Pharmacy Services analysis and coverage policy may differ from NCCN clinical practice guidelines.

Clinical Efficacy

- A single, low quality, single-arm, open-label trial (N=80) evaluated moxetumomab pasudotox-tdfk (Lumoxiti) in patients with relapsed or refractory HCL who received at least two prior therapies, including treatment with cladribine or pentostatin.
- A durable complete response of 30% was reported in the trial. The median duration of durable complete response was not reached. It is not known if these patients have longer remissions, live longer, or have better quality of life than those who receive other treatment options as there are no direct comparative studies that evaluate any of these outcomes to date. [1]
- Additional evidence is needed to establish the clinical benefit (e.g., improved survival, improved quality of life) of moxetumomab pasudotox-tdfk (Lumoxiti).
- The National Comprehensive Cancer Network (NCCN) HCL guideline lists moxetumomab pasudotox (Lumoxiti) among several other therapies for relapsed or refractory HCL. It is specifically recommended for patients who have progressed on two prior systemic therapies, including treatment with cladribine or pentostatin. [2]
- Other NCCN recommendations for relapsed/refractory HCL include single agent chemotherapy ± targeted therapies, monotherapy targeted agents, and combination targeted therapies. [2]

Investigational Uses

- Based on its mechanism of action, moxetumomab pasudotox-tdfk (Lumoxiti) may have potential applications in other B-cell mediated cancers; [3] however, there is no currently published evidence supporting use in any other condition other than CD-22-positive B-cell HCL.
- NCCN guidelines do not list moxetumomab pasudotox-tdfk (Lumoxiti) as a treatment option outside of relapsed or refractory B-cell HCL setting.

Safety [4]

- To date, there is only short-term, non-comparative information available regarding the safety of moxetumomab pasudotox-tdfk (Lumoxiti).
- Moxetumomab pasudotox-tdfk has a boxed warning for capillary leak syndrome and hemolytic uremic syndrome. Other serious AEs include electrolyte abnormalities.
- The most common AEs (incidence ≥ 20%) in clinical trials included infusion related reactions, edema, nausea, fatigue, headache, pyrexia, constipation, anemia, and diarrhea.

Dosing [4]

- Moxetumomab pasudotox-tdfk (Lumoxiti) is given via intravenous infusion in a dose of 0.04 mg/kg on days 1, 3, and 5 of each 28-day cycle.
- Treatment is given for a maximum of six cycles (18 infusions); however, treatment may be stopped early for disease progression or unacceptable toxicity.

Medication Policy Manual | **Policy No:** dru565

Topic: Libtayo, cemiplimab-rwlc | **Date of Origin:** April 1, 2019

Committee Approval Date: September 19, 2024 | **Next Review Date:** 2025

Effective Date: January 1, 2025

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Libtayo (cemiplimab-rwlc) is an intravenously administered programmed death receptor-1 blocking antibody (PD-1 inhibitor) that is used in the treatment of several different types of cancers.

Policy/Criteria

Most contracts require pre-authorization approval of Libtayo (cemiplimab-rwlc) prior to coverage.

I. Continuation of therapy (COT): Libtayo (cemiplimab-rwlc) may be considered medically necessary for COT when criterion A, B, or C below is met.

A. For diagnoses NOT listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND there is documentation that the medication was covered by another health plan. Examples of documentation include the coverage approval letter from the previous health plan or paid claim.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

B. For diagnoses listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

C. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

Please note*: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Libtayo (cemiplimab-rwlc) may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) confirming that criterion A, B, or C below is met.

A. A diagnosis of **cutaneous squamous cell carcinoma** (cSCC) when criteria 1, 2, and 3 below are met:

1. Documentation that the disease is metastatic or is not curable with surgical excision or radiation therapy.

AND

2. Libtayo (cemiplimab-rwlc) will be used as monotherapy.

AND

3. No prior use of programmed death receptor-1 blocking antibody therapy (PD-1 inhibitors) or programmed death-ligand 1 blocking antibody therapy (PD-L1 inhibitors) [see *Appendix 1*].

OR

B. A diagnosis of **basal cell carcinoma** (BCC), **locally advanced or metastatic**, when criteria 1 and 2 below are met:

1. Prior hedgehog pathway inhibitor therapy [e.g., Odomzo (sonidegib), or Erivedge (vismodegib)] was not effective or was not tolerated, unless use of hedgehog pathway inhibitor therapy is not appropriate.

AND

2. No prior therapy with PD-1/PD-L1 blocking antibody therapy (see *Appendix 1*).

OR

C. A diagnosis of **non-small cell lung cancer** (NSCLC), **locally advanced (not candidates for surgical resection or definitive chemoradiation) or metastatic**, when criteria 1, 2, and 3 below are met:

1. No prior use of systemic therapy for locally advanced or metastatic disease.

AND

2. No prior therapy with PD-1/PD-L1 blocking antibody therapy (see *Appendix 1*).

AND

3. Libtayo (cemiplimab) will be used in one of the following settings (a or b):

a. As monotherapy for tumors that express PD-L1 with a Tumor Proportion Score of at least 50% (TPS $\geq$50%).

OR

b. In combination with platinum-based chemotherapy for tumors that do not have EGFR, ALK, or ROS1 aberrations.

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers Libtayo (cemiplimab-rwlc) coverable only under the medical benefit (as a provider-administered medication).

B. When pre-authorization is approved, Libtayo (cemiplimab-rwlc) will be authorized for 24 weeks in doses up to 350 mg every three weeks, until disease progression.

C. Reauthorization: Authorization **shall** be reviewed at least every 24 weeks for documented benefit. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met. Specifically, documentation that the medication is providing clinical benefit, including disease stability or improvement, and lack of disease progression, based on an assessment of change in tumor burden. If there is documentation of

potential disease progression, a shortened authorization (up to three months) may be approved to allow time for clarification of response to Libtayo (cemiplimab-rwlc), including clinical re-evaluation of the patient and reimaging.

PLEASE NOTE: Additional doses of Libtayo (cemiplimab-rwlc) will not be authorized without a documented recent assessment by the treating provider (such as oncologist) with objective evidence of response to therapy, such as by re-imaging and use of iRECIST criteria.

IV. Libtayo (cemiplimab-rwlc) is considered not medically necessary when used for the treatment of cervical cancer.

V. Libtayo (cemiplimab-rwlc) is considered investigational when used for all other conditions.

Position Statement

Summary

- Libtayo (cemiplimab-rwlc) is an intravenously administered programmed death receptor-1 blocking antibody (PD-1 inhibitor) used in the treatment of several types of cancers.
- The intent of this policy is to cover Libtayo (cemiplimab-rwlc) in settings where it has been studied and shown to be safe and effective, as detailed in the coverage criteria, with consideration for other available treatment options.
    * Where there is lack of proven additional benefit and/or lack of demonstrated health outcome (such as overall survival or improved quality of life) relative to alternative therapies, use of Libtayo (cemiplimab-rwlc) alone or in combination with other therapies is not coverable ("not medically necessary" or "investigational").
    * It is important to note that the fact that a medication is FDA approved for a specific indication does not, in itself, make the treatment medically reasonable and necessary.
- Many of the clinical indications for immunotherapies (PD-1, PD-L1, and others) have been approved by the FDA and endorsed by clinical guidelines based on surrogate measures such as overall tumor response rate (ORR) and progression-free survival (PFS) which are not proven to accurately predict clinically important outcomes such as improved overall survival or improved quality of life.
- *PD-L1 expression testing*: is required for coverage of many clinical indications for PD-1 and PD-L1 inhibitors.
    * There are several ways in which PD-L1 expression can be defined. In addition, how PD-L1 expression is defined varies by tumor type and setting.
    * PD-L1 expression is determined by the FDA-approved companion diagnostic testing, based on both the specific PD-1/PD-L1 inhibitor and the tumor type.
    * However, PD-L1 test results are not interchangeable across PD-1/PD-L1 inhibitors and/or indications. There is no conversion available from one type of test to another, such as combined positive score (CPS) versus tumor proportion score (TPS) versus percent of tumor cells (TC). Therefore, the correct test must be conducted for proper selection of patient populations for a given use.
- National Comprehensive Cancer Network (NCCN) guidelines recommend Libtayo (cemiplimab-rwlc) as a potential option in each of the treatment settings listed in the coverage criteria. In general, NCCN recommendations parallel the FDA approved indications.
- The PD-1 and PD-L1 inhibitors have the potential to cause immune-mediated adverse reactions that can result in pneumonitis, colitis, hepatitis, endocrinopathies, and nephritis.
- The FDA-approved dose of Libtayo (cemiplimab-rwlc) is 350 mg IV every three weeks until disease progression.
- Optimal sequencing of chemotherapy and immunotherapy in many cancers is unknown or the data is evolving. At this time, sequential use of immunotherapies is not supported by

current evidence. Specifically, there is no evidence to support the sequential use of different PD-1 or PD-L1 inhibitors once there is disease progression on prior PD-1 or PD-L1 inhibitor therapy, as well as use of adjuvant PD-1/PD-L1 inhibitor after neoadjuvant PD-1/PD-L1 inhibitor therapy (unless explicitly listed in the coverage criteria). Therefore, the use of sequential courses of PD-1/PD-L1 immunotherapy is not coverable.

- There is a study that evaluates Libtayo (cemiplimab-rwlc) in recurrent cervical cancer; however, the manufacturer has withdrawn the application for this indication. Keytruda (pembrolizumab) already has an indication in this population.
- There are ongoing studies using Libtayo (cemiplimab-rwlc) in a variety of other cancers. However, although initial evidence may be promising, the potential for clinical benefit in these conditions is still being investigated.
- *Reauthorization Criteria*: When coverage criteria are met, Libtayo (cemiplimab-rwlc) is authorized for six months (24 weeks) of therapy, after which time documentation must be provided to establish that the medication is effective. Specifically, there must be documentation of clinical benefit, including disease stability or improvement and there is a lack of disease progression, based on an assessment of change in tumor burden. Documentation of benefit must include an assessment of the most recent imaging ("restaging scans") and/or re-biopsy by the treating oncologist.

Regence Pharmacy Services performs independent analyses of oncology medication evidence, to establish coverability per the contracts with the health plan.

- Most contracts define coverability based on established clinical benefit in published, peer-reviewed literature, along with consideration of regulatory status.
- FDA approval does not in itself establish medical necessity, as unpublished, low-quality evidence, including exploratory analyses and unvalidated surrogate endpoints, may be used as the basis of approval. Regulatory approval may or may not reflect clinical benefit relative to standard of care and the recommendations of expert clinical advisors such as the Oncologic Drugs Advisory Committee (ODAC). FDA approvals generally do not consider cost compared to established therapies, or value to members.
- Likewise, NCCN clinical practice guidelines assignment of a recommendation (category 1, 2a, or 2b) does not necessarily establish medically necessity. NCCN recommendations are inconsistently supported by published, peer-reviewed literature and do not uniformly consider value of new therapies relative to existing potentially higher-value treatment options, considering effectiveness, safety, and cost.
- Medication coverage criteria are developed based on the 'medical necessity' assessment, as described above.

Regence Pharmacy Services analysis and coverage policy may differ from FDA labeled indication and/or NCCN clinical practice guidelines.

Clinical Efficacy

Cutaneous Squamous Cell Carcinoma (cSCC)

- Two small low-quality, single-arm, non-comparative open-label trials evaluated Libtayo (cemiplimab-rwlc) in patients with cutaneous squamous cell carcinoma (cSCC) who were not candidates for curative surgical resection or radiation therapy. [1 2]
    * One trial (phase 1) included 16 patients with metastatic cSCC, and 10 patients with disease that had recurred after two or more prior surgical procedures and the investigator expected that curative resection would be unlikely, or surgery would result in substantial complications or deformity. The second trial (phase 2) included 59 patients with metastatic cSCC.
    * Approximately 57% of the subjects in the trials had prior systemic therapy, and about 82% had prior radiotherapy.
    * In the phase 1 trial, the objective response rate (ORR), the primary endpoint, was 50% [95% CI: 30, 70]. There were no complete responses.
    * In the phase 2 trial, the ORR was 47% [95% CI: 34, 61]. There were four (7%) complete responses.
    * The Libtayo (cemiplimab-rwlc) trials evaluated objective response rate (ORR) as a surrogate endpoint. ORR is a measure of tumor size (visible by physical observation or on x-ray) and is a combination of complete and partial responses. In advanced disease, ORR may not be representative of disease that has traveled to lymph nodes of other parts of the body, so it may not be an accurate measure of clinical benefit. To further complicate interpretation of these results, there were only four complete responses reported out of the 85 patients enrolled in the trial. The remainder were partial responses. There is currently no way to predict in advance who might achieve a complete response.
- It has not yet been determined if Libtayo (cemiplimab-rwlc) provides clinically meaningful benefit in cSCC as current studies have used surrogate measures such as overall tumor response rate (ORR) which are not proven to accurately predict clinically important outcomes such as improved overall survival or improved quality of life. There is no evidence that compares the safety and effectiveness of Libtayo (cemiplimab-rwlc) with any other therapy that may be used in the inoperable/metastatic cSCC setting. Libtayo (cemiplimab-rwlc) was only studied as a monotherapy (not in combination with other systemic therapy).
- Libtayo (cemiplimab-rwlc) has not been studied in patients who have received prior PD-1 inhibitor therapy.
- The quality of the currently available evidence is low. Additional evidence is needed to establish the clinical benefit (e.g., improved survival, improved quality of life) and the durability of effect of Libtayo (cemiplimab-rwlc).
- The National Comprehensive Cancer Center (NCCN) SCC guideline lists Libtayo (cemiplimab-rwlc) among possible therapies for patients with cutaneous SCC that is considered inoperable. Other potential options include radiation, and/or chemotherapy. [3]

Basal Cell Carcinoma (BCC)

- The available evidence for Libtayo (cemiplimab-rwlc) as a monotherapy in BCC is based on a small, single-arm trial (low-quality evidence) that enrolled 84 patients with locally advanced BCC (laBCC) and 48 patients with metastatic BCC (mBCC). [1 4 5]
    * All patients had prior therapy with a hedgehog inhibitor (HHI), the current standard of care for advanced BCC. Seventy six percent had disease progression on a prior HHI, 34% had intolerance to a prior HHI, and 10% had no better than stable disease while on HHI therapy.
    * The primary endpoint of the study was objective response rate (ORR). ORRs ranged from 21% in the mBCC population, to 29% in the laBCC population. There were no complete responses in the mBCC population, while five patients (6%) were considered to have a complete response in the laBCC group.
- As described above under cSCC, ORR is a surrogate endpoint that does not necessarily predict clinical benefit, such as improved overall survival or improved quality of life.
- Of note, the part of the FDA BCC indication for Libtayo (cemiplimab-rwlc) that refers to "or in whom a HHI is not appropriate" is not part of a population that was defined or enrolled in the clinical trial. There are no known objective parameters used to define this subpopulation.
- All patients in the trial were naïve to prior PD-1/PD-L1 inhibitor therapy. To date, there is no evidence to support the benefit of sequential PD-1/PD-L1 inhibitor therapy after disease has progressed on a prior therapy with these agents.
- HHIs and cemiplimab are the only systemic therapies available for the treatment of laBCC and mBCC. The NCCN Basal Cell Skin Cancer guideline recommends Libtayo (cemiplimab-rwlc) for patients who have been previously treated with a HHI or for whom a HHI is not appropriate. [3]

Non-Small Cell Lung Cancer (NSCLC)

Front-line therapy, as monotherapy – NSCLC:

- The evidence for Libtayo (cemiplimab-rwlc) as a front-line monotherapy for advanced NSCLC when tumors have a PD-L1 of at least 50% [tumor proportion score (TPS) ≥ 50%] is derived from an open-label, randomized controlled trial (N = 710) that compared it with standard platinum doublet chemotherapy (EMPOWER-Lung 1). [6]
    * The population included patients with locally advanced (stage IIIB or IIIC, 15%) or metastatic (stage IV, 85%) NSCLC. Patients were naïve to prior therapy for advanced disease and had TPS ≥ 50%.
    * Patients with EGFR mutations, ALK translocations, or ROS1 fusions were excluded from the trial because therapy with targeted agents is the standard front-line therapy in these populations.
    * The median overall survival (OS) in the Libtayo (cemiplimab-rwlc) treatment arm was superior to that in the cytotoxic chemotherapy arm (22.1 months and 14.3 months, respectively; HR 0.68 [95%CI: 0.53, 0.87], p = 0.0022).
    * Libtayo (cemiplimab-rwlc) was found to improve median overall survival (OS) relative to standard of care cytotoxic chemotherapy when used as a front-line therapy for advanced NSCLC when the TPS > 50%. However, its relative

effectiveness when compared to Tecentriq (atezolizumab) or Keytruda (pembrolizumab), which are also each approved as monotherapy in this setting, is not known. There is not head-to-head data that compares any of these agents with one another.

Front-line therapy, in combination with platin-based chemotherapy – NSCLC:

- Libtayo (cemiplimab-rwlc) was also approved as part of a front-line regimen for advanced NSCLC based on a randomized, double blinded, phase 3 trial that compared Libtayo (cemiplimab-rwlc) and placebo. Both arms were given in combination with four cycles of platinum-doublet chemotherapy (followed by pemetrexed maintenance as indicated) (EMPOWER-Lung 1). [7]
    * The population included patients with locally advanced (stage III, 14.8%) or metastatic (stage IV, 85.2%) NSCLC. Patients were naïve to prior therapy for advanced disease.
    * Patients were negative for therapeutically actionable genetic mutations (EGFR mutations, ALK translocations, or ROS1 fusions).
    * Patients were enrolled irrespective of PD-L1 expression (29.8% PD-L1 <1%) or histology (57.1% non-squamous).
    * Libtayo (cemiplimab-rwlc) was initiated with investigators' choice of histology-specific platin-based chemotherapy as induction (four cycles) and then continued as monotherapy versus platin-based chemotherapy induction followed by pemetrexed switch maintenance or best supportive care (BSC).
    * The Libtayo (cemiplimab-rwlc) treatment arm demonstrated improved overall survival relative to the placebo arm, with an 8.9-month improvement in median OS.
    * It was noted that the combination of Libtayo (cemiplimab-rwlc) with chemotherapy may add additional toxicity relative to either therapy alone.
- The evidence for Libtayo (cemiplimab-rwlc) in locally advanced or metastatic NSCLC as an add-on to front-line platinum-based chemotherapy is based on a phase 3, double-blind RCT (EMPOWER-Lung 3) that demonstrated a statistically significant and clinically relevant improvement in OS relative to standard-of-care platinum-based chemotherapy alone (placebo group). The median OS was 21.9 months [95% CI: 15.5, NE] and 13.0 months [95% CI: 11.9, 16.1] in the Libtayo (cemiplimab-rwlc) and placebo groups, respectively. [8]
- As with other PD-1/PD-L1 inhibitors in their many other treatment settings, there is no evidence to support the benefit of sequential PD-1/PD-L1 inhibitor therapy after disease has progressed on a prior therapy with these agents.
- The NCCN NSCLC guideline lists Libtayo (cemiplimab-rwlc) among several preferred, regimens in the population for which it is indicated. [3]

Reauthorization Criteria:

- When coverage criteria are met, Libtayo (cemiplimab-rwlc) is authorized for six months (24 weeks) of therapy, after which time documentation must be provided to establish that the medication is effective. Specifically, there must be documentation of clinical benefit, including disease stability or improvement and there is a lack of disease progression,

based on an assessment of change in tumor burden.

* The standard of care for evaluation of response to cancer immunotherapy, such as Libtayo (cemiplimab-rwlc), is use of the iRECIST criteria for assessment of tumor burden. [9]
* The iRECIST criteria include use of quantitative and qualitative criteria for assessment of change in tumor burden for target lesions and non-target lesions. [10]
    - Quantitative measurements for target lesions (tumor size and % change)
    - Qualitative evaluation for non-target lesions (present/disappeared/ unequivocal progression)
* Documentation of benefit must include an assessment of the most recent imaging ("restaging scans") by the treating oncologist. Given the complexity of the evaluation, including use of the iRECIST criteria, Libtayo (cemiplimab-rwlc) will not be reauthorized without an assessment of response to therapy, such a partial response (iPR), complete response (iCR), or stable disease (iSD).
* Use of immunotherapy may result in pseudoprogression, due to immune and T-cell activation, which can appear similar to tumor flare. If there is documentation of potential disease progression ["unconfirmed progressive disease (iUPD)"], a shortened authorization (up to three months) may be approved to allow time for clarification of response to Libtayo (cemiplimab-rwlc), including clinical re-evaluation of the patient and reimaging. Guidelines recommend reimaging for iUPD after 4-8 weeks.
* If a patient has confirmed, unequivocal new lesions (progression of disease, iPD), additional Libtayo (cemiplimab-rwlc) is not coverable. If a new lesion is equivocal, iUPD reassessment by the treating oncologist with repeat imaging would apply (as noted above).

Not Medically Necessary Uses

- Libtayo (cemiplimab-rwlc) was studied in recurrent cervical cancer where it was found to improve overall survival relative to single-agent chemotherapy. The manufacturer withdrew its application to expand use of Libtayo (cemiplimab-rwlc) in this population. Keytruda (pembrolizumab) is already approved for use in cervical cancer. [11]

Investigational Uses

- There is the potential for off-label use of Libtayo (cemiplimab-rwlc) based on its mechanism of action (immune checkpoint inhibition).
- There are currently no published clinical trials that evaluate Libtayo (cemiplimab-rwlc) outside of the settings described above.

Dosing [1]

- The FDA-approved dose of Libtayo (cemiplimab-rwlc) is 350 mg IV every three weeks until disease progression.
- The dose studied in the clinical trials was 3 mg/kg every two weeks, which differs from the FDA-approved dose.

Revision History

Revision Date	Revision Summary
9/19/2024	**Effective 1/1/2025:** Changed reauthorization from 'may' to 'shall.' Operationally, all approvals will be for 24 weeks (6 months). Ongoing therapy (beyond 24 weeks) will be subject to reauthorization review every 24 weeks, for documentation of disease stability or improvement and lack of disease progression.
12/7/2023	Added coverage criteria for Libtayo (cemiplimab) as an add-on to front-line platinum-based chemotherapy when no EGFR, ALK, or ROS1 aberrations are present. [New indication]
6/15/2023	Added coverage criteria for advanced NSCLC, 1st line in combination with platinum-based chemotherapy (effective 7/15/2023).
12/9/2022	Effective 3/1/2023: • Updated standard language in policy. • Added cervical cancer as not medically necessary.
7/16/2021	Added coverage criteria for advanced basal cell carcinoma (BCC) and in the front-line treatment of advanced non-small cell lung cancer (NSCLC) when tumor expression of PD-L1 is at least 50% (TPS $\geq$ 50%), two newly FDA approved indications.
4/21/2021	• No changes to coverage criteria with this annual update. • COT language was updated (no change to intent of coverage criteria).
1/22/2020	Added continuation of therapy (COT) criteria (no change to intent of coverage criteria).
1/31/2019	New policy (effective April 1, 2019). Limits coverage to patients with the cutaneous squamous cell carcinoma (cSCC), the setting in which it was studied and has a labeled indication.

Drug names identified in this policy are the trademarks of their respective owners.

Medication Policy Manual | **Policy No:** dru574

Topic: Azedra, iobenguane I 131 | **Date of Origin:** April 1, 2019

Committee Approval Date: June 20, 2024 | **Next Review Date:** 2025

Effective Date: September 1, 2024

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Azedra (iobenguane I 131) is a radioactive drug that is injected directly into the bloodstream and is used to treat rare neuroendocrine tumors, specifically pheochromocytoma or paragangliomas when surgery and chemotherapy are not a treatment option.

PLEASE NOTE: This policy is not intended to limit the use of Azedra (iobenguane I 131) for diagnostic use.

Policy/Criteria

Most contracts require pre-authorization approval of Azedra (iobenguane I 131) prior to coverage.

I. Continuation of therapy (COT): Azedra (iobenguane I 131) may be considered medically necessary for COT when criterion A, B, or C below is met.

A. For diagnoses NOT listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND there is documentation that the medication was covered by another health plan. Examples of documentation include the coverage approval letter from the previous health plan or paid claim.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

B. For diagnoses listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

C. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

Please note*: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Azedra (iobenguane I 131) may be considered medically necessary when there is clinical documentation (including, but no limited to chart notes) that criteria A, B, and C below are met.

A. A diagnosis of **pheochromocytoma or paraganglioma** (PPGL) that is locally unresectable or has distant metastases.

AND

B. Documentation of a prior positive MIBG (iobenguane) scan [also known as an iobenguane, metaiodobenzylguanidine (MIBG) scan].

AND

C. Documentation of one of the following clinical situations (1 or 2):

1. The patient is ineligible for curative surgery and has progressed on prior PPGL therapy (such as prior surgery, chemotherapy, radiation)

OR

2. The patient is ineligible for chemotherapy.

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers Azedra (iobenguane I 131) coverable only under the medical benefit (as a provider-administered medication).

B. When pre-authorization is approved, Azedra (iobenguane I 131) may be authorized one-time for a maximum of two therapeutic doses [up to 18,500 MBq (500 mCi) per dose].

C. Additional doses (beyond two) are considered investigational.

IV. Azedra (iobenguane I 131) is considered investigational when used for all other conditions.

Position Statement

Summary

- Azedra (iobenguane I 131) is a radiolabeled norepinephrine analog indicated for the treatment of patients with iobenguane scan positive, unresectable, locally advanced or metastatic pheochromocytoma or paraganglioma (PPGL) who require systemic anticancer therapy.
- At lower doses Azedra (iobenguane I 131) is used as a diagnostic agent, this policy is not intended to limit diagnostic use.
- The intent of the policy is to provide coverage for the FDA-labeled indications, where it has been shown to be safe and effective.
    * Azedra (iobenguane I 131) is approved for the treatment of iobenguane scan positive, unresectable, locally advanced or metastatic pheochromocytoma or paraganglioma (PPGL) that has progressed on prior therapy for PPGL (such as prior surgery, radiation, chemotherapy) or are not candidates for chemotherapy and when curative surgery is not a treatment option. [1]
    * In the clinical trial, patients had to: [2]
        - Be at least 12 years old,
        - Fail a prior PPGL therapy OR were not candidates for chemotherapy or other curative therapies (such as surgery for pheochromocytoma)
        - Be on stable antihypertensive medication for pheochromocytoma-related hypertension for at least 30 days
- The NCCN Neuroendocrine and Adrenal Tumors guideline recognizes Azedra (iobenguane I 131) for primary treatment of locally unresectable PPGL or distant metastases, with prior positive iobenguane (MIBG) scan. [3]
- There are no clinical trials that have demonstrated a superior benefit of any therapies for the treatment of PPGL over first line treatment with surgery.
- The recommended therapeutic dose of iobenguane I 131 (Azedra) is no more than 18,500 MBq (500 mCi) administered at least 90 days apart for a total of two therapeutic doses. The safety and effectiveness of higher or more frequent doses have not been established. [1]
    * Azedra (iobenguane I 131) is administered intravenously as a dosimetric (diagnostic) dose, followed by two therapeutic doses administered at least 90 days apart.

* The recommended dosimetric dose of Azedra (iobenguane I 131) is no more than 185-222 MBq (5-6 mCi).

Regence Pharmacy Services performs independent analyses of oncology medication evidence, to establish coverability per the contracts with the health plan.

- Most contracts define coverability based on established clinical benefit in published, peer-reviewed literature, along with consideration of regulatory status.
- FDA approval does not in itself establish medical necessity, as unpublished, low-quality evidence, including exploratory analyses and unvalidated surrogate endpoints, may be used as the basis of approval. Regulatory approval may or may not reflect clinical benefit relative to standard of care and the recommendations of expert clinical advisors such as the Oncologic Drugs Advisory Committee (ODAC). FDA approvals generally do not consider cost compared to established therapies, or value to members.
- Likewise, NCCN clinical practice guidelines assignment of a recommendation (category 1, 2a, or 2b) does not necessarily establish medically necessity. NCCN recommendations are inconsistently supported by published, peer-reviewed literature and do not uniformly consider value of new therapies relative to existing potentially higher-value treatment options, considering effectiveness, safety, and cost.
- Medication coverage criteria are developed based on the 'medical necessity' assessment, as described above.

Regence Pharmacy Services analysis and coverage policy may differ from FDA labeled indication and/or NCCN clinical practice guidelines.

Clinical Efficacy

- There is low confidence in the evidence of efficacy for Azedra (iobenguane I 131). Evidence is limited to one single-arm, phase 2, open-label trial which is insufficient to demonstrate cause and effect, given the absence of a comparator. [1] There is no information on the efficacy of iobenguane I 131 (Azedra) relative to any other therapy.
- The endpoint employed in the trial, percentage of patients who had at least a 50% decrease in antihypertensive medications, is a surrogate endpoint that may be relevant to symptomatic treatment of extra-catecholamine release but does not accurately predict the durability of effect of Azedra (iobenguane I 131) or its effect on any clinically relevant outcome such as overall survival or improved quality of life.
    * The reported result was that 17 patients out of 68 evaluable patients (25%) had at least a 50% decrease in antihypertensive medications for at least six months.
    * Flaws of this low confidence trial include lack of a meaningful health outcome, open-label study design, and lack of a comparator arm.
    * There is insufficient evidence to establish the efficacy of Azedra (iobenguane I 131) for the treatment of neuroblastoma. There are multiple trials listed in clincatrials.gov, published early phase clinical trials and a Cochrane review the concluded that there is a lack of compelling evidence for the efficacy of Azedra (iobenguane I 131) for the treatment of neuroblastoma. [4] Although the preliminary evidence is promising, larger, well controlled trials are needed to establish the safety and efficacy of Azedra (iobenguane I 131) in this setting.

Safety [1]

- Radiolabeled iobenguane I-131 has been available for decades in lower diagnostic doses. Adverse events at the lower diagnostic doses are well characterized. At the higher therapeutic doses, the safety profile is still emerging, especially as it relates to secondary malignancies and radiation exposure risk. There is insufficient evidence to determine the long-term or relative safety of Azedra (iobenguane I 131) at the therapeutic doses that have been approved for treatment. However, based on the severity of the disease and the lack of other treatment options in the unresectable, locally advanced or metastatic setting, individual patients may find the potential for benefit to outweigh the risk.
- There is no high-quality evidence to support more frequent dosing of Azedra (iobenguane I 131) in pheochromocytoma or paragangliomas (PPGL). Higher doses of iobenguane I 131 (Azedra) have not been proven in published clinical trials to be more effective or safer for treatment of PPGL.
- There are multiple drug interactions with Azedra (iobenguane I 131) that impact effectiveness and safety. This should only be prescribed a provider familiar with these interactions.

Revision History

Revision Date	Revision Summary
6/20/2024	No criteria changes with this annual review.
12/7/2023	No criteria changes with this annual review.
12/9/2022	• Updated standard language in policy. • No changes to coverage criteria with this annual update.
1/20/2021	Updated continuation of therapy (COT) language. No changes to coverage criteria.
1/22/2020	Added continuation of therapy (COT) criteria (no change to intent of coverage criteria).
1/31/2019	New policy (effective 4/01/2019). Limits coverage to patients with iobenguane scan positive, unresectable, locally advanced or metastatic pheochromocytoma or paraganglioma (PPGL), the setting in which it was studied and has a labeled indication.

Medication Policy Manual

Policy No: dru575

Topic: Fabry Disease Treatments

- Fabrazyme, agalsidase beta
- Galafold, migalastat
- Elfabrio, pegunigalsidase alfa

Date of Origin: April 1, 2019

Committee Approval Date: June 20, 2024

Next Review Date: 2025

Effective Date: September 1, 2024

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Medications in this policy are used in the treatment of Fabry disease, a rare metabolic condition.

Policy/Criteria

Most contracts require pre-authorization approval of Fabry disease treatments prior to coverage.

I. Continuation of Therapy (COT): Fabry disease treatments may be considered medically necessary for COT when there is clinical documentation (including, but not limited to, chart notes) confirming that criteria A through C below are met:

A. One of the following are met:

1. For diagnoses NOT listed in the coverage criteria below, criteria (a and b) must be met:

a. The patient was established on therapy prior to current health plan membership AND there is documentation that the medication was covered by another health plan. Examples of documentation include the coverage approval letter from the previous health plan or paid claim.

AND

b. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

2. For diagnoses listed in the coverage criteria below, criteria (a and b) must be met:

a. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

b. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

3. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

AND

B. **(For Fabrazyme [agalsidase beta] and Elfabrio [pegunigalsidase alfa] only)** Site of care administration requirements are met (refer to Medication Policy Manual, Site of Care Review, dru408).

AND

C. Administration, Quantity Limitations, and Authorization Period" below applies, as well as "Investigational Uses" for combination therapy.

Please note: *Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Fabry disease treatments may be considered medically necessary when there is clinical documentation that criteria A through E below are met.

A. A diagnosis of **Fabry disease** has been established by or in consultation with a specialist in endocrinology or genetics.

AND

B. The diagnosis has been confirmed by alpha-Gal A enzyme deficiency (< 30 % normal activity) **AND/OR** confirmation of GLA mutation.

AND

C. **(Fabrazyme [agalsidase beta] or Elfabrio [pegunigalsidase alfa] only)** Site of care administration requirements are met [refer to Medication Policy Manual, *Site of Care Review*, dru408].

AND

D. **(Galafold [migalastat] only)** The patient has an amenable galactosidase alpha gene (GLA) variant, based on in vitro assay data.

AND

E. **(Galafold [migalastat] only)** Fabrazyme (agalsidase beta) or Elfabrio (pegunigalsidase alfa) have been ineffective, contraindicated, or not tolerated.

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers Fabrazyme (agalsidase beta) and Elfabrio (pegunigalsidase alfa) coverable only under the medical benefit (as a provider-administered medication).

B. Regence Pharmacy Services considers Galafold (migalastat) coverable only under the pharmacy benefit (as a self-administered medication).

C. When pre-authorization is approved, treatments for Fabry Disease will be authorized in the following quantities:

TABLE 1.

Product	Quantity Limit
Fabrazyme (agalsidase beta)	Up to 26 infusions per year; ≤ 1 mg/kg every two weeks.
Elfabrio (pegunigalsidase alfa)	Up to 26 infusions per year; ≤ 1 mg/kg every two weeks.
Galafold (migalastat)	Up to 14 of the 123 mg capsules per 28 days.

D. Authorization **may** be reviewed at least annually. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, such as disease stability or improvement.

IV. Combination use of any of the Fabry disease treatments is considered investigational.

V. Fabry disease treatments are considered investigational when used for any condition other than their FDA approved indications, as detailed in the coverage criteria above.

Position Statement

Summary

- Fabry disease treatments are intravenous (IV) or orally administered medications that are approved for use in Fabry disease and include the following:
    * Fabrazyme (agalsidase beta) and Elfabrio (pegunigalsidase alfa) are available as an IV infusion that provide exogenous sources of the deficient enzyme (alpha-Gal A) in patients with Fabry disease.
    * Galafold is an alpha-galactosidase A pharmacological chaperone indicated for the treatment of adults with a confirmed diagnosis of Fabry disease and an amenable galactosidase alpha gene variant based on in vitro assay data.
- Fabry disease is a rare, multi-system, X-linked, inborn error of glycosphingolipid metabolism caused by genetic mutation in the GLA gene resulting in partial or complete deficiency of the lysosomal enzyme alpha-Gal A. Deficiency in this enzyme results in the progressive intralysosomal accumulation of glycosphingolipids including globotriaosylceramide (GL3 or Gb3) in the kidneys, cardiovascular system, peripheral nerves, and the gastrointestinal tract leading to irreversible organ damage. It is chronic and slowly progressing. [1 2]
- The intent of this policy is to limit coverage of Fabry disease treatments for patients diagnosed with Fabry disease, confirmed by either an enzyme deficiency AND/OR positive GLA mutation, when prescribed by a specialist. Galafold (migalastat) may be covered when Fabrazyme (agalsidase beta) or Elfabrio (pegunigalsidase alfa) are ineffective or not a treatment option, as detailed in the coverage criteria.
- Galafold (migalastat) has only received an accelerated approval pathway based on reduction in kidney interstitial capillary cell globotriaosylceramide (KIC GL-3) substrate. this is a surrogate endpoint that is associated with a slower rate of progression of renal disease. [2] [1]
- Galafold (migalastat) has only demonstrated efficacy in patients with an amenable GLA variant that is interpreted by a clinical genetics professional as causing Fabry disease (pathogenic or likely pathogenic) in the clinical context of the patient. A list of amenable GLA variants is provided in the prescribing information or at http://www.fabrygenevariantsearch.com.
- Although one phase three study (the ATTRACT study) demonstrated that Galafold (migalastat) had efficacy in maintaining estimated glomerular filtration rate (eGFR) or measured GFR and significant decrease in left ventricular mass index compared to enzyme replacement therapy (ERT), its effect on more clinically meaningful outcomes such as overall survival, decreased incidence of end-stage renal disease, or cardiac events is uncertain.

- Fabrazyme (agalsidase beta), which has a full FDA approval, has a long history of use and has been demonstrated to reduce microvascular endothelial deposits of GL-3 and improve pain-related quality of life.
- Elfabrio (pegunigalsidase alfa) recently received a full FDA approval, showed comparable results in reducing kidney Gb3 deposits and slowing eGFR rates to Fabrazyme (agalsidase beta)., with both providing an exogenous source of alpha-Gal A enzyme
- While Galafold (migalastat) provides an oral option for the management of Fabry disease, it lacks long term safety and efficacy data.
- Fabrazyme (agalsidase beta) and Elfabrio (pegunigalsidase alfa) are administered intravenously every two weeks.
- The recommended dose of Galafold (migalastat) is 123 mg (1 capsule) by mouth once every other day at the same time of day. Higher doses have not been studied.
- The safety and efficacy of any of the Fabry disease treatments used in combination with each other has not been established. Galafold (migalastat) has not been studied in combination with enzyme replacement therapy for Fabry disease.
- Uniform recommendations for use of ERT in Fabry disease are not available, but guidelines based on the opinions of experts with experience in treating patients with Fabry's disease recommend that ERT be initiated as soon as possible in Type 1 (classic Fabry disease) and when clinical manifestations are observed in Type 2 (atypical Fabry disease).[3]
- Note: Galafold (migalastat) and Zavesca (miglustat) are distinct chemical entities. Zavesca (miglustat) is used in the treatment of Gaucher's disease.

Clinical Efficacy - Fabrazyme (agalsidase beta)

- Fabrazyme (agalsidase beta) is indicated for Fabry disease. A Cochrane Review A systemic review of nine trials comparing agalsidase alpha or beta in 351 participants, showed that when compared to placebo, ERT showed significant improvement regarding microvascular endothelial deposits of GL-3 and in pain-related quality of life. [4] Additionally, a double-blind, placebo-controlled, randomized, controlled trial conducted in 9 countries with Fabrazyme (agalsidase beta) demonstrated slowed progression to renal, cardiac, and cerebrovascular outcomes, and death. [5]
- Enzyme replacement therapy for Fabry disease as long history of use and a larger body of evidence for efficacy compared to Galafold (migalastat).
- Despite limited evidence to correlate improvement microvascular endothelial deposits of GL-3 with clinically meaningful outcomes there are limited treatment options for the management of Fabry disease.[6]

Clinical Efficacy – Elfabrio (pegunigalsidase alfa)

- Efficacy of Elfabrio (pegunigalsidase alfa) was established via two trials: F01/02, a phase 1/2 multicenter, single arm, open label trial with confirmatory supportive evidence from BALANCE, a phase 3 multicenter randomized, double blind, actively controlled trial.[5,7]

- In trial F01/F02, patients were infused with either 0.2 mg/kg, 1.0 mg/kg, or 2.0 mg/kg every 2 weeks for 3 months (F01) with 16 of the 18 patients enrolling in the extension phase (F02) for 9 additional months. All patients had confirmed symptomatic Fabry disease via alpha-Gal A enzyme deficiency or positive GLA mutation and were ERT naïve.[7,8]
    * The primary endpoint was reduction from baseline at 26 weeks in the average number of Gb3 inclusions via the Barisoni Lipid Inclusion Scoring System (BLISS), a quantitative biopsy scoring methodology that counts the actual number of Gb3 inclusions in each kidney peritubular capillary (PTC), then averages it across all the PTCs, with higher scores correlating to more severe disease. Gb3 scoring via the BLISS system is an accepted surrogate marker, used in the accelerated approval of migalastat (Galafold), however the correlation to providing clinically meaningful outcomes is unknown
    * Elfabrio (pegunigalsidase alfa) significantly reduced the mean Gb3 inclusions by 55% (-3.1) at 26 weeks, with a median reduction of 78% (-2.5).[8,9]
- The BALANCE study (n=77) compared Elfabrio (pegunigalsidase alfa) to enzyme replacement therapy with Fabrazyme (agalsidase beta) in patients with symptomatic and confirmed Fabry disease that had been on Fabrazyme (agalsidase beta) for at least 1 year prior to enrollment.[8,9]
    * Patients were randomized 2:1 to received Elfabrio (pegunigalsidase alfa) or Fabrazyme (agalsidase beta) both dosed at 1 mg/kg every 2 weeks for 2 years.
    * The primary endpoint was the annualized change from baseline in the eGFR slope at 24 months, a validated guideline accepted, and widely used surrogate endpoint.
    * Elfabrio (pegunigalsidase alfa) demonstrated comparable efficacy to Fabrazyme (agalsidase beta) in slowing eGFR decline (-2.4 vs -2.3 respectively) at two years.
    * However, non-inferiority to Fabrazyme (agalsidase beta) was not inferred by the FDA as there was a lack of previous data to determine the treatment effect of Fabrazyme (agalsidase beta) for this similar patient population in the BALANCE trial, such that the expected treatment effect of the active control is not well characterized.
- Elfabrio (pegunigalsidase alfa), an exogenous source of alpha-Gal A enzyme, demonstrated a significant improvement in the reduction of renal Gb3 inclusions in treatment naïve patients and displayed similar efficacy to the established standard of care ERT Fabrazyme (agalsidase beta) in the rate of annualized eGFR slope decline; However, these are surrogate endpoints that are not directly related to how a patients feels or functions.
- Elfabrio (pegunigalsidase alpha) has yet to prove an effect on clinically relevant outcomes including overall survival and quality of life measures. Long term efficacy data evaluating endpoints such as survival, decreased incidence of end-stage renal disease, or cardiac events are warranted.

Clinical Efficacy – Galafold (migalastat)

- Accelerated approval for Galafold (migalastat) was based on one phase-3 trial in patients 16 to 74 years of age with Fabry disease (the FACETS study).
- FACETS consisted of 3 parts: a 6-month double-blind, placebo-controlled treatment period, a 6-month open-label treatment period, a 12-month open-label extension phase to assess long-term outcomes. [10]
    * The primary endpoint was reduction in the average number of GL-3 inclusions in kidney interstitial. This is a surrogate endpoint that is associated with a slower rate of progression of renal disease, which provided the basis of accelerated approval.
    * The study enrolled 67 patients, however only 50 patients had amenable GLA variants. Results for were not statistically significant in the ITT population but
    * Among patients with an amenable variant, 52% of patients in the Galafold (migalastat) group had a ≥50% reduction in number of inclusions compared to 45% in the placebo group.
    * Additional studies are needed to confirm the benefit of Galafold (migalastat) on clinical outcomes.
- The ATTRACT study was an open-label, randomized, controlled study comparing Galafold (migalastat) to enzyme replacement therapy. Both treatments produced similar Reductions consisted of 3 parts: an 18-month open-label treatment period followed by a 12-month open-label optional extension to assess long-term outcomes. The primary endpoint was glomerular filtration rate (GFR). [11]
    * Galafold (migalastat) demonstrated similar efficacy to ERT in maintaining eGFR; however, longer term studies evaluating endpoints such as survival, decreased incidence of end-stage renal disease, or cardiac events are needed.

Genetic Testing [12][8]

- Galafold (migalastat) has only demonstrated efficacy in patients with an amenable GLA variant that is interpreted by a clinical genetics professional as causing Fabry disease (either pathogenic or likely pathogenic) in the clinical context of the patient. A list of amenable GLA variants is provided in the prescribing information or at http://www.fabrygenevariantsearch.com.

Investigational Uses

- The safety and efficacy of combination use with Fabry disease treatments has not been established. Fabry disease treatments have not been studied in combination with each other for Fabry disease. In clinical studies of Galafold (migalastat) and Elfabrio (pegunigalsidase alfa) patients were required to discontinue enzyme replacement therapy before enrolling in the treatment arm of the trials.

Revision History

Revision Date	Revision Summary
6/20/2024	• Updated HCPCS code for Elfabrio (pegunigalsidase alfa). • No criteria changes with this annual review.
9/14/2023	• Added newly FDA-approved Elfabrio (pegunigalsidase alfa) to current policy. • Updated coverage criteria to include confirmed Fabry disease diagnosis via enzyme deficiency (<30% alpha-Gal A activity) AND/OR genetic mutation of GLA gene.
6/15/2023	Updated quantity limit for Galafold to "Up to fourteen 123 mg capsules per 28 days" due to package size of 14 capsules (previously listed up to fifteen 123 mg capsules per 30 days).
6/17/2022	No criteria updates with this annual review.
7/16/2021	Updated continuation of therapy (COT) criteria (no change to intent of coverage criteria).
7/22/2020	Added continuation of therapy (COT) criteria (no change to intent of coverage criteria).
7/24/2019	• Moved Fabrazyme (agalsidase beta) to policy from dru426. Limits coverage to patients with Fabry Disease. • No change to intent of other coverage criteria. Clarification of policy language.
1/31/2019	New policy (effective 4/1/2019). Limits coverage to patients with Fabry Disease with an amenable GAL mutation in whom Fabrazyme (agalsidase beta) has been ineffective, not tolerated, or contraindicated.

Drug names identified in this policy are the trademarks of their respective owners.

Medication Policy Manual | **Policy No:** dru577

Topic: Onpattro, patisiran | **Date of Origin:** April 1, 2019

Committee Approval Date: January 20, 2021 | **Next Review Date:** January 2022

Effective Date: April 1, 2021

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Patisiran (Onpattro) is used for treatment of polyneuropathy of hereditary transthyretin (hATTR)-mediated amyloidosis. Hereditary transthyretin-mediated amyloidosis is rare, progressive, hereditary disease caused by the buildup of abnormal protein deposits in the nervous system and major organs.

Policy/Criteria

Most contracts require pre-authorization approval of patisiran (Onpattro) prior to coverage.

I. Continuation of therapy (COT): Patisiran (Onpattro) may be considered medically necessary for COT when full policy criteria below are met, including site of care requirements, reauthorization criteria and quantity limit. Diagnostic criteria as well as the BASELINE functional status, including ADL limitations and/or polyneuropathy symptoms, prior to initiation of patisiran (Onpattro) must be provided.

***Please note**: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Patisiran (Onpattro) may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes), that criteria A through F below are met.

A. Site of care administration requirements are met. [refer to Medication Policy Manual, Site of Care Review, dru408]

AND

B. A diagnosis of **hereditary transthyretin (hATTR) amyloidosis with polyneuropathy** established by a specialist in neurology, cardiology, amyloidosis, or genetics.

AND

C. The diagnosis has been confirmed by genetic testing, with documentation of a mutation in the transthyretin (TTR) gene.

AND

D. The patient has **Familial Amyloid Polyneuropathy (FAP)** Stage 1 or Stage 2 (*as defined in Appendix 1).*

AND

E. The patient has symptoms consistent with polyneuropathy (See *Appendix 2* for Symptoms of Polyneuropathy*).*

AND

F. The patient has not had a prior liver transplant

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers patisiran (Onpattro) to be a provider-administered medication.

B. When pre-authorization is approved, patisiran (Onpattro) be authorized in quantities as follow:

1. Patients weighing less than 100 kg: Up to 18 infusions in a one-year period based on dose of 0.3 mg/kg every 3 weeks

2. Patients weighing 100 kg or more: Up to 18 infusions in a one-year period based on dose of 30 mg every 3 weeks

C. Authorization shall be reviewed at least every six months. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, including stability or improvement in symptoms consistent with polyneuropathy.

IV. Patisiran (Onpattro) is considered investigational when used for all other conditions, including but not limited to:

A. Hereditary transthyretin amyloidosis without polyneuropathy.

B. In combination with inotersen (Tegsedi).

C. Other forms of amyloidosis.

Position Statement

Summary

- Patisiran (Onpattro) a small interfering RNA (siRNA) used in the treatment of polyneuropathy of hereditary transthyretin (hATTR) amyloidosis.
- The intent of the policy is to allow coverage of patisiran (Onpattro) for patients with a confirmed diagnosis of hATTR (by genetic testing), when there is documented symptoms due to polyneuropathy, similarly to how it was studied, as detailed in the coverage criteria.
- The efficacy of patisiran (Onpattro) was demonstrated in the APOLLO study, an 18-month, phase 3 randomized, placebo-controlled trial in patients with genetically confirmed hATTR amyloidosis and polyneuropathy (FAP Stage 1 or 2).
- Patients with a history of liver transplant were excluded from the clinical trial.[1,2]
- Patisiran (Onpattro) improved neurologic function and quality of life compared to placebo. [2]
- Genetic testing is required to confirm the diagnosis of hATTR amyloidosis.
- Patisiran (Onpattro) may be covered for up to 0.3 mg/kg every 3 weeks (up to a max of 30 mg IV for patients weighing 100 kg or more), the dose studied in clinical trials. [1] The safety and effectiveness of higher doses have not been established. [1]

- The safety and effectiveness of patisiran (Onpattro) in conditions other than polyneuropathy of hATTR have not been established.
- The safety and efficacy of patisiran (Onpattro) in combination with inotersen (Tegsedi) has not been established.

Clinical Efficacy

- Efficacy of patisiran (Onpattro) was demonstrated the APOLLO study, an 18-month, phase 3 randomized, placebo-controlled trial. [2,3] Patients were required to meet the following requirements for enrollment:
    * FAP stage 1 (mild ambulatory impairment) or stage 2 (ambulatory with assistance).
    * A diagnosis of hATTR confirmed by genetic testing and biopsy.
    * Symptoms of neuropathy, measured using the Neuropathy Impairment Score (NIS). The NIS is a tool used to measure motor, sensory, and reflex function.
    * Patients with a history of liver transplant were excluded.
- The primary endpoint was change in modified Neuropathy Impairment Score +7 (mNIS+7) from baseline. Change in Norfolk Quality of Life-Diabetic Neuropathy (Norfolk QOL-DN) score was a secondary endpoint.[2,4]
    * The mNIS+7 is exam-based assessment of neuropathy which includes measures of nerve fiber conduction, sensory testing, and autonomic measures (postural blood pressure). Higher scores indicate worse neurologic function.
    * The Norfolk QOL-DN evaluates patients' perception of impairment with respect to physical functioning/large fiber neuropathy, activities of daily living, neuropathy symptoms, small fiber neuropathy, and autonomic dysfunction. Higher scores indicate poorer quality of life.
- Results showed that patisiran (Onpattro) improved neurologic symptoms and improved quality of life compared to placebo. There is limited data on effect of patisiran (Onpattro) on other end organ dysfunction associated with amyloidosis, such as cardiovascular outcomes or mortality.[2]

Investigational Uses

- There are no published clinical trials evaluating the safety or efficacy of patisiran (Onpattro) for the treatment of any condition other than polyneuropathy of hATTR.
- Trials of patisiran (Onpattro) excluded patients with prior liver transplant. It is unclear if patients who have received a liver transplant would experience benefit as they would not be expected to produce mutated transthyretin protein.

Appendix 1: Familial Amyloid Polyneuropathy (FAP) Staging[5]	
Stage	**Symptoms**
0	Asymptomatic
I	Mild, ambulatory, symptoms at lower limbs limited
II	Moderate, further neuropathic deterioration, ambulatory but requires assistance
III	Severe, bedridden/wheelchair bound with generalized weakness

Appendix 2: Symptoms of Polyneuropathy	
Peripheral sensorimotor polyneuropathy Symptoms	**Autonomic neuropathy symptoms**
Tingling or increased pain in the hands, feet, hands and/or arms,	Orthostasis
Loss of feeling in the hands and/or feet, numbness or tingling in the wrists,	Abnormal sweating
Loss of ability to sense temperature,	Sexual dysfunction
Difficulty with fine motor skills	Recurrent urinary tract infections
Seizures	Dysautonomia (constipation and/or diarrhea, nausea, vomiting, anorexia, early satiety)

Medication Policy Manual

Policy No: dru589

Topic: Elzonris, tagraxofusp-erzs

Date of Origin: July 1, 2019

Committee Approval Date: September 19, 2024

Next Review Date: 2025

Effective Date: December 1, 2024

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Elzonris (tagraxofusp-erzs) is an intravenously administered CD123-directed cytotoxin for the treatment of blastic plasmacytoid dendritic cell neoplasm (BPDCN) in adults and in pediatric patients 2 years and older, a rare type of cancer.

Policy/Criteria

Most contracts require pre-authorization approval of Elzonris (tagraxofusp-erzs) prior to coverage.

I. Continuation of therapy (COT): Elzonris (tagraxofusp-erzs) may be considered medically necessary for COT when criterion A, B, or C below is met.

A. For diagnoses NOT listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND there is documentation that the medication was covered by another health plan. Examples of documentation include the coverage approval letter from the previous health plan or paid claim.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

B. For diagnoses listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

C. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

Please note*: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Elzonris (tagraxofusp-erzs) may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) of a diagnosis of **blastic plasmacytoid dendritic cell neoplasm** (BPDCN).

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers Elzonris (tagraxofusp-erzs) coverable only under the medical benefit (as a provider-administered medication).

B. When pre-authorization is approved, Elzonris (tagraxofusp-erzs) will be authorized in quantities of up to five doses per 21-day cycle, until disease progression.

C. Authorization **may** be reviewed at least annually. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, such as disease stability or improvement.

IV. Elzonris (tagraxofusp-erzs) is considered investigational when used for all other conditions, including but not limited to:

A. Acute Myeloid Leukemia (AML).

B. Myelodysplastic Syndrome (MDS).

C. Myelofibrosis (MF).

D. Chronic Myelomonocytic Leukemia (CMML).

Position Statement

Summary

- Elzonris (tagraxofusp-erzs) is a CD123-directed cytotoxin used for the treatment of blastic plasmacytoid dendritic cell neoplasm (BPDCN) in adults and in pediatric patients 2 years and older.
- The intent of this policy is to limit coverage of Elzonris (tagraxofusp-erzs) to patients diagnosed with BPDCN (in the front-line or relapsed/refractory setting), up to the dose shown to be safe and effective in clinical trials.
- There is low certainty in the evidence that Elzonris (tagraxofusp-erzs) improves complete remission/clinical complete remission (CR/CRc) when used in the front-line or relapsed/refractory setting of BPDCN based on one small, multi-cohort, open-label, single-arm trial.
- Typical treatment of BPDCN includes intensive chemotherapy followed by allogeneic stem cell transplant during the first remission based on low-quality, case series and retrospective reviews. The NCCN acute myeloid leukemia guideline lists Elzonris (tagraxofusp-erzs) as a potential therapy when used as part of intensive induction, and for patients with relapsed or refractory BPDCN.
- It is not yet known if the composite CR/CRc advantage seen with Elzonris (tagraxofusp-erzs) will translate to any clinically relevant benefit such as extended duration of remission or overall survival (OS) based on current trial results.
- The relative efficacy of the Elzonris (tagraxofusp-erzs) compared to multi-agent chemotherapy regimens is not known. There have been no direct comparisons of CR or OS benefit made to date.

- The safety and efficacy of Elzonris (tagraxofusp-erzs) in acute myeloid leukemia (AML), myelodysplastic syndrome (MDS), myelofibrosis (MF), or chronic myelomonocytic leukemia (CMML) has not been established. Use in these settings is considered investigational.
- Use of Elzonris (tagraxofusp-erzs) in combination with other cytotoxic or targeted chemotherapy regimens has not been shown to improve its effectiveness.
- The National Comprehensive Cancer Network (NCCN) lists Elzonris (tagraxofusp-erzs) as an option in the population in which it is indicated in package labeling.
- Common adverse effects (AEs) reported with Elzonris (tagraxofusp-erzs) include capillary leak syndrome, nausea, fatigue, peripheral edema, pyrexia, and weight loss.
- The covered dose of Elzonris (tagraxofusp-erzs) is 12 mcg/kg IV over 15 minutes once daily on days 1 to 5 of a 21-day cycle. The safety and effectiveness of higher doses have not been established. Dose modifications may be necessary for severe AEs.

Regence Pharmacy Services performs independent analyses of oncology medication evidence, to establish coverability per the contracts with the health plan.

- Most contracts define coverability based on established clinical benefit in published, peer-reviewed literature, along with consideration of regulatory status.
- FDA approval does not in itself establish medical necessity, as unpublished, low-quality evidence, including exploratory analyses and unvalidated surrogate endpoints, may be used as the basis of approval. Regulatory approval may or may not reflect clinical benefit relative to standard of care and the recommendations of expert clinical advisors such as the Oncologic Drugs Advisory Committee (ODAC). FDA approvals generally do not consider cost compared to established therapies, or value to members.
- Likewise, NCCN clinical practice guidelines assignment of a recommendation (category 1, 2a, or 2b) does not necessarily establish medically necessity. NCCN recommendations are inconsistently supported by published, peer-reviewed literature and do not uniformly consider value of new therapies relative to existing potentially higher-value treatment options, considering effectiveness, safety, and cost.
- Medication coverage criteria are developed based on the 'medical necessity' assessment, as described above.

Regence Pharmacy Services analysis and coverage policy may differ from FDA labeled indication and/or NCCN clinical practice guidelines.

Clinical Efficacy

- The efficacy of Elzonris (tagraxofusp-erzs) for the treatment of BPDCN was evaluated in one, unpublished, prospective, multi-cohort, open-label, single-arm trial. [1,2]
    * The trial consisted of three stages: Stage 1 (lead-in, dose escalation), Stage 2 (expansion), and Stage 3 (pivotal, confirmatory). The review of efficacy was based primarily on the results of the Stage 3 cohort which included patients with treatment-naïve BPDCN.
    * Thirteen subjects were enrolled in the Stage 3 cohort which evaluated the composite endpoint CR/CRc rate, median CR/CRc and duration of CR/CRc.

    * CR/CRc was achieved in 54% of patients however median CR/CRc was not reached in the treatment group.
    * In a separate cohort of 15 patients with relapsed/refractory BPDCN, one patient achieved a CR (duration: 111 days) and one patient achieved CRc (duration: 424 days).
    * Evidence from this trial is of low quality due to the small, multi-cohort, open-label, single-arm design. Investigators and subjects were unmasked to treatment allocation.
    * Additionally, the composite CR/CRc endpoint has not been validated to accurately predict clinically relevant endpoints such as OS or quality of life.
- The treatment of BPDCN is addressed in the National Comprehensive Cancer Network (NCCN) acute myeloid leukemia (AML) guideline. The guideline lists Elzonris (tagraxofusp-erzs) among recommendations for BPDCN as a therapy for induction of intensive remission, and for patients with relapsed or refractory disease. [3]

Investigational Uses

- There are no published clinical trials evaluating the safety or efficacy of Elzonris (tagraxofusp-erzs) for the treatment of acute myeloid leukemia (AML), myelodysplastic syndrome (MDS), myelofibrosis (MF), or chronic myelomonocytic leukemia (CMML). [4]
- Although a cohort in the pivotal trial included patients with AML, there is insufficient data to support the efficacy and safety of Elzonris (tagraxofusp-erzs) in this setting. [1]

Safety and Administration [1]

- The adverse events (AEs) observed with Elzonris (tagraxofusp-erzs) have the potential to be severe if not properly managed.
- Elzonris (tagraxofusp-erzs) has a box warning for capillary leak syndrome which may be life-threatening or fatal if not properly managed.
- Other serious AEs reported with Elzonris (tagraxofusp-erzs) include hepatotoxicity, nausea, fatigue, peripheral edema, pyrexia, and weight loss.
- The dose of Elzonris (tagraxofusp-erzs) is 12 mcg/kg IV over 15 minutes once daily on days 1 to 5 of a 21-day cycle. Dose modifications may be necessary for severe AEs (refer to prescribing information).

Medication Policy Manual | **Policy No:** dru590

Topic: Gamifant, emapalumab-lzsg | **Date of Origin:** July 1, 2019

Committee Approval Date: March 21, 2024 | **Next Review Date:** 2025

Effective Date: June 1, 2024

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Gamifant (emapalumab-lzsg) is a medication used in the treatment of a rare blood condition [hemophagocytic lymphohistiocytosis (HLH)]. It is given by intravenous (IV) infusion.

Policy/Criteria

Most contracts require pre-authorization approval of Gamifant (emapalumab-lzsg).

I. Continuation of therapy (COT): Gamifant (emapalumab-lzsg) may be considered medically necessary for COT when criterion A or B below is met.

A. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

OR

B. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

***Please note**: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Gamifant (emapalumab-lzsg) may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) that criteria A through D below are met.

A. A diagnosis of refractory primary **hemophagocytic lymphohistiocytosis (HLH)**, established by or in consultation with a hematologist.

AND

B. Documentation that at least one prior HLH treatment (see *Appendix A*) was ineffective, not tolerated, or all options are contraindicated.

***PLEASE NOTE:** Ineffective is defined as no clinical response or improvement after at least two weeks of treatment.*

AND

C. Gamifant (emapalumab-lzsg) will be used in combination with dexamethasone.

AND

D. The patient meets criteria for, and actively participates in, a health plan care management program.

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers Gamifant (emapalumab-lzsg) coverable only under the medical benefit (as a provider-administered medication).

B. When pre-authorization is approved, Gamifant (emapalumab-lzsg) will be authorized as follows:

1. Initial starting dose of up to 1 mg/kg twice weekly, for up to a total of 8 weeks.

2. If there is insufficient response to starting doses, Gamifant (emapalumab-lzsg) may be authorized for up to 10 mg/kg/dose twice weekly (dose escalation may be requested through your health plan care manager).

3. Total maximum duration of therapy: 8 weeks, or until time of hematopoietic stem cell transplantation (HSCT). Any authorization beyond 8 weeks will be requested and coordinated through your health plan care manager.

IV. Gamifant (emapalumab-lzsg) is considered investigational when used for any other conditions, including, but not limited to:

A. Retreatment, defined as use for relapsed/refractory HLH on or after a prior course of Gamifant (emapalumab-lzsg) treatment.

B. Previously untreated (treatment-naïve) primary HLH.

C. Secondary HLH (such as HLH developed during malignancies).

V. Gamifant (emapalumab-lzsg) is considered not medically necessary when used beyond 8 weeks.

Position Statement

Summary

- The intent of this policy is to allow for coverage of Gamifant (emapalumab-lzsg) for treatment refractory primary hemophagocytic lymphohistiocytosis (HLH) as a bridge to hematopoietic stem cell transplantation (HSCT), the indication studied in trials, when conventional HLH treatments are ineffective, not tolerated, or use is contraindicated.
- Primary HLH is a rare, autosomal recessive condition. It is caused by a genetic lymphocyte defect, which leads to uncontrolled immune activation, inflammation, and overproduction of cytokines such as interferon-γ (IFNγ), interleukin 6 (IL-6), and interleukin 10 (IL-10). If left untreated, primary HLH is a fatal condition with a median survival of two months after diagnosis.
- Gamifant (emapalumab-lzsg) is a monoclonal antibody that binds to and inhibits IFNγ. It is to be used until HSCT can occur and is given in combination with dexamethasone.
- The safety and efficacy of Gamifant (emapalumab-lzsg) was established based on one single-arm clinical trial in patients with treatment refractory primary HLH. There was a 63% ORR at week 8, and 70% survived to receive a HSCT. Despite the promising short-term response, clinically meaningful long-term outcomes such as overall survival are unknown at this time.
- Gamifant (emapalumab-lzsg) was not sufficiently studied in patients with treatment-naive primary HLH as only seven treatment-naïve patients were included in the trials. Conventional treatment options including etoposide (HLH-94, HLH-2004) and anti-thymocyte-based therapies have demonstrated effectiveness in this population. The use of Gamifant (emapalumab-lzsg) as first line therapy is not recommended by the FDA at this time.

- Gamifant (emapalumab-lzsg) may be covered in doses up to 10 mg/kg twice weekly for 8 weeks or until HSCT (i.e., the dosing studied in trials). The efficacy and safety of higher doses, a longer treatment duration, or use for relapsed/refractory HLH after a prior course of Gamifant (emapalumab-lzsg) has not been established.

Clinical Efficacy

Refractory Primary Hemophagocytic Lymphohistiocytosis [1]

- One unpublished, phase 2/3, single arm, open-label trial evaluated Gamifant (emapalumab-lzsg) for the treatment of refractory primary HLH (n=27) and treatment-naïve primary HLH (n=7).
- According to the FDA, the number of treatment-naïve patients was too small to be used as confirmatory evidence in this population and only the refractory population was considered to be the primary analysis population.
    * Patients received Gamifant (emapalumab-lzsg) with dexamethasone for 8 weeks, or until HSCT, whichever occurred first.
    * The primary endpoint was overall response (ORR) at the end of treatment.
    * Treatment with Gamifant (emapalumab-lzsg), was associated with an overall response rate of 63% (17/27) in the refractory primary HLH treatment group.
    * A total of 70% (19/27) of patients treated with Gamifant (emapalumab-lzsg) survived to receive a HSCT.
- To date, there are no trials comparing Gamifant (emapalumab-lzsg) with other treatments, either as a first-line or refractory therapy. Therefore, the relative efficacy is unknown.

Treatment Guidelines[2 3]

- The Histiocyte Society published a treatment protocol and diagnosis guidelines for HLH in 2004. The etoposide-based treatment protocol is known as HLH-2004.
- The following therapies are recommended for treatment of primary HLH:
    * Initial therapy: systemic therapy consisting of etoposide, cyclosporine, dexamethasone, and methotrexate (if CNS activity suspected) for 8 weeks.
    * Therapy can be continued past 8 weeks until a matched donor is found, and hematopoietic stem cell transplantation (HSCT) can occur.
    * The optimal medications to use in salvage therapy, for patients who do not respond to conventional treatment options listed above, is unclear at this time. Options include the addition of antithymocyte globulin (ATG; thymoglobulin) or alemtuzumab.
- Primary HLH is characterized by frequent reactivations unless patients undergo HSCT. During a reactivation, intensification of the systemic therapy will often result in a response to treatment, but the only known cure of primary HLH is HSCT.
- Between 25-50% of patients will fail to achieve a complete response to the current standard of care therapy and will require additional treatments.
- The 5-year survival for HLH is 50-60% with the therapies mentioned above and HSCT.

- Conventional treatment protocols, such as etoposide- (HLH-94, HLH-2004) and anti-thymocyte-based therapies have all demonstrated effectiveness in treatment-naïve primary HLH.

Investigational Uses

- Although the American Society of Hematology (ASH) lists Gamifant (emapalumab-lzsg) as a reported salvage option in secondary HLH, there is no evidence for the safety and efficacy of Gamifant (emapalumab-lzsg) for use in patients with secondary HLH.[4] Studies are ongoing for use of Gamifant (emapalumab-lzsg) in secondary HLH.[5]
- There is no evidence to establish the safety or efficacy of Gamifant (emapalumab-lzsg) in patients with secondary HLH, treatment-naïve primary HLH, use greater than 8 weeks, or as retreatment after a previous course of Gamifant (emapalumab-lzsg) therapy.

Safety [1 6]

- The most common side effects (>20% incidence) experienced during clinical trials were infections, hypertension, infusion-related reactions, and pyrexia.
- There were seven deaths (26%) in patients who received Gamifant (emapalumab-lzsg), reported at the time of the data cut-off. Of the seven deaths, five occurred prior to receiving the HSCT, and two occurred after the transplant.
    * Of the pre-transplant deaths, four were the result of new infections or worsening of a pre-existing infection.
    * Post-transplant deaths were attributed to known post-transplant complications, graft versus host disease, and graft rejection.

Appendix A. Conventional Treatments Used for Primary Hemophagocytic Lymphohistiocytosis [1 2]	
HLH-94	Etoposide Dexamethasone Intrathecal methotrexate (if CNS involvement is suspected)
HLH-2004	Etoposide Dexamethasone Cyclosporine Intrathecal methotrexate (if CNS involvement is suspected)
Anti-Thymocyte Based Therapy	Anti-thymocyte globulin (ATG, thymoglobulin) Corticosteroid Cyclosporine Intrathecal methotrexate (if CNS involvement is suspected)

Campath (alemtuzumab)* may be considered, as a second line therapy. For the purposes of the coverage of Gamifant, only medications listed within the table above will be considered versus the coverage criteria for previous therapy.

* *Note: Campath is no longer commercially available but may be provided free of charge via the Campath Distribution Program.*

Medication Policy Manual | **Policy No:** dru591

Topic: Zolgensma, onasemnogene abeparvovec-xioi | **Date of Origin:** July 5, 2019

Committee Approval Date: December 7, 2023 | **Next Review Date:** 2024

Effective Date: March 1, 2024

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Zolgensma (onasemnogene abeparvovec-xioi) is an adeno-associated virus (AAV) vector-based gene therapy which replaces the defective SMN1 gene. It is used in the treatment of spinal muscular atrophy (SMA), a rare neuromuscular condition that affects motor function. It is given as a single, one-time intravenous (IV) infusion.

Policy/Criteria

Most contracts require pre-authorization approval of Zolgensma (onasemnogene abeparvovec-xioi) prior to coverage.

I. Continuation of therapy (COT): Zolgensma (onasemnogene abeparvovec-xioi) may be considered medically necessary for COT when full policy criteria below are met, including quantity limit.

***Please note**: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Zolgensma (onasemnogene abeparvovec-xioi) may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) that criteria A through J below are met.

A. A diagnosis of **spinal muscular atrophy** (SMA), established by or in consultation with a pediatric neuromuscular specialist (pediatric neurologist or rehabilitation doctor).

AND

B. Genetic confirmation of bi-allelic SMN1 mutations and two or three copies of survival motor neuron 2 (SMN2).

AND

C. Anti-AAV9 antibody titers ≤1:50, as determined by ELISA binding immunoassay.

AND

D. Documentation of SMA associated symptoms if present. This is to include an assessment of baseline motor function, with objective function-based testing (such as with CHOP-INTEND score).

AND

E. The patient will be less than 2 years of age at the time of the Zolgensma (onasemnogene abeparvovec-xioi) infusion.

AND

F. Patient has NOT received prior SMA gene therapy.

AND

G. Documentation of comprehensive SMA care, including physical therapy, respiratory care, and nutrition support as part of the patient's care plan.

AND

H. The patient does not have advanced SMA, as defined by one of the following:

1. Complete paralysis of the limbs.

OR

2. Requires invasive ventilatory support, defined as a tracheotomy with positive pressure.

OR

3. Requires non-invasive ventilatory support for greater than 16 hours per day.

AND

I. The patient meets criteria for, and actively participates in, a health plan care management program.

AND

J. Zolgensma (onasemnogene abeparvovec-xioi) will be administered intravenously (IV).

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers Zolgensma, onasemnogene abeparvovec-xioi coverable only under the medical benefit (as a provider-administered medication).

B. When pre-authorization is approved, Zolgensma (onasemnogene abeparvovec-xioi) will be authorized in quantities up to 1.1×10^{14} vg/kg IV once, for one treatment course per lifetime.

C. Additional infusions of Zolgensma (onasemnogene abeparvovec-xioi) will not be authorized.

IV. Zolgensma (onasemnogene abeparvovec-xioi) is considered investigational when used for all other conditions not specifically addressed in the coverage criteria above, including, but not limited to:

A. Other types of classic SMA not specified above.

B. Non-5q SMA (SMA due to genetic abnormalities other than on chromosome 5q).

V. Zolgensma (onasemnogene abeparvovec-xioi) is considered not medically necessary when used in combination with Spinraza (nusinersen) or Evrysdi (risdiplam).

Position Statement

Summary[1-4]

- Zolgensma (onasemnogene abeparvovec-xioi) is an adeno-associated virus (AAV) vector-based gene therapy which replaces the defective SMN1 gene.
- Spinal muscular atrophy (SMA) is a rare condition, in which a genetic defect in the survival motor neuron (SMN) 1 gene leads to progressive loss of motor neuron function, hypotonia, weakness, and chronic respiratory insufficiency.
  * Children with the most severe form (SMA type 1) have symptoms before the age of 6 months and do not reach motor milestones (like sitting unassisted). SMA type 1 is also called “infantile SMA” or Werdig-Hoffman disease.
  * Later onset SMA (such as SMA type 2 or 3) is diagnosed later (symptom onset after 6 months of age), when a child fails to meet a motor milestone. SMA type 2 is also called Dubowitz disease. SMA type 3 is also called Kugelberg-Welander disease.
- Zolgensma (onasemnogene abeparvovec-xioi) has limited clinical trial data in a very specific patient population. However, in the currently available data, there is evidence of

a clinical improvement in SMA-related symptoms (improvement in motor function) in a patient population where motor function of that level would not be expected.

- Currently available clinical trial data is limited to pre-symptomatic SMA patients with two or three copies of SMN2 and symptomatic SMA type 1 patients with two copies of the SMN2 gene.
    * A diagnosis of SMA was confirmed genetically with a bi-allelic SMN1 mutations.
    * Clinical trials of Zolgensma (onasemnogene abeparvovec-xioi) in patients older than 2 years of age via intrathecal route are ongoing.
    * In addition, the safety and efficacy of Zolgensma (onasemnogene abeparvovec-xioi) in patients with a different number of copies of SMN2 is unknown at this time.
    * Genetic testing is required to confirm of a diagnosis of classic SMA (5q SMA) and to rule out other causes of spinal muscular atrophy. Onset of SMA symptoms (such as failure to meet motor milestones) differentiates SMA types 1, 2, and 3. SMA type 1 has onset of symptoms prior to 6 months of age and is the most severe, progressive form of SMA.
    * Zolgensma (onasemnogene abeparvovec-xioi) has not been studied in patients with advanced SMA, such as complete paralysis of the limbs or disease that has progressed to the point of requiring permanent ventilation. This is defined as the use of invasive ventilatory support (tracheotomy with positive pressure) OR non-invasive ventilator support for greater than 16 hours per day. Patient with complete paralysis or significant ventilatory support were excluded from clinical trials.
- Patients with Anti-AAV9 antibody titers >1:50 (determined by ELISA binding immunoassay) were excluded from the trial due to the potential for these antibodies to render the AAV9 vector-based therapy ineffective.
- Guidelines recommend aggressive, comprehensive supportive care and monitoring of motor milestones with objective function-based testing (such as with a HINE or CHOP-INTEND score).
- Zolgensma (onasemnogene abeparvovec-xioi) is only coverable in patients who are less than 2 years of age by the date of Zolgensma (onasemnogene abeparvovec-xioi) administration.
- Zolgensma (onasemnogene abeparvovec-xioi) may be covered for up to one dose per lifetime. There is no data on the safety or efficacy of repeated doses.
- Zolgensma (onasemnogene abeparvovec-xioi) is administered via a single, weight based intravenous (IV) infusion. There is insufficient evidence to support the safety or efficacy of other routes of administration at this time.
- The use of Spinraza (nusinersen) or Evrysdi (risdiplam) after Zolgensma (onasemnogene abeparvovec-xioi) for patients with an incomplete response, defined as persistent SMA symptoms, may be effective. However, the use of Spinraza (nusinersen) for residual SMA symptoms after Zolgensma (onasemnogene abeparvovec-xioi) is considered not medically necessary. Given the very high cost of the Zolgensma (onasemnogene abeparvovec-xioi) and Spinraza (nusinersen) therapies, we are unable to cover both treatment options.

Clinical Efficacy

Spinal Muscular Atrophy Type 1[3]

- One, ongoing, open-label, phase III trial (SPR1NT) in pre-symptomatic pediatric patients (n=29) with two or three copies of SMN2, demonstrated promising results.
    * In the 2-copy cohort (n=14), 100% of patients were alive without the need for respiratory support, 100% could sit independently for > 30 seconds, and 64% were walking independently at 14 months.
    * Preliminary results for the 3-copy cohort (n=15) demonstrate a similar story, although the trial is ongoing in this subset.
- One, low confidence, phase 1, open-label, dose-escalation trial in symptomatic pediatric patients with SMA type 1. Patients either enrolled in a low dose cohort (n=3) or a high dose cohort (n=12). The high dose cohort received the proposed therapeutic dose.
    * The primary endpoint was safety, which was defined as the incidence of grade III or higher treatment related toxicity.
    * Secondary endpoints included changes in Children's Hospital of Philadelphia Infant Test of Neuromuscular Diseases (CHOP-INTEND) from baseline score and improvement of motor function and muscle strength.
        ▪ No major milestones were achieved in the cohort that received the low dose Zolgensma (onasemnogene abeparvovec-xioi).
        ▪ In the high dose cohort at 24 months, the following major milestones were achieved:
            - 11 out of 12 patients (92%) had head control and could sit unassisted for 5 seconds.
            - 9 out of 12 patients (75%) could roll over or sit unassisted for 30 seconds.
            - 7 out of 12 patients (58%) required no ventilatory support.
            - 6 out of 12 patients (50%) required no nutritional support.
            - 2 out of 12 patients (17%) could crawl, stand, and walk independently.
    * At two years, no patients in either cohort died or were put on permanent ventilation.
    * Trial data is largely limited to SMA type 1 patients less than 6 months of age. A single patient over 6 months received the proposed therapeutic dose and did not have a response to the treatment. This prompted a change in the inclusion criteria to only enroll patients less than 6 months of age at the time of the infusion.
- An unpublished phase 3 trial (n=22) in the symptomatic SMA type 1 population (the STR1VE trial), with encouraging preliminary results, is currently ongoing.

Treatment Guidelines[1 2]

- Guidelines recommend maximizing aggressive multidisciplinary care in patients with all types of SMA.

    * Therapy should be tailored to the patient's functional level (non-sitter, sitter, or walker) and is to include a proactive approach (often prior to symptoms begin) for the following: rehabilitation, orthopedic management, nutritional support, pulmonary management, and psychological/social support for impacted families.
    * Although uptake in these treatment guidelines have improved survival for all types of SMA, developmental milestones are rarely acquired after a diagnosis of SMA type 1 is made.
- Guidelines were updated in 2017, and do not address the role of Spinraza (nusinersen), Evrysdi (risdiplam), or Zolgensma (onasemnogene abeparvovec-xioi).
- SMA is included as part of the recommended newborn health screenings by the Secretary of the Department of Health and Human Services. The majority of US states have implemented this recommendation and a pre-symptomatic diagnosis will soon be the predominant phase of SMA disease identification.

Investigational Uses

- There are no published trials that establish the safety or efficacy of Zolgensma (onasemnogene abeparvovec-xioi) in patients over the age of two years, such as those with symptomatic type 3 or type 4 SMA.
- There is no evidence to establish the safety or efficacy of repeat doses of Zolgensma (onasemnogene abeparvovec-xioi). If medical necessity criteria are met, only a single dose of Zolgensma (onasemnogene abeparvovec-xioi) will be covered per lifetime.

Safety [3 5]

- During the pivotal clinical trial of Zolgensma (onasemnogene abeparvovec-xioi) (n=15), about 1/3 of patients had liver enzyme elevation.
- Although in the clinical trials and in postmarketing experience, asymptomatic aminotransferase elevations were very commonly reported in the managed access program and in the post-marketing setting, Cases of acute serious liver injury and acute liver failure including a few cases with fatal outcomes, have been reported.The most common side effects (>40% incidence) experienced during clinical trials were upper respiratory tract infections, vomiting, constipation, pyrexia, nasal congestion, and gastroesophageal reflux. These are common conditions seen in all patients with SMA, although it is unclear if this therapy worsens these conditions, due to a lack of a control group.
- Due to the small number of patients treated with Zolgensma (onasemnogene abeparvovec-xioi) during clinical trials, additional data is necessary to further define the safety profile.

Revision History

Revision Date	Revision Summary
12/7/2023	No criteria changes with this annual review.
12/9/2022	No changes to coverage criteria with this annual update.
7/16/2021	Effective 8/15/2021: • Updated coverage criteria to allow for use of Zolgensma (onasemnogene abeparvovec-xioi) in genetically diagnosed SMA in patients with 2 or 3 copies of SMN2, including those diagnosed pre-symptomatically, up to 2 years of age. • Updated criteria to be inclusive of additional symptoms of advanced SMA, including complete paralysis of the limbs AND permanent respiratory support. • Removed clinical trial ineligibility requirement.
1/20/2021	Added combination use with Evrysdi (risdiplam) to not medically necessary uses.
4/22/2020	Modification of criteria pertaining to coverage of onasemnogene abeparvovec in patients with prior nusinersen use (*criteria F.*). Updated to include prior SMA gene therapy only.
6/26/2019	New policy. Effective 7/5/2019. Limits coverage to symptomatic SMA Type I patients with 2 copies of the SMN2 gene and will be less than 6 months of age at the time of the Zolgensma (onasemnogene abeparvovec-xioi) infusion, the setting in which it was studied in trials.

Medication Policy Manual

Policy No: dru598

Topic: Medications for Thrombotic Thrombocytopenic Purpura (TTP)

- Adzynma (ADAMTS13, recombinant-krhn)
- Cablivi (caplacizumab-yhdp)

Date of Origin: October 1, 2019

Committee Approval Date: June 20, 2024

Next Review Date: 2025

Effective Date: September 1, 2024

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of medication policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Cablivi (caplacizumab-yhdp) and Adzynma (ADAMTS13, recombinant-krhn) are injectable medications which inhibit von Willebrand Factor (VWF) from binding to platelets to treat specific rare blood disorders.

Policy/Criteria

Most contracts require pre-authorization approval of Cablivi (caplacizumab-yhdp) prior to coverage.

I. Continuation of therapy (COT): Medications for Thrombotic Thrombocytopenic Purpura (TTP) [as listed in Table 1] may be considered medically necessary for COT when full policy criteria below are met, including quantity limit.

***Please note**: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Medications for TTP may be covered as follows:

A. **Cablivi (caplacizumab-yhdp)** is considered not medically necessary for **acquired thrombotic thrombocytopenic purpura** (aTTP).

OR

B. **Adzynma (ADAMTS13, recombinant-krhn)** may be considered medically necessary when clinical documentation (including, but not limited to chart notes) confirming that criteria 1 through 4 below are met.

1. Diagnosis of **congenital TTP (cTTP)** confirmed by both of the following (a and b):

a. Genetic testing (mutation in the ADAMTS13 gene).

AND

b. Documented ADAMTS13 activity < 10% [a disintegrin and metalloprotease with thrombospondin type 1 motif, 13 (ADAMTS13) activity < 10%].

AND

2. Diagnosis has been made by a specialist (hematologist, rare hematologic disease specialist, oncologist, or intensive care unit specialist).

AND

3. Other TTP or TTP-like disorders have been ruled out, including, but not limited to, acquired TTP (aTTP), complement-mediated hemolytic-uremic syndrome (CM-HUS), infection associated hemolytic-uremic syndrome (IA-HUS), antiphospholipid syndrome (APLS) etc.

AND

4. For use of Adzynma (ADAMTS13, recombinant-krhn) ***as prophylaxis***, documentation of persistent/refractory cTTP, defined as meeting all of the following (a through c):

a. History of at least one documented acute TTP event in the last 12 months, defined as all of the following (during the event timeframe) (i and ii):

i. A drop in platelet count ≥ 50% of baseline or a platelet count less than 100 x 10^9/L

AND

ii. An elevation of lactate dehydrogenase (LDH) levels >2 times baseline or > 2 times upper limit of normal per laboratory values.

AND

b. The patient is currently receiving plasma-based *prophylaxis* therapy, unless contraindicated, not tolerated or ineffective.

PLEASE NOTE: plasma-based therapies include, but are not limited to, fresh frozen plasma (FFP), solvent/detergent (S/D) plasma, and factor VIII products.

AND

c. At the time of initiation of Adzynma (ADAMTS13, recombinant-krhn), the patient is NOT having an acute TTP event, with documentation of stability with both of the following (i and ii):

i. Platelet count greater than or equal to 100 x 10^9/L

AND

ii. Lactate dehydrogenase (LDH) levels less than 2 times the upper limit of normal (ULN).

III. Medications for TTP (as listed in *Table 1*) are considered investigational when used for all other conditions.

IV. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers Adzynma (ADAMTS13, recombinant-krhn) coverable under the medical benefit (as a provider-administered medication).

B. Regence Pharmacy Services considers Cablivi (caplacizumab-yhdp) coverable under the pharmacy benefit (as a self-administered medication) OR coverable under the medical benefit (as a provider-administered medication).

C. When prior authorization is approved, each drug will be covered in the following quantities and for the following authorization periods outlined in *Table 1*.

Table 1:

Product	Authorization Limit
Adzynma (ADAMTS13, recombinant-krhn)	**Initial authorization:** • In quantities up to the FDA-recommended weight-based dose and frequency limits. • Authorization: **shall** be reviewed at 6 months to confirm that current medical necessity criteria are met and that the medication is effective. **Continued authorization:** • In quantities up to the FDA-recommended dose and frequency limits (prophylaxis dosing frequency may be adjusted from once every OTHER week to once weekly dosing based on clinical response to treatment). • Authorization **shall** be reviewed every 12 months. Ongoing coverage requires documentation, (including chart notes) that the medication is effective, including, but not limited to, reduction in clinical symptoms (fatigue, headache, abdominal discomfort, lethargy, loss of concentration etc.), reduction in number of acute TTP events (including subacute events), an improvement in platelet counts (see *Appendix 1*).
Cablivi (caplacizumab-yhdp)	Although the use of Cablivi (caplacizumab-yhdp) is considered "not medically necessary," if pre-authorization is approved, Cablivi (caplacizumab-yhdp) will be authorized as follows: **Initial authorization:** • In quantities of up to 31 of the 11 mg vials for the first 30 days based on a dosing of 22 mg on Day 1, followed by 11 mg daily for up to 30 days after Plasma Exchange (PLEX) has ended. **Continued authorization (after the first 30 days):** • Up to a maximum 1 vial (11mg) per day for 30 days after PLEX has ended. • Authorization **shall** be reviewed at 30 days. Ongoing coverage of Cablivi (caplacizumab-yhdp) requires clinical documentation, including chart notes which indicate PLEX duration and discontinuation date and that the patient is not experiencing a recurrence of aTTP. Recurrence defined as thrombocytopenia requiring PLEX re-initiation. If a patient experiences more than 2 recurrences of aTTP while on therapy, no further Cablivi (caplacizumab-yhdp) will be authorized.

	Dose continuation beyond 30 days post-PLEX as follows: • ATTP has stabilized: No additional caplacizumab will be authorized. • ATTP has not stabilized: A maximum total of twenty-eight 11-mg vials per 28-day supply may be authorized until time of aTTP stabilization. No additional caplacizumab will be authorized once aTTP has stabilized, or beyond 28 days, whichever occurs first. • Authorization **shall** be reviewed at 30 days post PLEX discontinuation. Ongoing coverage of Cablivi (caplacizumab-yhdp) requires clinical documentation, including chart notes, that indicate the following: o Patient is at high risk for a recurrence of aTTP defined as ADAMTS13 level <10%. **AND** o Immunosuppressive therapy has been optimized. Defined as restarting or increasing corticosteroid dose or starting other immunosuppressive treatments (such as rituximab).

Position Statement

Adzynma (ADAMTS13, recombinant-krhn)

- Adzynma (ADAMTS13, recombinant-krhn) is a recombinant form of the endogenous human enzyme, a disintegrin and metalloproteinase with thrombospondin motifs 13 (ADAMTS13), used to treat individuals with congenital TTP.
- The intent of this policy is to limit coverage of Adzynma (ADAMTS13, recombinant-krhn)to patients with genetically confirmed cTTP, when prescribed by a specialist, and refractory to standard of care agents (plasma-based therapies).
- Laboratory testing to establish the diagnosis of cTTP includes genetic testing for mutations in the ADAMTS13 gene, the finding of severe ADAMTS13 deficiency (<10% of normal activity), and the absence of autoantibodies ("inhibitors") to ADAMTS13.
- The current standard of care focuses on ADAMTS13 replacement for both prophylaxis and acute events, using infusions of commercially-available plasma-based therapies (fresh frozen plasma, solvent/detergent plasma, and less often, factor VIII products) to replenish absent or low levels of ADAMTS13.
- The approval of Adzynma (ADAMTS13, recombinant-krhn) was based on one small phase 3 study for prophylaxis and on-demand treatment in individuals with cTTP.
- The pivotal trial showed a reduction, albeit minimal, in the number of acute TTP events over 12 months in subjects receiving prophylactic Adzynma (ADAMTS13, recombinant-krhn) compared to various plasma based prophylactic therapies. However, there is still insufficient evidence to show whether Adzynma (ADAMTS13, recombinant-krhn) has an

effect on quality of life related, clinically significant outcomes, such as reduction of chronic daily symptoms, reduction of end-organ damage, reduction in recurrent acute exacerbations over a longer time period, or reduction of clinically meaningful sequelae of acute TTP events (stroke, transient ischemic attacks, myocardial infarction etc.).

- Most subjects in the prophylactic cohort (n=37) of the pivotal trial were receiving a prophylactic plasma-based therapy at baseline or had a history of at least one or more acute TTP events. Platelet and lactate dehydrogenase (LDH) levels were measured to ensure subjects were eligible for prophylaxis, were not experiencing an acute event and were clinically stable.
- Both the 2020 British Society of Hematology (BSH) and the 2023 International Society on Thrombosis and Hemostasis (ISTH) guidelines recommend plasma-based therapies such as fresh frozen plasma (FFP) and solvent/detergent (S/D) plasma as treatments for cTTP, for prophylaxis and acute TTP events. Factor VIII products are mentioned only as alternatives to FFP and S/D plasma.
- Plasma based therapies (FFP, S/D plasma, factor VIII products) provide the best value. Adzynma (ADAMTS13, recombinant-krhn) has not been proven to be substantially more effective or safer than plasma-based therapies but is much more costly.
- Adzynma (ADAMTS13, recombinant-krhn) may be covered for up to the FDA-recommended weight-based dose and frequency. The safety and effectiveness of higher doses or increased frequencies have not been established.
- The safety and effectiveness for Adzynma (ADAMTS13, recombinant-krhn) in conditions other than cTTP have not been established.
- Given that most patients who present with an acute TTP event will be hospitalized, coverage for acute ("on-demand") treatment with Adzynma (ADAMTS13, recombinant-krhn) will be reviewed as part of an inpatient hospital stay.

Cablivi (caplacizumab-yhdp)

- Cablivi (caplacizumab-yhdp) is a monoclonal nanobody used to treat adult patients with acquired thrombotic thrombocytopenic purpura (aTTP) in combination with plasma exchange (PLEX) and immunosuppressive therapy.
- The use of Cablivi (caplacizumab-yhdp) for aTTP is considered not medically necessary, given the lack of proven additional benefit versus PLEX and immunosuppressive therapy, the current standard of care, which is known to have a very high response rate.
- Caplacizumab was studied in one phase 3 trial in patients with aTTP. The trial demonstrated no clinically meaningful difference in the time to normalization of platelet count between caplacizumab and placebo-treated patients. All patients in the trial remained on their baseline standard of care treatment regimen, which consisted of PLEX and immunosuppressive therapy.
- Caplacizumab does not address the underlying pathophysiology of aTTP; therefore, its role in reducing long-term sequelae of aTTP, such as neurocognitive deficits, arterial hypertension, and major depression, is unknown at this time.
- Additional, long-term, controlled trials are needed to assess the safety of caplacizumab, as bleeding safety signals were noted during clinical trials.

- Despite a reduction in aTTP recurrence rate, there is insufficient evidence to establish that the addition of caplacizumab to aTTP treatment regimens provides any value over the current SOC in improving clinically relevant outcomes, such as improving survival or reducing thromboembolic (TE) events. Therefore, the use of caplacizumab in aTTP is considered not medically necessary.
- Although the use of Cablivi (caplacizumab-yhdp) is NMN, the doses studied in trials were not to exceed use 30 days past the end of PLEX.

Disease Background - aTTP

- Acquired thrombotic thrombocytopenic purpura (aTTP) is a rare hematologic condition, caused by a severe deficiency in ADAMTS13, a protease responsible for cleaving von Willebrand factor (VWF) multimers. Without being cleaved, VWF multimers bind to platelets and form large platelet-rich clots which lead to tissue ischemia and multiorgan dysfunction.
- A presumptive diagnosis of aTTP is made if patients present with thrombocytopenia and hemolytic anemia without any other obvious cause. aTTP is confirmed by the finding of severe ADAMTS13 deficiency (<10% of normal activity), and the presence of autoantibodies ("inhibitors") directed against ADAMTS13.
- The current standard of care (SOC) for aTTP is PLEX and immunosuppressive therapy, which has led to a survival rate of 80-90%. Despite this high survival rate, neurocognitive deficits, arterial hypertension, and major depression have been reported to be more prevalent in survivors of aTTP compared to healthy populations without aTTP.

Disease Background - cTTP

- Congenital thrombotic thrombocytopenic purpura (cTTP) is an ultra-rare, autosomal recessive disease that is caused by mutations in the gene encoding for ADAMTS13, an enzyme that cleaves von Willebrand factor (VWF) multimers. Severe deficiencies in the ADAMTS13 enzyme (< 10% of normal enzyme activity) can lead to the formation of large, platelet rich VWF multimers, which create thrombi that can lead to ischemic damage to multiple organs (brain, kidney, and heart).
- Laboratory testing to establish the diagnosis of cTTP includes genetic testing for mutations in the ADAMTS13 gene, the finding of severe ADAMTS13 deficiency (<10% of normal activity), and the absence of autoantibodies ("inhibitors") to ADAMTS13.
- The current standard of care focuses on ADAMTS13 replacement for both prophylaxis and acute events, using infusions of commercially available, plasma-based therapies (fresh frozen plasma, solvent/detergent plasma, and less often, factor VIII products) to replenish absent or low levels of ADAMTS13.

Clinical Efficacy [1-4]

Adzynma (ADAMTS13, recombinant-krhn)

- Evidence for the safety and efficacy of Adzynma (ADAMTS13, recombinant-krhn) comes from a phase 3, randomized, controlled, multicenter, open-label, 2-period crossover with a single arm continuation trial (N=42).
- Subjects in the prophylaxis cohort (n=37) were randomized 1:1 to receive 6 months of either intravenous plasma-based therapy weekly or every other week based on the regimen at enrollment or Adzynma (ADAMTS13, recombinant-krhn) 40IU/kg IV every other week, followed by 6 months of alternate treatment for each cohort. Following this randomized crossover, 35 subjects entered the single arm continuation trial for 6-months and received Adzynma (ADAMTS13, recombinant-krhn) 40IU/kg IV every other week only.
    * The primary endpoint was the incidence of acute TTP events in the prophylaxis cohort. In the first 12 months, a single subject on plasma-based therapy had an acute TTP event, whereas there were no acute TTP events in subjects treated with Adzynma (ADAMTS13, recombinant-krhn). Due to minimal events captured, it is unknown whether Adzynma (ADAMTS13, recombinant-krhn) is substantially and meaningfully superior in reducing the incidence of acute TTP events, compared to plasma-based therapies.
    * Secondary endpoints were the incidence of subacute TTP events and incidence of TTP manifestations in the prophylaxis cohort (see Appendix 1, Definitions). There were fewer subacute and TTP manifestations in the Adzynma (ADAMTS13, recombinant-krhn) treatment groups compared to plasma-based therapy treated subjects, however, it is unclear what clinically meaningful outcomes these events relate to as they were defined by laboratory measures and subjective signs and symptoms only.
- Subjects in the *on-demand* cohort (n=5) were randomized 1:1 to receive treatment with either investigator-recommended plasma-based therapy or Adzynma (ADAMTS13, recombinant-krhn) for treatment of an acute TTP event, defined by laboratory values (see Appendix 1, Definitions).
    * Of the five acute TTP events in the on-demand treatment cohort, only two events met actual protocol criteria for acute TTP events. Of these two events, one was treated with Adzynma (ADAMTS13, recombinant-krhn), and the other with fresh-frozen plasma; both treatments led to acute TTP event resolution. Given the small number of acute TTP events captured, it is unknown whether Adzynma (ADAMTS13, recombinant-krhn) is superior to plasma-based therapies for the treatment of acute TTP events.
- While Adzynma (ADAMTS13, recombinant-krhn) corrects the underlying cause of cTTP (low enzyme activity), it is unknown what levels of repleted ADAMTS13 evoke what type of efficacy response. Peaks and troughs necessary to be maintained, if at all, have not been established to elucidate treatment impact on long-term organ damage, symptom reduction etc.
- It is unknown currently whether Adzynma (ADAMTS13, recombinant-krhn) has an effect on quality of life related, clinically significant outcomes, such as reduction of

chronic daily symptoms, reduction of end-organ damage, reduction in recurrent acute exacerbations over a longer time period etc.

- Efficacy and safety are unknown in the population of individuals who are not currently on prophylactic therapy (previously untreated patients), or those without a history of an acute TTP event, based on pivotal study inclusion criteria.
- Differences in plasma-based products at baseline and changing frequencies of their administration throughout the study could have confounded the outcome of this trial as these products inherently have various levels of ADAMTS 13 and are not standardized among trial treatment centers.

Cablivi (caplacizumab-yhdp)

- Evidence of efficacy for Cablivi (caplacizumab-yhdp) comes from one phase 3 double-blind, multicenter, placebo-controlled, randomized controlled trial. Patients were randomized to receive caplacizumab plus standard of care (SOC) (n=72) or placebo plus SOC (n=73) in the front line setting for aTTP. Treatment was continued for 30 days after the discontinuation of PLEX.
    * The primary endpoint was time to platelet count response, defined as a platelet count ≥ 150×10^9/L with subsequent stopping of daily plasma exchange (PLEX) within 5 days. There was a statistically significant improvement in the time to platelet count response (2.69 vs 2.88 days with placebo); however, the difference is not clinically meaningful.
    * Key secondary endpoints consisted of a composite of aTTP-related events [aTTP-related death, recurrence of aTTP, or a treatment-emergent major thromboembolic (TE) event].
        - Fewer patients had an aTTP-related event (12 vs 49% placebo), driven predominantly by a reduction in aTTP recurrence (4 vs. 38% placebo).
        - Recurrence was defined as a decrease in the platelet count requiring re-initiation of PLEX. It is important to note, that a change in platelet count is a surrogate endpoint with unknown clinical relevance.
    * There was no statistically significant improvement in overall survival or the rate of TE events in the caplacizumab versus placebo-treated groups during trials.
    * Although caplacizumab demonstrated improvement in platelet counts and a reduction in aTTP recurrence rate during the trial and short 28-day follow-up period, an earlier phase 2 trial demonstrated similar short-term results in recurrence rate. However, over the course of one year, there was no difference in recurrence rate between the caplacizumab and placebo-treated groups.
    * Differences in the immunosuppressive regimens and the baseline population between the treatment arms has the potential to confound the results of the trial.
- The pivotal phase 3 caplacizumab trial only included a 28-day follow-up period after treatment was discontinued. An ongoing follow-up trial is underway.
- There is insufficient evidence to establish that the addition of caplacizumab to aTTP treatment regimens improves any clinically meaningful outcomes, such as overall survival or a reduction in thromboembolic events, compared to the current SOC.

Guidelines [5-8]

- The British Committee for Standards in Hematology updated their guidelines in 2012 and recommend the following for management of aTTP:
    * Initiation of daily PLEX, continued for a minimum of 2 days after complete remission. This is defined as a normal platelet count (>150×10^9/L). Increased frequency of PLEX can be considered in refractory disease.
    * Intravenous or oral steroids should be started immediately after PLEX is initiated.
    * Rituximab should be considered in refractory patients or those with severe disease, including disease with neurological or cardiac symptoms.
    * Additional immunosuppressives, such as vincristine and cyclosporine, are generally reserved for aTTP refractory to other lines of therapy mentioned above.
    * The guidelines have not been updated since the approval of caplacizumab.

- The 2023 British Society of Hematology (BSH) and the 2020 International Society on Thrombosis and Hemostasis (ISTH) recommend the following for management of cTTP:
    * For an acute TTP event, plasma infusion is recommended, given its greater reliability as a ADAMTS13 source (higher post treatment ADAMTS13 activity) compared to factor VIII products. Factor VIII products can be considered if plasma infusion is not an option.
    * For patients with cTTP who are in remission, prophylaxis with plasma infusion or a "watch and wait" strategy is recommended. The approach to prophylaxis is highly individualized, considering patient characteristics, preferences, and the overall clinical circumstances.
    * Factor VIII products are usually not recommended for most patients and are reserved for use when plasma infusion is not an option, given sparse, low quality efficacy evidence and their product specific, high variability in ADAMTS13 concentrations.
    * For patients with cTTP who are pregnant, prophylaxis treatment with plasma infusion over factor VIII products is recommended. There is no evidence from clinical trials to support the use of Adzynma (ADAMTS13, recombinant-krhn) in pregnancy.

Safety [9 10]

<u>Cablivi (caplacizumab-yhdp)</u>

- The overall safety profile appears to be moderate and manageable in the context of the disease; however, bleeding safety signals were noted during the caplacizumab trials. Bleeding events occurred in 58% of patients in the caplacizumab treated group, versus 43% of the placebo-treated group.

Adzynma (ADAMTS13, recombinant-krhn)

- The overall safety profile appears to be moderate and manageable, with the most common adverse events in > 5% of subjects treated with Adzynma (ADAMTS13, recombinant-krhn) being headache, diarrhea, migraine, abdominal pain, nausea and upper respiratory infections.
- There were no reported deaths in the clinical trial with either treatment, and no hypersensitivity events with Adzynma (ADAMTS13, recombinant-krhn) treatment.

Dosing[9]

Adzynma (ADAMTS13, recombinant-krhn)

Prophylactic Therapy:

- 40 IU/kg body weight IV once every other week
- May be adjusted to 40 IU/kg body weight IV once weekly based on prior prophylactic dosing regimen or clinical response.

Appendix 1: Definitions of cTTP-related events

Event Type	Definition
Acute TTP event	Drop in platelet count ≥50% of baseline or a platelet count <100 x 10^9/L AND an elevation of lactate dehydrogenase (LDH) more than 2 times baseline or more than 2 times upper limit normal (ULN)
Subacute event	Thrombocytopenia event or a microangiopathic hemolytic anemia event AND organ-specific signs and symptoms including but not limited to renal dysfunction events, neurological symptoms events, fever, fatigue/lethargy, and/or abdominal pain.
Thrombocytopenia event	Drop in platelet count ≥25% of baseline or a platelet count <150 x 10^9/L.
Microangiopathic hemolytic anemia (MAHA) event	Elevation of LDH more than 1.5 times baseline or more than 1.5 times the upper limit of normal (ULN).

Codes	Number	Description
HCPCS	J3590	Unclassified biologics [when specified as Adzynma (ADAMTS13, recombinant-krhn)]
	C9399	Unclassified drugs or biologicals [when specified as Adzynma (ADAMTS13, recombinant-krhn)]
HCPCS	C9047	Injection, caplacizumab-yhdp (Cablivi), 1mg.

Revision History

Revision Date	Revision Summary
6/20/2024	No criteria changes with this annual review.
3/21/2024	Added Adzynma (ADAMTS13, recombinant-krhn) to policy. Limits coverage to prophylaxis for patients with genetically confirmed cTTP, when prescribed by a specialist, and the patient is currently receiving plasma-based *prophylaxis* therapy, unless contraindicated, not tolerated or ineffective. Policy renamed Medications for Thrombotic Thrombocytopenic Purpura (TTP).
6/15/2023	No criteria changes with this annual update.
6/17/2022	No criteria changes with annual update, revision of description to simplify (no change of intent of policy).
7/19/2021	No criteria changes with this annual update.
7/22/2020	Added continuation of therapy (COT) criteria (no change to intent of policy).
7/24/2019	New policy. Effective 10/1/2019. The use of Cablivi (caplacizumab-yhdp) for aTTP is considered not medically necessary given the lack of clinically meaningful benefit versus the current standard of care alone, which is known to have a very high response rate.

Drug names identified in this policy are the trademarks of their respective owners.

Medication Policy Manual

Policy No: dru600

Topic: Polivy, polatuzumab vedotin-piiq

Date of Origin: November 15, 2019

Committee Approval Date: March 6, 2025

Next Review Date: 2026

Effective Date: May 1, 2025

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Polivy (polatuzumab vedotin-piiq) is an intravenously administered medication used in the treatment of diffuse large B-cell lymphoma (DLBCL).

Policy/Criteria

Most contracts require pre-authorization approval of Polivy (polatuzumab vedotin-piiq) prior to coverage.

I. Continuation of therapy (COT): Polivy (polatuzumab vedotin-piiq) may be considered medically necessary for COT when is clinical documentation (including, but not limited to chart notes) confirming that criteria A and B below are met.

A. One of the following (1, 2, or 3) is met:

1. For diagnoses NOT listed in the coverage criteria below, criteria a and b must be met:

a. The patient was established on therapy prior to current health plan membership AND there is documentation that the medication was covered by another health plan. Examples of documentation include the coverage approval letter from the previous health plan or paid claim.

AND

b. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

2. For diagnoses listed in the coverage criteria below, criteria a and b must be met:

a. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

b. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

3. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

AND

B. The requested number of doses (cycles) is within the policy limits below (Note: doses (cycles) already administered will be counted towards the coverable maximum quantity).

***Please note**: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Polivy (polatuzumab vedotin-piiq) may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) that criteria A through C below are met.

A. A diagnosis of **diffuse large B-cell lymphoma, not otherwise specified** (DLBCL NOS).

AND

B. Polivy (polatuzumab vedotin-piiq) is used in one of the following settings (1 or 2):

1. Previously untreated DLBCL NOS when all of the following are met:

a. The DLBCL NOS is Stage II with extensive mesenteric disease, Stage II with stage-modified International Prognostic Index (smIPI) >1, or stage III or IV.

AND

b. An International Prognostic Index (IPI) score of 2 or more.

AND

c. Polivy (polatuzumab vedotin-piiq) will be used in combination with rituximab, cyclophosphamide, doxorubicin, and prednisone as part of the Pola-R-CHP regimen. *(The R-CHP regimen includes rituximab, cyclophosphamide, doxorubicin, and prednisone)*

OR

2. For relapsed or refractory DLBCL NOS when all of the following are met:

a. The disease is refractory to, or has progressed on or after, at least two prior chemotherapy regimens for DLBCL.

AND

b. The patient is not eligible for a stem cell transplant (SCT).

AND

c. Polivy (polatuzumab vedotin-piiq) will be given in combination with Treanda (bendamustine) and rituximab.

AND

C. The patient has not had prior therapy with Polivy (polatuzumab vedotin-piiq).

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers Polivy (polatuzumab vedotin-piiq) coverable only under the medical benefit (as a provider-administered medication).

B. When pre-authorization is approved, Polivy (polatuzumab vedotin-piiq) will be authorized for up to six infusions (cycles). No additional doses beyond the six initial infusions (cycles) will be authorized.

IV. Polivy (polatuzumab vedotin-piiq) is considered investigational when used for high-grade B-cell lymphoma (HGBL) and for all other conditions.

Position Statement

Summary

- The intent of this policy is to allow for coverage of Polivy (polatuzumab vedotin-piiq) in diffuse large B-cell lymphoma (DLBCL) not otherwise specified (NOS) either in the front-line setting as part of the Pola-R-CHP regimen [Polivy (polatuzumab vedotin-piiq) plus rituximab, cyclophosphamide, doxorubicin, and prednisone] when patients have advanced-stage disease, or in the subsequent-line treatment setting when front-line treatment alternatives are not effective and stem cell transplant (SCT) is not an option, up to the dose shown to be safe and effective in trials.
- ***Treatment-naïve (front line) DLBCL NOS:*** Evidence is based on a fair quality randomized controlled trial (RCT) that compared Pola-R-CHP with R-CHOP [this regimen contains vincristine in place of the Polivy (polatuzumab vedotin-piiq)], the long-standing standard of care, in patients with advanced stage DLBCL NOS who had an International Prognostic Index (IPI) score of at least 2. Though progression-free survival (PFS) at two years was slightly higher in the Pola-R-CHP group, there was no difference in overall survival (OS). Investigators will continue to follow this data. A small cohort of patients with high grade B-cell lymphoma (HGBL) was included in this trial; however, it is unclear if potential benefit extends to this subpopulation based on current analyses.
- ***Relapsed or refractory DLBCL NOS:*** Evidence is based on a cohort of patients from a larger RCT (poor quality evidence) that compared the addition of Polivy (polatuzumab vedotin-piiq) to Treanda (bendamustine)/rituximab with Treanda (bendamustine)/ rituximab alone (control arm) in patients with refractory or relapsed DLBCL NOS who had a median of two prior therapies, and who were not candidates for a stem cell transplant. A higher number of complete responses (CR) was noted in the Polivy (polatuzumab vedotin-piiq) treatment arm at the end of therapy. This is not predictive of improvement in any clinical outcome (such as overall survival or quality of life) or durability of effect. Patients on Polivy (polatuzumab vedotin-piiq) experience a higher rate of side effects than those receiving Treanda (bendamustine) and rituximab alone.
- The NCCN B-cell lymphomas guideline lists Polivy (polatuzumab vedotin-piiq) among several possible options for patients with relapsed or refractory DLBCL who are not candidates for stem cell transplant. For patients with treatment-naïve disease, it lists both chemoimmunotherapy (R-CHOP) and Polivy (polatuzumab vedotin-piiq) plus chemoimmunotherapy (pola-R-CHP) as similar potential front-line options in patients with Stage III or IV DLBCL NOS who have an IPI $\geq$ 2.
- To date Polivy (polatuzumab vedotin-piiq) has primarily been evaluated in populations with a diagnosis of DLBCL NOS. Because DLBCL is a heterogeneous disease made up of different subtypes based on morphology, genetics, and biological behavior, additional studies in the other DLBCL subtypes are necessary before it can be established that Polivy (polatuzumab vedotin-piiq) is safe and effective in a broader DLBCL population.
- Polivy (polatuzumab vedotin-piiq) is administered intravenously in a dose of 1.8 mg/kg every three weeks for a total of 6 doses. A higher dose or a longer duration of therapy has not been shown to improve efficacy and may increase the risk of AEs.

Regence Pharmacy Services performs independent analyses of oncology medication evidence, to establish coverability per the contracts with the health plan.

- Most contracts define coverability based on established clinical benefit in published, peer-reviewed literature, along with consideration of regulatory status.
- FDA approval does not in itself establish medical necessity, as unpublished, low-quality evidence, including exploratory analyses and unvalidated surrogate endpoints, may be used as the basis of approval. Regulatory approval may or may not reflect clinical benefit relative to standard of care and the recommendations of expert clinical advisors such as the Oncologic Drugs Advisory Committee (ODAC). FDA approvals generally do not consider cost compared to established therapies, or value to members.
- Likewise, NCCN clinical practice guidelines assignment of a recommendation (category 1, 2a, or 2b) does not necessarily establish medically necessity. NCCN recommendations are inconsistently supported by published, peer-reviewed literature and do not uniformly consider value of new therapies relative to existing potentially higher-value treatment options, considering effectiveness, safety, and cost.
- Medication coverage criteria are developed based on the 'medical necessity' assessment, as described above.

Regence Pharmacy Services analysis and coverage policy may differ from FDA labeled indication and/or NCCN clinical practice guidelines.

Clinical Efficacy

Relapsed/refractory DLBCL (subsequent therapy)

- The efficacy of Polivy (polatuzumab vedotin-piiq) is based on a small cohort of patients from a larger, open-label study. Approval was via the FDA Accelerated pathway meaning a clinical benefit has not been established. The overall quality of the evidence is poor. [1-3]
    - The cohort (N = 80) included patients with relapsed or refractory DLBCL, not otherwise specified (NOS).
        - Patients received a median of two prior systemic therapies for their disease [approximately one-quarter (12 patients) had one prior therapy, one-quarter had two prior therapies, and one-half had three or more prior therapies].
        - Nearly all (98%) had prior therapy with an anti-CD20 agent.
        - Enrolled subjects were not candidates for an autologous stem cell transplant.
    - The study compared complete response rates (CR) achieved at the end of therapy (after six cycles) in patients who received Polivy (polatuzumab vedotin-piiq) plus Treanda (bendamustine)/rituximab [BR] with patients who received BR alone (control arm).
    - The complete response rate, an unvalidated radiographic endpoint, was 40% and 18% in the Polivy (polatuzumab vedotin-piiq) and control arms, respectively.

    * It is possible that the efficacy of Polivy (polatuzumab vedotin-piiq) is overstated. Exposure to Treanda (bendamustine) and rituximab was lower in the BR alone arm than in the Polivy (polatuzumab vedotin-piiq)/BR arm. Additionally, the response rates in the control arm (BR) of this study are approximately half of what has been reported in prior studies for BR in a similar population.

- *Guidelines*: The NCCN B-cell lymphoma guideline lists Polivy (polatuzumab vedotin-piiq) in combination with rituximab and bendamustine among treatment options for DLBCL that is refractory to, or relapsed after, prior therapy when patients are not eligible for a stem cell transplant. [4]

Front-line DLBCL (treatment-naïve)

- Polivy (polatuzumab vedotin-piiq) has subsequently been studied (POLARIX Study) in the front-line DLBCL treatment setting as an add-on to chemoimmunotherapy. [5]
    * Patients in the trial had CD20-positive, stage III or IV (89%) DLBCL NOS with an International Prognostic Index (IPI) score between 2 and 5 (two-thirds of participants had a score of 3 to 5 indicating intermediate-high- to high-risk disease). Patients with known CNS disease were excluded from the study.
    * The study compared Polivy (polatuzumab vedotin-piiq) plus rituximab, cyclophosphamide, doxorubicin, and prednisone (pola-R-CHP) with rituximab, cyclophosphamide, doxorubicin, vincristine, and prednisone (R-CHOP). Therapy was given for up to six cycles (21-day cycles) in each treatment arm. Rituximab monotherapy was then continued for 2 additional cycles in each group.
    * Progression-free survival (PFS) at 2 years was 76.7% and 70.2% in the pola-R-CHP and R-CHOP treatment arms, respectively. There was no difference in overall survival (OS) at 2 years.
    * OS is the clinical endpoint of interest because PFS does not accurately predict clinical benefit.
    * The study included a subpopulation of patients with high-grade B-cell lymphoma (HGBL). However, because of the small size of this population, it is not known if potential benefits extend to this subgroup.
- *Guidelines*: The NCCN B-cell lymphoma guideline lists both Polivy (polatuzumab vedotin-piiq) plus R-CHP and R-CHOP as similar front-line treatment options for Stage III or IV (or Stage II with extensive mesenteric disease) DLBCL NOS in patients with an IPI $\geq$ 2. The guideline also notes that patients with Stage II disease with stage-modified International Prognostic Index (smIPI) >1 should be treated via the same pathway as patients with Stage III or IV disease. [4]
- There are no published studies that evaluate the efficacy of Polivy (polatuzumab vedotin-piiq) as a single agent.

Polivy (polatuzumab vedotin) as 'Bridging Therapy' for CAR T Therapy

- There are no well-conducted studies that directly compare Polivy (polatuzumab vedotin)-based regimens with chemotherapy-based regimens as a bridge to CAR T therapy for DLBCL. The available evidence is limited to a case series and one small, low-quality trial (n=42). Therefore, the relative efficacy of Polivy (polatuzumab vedotin)-based regimens versus chemotherapy-based regimens is not known. [6,7]

- There is no direct evidence demonstrating that Polivy (polatuzumab vedotin) is safer or better tolerated than chemotherapy-based bridging regimens. Polivy (polatuzumab vedotin) is. currently only indicated in combination with other chemotherapy (either BR or R-CHOP). Indirect comparisons across different studies may be confounded by differences in drug exposure and growth factor support.

Investigational Uses

- There is insufficient clinical trial evidence evaluating the safety or efficacy of Polivy (polatuzumab vedotin-piiq) outside of the DLBCL NOS treatment setting.t
- The use of Polivy (polatuzumab vedotin-piiq) in combination with anti-CD20 monoclonal antibodies other than rituximab is considered investigational. In the pivotal study, a small cohort of patients (N = 27) received Polivy (polatuzumab vedotin-piiq) plus Gazyva (obinutuzumab)/bendamustine in parallel to the Polivy (polatuzumab vedotin-piiq) plus BR and BR alone study arms; however, this data is of low quality and was not considered in the approval of Polivy (polatuzumab vedotin-piiq). [8] Furthermore, there is no evidence to establish the safety or efficacy of Gazyva (obinutuzumab) as a single agent in DLBCL.
- An early-phase, dose-expansion study evaluated the combination of Polivy (polatuzumab vedotin) in combination with Lunsumio (mosunetuzumab) in patients with relapsed or refractory large B-cell lymphoma (LBCL). The evidence is of low quality as it evaluated tumor response as a surrogate marker and did not employ any comparator arm. [9]
- The safety and efficacy of Polivy (polatuzumab vedotin-piiq) have not been established when:
    * Used as a monotherapy.
    * Used in doses higher than 1.8 mg/kg every 3 weeks for 6 infusions (total of 6 doses)

Safety [1]

- When Polivy (polatuzumab vedotin-piiq) is combined with Treanda (bendamustine) and rituximab:
    * The most commonly reported AEs are cytopenias and peripheral neuropathy.
    * The incidence of grade 3 or greater adverse effects (AEs) increases by approximately 10% over the use of Treanda (bendamustine) and rituximab alone [84% versus 74%, respectively].
- Based on current experience it appears that the safety and tolerability of Pola-R-CHP and R-CHOP regimens for DLBCL are similar. Cytopenia and nervous system AEs, including peripheral neuropathy, were numerically similar between the two regimens. R-CHOP may have a slight advantage over Pola-R-CHP with regard to gastrointestinal AEs.
- Strong CYP3A4 inhibitors may increase exposure to unconjugated monomethyl auristatin E (MMAE) [the anti-mitotic chemotherapeutic agent part of the polatuzumab vedotin-piiq molecule].

Dosing and Administration [1]

- Polivy (polatuzumab vedotin-piiq) is administered:
  - * As an intravenous infusion over 90 minutes. Premedication with an antihistamine and antipyretic is recommended. If tolerated, the rate of infusion can be decreased to 30 minutes on subsequent infusions.
  - * In a dose of 1.8 mg/kg every 3 weeks for six cycles total.
  - * In combination with Treanda (bendamustine) and rituximab
- There are recommendations to modify the dose of Polivy (polatuzumab vedotin-piiq) for peripheral neuropathy, infusion-related reactions, and cytopenias.

Appendix A: Subtypes of Diffuse Large B-cell Lymphoma (DLBCL) [4]
DLBCL, not otherwise specified (NOS)*
Follicular lymphoma (grade 3 only)
DLBCL coexistent with a low-grade lymphoma of any kind
Intravascular large B-cell lymphoma
DLBCL-associated with chronic inflammation
Anaplastic lymphoma kinase (ALK)-positive DLBCL
Epstein-Barr virus (EBV)-positive DLBCL in older patients
T-cell/histiocyte-rich large B-cell lymphoma

* This is the only subtype of DLBCL for which Polivy (polatuzumab vedotin-piiq) is covered

Revision History

Revision Date	Revision Summary
3/6/2025	Extended coverage in front-line diffuse large B-cell lymphoma not otherwise specified (DLBCL NOS) to patients with Stage II with stage-modified International Prognostic Index (smIPI) >1.
3/21/2024	No criteria changes with this annual review.
9/14/2023	• Coverage criteria was added for Polivy (polatuzumab vedotin-piiq) in extensive stage II, or stage III or IV diffuse large B-cell lymphoma not otherwise specified (DLBCL NOS). • High-grade B-cell lymphoma (HGBL) was specifically listed as investigational.
3/16/2023	Added the use of Polivy (polatuzumab vedotin-piiq) in the front-line DLBCL setting in combination with chemoimmunotherapy as not medically necessary.
3/18/2022	• Made criterion IV (Investigational Uses) more general by removing specific conditions that might be considered investigational. • Combined allowed quantity and maximum number of infusions into one criterion (combined III.B and III.C). • Updated position statement to reflect guideline changes, etc.
4/21/2021	Updated COT. Clarification of criteria wording (no change to intent of coverage criteria with this annual update).
6/15/2020	Removed references to brand Rituxan from policy to account for upcoming changes in biosimilars policy (dru620).
4/22/2020	Added continuation of therapy (COT) criteria (no change to intent of coverage criteria).
10/23/2019	New policy (effective 11/15/2019). Limits coverage to patients with relapsed or refractory DLBCL NOS, the setting in which it was studied and has a labeled indication.

Drug names identified in this policy are the trademarks of their respective owners.

Medication Policy Manual | **Policy No:** dru605

Topic: Spravato, esketamine | **Date of Origin:** August 15, 2019

Committee Approval Date: December 7, 2023 | **Next Review Date:** 2024

Effective Date: March 1, 2024

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Spravato (esketamine) is a nasal medication used for the management of treatment-resistant depression (TRD) or depressive symptoms in adults with major depressive disorder (MDD) with acute suicidal ideation or behavior. It is used in combination with an oral antidepressant. Spravato (esketamine) is administered under the supervision of a healthcare provider.

Policy/Criteria

Most contracts require pre-authorization approval of Spravato (esketamine) prior to coverage.

I. Continuation of therapy (COT): Spravato (esketamine) may be considered medically necessary for COT when criterion A, B, or C below is met.

A. For diagnoses NOT listed in the coverage criteria below, full policy criteria must be met for coverage.

OR

B. For diagnoses listed in the coverage criteria below, criteria 1, 2 and 3 below must be met:

1. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

2. Attestation of evaluation by, or in consultation with, a board-certified psychiatric-mental health (PMH) prescriber [psychiatrist or PMH nurse practitioner (PMHNP)], and agreement with the use of Spravato (esketamine).

PLEASE NOTE: Attestation of previous PMH evaluation, at the initiation of Spravato (esketamine), may be used to establish medical necessity of this criterion.

AND

3. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

C. Spravato (esketamine) was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission, AND attestation of an evaluation by, or in consultation with, a board-certified psychiatric-mental health (PMH) prescriber [psychiatrist or PMH nurse practitioner (PMHNP)] and agreement with the use of Spravato (esketamine).

***Please note**: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Spravato (esketamine) may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) that criteria A, B, and C below are met:

A. Mental health provider assessment - One of the following is met (criteria 1 or 2):

1. The prescriber is a psychiatrist.

OR

2. The prescriber is not a psychiatrist, and both of the following are met (criteria a and b):

a. The patient is managed by, or in consultation with, a board-certified psychiatric-mental health (PMH) provider [psychiatrist or nurse practitioner (PMHNP)].

AND

b. The board-certified PMH provider completes both of the following (criteria i and ii):

i. Establishes the coverable diagnosis [attestation].

AND

ii. Has evaluated the suitability of the patient for the use of and agrees with the treatment plan for Spravato (esketamine) [attestation].

AND

B. Diagnostic criteria - One of the following (criteria 1 or 2) are met, as outlined in clinical documentation (in chart notes):

1. Depressive symptoms in patients with a diagnosis of **major depressive disorder** (MDD) **with acute suicidal ideation or behavior**.

OR

2. A diagnosis of **treatment resistant major depressive disorder** (MDD), when all the following are met (criteria a and b):

a. Documentation that at least three different antidepressants from two classes were ineffective or not tolerated (see *Appendix 1*).

AND

b. Documentation of non-pharmacologic treatments (including but not limited to cognitive behavioral therapy (see *Appendix 2*).

AND

C. Use in combination with an antidepressant: Spravato (esketamine) will be used in combination with an oral antidepressant.

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers Spravato (esketamine) coverable only under the medical benefit (as a provider-administered medication).

B. **Quantity Limits** - When pre-authorization is approved, Spravato (esketamine) will be authorized in quantities as follows:

1. **Initial authorization (Induction Phase)**: Up to 12 dose kits (56 mg or 84 mg per dose kit) in 8 weeks.

2. Continued authorization (Maintenance Phase): Up to 48 dose kits (56 mg or 84 mg per dose kit) in 48 weeks.

C. Authorization shall be reviewed as follows to confirm that medical necessity criteria are met, and that the medication is effective (criteria 1 and 2 below).

1. Authorization shall be reviewed as follows:

a. Initial authorization: Authorization shall be reviewed after 8 weeks.

b. Continued authorization (after the initial 8-week induction period): Authorization shall be reviewed at least every 48 weeks.

2. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, including all of the following (a through d):

a. Spravato (esketamine) continues to be used in conjunction with an oral antidepressant.

b. The patient has been re-evaluated and Spravato (esketamine) is providing clinical benefit evidenced by documented improvement or sustained improvement of depression symptoms.

PLEASE NOTE: Patient-specific symptoms must be provided, both current depression symptoms. Use of a depression symptom score (such as PHQ-9 or MADRS) may be used in the efficacy assessment.

c. Documentation that the current dose and frequency of Spravato (esketamine) is within the Quantity Limits (as stated above).

d. Use of doses of Spravato (esketamine) in excess of those listed above in the Quantity Limits are not coverable.

IV. Spravato (esketamine) is considered investigational when used for all other conditions, including but not limited to:

A. Depression other than listed in the coverage criteria above.

B. As an anesthetic agent.

Position Statement

Summary

- Spravato (esketamine) nasal spray is a non-competitive N-methyl-D-aspartate receptor antagonist that is used in combination with an oral antidepressant for the treatment of treatment-resistant depression (TRD), as well as depressive symptoms in patients with major depressive disorder (MDD) with acute suicidal ideation or behavior. [1]
- The intent of the policy is to cover Spravato (esketamine) for the treatment of TRD, as well as for depressive symptoms in patients with MDD with acute suicidal ideation (SI) or behavior, the indications where it has been studied and shown to be safe and effective, as detailed in coverage criteria.
- The efficacy of Spravato (esketamine) plus an oral antidepressant was evaluated as follows:

    * TRD: In three phase 3, randomized, controlled acute efficacy trials, as well as one maintenance trial. Patients had moderate to severe MDD and failed therapy with at least two other oral antidepressants. Once enrolled in the trial, patients received treatment with esketamine plus a newly assigned oral antidepressant or an oral antidepressant alone. [2]
- Depressive symptoms with MDD and SI: In two Phase 3, 4-week randomized, double-blind, placebo-controlled studies in adults with moderate-to-severe MDD (MADRS total score >28) who had active SI and intent. [2] In clinical trials, Spravato (esketamine) has only been studied as an adjunct therapy to oral antidepressants. The use of Spravato (esketamine) as a monotherapy is not coverable. [1]
- Guidelines recommend psychotherapy in combination with an oral antidepressant for the initial treatment for MDD. If there is no adequate response after optimizing the antidepressant dose for an adequate duration of time, switching to another antidepressant (from the same or different class), or combination with another antidepressant (from a different class) or non-antidepressant medication (lithium, thyroid hormone, a second-generation antipsychotic, or a stimulant) are recommended treatment options (see *Appendix 1*). [3]
- Spravato (esketamine) is dosed at 56 mg or 84 mg twice per week during the induction phase (weeks 1 to 4). Evidence of therapeutic benefit is evaluated at the end of the induction phase (at week 4) to determine the need for continued treatment. During the maintenance phase (beyond week 4), treatment is administered once weekly or every two weeks. [1]
- Because of the risk for sedation and dissociation after administration, Spravato (esketamine) must be administered under direct supervision of a healthcare provider, including a post-administration 2-hour observation period. [1,5] In addition, because the medication is for administration only by a REMS-certified provider, Spravato (esketamine) is not considered a self-administered medication. Therefore Spravato (esketamine) is coverable only under the medical benefit.
- The safety and effectiveness of Spravato (esketamine) in conditions other than TRD and depressive symptoms in patients with MDD with acute SI or behavior have not been established.

Clinical Efficacy

- The efficacy of Spravato (esketamine) for TRD was evaluated in three phase 3, randomized, controlled trials in patients with MDD. [4-6]
    * Patients were required to have a MADRS total score ≥28.
    * Patients failed therapy with at least two other antidepressants.
    * In the trial, patients had used an average of two prior antidepressants.
    * The trials compared treatment with Spravato (esketamine) plus a newly assigned oral antidepressant (duloxetine, escitalopram, sertraline, or venlafaxine) to an oral antidepressant alone for four weeks.
    * The primary endpoint in all three trials was the change from baseline in the MADRS total score.

    * Of the three trials, one trial demonstrated a significant difference between treatment with Spravato (esketamine) plus an oral antidepressant compared to the oral antidepressant alone.
- A long-term randomized, double-blind, maintenance study was also conducted in patients with TRD and determined that the time to relapse was delayed in patients treated with Spravato (esketamine) plus an oral antidepressant compared to an oral antidepressant alone. [1]
- The efficacy of Spravato (esketamine) for depressive symptoms with moderate-to-severe MDD and active SI was evaluated in two phase 3, 4-week randomized, double-blind, placebo-controlled studies. [7,8]
    * Patients were required to have a MADRS total score ≥28 and active suicidal ideation and intent.
    * All patients received comprehensive standard of care treatment, including an initial inpatient psychiatric hospitalization and a newly initiated or optimized oral antidepressant. Patients were on antidepressant monotherapy or antidepressant plus augmentation therapy (see *Appendix 1*).
    * Spravato (esketamine) plus standard of care demonstrated statistical superiority on the primary efficacy measure of the change from baseline in the MADRS total score at 24 hours after first dose (Day 2) compared to placebo nasal spray plus standard of care.
- In clinical trials, Spravato (esketamine) has only been studied as an adjunct therapy to oral antidepressants. The use of Spravato (esketamine) as a monotherapy is not coverable. [1]
- There is insufficient evidence to establish the safety or efficacy of dose escalation of Spravato (esketamine) beyond the doses in the FDA approved labeling (up to a maximum dose of 84 mg weekly). In addition, given the short half-life of Spravato (esketamine), the use of a repeat loading (full or partial) is not recommended for dose escalation. No published evidence was identified for higher doses or use of reloading. Therefore, the use of higher doses and/or a repeat loading dose is not coverable.
- There are various available antidepressant options, with several different mechanisms of action for treatment of MDD. There is no conclusive evidence that one antidepressant (within a class or between classes) is superior to other antidepressants, including use of augmentation medications (see *Appendix 1*) or Spravato (esketamine). However, Spravato (esketamine) is significantly more costly than other antidepressants, including many generics. Therefore, Spravato (esketamine) for TRD is coverable only when at least three antidepressant options, from at least two therapeutic classes, are ineffective or not a treatment option, when given as scheduled adequate therapeutic antidepressant doses. Of note: Some antidepressants (and augmentation therapies) may be used at much lower doses for sleep, management of pain, and other conditions. Therefore, the step therapy with lower-cost antidepressant treatment alternatives is met only when there is documented use of symptoms refractory to therapeutic antidepressant doses.
- MDD guidelines have not been updated for more than a decade. The 2010 American Psychiatric Association (APA) Guidelines recommend a stepwise approach to treatment of MDD with the following: [3]

    * For initial treatment for MDD, use of psychotherapy in combination with an oral antidepressant.
    * If inadequate response after optimizing the antidepressant dose for an adequate duration of time, switch to another antidepressant, from the same or different class.
    * Alternatively, use of the initial antidepressant in combination with another antidepressant (from a different class) or non-antidepressant medication (lithium, thyroid hormone, a second-generation antipsychotic, or a stimulant) are recommended treatment options (See *Appendix 1*).
    * Neither ketamine nor Spravato (esketamine) are included in the most recent guidelines (2010).

Investigational Uses

- The safety and effectiveness of Spravato (esketamine) in conditions other than those listed above (TRD or depressive symptoms with MDD with SI as detailed in the coverage criteria) have not been established.

Safety [1]

- The most common adverse reactions associated with Spravato (esketamine) are dissociation, dizziness, nausea, sedation, vertigo, hypoesthesia, anxiety, lethargy, increased blood pressure, vomiting, and feeling drunk.
- Because of the possibility of delayed or prolonged sedation and dissociation, Spravato (esketamine) must be administered under the direct supervision of a healthcare provider, including the administration period and the post-administration 2-hour observation period with each treatment session.
- Patients are not to engage in potentially hazardous activities, such as driving a motor vehicle or operating machinery, until the next day after a restful sleep.
- Spravato (esketamine) is only available through a restricted program under a REMS due to the serious adverse outcomes from sedation, dissociation, and abuse and misuse. [5] REMS certified pharmacies and distributors include, but are not limited to, facility (such as hospital) or specialty pharmacies such as home infusion pharmacies. Once REMS certified, providers should call 1-855-382-6022 to access information on how to obtain Spravato for their patient(s). [10]
    * A REMS-certified pharmacy will dispense (in person or ship) Spravato (esketamine) for a patient directly to the administering provider's office for storage and administration.
    * All REMS-certified providers must have a facility DEA number and the ability to "Maintain records on all shipments of SPRAVATO received and dispensing information including the patient name, dose, number of devices and date administered."

Appendix 1: An antidepressant (or treatment regimen) would include any of the following classes or combination of classes, given as scheduled adequate therapeutic antidepressant doses [3,9]				
TCAs [a]	SSRIs	SNRIs	Serotonin Modulators	Augmentation Medications
amitriptyline [b] desipramine doxepin imipramine nortriptyline protriptyline trimipramine	citalopram escitalopram fluoxetine fluvoxamine paroxetine sertraline vilazodone	desvenlafaxine duloxetine levomilnacipran milnacipran venlafaxine	nefazodone trazodone [b] vortioxetine	- lithium - liothyronine (Cytomel) - Atypical antipsychotics: aripiprazole, brexpiprazole, quetiapine, [b] olanzapine, risperidone - AEDs: carbamazepine, valproic acid, lamotrigine - Stimulants: methylphenidate, modafinil
		NE-Serotonin	MAOIs	
		mirtazapine	isocarboxazid phenelzine selegiline tranylcypromine	
		DNRI		
		bupropion [b]		

[a] Less frequently used, due to adverse event profile: clomipramine, maprotiline
[b] Antidepressant usual doses (mg/day): bupropion 300-450; trazodone 150-600; quetiapine 300. Lower doses are used for non-MDD indications, such as sleep.

Key: DNRI=dopamine norepinephrine reuptake inhibitor; MAOI=monoamine oxidase inhibitor; NE=norepinephrine; SNRI=serotonin norepinephrine reuptake inhibitor; SSRI=selective serotonin reuptake inhibitor; TCA=tricyclic antidepressant

NOTE: Documentation of duration of treatment and outcome of therapy to scheduled use of an adequate therapeutic dose for depression must be met.

Appendix 2: Psychotherapy methods to treat major depressive disorder may include, but are not limited to the following:
• Cognitive behavioral therapy (CBT) • Interpersonal therapy (IPT) • Psychodynamic therapy • Problem-solving therapy (in individual and group formats)

Revision History

Revision Date	Revision Summary
12/7/2023	• No criteria changes with this annual review.
12/9/2022	• Updated COT criteria to include PMH provider requirement. • Expanded prescriber requirement criterion to include PMHNP and reworded PMH provider assessment. • For operational consistency: Simplified antidepressant step therapy criterion, Updated Appendix 1 alternatives to align with guidelines. • Reworded reauthorization review criteria.
04/21/2021	Updated COT language wording (no change to intent). No other criteria changes with this annual update.
10/28/2020	Added coverage criteria for major depressive disorder (MDD) with acute suicidal ideation or behavior, a newly approved FDA indication. Clarified intent of other coverage criteria for MDD.
01/22/2020	Added continuation of therapy (COT) criteria (no change to intent of coverage criteria).
07/24/2019	New policy (effective 8/15/2019). Limits coverage to patients with treatment-resistant depression, the setting in which it was studied and has a labeled indication.

Drug names identified in this policy are the trademarks of their respective owners.

Medication Policy Manual | **Policy No:** dru606

Topic: Vyondys 53, golodirsen | **Date of Origin:** August 15, 2019

Committee Approval Date: June 20, 2024 | **Next Review Date:** 2024

Effective Date: October 1, 2024

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Vyondys 53 (golodirsen) is an intravenous medication that may be used for Duchenne muscular dystrophy (DMD) when patients have a specific gene mutation. A clinical benefit, such as improved ambulation, of Vyondys 53 (golodirsen) has not been established.

Policy/Criteria

Most contracts require pre-authorization approval of Vyondys 53 (golodirsen) prior to coverage.

I. Continuation of therapy (COT): Vyondys 53 (golodirsen) is considered investigational for all conditions, per the full policy criteria below.

***Please note**: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Vyondys 53 (golodirsen) is considered investigational for all conditions, including Duchenne muscular dystrophy (DMD) that is amenable to exon 53 skipping (Table 1). However, if found to be medically necessary, criteria A must also be met:

A. Site of care administration requirements are met [refer to Pharmacy Services Medication Policy Manual, Site of Care Review, dru408].

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers Vyondys 53 (golodirsen) coverable under the medical benefit (as a provider administered medication).

B. Although the use of Vyondys 53 (golodirsen) is considered investigational for all conditions, including DMD that is amenable to exon 53 skipping, if pre-authorization is approved, Vyondys 53 (golodirsen) will be authorized in doses up to 30 mg/kg every week (52 infusions per year).

C. Authorization shall be reviewed at least every twelve months for documented benefit. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met. Specifically, documentation that the medication is providing clinical benefit, including disease stability or improvement, and lack of disease progression.

Position Statement

Summary

- Vyondys 53 (golodirsen) is an intravenous therapy FDA approved for the treatment of Duchenne muscular dystrophy (DMD) when there is a confirmed mutation of the DMD gene that is amenable to exon 53 skipping. It was approved through the FDA Accelerated Approval Program based on an increase in dystrophin in skeletal muscles observed in some patients during a phase I/II trial. However, A clinical benefit of the drug, including improved motor function, improved strength, lack of disease progression (such as maintained ability to ambulate), and/or improved quality of life has not been established at this time. The FDA label states, "Continued approval for this indication may be contingent upon verification of a clinical benefit in confirmatory trials."

- A clinical benefit (e.g. prolongation of independent ambulation, improved quality of life, or prevention of disease progression and disability) of Vyondys 53 (golodirsen) has not been established.
    * In one ongoing, open-label trial in a total of 25 patients, Vyondys 53 (golodirsen) was shown to increase dystrophin levels. However, it has not been proven that an increase in dystrophin will translate to improved clinical outcomes, such as improved motor function.
- The U.S. Centers for Disease Control and Prevention (CDC) has developed general management guidelines for DMD. The CDC recommends corticosteroids and supportive care to slow disease progression. These guidelines were published prior to the submission of Vyondys 53 (golodirsen) to the FDA, thus the use of Vyondys 53 (golodirsen) for DMD has not yet been addressed. [1-3]

Clinical Efficacy [4]

- Evidence regarding the effect of Vyondys 53 (golodirsen) on dystrophin levels is inconclusive. Data is limited to a small, unpublished, ongoing phase I/II trial; a placebo-controlled, two-part, dose escalation trial. Additional, larger, well-controlled trials are needed to establish the safety and efficacy of Vyondys 53 (golodirsen) in Duchenne muscular dystrophy (DMD).
- In the phase I/II trial, 12 patients were initially randomized to receive either placebo or Vyondys 53 (golodirsen) for 12 weeks. After 12 weeks, all existing patients and 13 newly recruited patients, received open-label Vyondys 53 (golodirsen) at a dose of 30mg/kg intravenously once weekly. Compared to baseline, the mean dystrophin levels increased by 0.918% of normal for the golodirsen-treated patients at 48 weeks.
    * Dystrophin production is a surrogate biomarker of disease improvement with an unknown correlation to health outcomes.
    * An absolute increase in dystrophin levels has not been correlated to improved ambulation or muscle function and a minimal clinically important difference in dystrophin levels has not yet been established. Experts have proposed that dystrophin levels greater than 10% of normal may be clinically meaningful; however, validation is needed.
    * The trial is ongoing (as of the date of FDA approval) to assess change in motor function. If the trial does not show an improvement in motor function, the FDA approval could be withdrawn.
- Although change in distance walked on a 6-minute walk test (6MWT) is a primary endpoint in the ongoing phase I/II golodirsen trial, the lack of a control group limits the clinical interpretation of the response. At week 144, the mean decrease in 6MWT was 99.0 m.[5]
- Vyondys 53 (golodirsen) has not yet been shown to improve any clinical outcomes such as quality of life, prolongation of independent ambulation, or prevention of disease progression and disability.

Safety

- The safety data is limited to very few patients included in the clinical trials. However, there was renal toxicity was observed in animals who received Vyondys 53 (golodirsen). The FDA label states, "Although renal toxicity was not observed in the clinical studies with VYONDYS 53, renal toxicity, including potentially fatal glomerulonephritis, has been observed after administration of some antisense oligonucleotides."[6]

Revision History

Revision Date	Revision Summary
6/20/2024	Added Vyondys 53 to site of care (SOC) program (effective 10/1/2024).
12/7/2023	• Added quantity limit and reauthorization criteria (no change to intent) • Updated cross references.
12/9/2022	No criteria changes with this annual update.
1/20/2021	No criteria changes with this annual update.
1/22/2020	No criteria changes with this annual update.
12/13/2019	• Policy updated with brand name, based on FDA approval (on 12/12/19). • Added continuation of therapy (COT) criteria (no change to intent of coverage criteria).
7/24/2019	New policy. Effective 8/15/2019. Use of Vyondys 53 (golodirsen) is considered investigational in the treatment of all conditions, including Duchenne muscular dystrophy (DMD) that is amenable to exon 53 skipping. The available clinical trial data was insufficient to demonstrate safety or efficacy of Vyondys 53 (golodirsen) in the treatment of DMD.

Medication Policy Manual **Policy No:** dru612

Topic: Anabolic Bone Medications **Date of Origin:** January 1, 2020

- Evenity, romosozumab
- Teriparatide (generic, Forteo)
- Tymlos, abaloparatide

Committee Approval Date: September 19, 2024 **Next Review Date:** 2025

Effective Date: December 1, 2024

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Medications included in this policy help with bone formation and are used to treat osteoporosis. Osteoporosis is when the bone becomes brittle and may lead to fractures.

Policy/Criteria

Most contracts require pre-authorization approval of anabolic bone medications prior to coverage.

I. Continuation of therapy (COT): Anabolic bone medications may be considered medically necessary for COT when criterion A, B, and C below are met.

A. One of the following (1, 2, or 3):

1. For diagnoses NOT listed in the coverage criteria below, full policy criteria must be met for coverage.

OR

2. For diagnoses listed in the coverage criteria below, criteria a and b must be met:

a. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

b. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

3. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

AND

B. For provider-administered medications: Site of care administration requirements are met [refer to Pharmacy Services Medication Policy Manual, Site of Care Review, dru408].

AND

C. When pre-authorization is approved, under COT, anabolic bone medications will be authorized using the dosing schedule for the cumulative lifetime approval duration found in *Table 1* below.

***Please note**: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Anabolic bone medications may be considered medically necessary when there is clinical documentation (including, but not limited to, chart notes) that criteria A through C below are met.

A. For provider-administered medications: Site of care administration requirements are met [refer to Pharmacy Services Medication Policy Manual, Site of Care Review, dru408].

AND

B. One of the following diagnostic criteria 1 through 4 below is met.

1. **For Evenity (romosozumab):** Diagnosis of **osteoporosis** with high risk of fracture as defined by meeting criteria a and b below:

a. Documented as postmenopausal.

AND

b. One of the following risks is present (criterion i or ii):

i. A bone mineral density that is 2.5 or more standard deviations below that of a "young normal" adult (T score at or below -2.5).

OR

ii. Current or history of at least one fragility fracture.

OR

2. **For Tymlos (abaloparatide):** Diagnosis of **osteoporosis** with high risk of fracture as defined by meeting criterion a or b below:

a. A bone mineral density that is 2.5 or more standard deviations below that of a "young normal" adult (T score at or below -2.5).

OR

b. Current or history of at least one fragility fracture.

OR

3. **For brand Forteo (teriparatide) and teriparatide (620mcg/2.48ml)**: Diagnosis of **osteoporosis or osteopenia** and both criteria a and b below are met:

a. Both generic teriparatide (**600mcg/2.4ml**) injection and Tymlos (abaloparatide) have been ineffective, contraindicated, or not tolerated.

AND

b. The patient is high risk for fracture as defined by meeting one of the following criterion (i, ii, or iii):

i. A bone mineral density that is 2.5 or more standard deviations below that of a "young normal" adult (T score at or below -2.5).

OR

ii. Current or history of fragility fracture.

OR

iii. Diagnosis of osteopenia (T-score between -1 and -2.5) and a history of glucocorticoid use for at least three months at a dose of 5 mg per day or higher of prednisone (or equivalent).

OR

4. **For generic teriparatide (600mcg/2.4ml)**: Diagnosis of **osteoporosis or osteopenia and** with high risk for fracture as defined by meeting criterion a, b, or c below:

   a. A bone mineral density that is 2.5 or more standard deviations below that of a "young normal" adult (T score at or below -2.5).

   OR

   b. Current or history of at least one fragility fracture.

   OR

   c. Diagnosis of osteopenia (T-score between -1 and -2.5) and a history of glucocorticoid use for at least three months at a dose of 5 mg per day or higher of prednisone (or equivalent).

AND

C. One of the following criteria 1 or 2 below is met:

1. The patient is at very high risk of fracture, defined as meeting one of the following criteria (a, b, or c) below:

   a. A history of multiple fragility fractures.

   OR

   b. A bone mineral density that is 3 or more standard deviations below that of a "young normal" adult (T score at or below - 3.0), with or without fracture history.

   OR

   c. A bone mineral density that is 2.5 or more standard deviations below that of a "young normal" adult (T score at or below -2.5) **and** a history of at least one fragility fracture.

OR

2. Step therapy with lower-cost alternatives has been ineffective, not tolerated or contraindicated as defined by at least one of the following (a through e):

   a. The patient has received at least three years of bisphosphonate therapy and remains at high risk for fracture.

   OR

   b. A bisphosphonate has been ineffective (e.g., a loss of BMD after at least 12 months of treatment or fracture while on treatment).

   OR

   c. Raloxifene was not effective after at least a 24-month treatment period, based on objective documentation (such as a reduction in T-score or fracture, despite 24-months of therapy).

   OR

   d. Bisphosphonates (both oral and IV) are documented as medically contraindicated, based on current medical literature and objective documentation (including, but not limited to, a creatinine clearance of less than 35 ml/minute).

   OR

e. Bisphosphonates (both oral and IV) are not tolerated due to documented clinical side effects.

PLEASE NOTE*:* In patients with underlying GI issues, use of oral bisphosphonates may be contraindicated or not tolerated. However, use of an IV bisphosphonate must be trialed for above criterion to be met.

IV bisphosphonates, such as zoledronic acid (generic Reclast), are available for coverage without pre-authorization.

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers Evenity (romosozumab) coverable only under the medical benefit (as a provider-administered medication).

B. Regence Pharmacy Services considers Tymlos (abaloparatide), teriparatide (generic [600mcg/2.4ml], Forteo), and teriparatide (620mcg/2.48ml) coverable only under the pharmacy benefit (as self-administered medications).

C. When pre-authorization is approved, anabolic bone medications will be authorized using the following dosing schedule for the cumulative lifetime approval duration listed below:

Table 1.

Medication	Dosing schedule	Cumulative lifetime approval duration	Administration
Tymlos (abaloparatide)	Up to 30 doses (80 mcg per dose) per month (one prefilled pen [1.56 ml total] monthly)	Up to 24 months	Self
teriparatide (generic 600mcg/2.4ml, Forteo)	Up to 28 doses (20 mcg per dose) per month (one prefilled pen [2.4ml total] monthly)	Up to 24 months	Self
teriparatide 620mcg/2.48ml	Up to 28 doses (20 mcg per dose) per month (one prefilled pen [2.48ml total] monthly)	Up to 24 months	Self
Evenity (romosozumab)	Up to one dose (210 mg per dose) per month (two prefilled pens [2.34 ml total] monthly)	Up to 12 months	Provider

D. When authorized, a maximum of 24 months will be approved as single agent (or in any combination) for (Tymlos, Forteo, teriparatide [600mcg/2.4ml], and teriparatide [620mcg/2.48ml]). Evenity (romosozumab) may be approved for a maximum of 12 months (as a single agent or in any combination). No further doses will be authorized beyond the cumulative lifetime approval duration listed above in *Table 1*.

E. Authorization **may** be reviewed at least annually to confirm that current medical necessity criteria are met, and that the medication is effective.

IV. Use of anabolic bone medications beyond one treatment course or for higher doses (as listed in *Table 1*) is considered not medically necessary.

V. Use of anabolic bone medications is considered investigational when used for all other conditions, including but not limited to:

A. Treatment of osteoporosis, other than listed in the coverage criteria above.

B. Prevention of osteoporosis.

C. To promote fracture healing.

D. To promote post-fusion healing.

E. Use in combination with denosumab (Prolia or Xgeva) or another anabolic bone medication (as listed in *Table 1*).

F. Sequential use, after therapy completion with other anabolic bone medication (as listed in *Table 1*).

Position Statement

Summary

- The intent of this policy is to limit coverage of anabolic bone medications for the indications and doses for which they have been shown to be safe and effective in trials, as detailed in the coverage criteria, when lower-cost standard of care treatment alternatives are not effective or use is contraindicated, or the patient is at very-high risk of fracture.
- Treatment decisions should be based on clinical information as well as intervention thresholds. When there is no demonstrated difference in safety or efficacy, the medication with the lowest cost often provides the best value for members.
- A T-score lower than -2.5 is diagnostic of osteoporosis. However, a non- or low- traumatic fracture (fragility fracture), is considered osteoporosis regardless of T-score. [1 2]
- Bisphosphonates (alendronate, risedronate, zoledronic acid, and ibandronate) for prevention of bone loss, regardless of cause, is the standard of care due to the body of evidence supporting efficacy and track record of safety. There are both oral and injectable bisphosphonates available as low-cost generics. Bisphosphonates and raloxifene have been shown to increase bone mineral density and reduce the incidence of fractures in patients with osteoporosis. [3-5] Risedronate and alendronate have been shown to be well-tolerated out to at least five years of therapy.
- There are many treatments for osteoporosis that are effective, have known long-term safety profiles, and are recommended by national treatment guidelines. Bisphosphonates represent the best value for the majority of patients.
- There is insufficient evidence to establish that any of the parathyroid hormone analog medications in this policy (Tymlos, Forteo, teriparatide [600mcg/2.4 ml], and teriparatide [620mcg/2.48 ml]) are safer or more effective than one another. [8] Of these products, generic teriparatide 600mcg/2.4 ml and Tymlos (abaloparatide) are lower cost options. As such, brand Forteo (teriparatide) and teriparatide (620mcg/2.48ml) are coverable only when these lower cost options are not a treatment option, as detailed in the coverage criteria.
- In a comparative trial, teriparatide had a lower rate of fractures as compared to risedronate; however, most patients were previously treated with osteoporosis medications such that the treatment affect may have been altered. [9]
- Preliminary data on sequential treatment suggests the use of the anabolic bone medications as first line therapy in high-risk patients followed by bisphosphonates may be more beneficial compared to bisphosphonates followed then by the anabolic bone medications: however, the data is limited to small trials, based only on bone density and not fracture risk reduction, and guidelines still recommend bisphosphonates as an option for initial treatment in high-risk patients.[8 10]
- American Association of Clinical Endocrinologists (AACE) guidelines recommend that Tymlos (abaloparatide), Prolia (denosumab), Evenity (romosozumab), teriparatide , and zoledronate as initial therapy for patients at very high fracture risk or for patients unable to use oral therapy. The definition for very high risk differs in Endocrine Society (ES) and AACE guidelines but both include patients with a T-score at or below -2.5 and

a history of fracture, or a history of multiple fractures. [8 11] An additional definition of very high risk in the AACE guidelines includes patients with a T-score at or below -3.0, regardless of fracture history. [8]

- The goal of therapy is to decrease osteoporotic fractures. However, there is insufficient evidence that one anabolic bone medication is superior to another or that bisphosphonates should be stopped after a "treatment course" and therapy changed to a different mechanism of action.
    * The 2019 Endocrine Society Osteoporosis guidelines update, and Agency for Healthcare Research and Quality (AHRQ) concluded that continuation of bisphosphonates after a three-to-five-year treatment course reduces some measures of vertebral fractures in high-risk patients. [11 12]
    * Based on this data, the ES recommends continued treatment if the patient remains at high fracture risk (which include multiple spine fractures or hip/spine T-score < 2.5) after a three to five years of bisphosphonate therapy. However, the guideline does not specifically recommend switching mechanism of action for ongoing use beyond three to five years. [11] In addition, the guideline considers the risks associated with ongoing bisphosphonate therapy, such as ONJ, to outweigh the risks of stopping therapy in higher risk patients. [11]
    * Patients with low-moderate fracture risk may consider a drug holiday, which is defined as a period of time when no osteoporosis medications are given.

Clinical Efficacy

Tymlos (abaloparatide)

- The efficacy of Tymlos (abaloparatide) was demonstrated in a randomized controlled trial that compared Tymlos (abaloparatide) to placebo, as well as open-label teriparatide), for 18 months of treatment in postmenopausal women. Patients in the pivotal trial of Tymlos (abaloparatide) in postmenopausal osteoporosis were required to have a T-score ≤ -2.5 and had a mean age of 68.8 years at baseline. [5]
    * Tymlos (abaloparatide) decreased the absolute risk of new vertebral fractures by 3.6% compared to placebo. New vertebral fractures occurred in 0.58% of participants in the Tymlos (abaloparatide) group and in 4.22% of those in the placebo group. [3 5]
    * Although considered an exploratory endpoint, new vertebral fractures occurred in 0.84% of participants treated with teriparatide). [5]

Evenity (romosozumab)

- In clinical trials, Evenity (romosozumab) reduced the number of new vertebral fractures versus either placebo or alendronate alone in women with postmenopausal osteoporosis. [13 14]
- The efficacy and safety of Evenity (romosozumab) in reducing the risk of osteoporotic fractures in postmenopausal women has been confirmed by two large randomized controlled trials, one comparing Evenity (romosozumab) versus placebo for 12 months followed by each arm receiving sequential denosumab therapy for 12 months (FRAME) and the other comparing sequential therapy with Evenity (romosozumab) for 12 months followed by alendronate for 12 months versus 24 months of alendronate (ARCH). [13 14]

* At 24 months, new vertebral fractures occurred in 0.6% in the Evenity (romosozumab) group, as compared with 2.5% in the placebo group (representing a 75% lower risk with romosozumab). Though clinical fracture rates differed significantly at 12 months, it did not reach statistical significance at 24 months. [13]
* Over a period of 24 months, a 48% lower risk of new vertebral fractures was observed in the romosozumab-to-alendronate group than in the alendronate-to-alendronate group (6.2% vs 11.9%, respectively). At the time of the primary analysis, Evenity (romosozumab) followed by alendronate resulted in a 27% lower risk of clinical fracture and a 38% lower risk of hip fracture than alendronate alone. [14]
* There was one randomized-controlled trial comparing Evenity (romosozumab) versus teriparatide) in postmenopausal women and one comparing Evenity (romosozumab) versus placebo in osteoporotic men that showed improved bone mass density in the Evenity (romosozumab) group but the quality of evidence of both studies was poor and applicability was limited. [15]

Teriparatide

- The efficacy and safety of teriparatide in reducing the risk of osteoporotic fractures in postmenopausal women has been confirmed by large randomized controlled trials. Patients treated in the pivotal trial of teriparatide in postmenopausal osteoporosis had a mean T-score of –2.6, a mean of 2.3 vertebral fractures, and a mean age of 69.5 years at baseline. [6 16 17]
- Teriparatide has been shown to reduce the risk of vertebral and non-vertebral fractures; however, it is unknown if teriparatide protects against hip fracture. Teriparatide increases bone mineral density (BMD) in the spine but has little effect on BMD in the hip or forearm. [3]
- Patients on teriparatide in a head-to-head trial comparing teriparatide to risedronate had a smaller number of radiographic vertebral fractures 5.4% vs 12% and clinical fractures than the risedronate group. However, there were no differences in pain, height, and health-related quality of life measures. Most patients had at least one prior osteoporosis therapy (median duration of previous bisphosphonate use 3.6 years). [18]
- When treatment with teriparatide is discontinued, bone density quickly declines the following year, although fracture reduction may persist for one to two years. It appears that continued antiresorptive therapy is necessary to maintain gains in BMD after withdrawal of teriparatide . [6 7 19 20] Administration of alendronate following one year of teriparatide treatment has been shown to prevent this loss and in some cases will be associated with a further increase in BMD. Effect on fracture has not been evaluated. [21]
- Combination therapy using teriparatide and alendronate has not been shown to be more effective than monotherapy with either agent. [22]

Guidelines[1-3 11 23]

- Treatment for people at high risk for fracture is recommended by guidelines. [11] The definition of high risk includes:
  * A history of fracture of the hip or spine.

    * A bone mineral density in the osteoporosis range (T-score of -2.5 or lower).
    * A bone mineral density in the low bone mass or osteopenia range with a higher risk of fracture defined by a Fracture Risk Assessment Tool (FRAX) score for major osteoporotic fracture 10-year probability of 20% or higher OR Hip fracture 10-year probability 3% or higher.

- For patients who are at very high risk of fracture, initial therapy with denosumab or an anabolic agent may be considered. The Endocrine Society Guidelines define very high risk as those with severe osteoporosis (low T-score ≤ −2.5 and fractures) or multiple vertebral fractures.
- An injectable option [e.g., zoledronic acid, Prolia (denosumab), Evenity (romosozumab), Tymlos (abaloparatide), or teriparatide] is recommended for those with a prior fragility fracture or indicators of higher fracture risk (e.g., advanced age, frailty, glucocorticoids, very low T-scores, or increased fall risk); however, no one specific injectable option is preferred over another. [8 11] Of the treatment options, generic zoledronic acid is the lowest cost treatment choice.
- The World Health Organization (WHO) algorithm (FRAX) was developed to calculate the 10-yr probability of a hip fracture and the 10-yr probability of any major osteoporotic fracture (defined as vertebral, hip, forearm, or humerus fracture) considering femoral neck BMD and the clinical risk factors. The WHO algorithm pertains only to previously untreated patients. [2]
- 2019 Endocrine Society Osteoporosis guideline recommend initial treatment with bisphosphonates (alendronate, risedronate, zoledronic acid, and ibandronate). They are available at low cost and have a long history of use. Denosumab and anabolic bone medications are considered alternative initial treatments for patients who are not candidates for a bisphosphonate or who have not had an adequate response to bisphosphonates. [24]
- The 2019 Endocrine Society Osteoporosis guideline and American Society for Bone and Mineral Research (ASBMR) recommend post-menopausal osteoporotic (PMO) women be evaluated for fracture risk after three to five years of bisphosphonates. [11]
    * Patients with low-moderate fracture risk may consider a drug holiday, which is defined as a period when no osteoporosis medications are given.
    * For patients with high risk (which include multiple spine fractures or hip/spine T-score <-2.5) osteoporosis treatment should be continued, as the benefits likely outweigh potential harms. Guidelines do NOT specifically suggest changing mechanism of action, such as stopping a bisphosphonate and use of Prolia (denosumab) or an anabolic bone medication, such as Tymlos (abaloparatide), teriparatide , or Evenity (romosozumab).
- Endocrine Society guidelines also recommend dual-energy X-ray absorptiometry (DEXA) at the spine and hip every 1 to 3 years to assess the response to treatment. While there is uncertainty regarding what is considered an adequate response, guidelines state the stable or increasing BMD may indicate a good response. Switching treatments may also be considered in patients who experience a fracture. [11]

- There have not been adequate studies to evaluate the efficacy of switching to alternative therapies and the optimal duration of bisphosphonate therapy is unclear. However, sequential therapy with an antiresorptive agent (drug used to prevent further bone loss, such as a bisphosphonate) is recommended if continued treatment is warranted after completion of anabolic therapy.
- Preliminary data on sequential therapy in high risk patients suggests that initial treatment with an anabolic bone medication followed by an antiresorptive agent (bisphosphonate) may lead to better outcomes than the traditional antiresorptive agent followed then by the anabolic bone medication, however this data is varied, mostly based on small trials using bone density not fracture reduction, and is not supported by the Endocrine Society guidelines.[10 25]
    * The VERO trial, in which 65% of patients had previously been treated with bisphosphonates prior to receiving teriparatide, showed that the anti-fracture efficacy of teriparatide when compared to risedronate was similar regardless of the patient's prior treatment with bisphosphonates or not, with the effect being independent of the interval between prior bisphosphonate treatment and inclusion in the trial.

Investigational Uses

- Bone healing: There are no clinical trials to support the use of Tymlos (abaloparatide), Evenity (romosozumab), or teriparatide for bone healing. Although there is promising animal data and a few published case reports, osteoanabolic agents have not been proven in published clinical trials to be effective or safe for fracture healing (these types of high-quality studies are “randomized,” “double-blinded,” and “controlled” and involve large treatment groups). There is no evidence to support the use of Tymlos (abaloparatide), Evenity (romosozumab) for any other indications, including for the prevention of postmenopausal osteoporosis, use in pre-menopausal osteoporosis or osteoporosis in men.
- Combination therapy: There is insufficient evidence to establish the safety and efficacy of combination of anabolic bone medications [including Prolia (denosumab)] or use of anabolic bone medications after completion of a course of therapy.
    * The evidence for combination use is limited to one small trial in post-menopausal women (n=94) on teriparatide with denosumab. Although the combination resulted in a larger increase in BMD than either agent alone, the effect on fractures is unknown (no data). [26 27]
    * Combination therapy substantially raises the cost and potential for side effects. Until the effect of combination therapy on fracture is better understood, AACE does not recommend concomitant use of these agents. [3 27]

Safety

Evenity (romosozumab)

- Unlike with other anabolic bone medications, there is a boxed warning for potential risk of major adverse cardiovascular events, including myocardial infarction, stroke, and cardiovascular death with Evenity (romosozumab). In a clinical trial comparing Evenity (romosozumab) to alendronate, patients in the Evenity (romosozumab) arm had a 1.3

times higher likelihood of a serious cardiovascular events than patients in the alendronate arm. Evenity (romosozumab) should not be initiated in patients who have had a myocardial infarction or stroke within the preceding year.

Teriparatide and Tymlos (abaloparatide)

- Due to the potential risk of osteosarcoma, cumulative use of Tymlos (abaloparatide) and teriparatide (Forteo, t teriparatide [600mcg/2.4 ml], and teriparatide [620mcg/2.48 ml]) for more than 2 years is not recommended.
- Tymlos (abaloparatide) or teriparatide (Forteo, teriparatide [600mcg/2.4 ml], and teriparatide [620mcg/2.48 ml]) should not be prescribed to patients at increased risk for osteosarcoma including those with Paget's disease of bone, patients with previous radiation therapy, and patients with bone metastases or skeletal malignancies.

Dosing

- Tymlos (abaloparatide) may be covered for up to 24-months, given as 80 mcg daily, the dose studied in clinical trials. The safety and efficacy of higher doses or durations longer than 24 months have not been established.
- Evenity (romosozumab) may be covered for up to 12-months, given as 210 mg every month, the dose studied in clinical trials. The safety and effectiveness of higher doses have not been established. In clinical trials, the efficacy of Evenity (romosozumab) waned after 12 months.
- Teriparatide (Forteo, teriparatide [600mcg/2.4 ml], and teriparatide [620mcg/2.48 ml]) may be covered for up to 24-months, given as 20 mcg daily, the dose studied in clinical trials. The safety and efficacy of higher doses or durations longer than 24 months have not been established.

Revision History

Revision Date	Revision Summary
9/19/2024	• Added additional criterion to define "very high risk" patients (T score ≤ - 3.0). • Added step therapy with generic teriparatide (600mcg/2.4ml) AND Tymlos (abaloparatide) for brand name Forteo (teriparatide) and teriparatide (620mcg/2.48ml) coverage.
3/24/2024	Added quantity limit criteria to COT language.
9/14/2023	Updated position statement regarding sequential therapy. No change to criteria. Removed "Bonsity" branding from policy. Teriparatide is no longer marketed under this name.
3/16/2023	Removed postmenopausal criterion from Tymlos (abaloparatide) to allow for coverage of new indication in males.
9/23/2022	• Reworded criteria for operational clarity (no change to intent). • Updated Bonsity to Teriparatide. • Clarified Teriparatide criteria a. AND b. must be met (no change to intent).
10/15/2021	• Reformatted Section B of policy coverage criteria to list each product separately. • Updated criteria to bypass step therapy requirements for patients at very high risk of fracture (T-score at or below -2.5 and a history of fragility fractures, or multiple fragility fractures).
4/21/2021	Updated not medically necessary uses to include requests for dosing higher that those listed in Table 1. No change to intent.
10/28/2020	• Added COT criteria. • Revised definition of ineffectiveness for bisphosphonates.
10/23/2019	• New combination policy replacing individual medication coverage policies for Tymlos (dru514), Forteo (dru085), and Evenity (dru594). Added new teriparatide product (Bonsity) to policy (effective 1/1/2020). • Limits coverage of Tymlos and Evenity to postmenopausal osteoporosis when alternative treatment options are not effective, the setting in which they were studied and have labeled indications. • Forteo and Bonsity are limited to osteoporosis OR patients at high risk for osteoporosis, when alternative treatments are not effective.

Medication Policy Manual | **Policy No:** dru616

Topic: Zilretta, triamcinolone acetonide extended-release (ER) injectable suspension | **Date of Origin:** May 1, 2020

Committee Approval Date: September 19, 2024 | **Next Review Date:** 2025

Effective Date: December 1, 2024

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Zilretta (triamcinolone acetonide extended-release [ER] injectable suspension) is a steroid that is injected directly into the knee joint to help improve pain associated with osteoarthritis of the knee.

Policy/Criteria

I. Continuation of therapy (COT): Zilretta (triamcinolone acetonide ER) may be considered medically necessary for COT when full policy criteria below are met.

***Please note**: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

New starts (treatment-naïve patients):

II. Zilretta (triamcinolone acetonide ER) is considered not medically necessary for osteoarthritis of the knee.

III. Zilretta (triamcinolone acetonide ER) is considered investigational when used for all other conditions, including but not limited to:

A. Rheumatoid arthritis.
B. Osteoarthritis in joints other than the knee.

Position Statement

Summary

- Zilretta (triamcinolone acetonide extended-release [ER]) is an intra-articular corticosteroid, injected directly into the knee joint, and has been studied and approved to reduce the pain associated with osteoarthritis (OA) of the knee.
- The intent of the policy is to offer members the best value IA steroids for OA of the knee.
- There is no evidence that Zilretta (triamcinolone acetonide ER) is safer or more effective than generic IA steroids, such as triamcinolone acetonide immediate-release (IR) (generic Kenalog) for osteoarthritis. However, Zilretta (triamcinolone acetonide ER) is significantly more costly than various generic IA steroids (including methylprednisolone and triamcinolone IR). Therefore, the use of Zilretta (triamcinolone acetonide ER) for OA of the knee is considered not medically necessary.
- IA steroids are used for various other indications, such as rheumatoid arthritis, synovitis, or OA in other joints (such as the knee or shoulder). However, there are no trials of Zilretta (triamcinolone acetonide ER) in any other conditions. Therefore, the use of Zilretta (triamcinolone acetonide ER) in any condition other than OA of the knee is considered investigational.
- All IA steroids have steroid-related adverse events due to their mechanism of action. Intraarticular steroid use may increase risks of post-injection flares, skin or fat changes, cartilage damage, and transient increase in blood glucose. [1]
- There is interest in the use of Zilretta (triamcinolone acetonide ER) for patients with concomitant diabetes and osteoarthritis of the knee. However, there is inclusive evidence

that Zilretta (triamcinolone acetonide ER) is safer than other available triamcinolone acetonide formulations. [2 3] Increases in blood glucose are transient. Therefore, the use of Zilretta (triamcinolone acetonide ER) for patients with diabetes is not medically necessary.

Clinical Efficacy [1 2]

- The evidence supporting efficacy of Zilretta (triamcinolone acetonide ER) for improving pain associated with OA of the knee is based primarily on one pivotal randomized control trial that compared one injection of Zilretta (triamcinolone acetonide ER) to placebo or triamcinolone IR.
    * After 12 weeks, there was a marginal improvement in average daily pain (ADP) score with patients who received Zilretta (triamcinolone acetonide ER) versus those who received placebo.
    * Zilretta (triamcinolone acetonide ER) showed no added benefit over triamcinolone IR for OA of the knee.
- Although the American Association of Orthopaedic Surgeons (AAOS)[4] implies triamcinolone ER can be used over IR to improve patient outcomes, in the pivotal trial triamcinolone ER showed a numerical advantage but failed to show statistical significance at Week 12 in the weekly mean average daily pain (ADP) score compared to triamcinolone IR. Other evidence to support the use of ER over IR is based on a post-hoc subpopulation analysis. [5]

Investigational Uses

- There are no large, randomized-controlled published clinical trials evaluating the safety or efficacy of Zilretta (triamcinolone acetonide ER) for the treatment of rheumatoid arthritis or in any other indications aside from OA of the knee.

Safety

- There is no evidence that Zilretta (triamcinolone acetonide ER) is safer than triamcinolone immediate-release.
- Overall adverse event rates were comparable in the Zilretta (triamcinolone acetonide ER) and the triamcinolone IR arms of the pivotal efficacy study but the incidence of arthralgia and worsening of knee pain were higher in the Zilretta (triamcinolone acetonide ER) arm. Diabetics with uncontrolled blood sugars were excluded from the study. [2]
- Evidence for use in diabetic patients is limited to a single, small (N=33) parallel group study [3] comparing use of Zilretta (triamcinolone acetonide ER) versus triamcinolone acetonide immediate-release in diabetic patients with OA of the knee. These patients were on one to two oral medications and not managed on injectables; they had a hemoglobin A1c level of 6.5 to 9.0% at baseline.

Medication Policy Manual

Policy No: dru620

Topic: Products with Therapeutically Equivalent Biosimilars/Reference Products:

- Bevacizumab
- Infliximab
- Long-acting Colony Stimulating Factors
- Rituximab
- Trastuzumab

Date of Origin: July 1, 2020

Committee Approval Date: December 12, 2024

Next Review Date: 2025

Effective Date: January 15, 2025

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

A biosimilar is a type of biologic drug that is highly similar to it an FDA-approved biologic drug, known as the reference product. Biosimilars provide equivalent clinical benefit to the original reference product ("therapeutically equivalent").

PLEASE NOTE: This policy and the coverage criteria below do not apply to preferred brands of bevacizumab, long-acting colony stimulating factors, rituximab, and trastuzumab (as listed in *Table 1*) as they do not require pre-authorization; however, all brands of infliximab are subject to Site of Care review.

Policy/Criteria

I. Continuation of therapy (COT) **and** new starts: The use of Zymfentra (infliximab-dyyb) subcutaneous is considered not medically necessary (see *Table 1*).

II. Continuation of therapy (COT): Non-preferred products (as listed in *Table 1*) may be considered medically necessary for COT when full policy criteria below are met, including Site of Care administration requirements (see below).

***Please note**: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

III. New starts (treatment-naïve patients): Non-preferred products (as listed in *Table 1*) may be considered medically necessary when criteria A and B below are met:

A. One of the following criteria 1, 2, or 3 below is met:

1. There is a documented intolerance or contraindication to all preferred product(s) (as listed in *Table 1*).

OR

2. **For infliximab non-preferred products only:** There is a documented loss of effectiveness with use of all of the preferred infliximab products (as listed in *Table 1*), defined as clinical documentation of **both** of the following (a and b):

a. The patient was clinically stable on the requested non-preferred infliximab product PRIOR to changing to the preferred infliximab products.

AND

b. An adequate trial of all of the preferred infliximab products was ineffective, defined as worsening or return of underlying disease symptoms while using the preferred brands of infliximab as compared to disease control while using the non-preferred brand of infliximab.

OR

3. **For Neulasta Onpro or Udenyca On-Body (pegfilgrastim pre-filled autoinjector device) only:** There is a documented medical need for the autoinjector device as established by meeting criteria a and b below.

a. Patient or patient's caregiver is not able to self-administer any of the pegfilgrastim PFS products (as listed in *Table 1*) due to significant behavioral issues, physical difficulties, and/or cognitive impairment including, but not limited to, those associated with developmental delay, down syndrome, dementia, or excessive anxiety such as severe needle phobia.

AND

b. Patient lives greater than 10 miles from the provider's office, such that it is not possible to return for administration of any of the pegfilgrastim PFS products (as listed in *Table 1*).

AND

B. For infliximab only (all products): Site of care administration requirements are met [refer to Medication Policy Manual, Site of Care Review, dru408].

Table 1: Products with Therapeutically Equivalent Biosimilars/Reference Products

	Product Name	Formulary Status
Bevacizumab Products		
Reference Product	Avastin (bevacizumab)	Non-preferred/PA required
Biosimilars	Alymsys (bevacizumab-maly)	Non-preferred/PA required
	Avzivi (bevacizumab-tnjn)	Non-preferred/PA required
	MVASI (bevacizumab-awwb)	**Preferred/No PA required** [a]
	Vegzelma (bevacizumab-adcd)	Non-preferred/PA required
	Zirabev (bevacizumab-bvzr)	**Preferred/No PA required** [a]
Infliximab Products		
Reference Product [b]	Remicade (infliximab)	Non-preferred/PA required
Intravenous (IV) Biosimilars [b]	Inflectra (infliximab-dyyb)	**Preferred/PA required** [b]
	infliximab (Janssen)	Non-preferred/PA required
	Renflexis (infliximab-abda)	Non-preferred/PA required
	Ixifi (infliximab-qbtx)	Non-preferred/PA required
	Avsola (infliximab-axxq)	**Preferred/PA required** [b]
Subcutaneous (SC) infliximab	Zymfentra (infliximab-dyyb)	Not medically necessary
Long-acting Colony Stimulating Factors		
Reference Product	Neulasta PFS (pegfilgrastim) Neulasta Onpro (pegfilgrastim)	Non-preferred/PA required
Biosimilars	Fulphila (pegfilgrastim-jmdb)	**Preferred/No PA required** [a]
	Fylnetra (pegfilgrastim-pbbk)	Non-preferred/PA required
	Nyvepria (pegfilgrastim-apgf)	**Preferred/No PA required** [a]
	Stimufend (pegfilgrastim-fpgk)	Non-preferred/PA required
	Udenyca (pegfilgrastim-cbqv)	Non-preferred/PA required
	Udenyca On-Body (pegfilgrastim-cbqv)	Non-preferred/PA required
	Ziextenzo (pegfilgrastim-bmez)	Non-preferred/PA required
Recombinant G-CSF	Rolvedon (eflapegrastim-xnst)	Non-preferred/PA required
	Ryzneuta (efbemalenograstim alfa-vuxw)	Non-preferred/PA required
Rituximab Products		
Reference Product	Rituxan (rituximab) Rituxan Hycela (rituximab SC)	Non-preferred/PA required
Biosimilars	Riabni (rituximab-arrx)	Non-preferred/PA required
	Ruxience (rituximab-pvvr)	**Preferred/No PA required** [a]
	Truxima (rituximab-abbs)	**Preferred/No PA required** [a]

	Product Name	Formulary Status
Trastuzumab Products		
Reference Product	Herceptin (trastuzumab) Herceptin Hylecta (trastuzumab SC)	Non-preferred/PA required
Biosimilars	Hercessi (trastuzumab-strf)	Non-preferred/PA required
	Herzuma (trastuzumab-pkrb)	Non-preferred/PA required
	Kanjinti (trastuzumab-anns)	**Preferred/No PA required** [a]
	Ogivri (trastuzumab-dkst)	Non-preferred/PA required
	Ontruzant (trastuzumab-dttb)	Non-preferred/PA required
	Trazimera (trastuzumab-qyyp)	**Preferred/No PA required** [a]

[a] Specified preferred products are not subject to pre-authorization (PA).

[b] All IV infliximab products are subject to Site of Care criteria review.

IV. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers the following products coverable only under the medical benefit (as provider-administered medications).

1. Bevacizumab

2. Rituximab

3. Trastuzumab

4. Infliximab intravenous (IV)

B. Pharmacy Services considers infliximab subcutaneous (SC) coverable under the pharmacy benefit (as self-administered medications).

C. Pharmacy Services considers all the pegfilgrastim pre-filled syringe (PFS) and recombinant G-CSF products coverable under the pharmacy benefit (as self-administered medications) OR coverable under the medical benefit (as provider-administered medications).

D. Pharmacy Services considers pegfilgrastim autoinjector devices (Neulasta Onpro and Udenyca On-Body) coverable only under the medical benefit (as a provider-administered medication).

E. When pre-authorization for **infliximab IV** is approved, the following quantity limitations will apply: Up to 14 infusions in a 12-month period the first year, then up to 13 infusions annually thereafter.

F. When infliximab SC is approved, the following quantity limitations will apply: Up to 26 doses (26-120 mg syringes/pens) in a 12-month period.

G. Authorization **may** be reviewed at least every 6 months. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, such as disease stability or improvement.

V. The use of Zymfentra (infliximab-dyyb) subcutaneous is considered not medically necessary.

Position Statement

Summary

- The intent of this policy is to cover non-preferred products only when preferred products are not a treatment option. In addition, the use of significantly more expensive formulations is considered "not medically necessary," and therefore not coverable (see *Table 1*).
- FDA-approved biosimilar medications are clinically not meaningfully different than their reference products, also called "therapeutically equivalent." Although small differences in clinically inactive portions of the molecule may exist, the FDA approval certifies that the manufacturer has shown their product to be identical in function. [1] There is no scientific basis to prefer one FDA-approved product over another; given similar efficacy and safety, most contracts consider more costly products not medically necessary.
- While eflapegrastim-xnst (Rolvedon) and efbemalenograstim alfa-vuwx (Ryzneuta) are not "therapeutically equivalent" or a biosimilar to pegfilgrastim, it may be considered therapeutically similar to pegfilgrastim. For the purposes of this policy, eflapegrastim-xnst (Rolvedon) and efbemalenograstim alfa-vuwx (Ryzneuta) are classified with other pegfilgrastim biosimilars.
- While Zymfentra (infliximab-dyyb) is not a biosimilar to Remicade, it may be considered therapeutically similar to infliximab. For the purposes of this policy, (infliximab-dyyb) (Zymfentra) is classified with other infliximab biosimilars.
- FDA-approved biosimilars offer a less costly alternative that is just as effective as the reference product.
    * There is no evidence that any one bevacizumab, infliximab, pegfilgrastim, rituximab, or trastuzumab product is safer or more effective than another, including subcutaneous (SC) products versus intravenous (IV) products.
    * **Preferred products:** Among these products, currently the preferred products (as listed in *Table 1*) provide the best value for health plan members.
    * **Non-preferred products:** Products NOT listed as "preferred," whether biosimilars and/or reference products, are considered non-preferred and not coverable, unless coverage criteria are met (as listed in *Table 1*). Although biosimilars offer a lower overall cost for care, the pricing between individual products is variable and the lowest net cost products are available for coverage.
    * **Not medically necessary products:** Products NOT listed as "preferred" or "non-preferred" are considered not medically necessary, and therefore not coverable. Pricing between individual products is variable and the lowest net cost products are available for coverage.
- For cancer indications: National guidelines published by NCCN have endorsed FDA-approved biosimilars as appropriate for all relevant indications. [2] The available peer reviewed data has demonstrated that FDA-approved biosimilars are not meaningfully different from reference products in terms of efficacy, safety, or immunogenicity.

- For Clinical trials: Coverage of services for members enrolled in clinical trials is provided consistent with current standards of care. FDA-approved biosimilars are not clinically different from reference products. Biosimilars are the current standard of care and have been endorsed by national guidelines such as NCCN. Reference products which are more costly than preferred biosimilars may be provided by study sponsors.
- Hospitals and health-systems have medication formularies developed independent of the health plan. The health plan is unable to cover more expensive products for the convenience of the hospital, health-system, provider, or member. Preferred biosimilar products represent the lowest cost to members and the health plan; the use of more expensive products without evidence of superior efficacy or safety is not medically necessary per the member's contract.

Infliximab intravenous (IV) and subcutaneous (SC) formulations

- There are several available biosimilars to Remicade (infliximab) (as listed in *Table 1*).
- Infliximab has been used to treat a variety of inflammatory conditions.
- Inflectra (infliximab-dyyb) and Avsola (infliximab-axxq), the health plan preferred brands of infliximab, has the same FDA-approved indications as Remicade (infliximab). However, the intent of this policy is to provide coverage for the best value infliximab product for health plan members, independent of indication of use. Significantly more expensive formulations are considered "not medically necessary," and therefore not coverable (see *Table 1*).
- Infliximab IV is coverable for up to 14 infusions in a 12-month period in the first year, based on a usual induction regimen of 5 mg/kg at weeks 0, 2 and 6 followed by a usual starting maintenance regimen of 5 mg/kg every 8 weeks thereafter, but may increase to 10 mg/kg up to every 4 weeks (up to 13 infusions per year). [3]
- If approved, infliximab SC is coverable for up to 26 doses (26-120 mg syringes/pens) in a 12-month period. If a higher dose beyond the quantity limit is required for disease remission, IV infliximab offers the most cost-effective infliximab option for members.

Pegfilgrastim

- There is no evidence that any one pegfilgrastim product is safer or more effective than another. Among these products, preferred PFS pegfilgrastim products provide the best value for members.
- The FDA reaffirmed the lack of superiority of one dosage form of pegfilgrastim over others. In July 2021, the FDA issued a warning to the manufacturer of Neulasta Onpro for misleading promotional material, based on an observational study. In short, the FDA determined claims of superiority of pegfilgrastim via the on-body injector Onpro over pegfilgrastim delivered through a prefilled syringe are not supported due to limitations of the available data. "The promotional communication's misleading claims and presentations could cause healthcare providers to conclude that pegfilgrastim delivered through the Onpro on-body injector is more effective than pegfilgrastim delivered through a prefilled syringe or that it is more effective than FDA-licensed biosimilar pegfilgrastim products, which are only delivered through a prefilled syringe."

- Like pegfilgrastim, eflapegrastim-xnst (Rolvedon) and efbemalenograstim alfa-vuwx (Ryzneuta) are types of granulocyte colony stimulating factors(G-CSF). They were produced by adding an Fc fragment to human G-CSF.[7-8] Efbemalenograstim alfa-vuwx (Ryzneuta) is a non-pegylated G-CSF product.[8]

Subcutaneous (SC) formulations: Rituxan Hycela and Herceptin Hylecta [2-6]

- Rituximab for IV infusion and trastuzumab for IV infusion, the "reference product" to the SC formulation, have been available for many years with proven efficacy and safety in their respective cancer indications and the preferred products do not require pre-authorization.
- Rituximab/hyaluronidase SC (Rituxan Hycela) and trastuzumab/hyaluronidase SC (Herceptin Hylecta) are subcutaneous formulations for injection under the skin with hyaluronidase. Hyaluronidase is used to facilitate a large volume SC injection and allows for a faster rate of dose administration (versus traditional SC infusion).
- Both these SC products were FDA-approved based on non-inferiority to the IV formulation in pharmacokinetic studies in patients with cancer [Rituxan Hycela in follicular lymphoma (FL), diffuse large B-cell lymphoma (DLBCL), and chronic lymphocytic leukemia (CLL) and Herceptin Hylecta in HER2+ breast cancer].
- The NCCN guidelines recognize trastuzumab IV, biosimilar, and trastuzumab/hyaluronidase SC (Herceptin Hylecta) as a treatment option for HER2-positive breast cancers where trastuzumab is recommended. Likewise, NCCN recognizes rituximab IV, biosimilar, and rituximab/hyaluronidase SC as a treatment option for various B-cell lymphomas, including follicular lymphoma, diffuse large B-cell lymphoma, and chronic lymphocytic leukemia, where rituximab is recommended.

Revision History

Revision Date	Revision Summary
12/12/2024	Effective 1/15/25: • Updated Zymfentra (infliximab-dyyb) subcutaneous as not medically necessary.
9/19/2024	• Added newly FDA-approved Hercessi (trastuzumab-strf) to policy as non-preferred. • Added HCPCS code for Ryzneuta (efbemalenograstim alfa-vuwx).
3/21/2024	Added newly FDA-approved Ryzneuta (efbemalenograstim alfa-vuwx), Udenyca On-Body (pegfilgrastim-cbqv), and Avzivi (bevacizumab-tnjn) to policy as non-preferred.
12/7/2023	Added Zymfentra (infliximab-dyyb) as non-preferred infliximab product with quantity limitation (QL)
9/14/2023	Effective 1/1/24: Updated preferred products.
6/15/2023	No changes to criteria with this annual update.
12/9/2022	Effective 1/15/23: • Added newly FDA-approved Vegzelma (bevacizumab-adcd) to policy as non-preferred. • Moved pegfilgrastim products from dru563 to this policy. Updated step therapy requirements for Neulasta Onpro to bypass preferred product requirements if medical need requirements are met. No other change to intent. • Added newly FDA-approved Rolvedon (eflapegrastim-xnst) to policy as non-preferred.

Revision Date	Revision Summary
6/17/2022	• Added new bevacizumab product to policy as non-preferred: Alymsys (bevacizumab-maly). • Modified criteria wording, for operational clarity (no change to intent of the criteria with this annual update). • Reformatted product table, to delineate the preferred/non-preferred and reference product/biosimilar. • Removed Quantity Limits.
10/15/2021	• Retitled policy to "Products with Therapeutically Equivalent Biosimilars/Reference Products." • Added infliximab (Janssen) to policy as non-preferred.
8/25/2021	Added infliximab products to policy, including Site of Care requirements.
4/21/2021	• Added subcutaneous products to policy as non-preferred: Rituxan Hycela (rituximab, hyaluronidase), Herceptin Hylecta (trastuzumab, hyaluronidase-oysk). • Updated position statement.
1/20/2021	• Added new rituximab product to policy as non-preferred: Riabni (rituximab-arrx) • Updated position statement.
6/9/2020	Added HCPCS code for Ruxience (rituximab-pvvr).
4/22/2020	Added rituximab to policy.
1/22/2020	New policy (effective 7/1/2020). Limits coverage to patients who have an intolerance or contraindication to a preferred product.

Drug names identified in this policy are the trademarks of their respective owners.

Medication Policy Manual

Policy No: dru621

Topic: Intravitreal Vascular Endothelial Growth Factor (VEGF) Inhibitors:

- aflibercept (Ahzantive, Enzeevu, Eylea, Eylea HD, Opuviz, Pavblu, Yesafili)
- Beovu, brolucizumab
- ranibizumab (Byooviz, Cimerli, Lucentis, Susvimo)
- Vabysmo, faricimab-svoa

Date of Origin: February 15, 2020

Committee Approval Date: September 19, 2024

Next Review Date: 2025

Effective Date: December 1, 2024

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

The medications in this policy are all inhibitors of vascular endothelial growth factor (VEGF), which prevent the formation of new blood vessels. They are injected directly into the eye (intravitreal) to treat a variety of eye conditions, by reducing swelling (blood vessel leakage and inflammation). Susvimo is a newer formulation that delivers ranibizumab injection via ocular implant.

Policy/Criteria

Most contracts require pre-authorization approval of intravitreal vascular endothelial growth factor (VEGF) inhibitors (as listed in *Table 1*) prior to coverage.

I. Continuation of therapy (COT): Intravitreal vascular endothelial growth factor (VEGF) inhibitors may be considered medically necessary for COT when criterion A or B below is met.

A. Both of the following:

1. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

2. **For Susvimo only:** Treatment with a lower-cost ranibizumab, Byooviz (ranibizumab-nuna), Cimerli (ranibizumab-eqrn) or Lucentis (ranibizumab), was ineffective, not tolerated, or use is contraindicated.

OR

B. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

Please note: *Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Intravitreal VEGF inhibitors may be considered medically necessary when there is clinical documentation that step therapy requirements below are met:

A. Step therapy requirements are considered met when:

1. Treatment with the required product(s) (as listed in *Table 1*) was ineffective, not tolerated, or use is contraindicated.

OR

2. There is evidence in the patient's paid medical claim history that the patient has used the required product(s) (as listed in *Table 1*).

Table 1. Intravitreal VEGF Inhibitor Products

Product Group	Products	Step Therapy Requirements
Level 1	- bevacizumab	No PA required when used in the eye
Level 2	- Byooviz (ranibizumab-nuna) - Cimerli (ranibizumab-eqrn) - Lucentis (ranibizumab)	**1.** Treatment with a Level 1 product
Level 3	- Ahzantive (aflibercept-mrbb) - Beovu (brolucizumab-dbll) - Enzeevu (aflibercept-abzv) - Eylea (aflibercept) - Eylea HD (aflibercept) - Opuviz (aflibercept-yszy) - Pavblu (aflibercept-ayyh) - Yesafili (aflibercept-jbvf)	**1.** Treatment with a Level 1 product **AND** **2.** Treatment with a Level 2 product
Level 4	- Susvimo (ranibizumab injection via ocular implant) - Vabysmo (faricimab-svoa)	**1.** Treatment with a Level 1 product **AND** **2.** Treatment with a Level 2 product **AND** **3.** Treatment with a Level 3 product

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers intravitreal VEGF inhibitors coverable only under the medical benefit (as provider-administered medications).

B. Authorization **may** be reviewed annually. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, such as disease stability or improvement.

Position Statement

- The intent of this policy is to cover higher cost branded VEGF inhibitors when lower cost options (as listed in the coverage criteria) are ineffective or not a treatment option, as detailed in the coverage criteria.
- Bevacizumab is the lowest cost VEGF inhibitor for the treatment of ocular conditions and therefore does not require pre-authorization (PA) for ocular conditions.
- Although intravitreal VEGF inhibitors have different indications, they have demonstrated evidence of efficacy for maintaining or improving visual acuity across various retinal disorders in clinical trials.
- Intravitreal VEGF inhibitors all work using the same mechanism of action by binding to the receptor binding site of active forms of VEGF-A. Likely because of similarities in mechanism of action, studies have not been able to demonstrate that one product is significantly superior to another in efficacy or safety (as detailed in the *Clinical Efficacy* sections below, by diagnosis).
    * Recently approved Vabysmo (faricimab-svoa) works by inhibiting both VEGF-A and angiopoietin-2 (Ang-2). However, per the FDA labeling, the contribution of Ang-2 inhibition to treatment effect remains unknown at this time. [1]
    * Ranibizumab injection via ocular implant (Susvimo) is a long-acting formulation of ranibizumab. Susvimo consists of a small surgically implanted "port" that releases ranibizumab continually for up to six months, at which time the port is refilled. In clinical trials, ranibizumab injection via ocular implant (Susvimo) was non-inferior to ranibizumab intravitreal injection (Lucentis). However, there was a temporary drop in visual acuity and increase in ocular adverse events with ranibizumab injection via ocular implant (Susvimo).
- Byooviz (ranibizumab-nuna) and Cimerli (ranibizumab-eqrn) are FDA-approved biosimilars to Lucentis (ranibizumab). These biosimilars offer an equally effective alternative to the reference product, ranibizumab intravitreal injection (Lucentis), as well as lower cost than ranibizumab injection via ocular implant (Susvimo). FDA-approved biosimilar medications are clinically not meaningfully different than their reference products, also called "therapeutically equivalent." Although small differences in clinically inactive portions of the molecule may exist, the FDA approval certifies that the manufacturer has shown their product to be identical in function. There is no scientific basis to clinically prefer one FDA-approved product over another; given similar efficacy and safety, most contracts consider more costly products not medically necessary.
- Evidence-based recommendations and clinical guidelines do not differentiate the VEGF inhibitors in clinical practice recommendations. Evidence-based recommendations and clinical guidelines equally recommend the use of VEGF inhibitors, including bevacizumab, for the treatment of neovascular (wet) age-related macular degeneration (wAMD), macular edema secondary to retinal vein occlusion (RVO), retinopathy of prematurity (ROP), and diabetic macular edema (DME; including diabetic retinopathy associated with DME).

- Despite the availability of well-designed studies that have shown similar efficacy between VEGF inhibitors, there is an absence of studies and evidence-based guidelines to guide treatment in refractory AMD individuals who have failed one or more VEGF inhibitors, due to lack of or incomplete response. Defining non-responders to treatment is an additional challenge among clinicians given that there is no universally accepted nomenclature for describing different types of non-responsiveness. Multiple clinical features are used in practice as measures of treatment efficacy and response (improvement in visual acuity, reduction in intraretinal or subretinal fluid, increase in central macular thickness etc.); patients without a particular response may or may not be deemed as non-responders depending on provider approach.
- In clinical practice, approaches to subsequent treatment for refractory AMD individuals include reducing treatment intervals, increasing the dose of the current treatment if available, or switching to a different medication.
- Higher-cost VEGF products, including Eylea / Eylea HD (aflibercept)have been studied in other vascular-related ocular conditions. The clinical benefit of higher-cost VEGF products in these indications is uncertain to date.
- Previous concerns over the use of compounded or repackaged products, such as bevacizumab, have been alleviated by the FDA's 2013 Drug Quality and Security Act, which provides better oversight of compounding pharmacies. In addition, the American Society of Retina Specialists has published online safety information about compounding pharmacies to help retina specialists choose high-quality providers of bevacizumab. Furthermore, in February 2015 the FDA issued Draft Guidance regarding drug compounding and repackaging of biologics to further standardize quality of bevacizumab. [2-4]

Clinical Efficacy

Neovascular (wet) Age-related Macular Degeneration (AMD)

- Intravitreal VEGF inhibitors have similar effectiveness for wet AMD. They all have been shown to maintain or improve vision based clinical trials. Systematic reviews have concluded that the comparators have similar efficacy.
    * One high-quality systematic review of Avastin (bevacizumab) in the treatment of wAMD concluded that it improves visual acuity and central retinal thickness (moderate correlate to visual acuity) and is more effective than photodynamic therapy (without verteporfin). [5]
    * A 2019 systematic review of VEGF inhibitors in wAMD concluded that there were no major differences with respect to vision related outcomes comparing Lucentis (ranibizumab) and Avastin (bevacizumab) after one year of treatment. Of note, the review did not include any trials with Eylea (aflibercept) or Beovu (brolucizumab-dbll). [6]
    * A 2016 systematic review focusing on Eylea (aflibercept) concluded that intravitreal aflibercept has similar efficacy to Lucentis (ranibizumab) in terms of improvement and stability in visual acuity after one and two years of treatment. [7]

    * Beovu (brolucizumab-dbll) was evaluated in two phase 3 randomized, controlled trials: HAWK and HARRIER. Both studies had nearly identical designs and endpoints. Results demonstrated the brolucizumab was non-inferior to aflibercept for maintaining visual acuity. [8]

- The American Academy of Ophthalmology (AAO) guidelines state that in patients with wAMD, intravitreal injection therapy using VEGF inhibitors are the most effective way to manage wAMD and represents the first line of treatment. Guidelines include Eylea (aflibercept), Avastin (bevacizumab), Lucentis (ranibizumab), and Beovu (brolucizumab-dbll) for the treatment of wet AMD. The AAO does not recommend the use of Macugen (pegaptanib) in the treatment of wAMD due to evidence indicating that it does not improve visual acuity on average in patients with new onset wAMD unlike other currently available VEGF inhibitors. [9] The guidelines have not been updated since the approval of newer VEGF products, such as Vabysmo (faricimab-svoa).

Diabetic Macular Edema (DME)

- There is moderate certainty that VEGF inhibitors improve visual acuity in patients with DME; however, there is insufficient evidence to demonstrate that one VEGF inhibitor is clinically superior to another in the treatment of DME based on one high-quality systematic review and one government-sponsored comparative study.
    * A Cochrane systematic review (2018) concluded that Eylea (aflibercept), Avastin (bevacizumab), and Lucentis (ranibizumab) are more effective than laser photocoagulation in improving visual acuity (i.e., likelihood of gaining three or more lines of vision). Although there were no significant sub-group differences in visual acuity between the VEGF inhibitors, there was insufficient power to detect a difference between them. [10]
    * A government-sponsored trial (PROTOCOL T) evaluated mean improvement in visual acuity for up to two years in patients with DME treated in a randomized fashion 1:1:1, with Eylea (aflibercept) 2mg, Avastin (bevacizumab) 1.25mg or Lucentis (ranibizumab) 0.3mg, every 4 weeks: [11 12]
        - The trial concluded that there was no clinically meaningful difference in improvement in visual acuity in the overall DME population.
        - It was noted that Eylea (aflibercept) was modestly more effective (approximate mean improvement of 6 letters) at improving visual acuity relative to the other VEGF inhibitors in a subset of patients with lower baseline visual acuity at the 1- and 2-year follow-up; however, there was low confidence in the trial results due to an imbalance in concomitant treatment between study arms, potential for bias as investigators were not blinded to treatment, and that results may not apply to eyes with persistent or recurrent DME that are already being treated with anti-VEGF inhibitors, based on study eligibility criteria.
- More recently, a new formulation of Susvimo (ranibizumab) was approved for delivery of ranibizumab injection via an implanted port. Clinical trials of ranibizumab via ocular implant (Susvimo) demonstrated comparable efficacy results to ranibizumab intravitreal injections (Lucentis); however, the implant was associated with a higher incidence of

adverse events, including a 3-fold higher rate of endophthalmitis. The clinical efficacy and safety of ranibizumab via ocular implant (Susvimo) was assessed in one randomized, visual assessor-masked, non-inferiority trial (Archway; n=415). [13]

* Patients diagnosed with wAMD within the nine months prior to screening and received at least three doses of intravitreal VEGF inhibitors. Only VEGF responders were included in the trial.
* Patients were randomized to ranibizumab via ocular implant (Susvimo) with refills every 24 weeks or ranibizumab intravitreal injections (Lucentis) every 4 weeks.
* The primary efficacy endpoint was the change from baseline in best-corrected visual acuity (BCVA) score averaged over week 36 and 40.
* Efficacy of ranibizumab via ocular implant (Susvimo) was noninferior to ranibizumab intravitreal injections (Lucentis) with a change from baseline BCVA of +0.2 and +0.5, respectively at 36-40 weeks [difference of -0.3 (CI -1.7 to 1.1) meeting non-inferiority].
* However, the trial was relatively short, given the chronic progressive nature of wAMD. Therefore, the durability of the treatment effect is unknown.
* Of note, patients treated with the ranibizumab via ocular implant (Susvimo) experienced a transient and reversible postsurgical drop in visual acuity, as measured by Early Treatment Diabetic Retinopathy Study Letters (ETDRS), after implant insertion, with vision returning to baseline by week 8.
* In addition, safety concerns inherent to an ocular implant may limit the utility of ranibizumab via ocular implant (Susvimo) (see *Safety* section below for additional details).

- The American Academy of Ophthalmology guidelines support the use of VEGF inhibitors, including Lucentis (ranibizumab), Eylea (aflibercept), and Avastin (bevacizumab) in the treatment of DME (including diabetic retinopathy associated with DME). [14 15]
  * AAO recommendations were based on trials comparing Eylea (aflibercept), Avastin (bevacizumab), and Lucentis (ranibizumab) to focal laser treatment (READ-2, BOLT, AND DA VINCI studies, respectively). All trials showed that treatment with VEGF inhibitors resulted in statistically and clinically significant improvements in visual acuity in patients with DME after one to two years of treatment compared to laser treatment.
  * In the BOLT study, Avastin (bevacizumab) was also shown to reduce the level of severity of diabetic retinopathy in patients with DME over the 12-month treatment period whereas the severity remained relatively stable in patients who received laser therapy. [16]
  * The guidelines have not been updated since the availability of newer VEGF products, such as ranibizumab injection via ocular implant (Susvimo), Vabysmo (faricimab-svoa), or the biosimilars.

Diabetic Retinopathy (without DME)

- Treatment with Lucentis (ranibizumab) demonstrated efficacy in the treatment of diabetic retinopathy without diabetic macular edema in the NIH-funded Diabetic Retinopathy Clinical Research Network Study. [17 18] The study compared Lucentis (ranibizumab) to panretinal laser therapy in patients with diabetic retinopathy, and found that patients both with and without diabetic macular edema had improved short-term and 2-year outcomes with Lucentis (ranibizumab) compared to panretinal or scatter photocoagulation laser therapy. [17]
- The American Academy of Ophthalmology guidelines support the use of VEGF inhibitors, including Lucentis (ranibizumab), Eylea (aflibercept), and Avastin (bevacizumab) in the treatment of DME (including diabetic retinopathy associated with DME). [14 15] [See *Diabetic Macular Edema* above, for details]
- Trials are ongoing for the use of Beovu (brolucizumab-dbll) in diabetic retinopathy. [19]

Retinal Vein Occlusion

- There is moderate certainty that VEGF inhibitors [Eylea (aflibercept), Avastin (bevacizumab), Macugen (pegaptanib), and Lucentis (ranibizumab)] are more effective than sham injection or laser therapy in maintaining or improving visual acuity in patients with macular edema secondary to RVO (branch and central; BRVO, CRVO) based on two Cochrane systematic reviews (2020); however, there is insufficient evidence to demonstrate that one VEGF inhibitor is clinically superior to another due to the lack of direct comparative evidence. [20 21]
- More recently, one non-inferiority LEAVO trial evaluated Lucentis (ranibizumab), Eylea (aflibercept), or bevacizumab in patients with CRVO (n = 463). [22] The pre-defined null hypothesis that Eylea (aflibercept) and bevacizumab are each inferior to Lucentis (ranibizumab), tested with a non-inferiority margin of –5 visual acuity letters over 100 weeks. The study demonstrated that Eylea (aflibercept) was non-inferior to Lucentis (ranibizumab), but not superior. However, the study was unable to demonstrate non-inferiority of bevacizumab to Lucentis (ranibizumab). Therefore, the aforementioned conclusion remains unchanged: there is insufficient evidence to demonstrate that one VEGF inhibitor is clinically superior to another due to the lack of direct comparative evidence.
- Results from two randomized, multicenter, phase III trials (BALATON and COMINO) demonstrated monthly treatment with Vabysmo (faricimab-svoa) provided early and sustained improvement in vision in individuals with branch and central RVO, meeting the primary endpoint of non-inferior visual acuity gains at 24 weeks, compared to Eylea (aflibercept). The BCVA gains from baseline at week 24 with Vabysmo (faricimab-svoa) were noninferior to Eylea (aflibercept) in BALATON (adjusted mean [95% confidence interval] change: +16.9 letters [15.7, 18.1] vs. +17.5 letters [16.3, 18.6]) and COMINO (+16.9 letters [15.4, 18.3] vs. +17.3 letters [15.9, 18.8]). [23]
- Evidence-based recommendations from UpToDate, the American Academy of Ophthalmology, and the Centers for Medicare and Medicaid Services support the use of VEGF inhibitors [Eylea (aflibercept), Avastin (bevacizumab), Lucentis (ranibizumab), and Vabysmo (faricimab-svoa)] for the treatment of macular edema secondary to retinal

vein occlusion. [24-26] As of publication of this policy, these recommendations have not been updated since the availability of newer VEGF products, such as ranibizumab injection via ocular implant (Susvimo), or the biosimilars.

Myopic Choroidal Neovascularization (mCNV)

- A Cochrane systematic review (2016) concluded that there is low-to-moderate certainty evidence for the efficacy of VEGF inhibitors to treat mCNV at one year and two years. [27] The authors also concluded that Lucentis (ranibizumab) and Avastin (bevacizumab) are equivalent in terms of efficacy in the treatment of patients with mCNV.
- Trials are ongoing for the use of Beovu (brolucizumab-dbll) in mCNV. [19]

Retinopathy of Prematurity (ROP)

- Retinopathy of prematurity (ROP) is a developmental vascular disorder that occurs in the retina of preterm infants and can lead to blindness. The incidence and severity of ROP increase with decreasing gestational age (GA) and birth weight. Severe ROP develops in approximately 40 percent of infants born at 22 to 25 weeks GA, 20 percent of those born at 25 to <27 weeks GA, and <5 percent of those born at 27 to 30 weeks GA. [42]
- Standard of care treatments for ROP include laser treatment and anti-VEGF injections including bevacizumab, ranibizumab, and aflibercept. [41]
- There is no evidence that any one anti-VEGF is safer or more effective than another for the treatment of ROP.

Refractory AMD

- Patients suffering from refractory or recurrent neovascular AMD (nAMD) may develop mechanisms of resistance to VEGF inhibitors which results in a diminished therapeutic effect. Most treatment approaches to refractory AMD are guided by provider clinical experience or preference, without specific guidelines available for this patient population.
- Evidence for treating refractory nAMD is limited to small, pilot studies or retrospective case reviews, not randomized controlled trials of significant size.
- The LAST study, a prospective pilot study of 9 subjects with subfoveal neovascular AMD with persistent subretinal or intraretinal fluid despite 6 months of treatment with either Lucentis (ranibizumab) 0.5mg/0.05ml or Avastin (bevacizumab) 1.25mg/0.05ml intravitreally, showed that at 6 months, high-dose Lucentis (ranibizumab) 2mg/0.05ml had the potential to maintain or improve visual acuity in patients with persistent fluid secondary to nAMD and despite prior monthly treatment with standard doses of VEGF-inhibitors. There was a mean improvement in visual acuity of 6 EDTRS letters; however, given the small sample size, it was not possible to make a statistical comparison between the two treatment groups. [28]

Other Uses

- The use of any VEGF inhibitor in conjunction with other VEGF inhibitors is considered investigational as there is no evidence evaluating the efficacy or safety of combination therapy.
- Trials of Eylea (aflibercept) in a variety of other conditions such as radiation retinopathy, central serous chorioretinopathy, and pathologic myopia are ongoing and are considered investigational due to lack of published, high-quality data.

- Published data evaluating Lucentis (ranibizumab) in several other conditions is preliminary. Larger well-controlled trials are needed to determine the clinical benefit of Lucentis (ranibizumab) in these conditions.
    * One study in 37 patients with retinal angiomatous proliferation evaluated Lucentis (ranibizumab) alone, and either Lucentis (ranibizumab) or intravitreal triamcinolone plus photodynamic therapy. Disease stabilization occurred in all three groups; however, a trend toward better visual acuity and anatomic restoration occurred in the triamcinolone/photodynamic therapy group. These results were confirmed at 3 years. [29 30]
    * A single-center pilot study in 10 patients with primary pterygia evaluated the tolerability of Lucentis (ranibizumab) either prior to surgery or at the time of surgery. [31]
    * A single-center pilot study in 10 patients undergoing trabeculectomy evaluated Lucentis (ranibizumab) to assist in wound healing when given with topical mitomycin C. [32]
    * Lucentis (ranibizumab) was evaluated versus photodynamic therapy in a single-center pilot study in 16 patients with chronic central serous chorioretinopathy. [33]

Safety [34]

- Intravitreal VEGF inhibitors have been associated with inflammation, blurred vision, corneal edema, eye discharge and irritation, and hypertension. However, a 2016 Cochrane review that concluded that neither Eylea (aflibercept) or Lucentis (ranibizumab) drug produces a greater incidence of systemic or vision-threatening complications. [7]
- Recent updates (2023) to prescribing information for Eylea/Eylea HD (aflibercept) and Vabysmo (faricimab-svoa) include warnings/precautions for the potential of retinal vasculitis with or without occlusion, based on post-marketing experience.
- Additional serious adverse effects reported with intravitreal VEGF inhibitors include endophthalmitis, retinal detachment, and iatrogenic traumatic cataract. After injection, patients should be advised to seek immediate care if the treated eye becomes red, painful, sensitive to light, or they notice a change in vision. There is no known difference between the safety profile of the currently available biosimilars and the innovator products.
- Although Lucentis (ranibizumab) has sufficient clinical safety experience, experience with the implant formulation of Susvimo (ranibizumab) is limited. In clinical trials, ranibizumab injection via ocular implant (Susvimo) was associated with a higher incidence of adverse events compared to monthly intravitreal injections of Lucentis (ranibizumab), including a three-fold higher rate of endophthalmitis, for which a black box warning is included in its prescribing information. In addition, the ranibizumab injection via ocular implant (Susvimo) and/or implant-related procedures have been associated with infection, hemorrhage, retinal detachment, implant dislocation, and decrease in visual acuity. [35]
- *Cardiovascular (CV) safety*: A meta-analysis evaluating the CV safety of intravitreal VEGF inhibitors in patients with wet AMD, DME, or RVO concluded that VEGF

inhibitors, specifically Avastin (bevacizumab) and Lucentis (ranibizumab), are not associated with a significant increase in risk of systemic CV and hemorrhagic events or in overall mortality, stroke, or CV mortality in elderly patients. However, the studies and meta-analysis were not sufficiently powered to correctly assess these risks. [36]

- *Comparative safety*: The trial conducted by the CATT research group comparing Lucentis (ranibizumab) to Avastin (bevacizumab) for the treatment of wet AMD found the following regarding safety: [17 18]
    * A statistically significant difference was seen at 52 weeks in the rates of serious systemic adverse events between the Lucentis (ranibizumab) and Avastin (bevacizumab) groups (19.0% vs 24.1%, P = 0.04).
    * A significant difference was also seen at 2 years [39.9% Avastin (bevacizumab) vs 31.7% Lucentis (ranibizumab); adjusted risk ratio 1.30; 95% CI: 1.07, 1.57; P = 0.009].
    * This difference was largely due to hospitalizations for infections such as pneumonia and urinary tract infections. It is uncertain if these events were related to either medication.
- *Compounded VEGF inhibitors* - Avastin (bevacizumab) is listed in national treatment guidelines and is recognized by the Centers for Medicare and Medicaid Services as a safe and effective treatment option for wet AMD, DME, and RVO. [12]
    * Avastin (bevacizumab), when used in the eye, must be extemporaneously compounded to achieve the appropriate dose. In 2011, a group of cases of endophthalmitis were reported with the use of Avastin (bevacizumab) which was determined to be the result of unsafe practices by one compounding pharmacy. [7 37 38]
    * While the use of Avastin (bevacizumab) continues to be associated with the risk of endophthalmitis, all intravitreal injections, including commercially available preparations of Eylea (aflibercept), Macugen (pegaptanib), and Lucentis (ranibizumab) carry this risk. [39 40]

Dosing [34]

- Eylea (aflibercept) 2 mg is injected intravitreally (into the eye) every 4 weeks for 12 weeks, then every 8 weeks. After one year of effective therapy patients may also be treated with one dose every 12 weeks. Eylea HD (aflibercept) 8 mg is injected intravitreally every 4 weeks (+/- 7 days) for the first three doses, followed by 8 mg every 8 to 16 weeks (+/- 1 week).
- Avastin (bevacizumab) 1.25 mg is injected intravitreally (into the eye) monthly or as needed.
- Beovu (brolucizumab) 6 mg is injected monthly for the first three doses, followed by 6 mg (one dose) every 8–12 weeks.
- Ranibizumab (biosimilars, Lucentis) 0.5 mg is injected intravitreally (into the eye) every 1 to 3 months.
- The Susvimo ocular implant system is initially inserted into the eye and the 2 mg ranibizumab injection solution refilled every 6 months.

- Vabysmo (faricimab-svoa) is injected monthly for the first four doses, followed by 6 mg (one dose) every 4-16 weeks, with significant variation in dosing dependent on indication and response to therapy.

Appendix 1: Nomenclature of ocular conditions treated with VEGF Inhibitors [24 41 42]

Diagnosis	Synonyms
Neovascular (wet) age-related macular degeneration	Exudative senile macular degeneration
	Age-related macular degeneration (ARMD)
	Choroidal neovascularization (CNV)
Diabetic Macular Edema and Diabetic Retinopathy	Diabetic macular edema (DME) associated with diabetic retinopathy
	DME due to Type 1 or Type 2 diabetic retinopathy
	DME due to nonproliferative or proliferative diabetic retinopathy (mild, moderate, or severe)
	Center involving diabetic macular edema
	Diabetic retinal edema
	Clinically significant diabetic macular edema (CSME)
Myopic choroidal neovascularization	Choroidal neovascularization secondary to pathologic myopia (mCNV)
	Pathologic myopia
Macular edema associated with Retinal Vein Occlusion	Macular edema associated with central retinal vein occlusion (CRVO)
	Macular edema associated with branch retinal vein occlusion (BRVO)
	Macular edema associated with tributary (branch) retinal vein occlusion

Codes	Number	Description
HCPCS	J0179	Injection, brolucizumab-dbll (Beovu), 1 mg
HCPCS	J0178	Injection, aflibercept (Eylea), 1 mg
HCPCS	J0177	Injection, aflibercept (Eylea HD), 8mg
HCPCS	J2778	Injection, ranibizumab (Lucentis), 0.1 mg
HCPCS	Q5128	Injection, ranibizumab-eqrn, biosimilar (Cimerli), 0.1mg
HCPCS	Q5124	Injection, ranibizumab-nuna, biosimilar, (Byooviz), 0.1 mg
HCPCS	J2779	Injection, ranibizumab, via intravitreal implant (Susvimo), 0.1 mg
HCPCS	J2777	Injection, faricimab-svoa (Vabysmo), 0.1 mg
HCPCS	J9035	Injection, bevacizumab, (Avastin) 10 mg
HCPCS	Q5107	Injection, bevacizumab-awwb, biosimilar, (Mvasi), 10 mg
HCPCS	Q5118	Injection, bevacizumab-bvzr, biosimilar, (Zirabev), 10 mg
HCPCS	Q5126	Injection, bevacizumab-maly, biosimilar (Alymsys), 10 mg
HCPCS	Q5129	Injection, bevacizumab-adcd biosimilar, (Vegzelma), 10 mg

Revision History

Revision Date	Revision Summary
9/19/2024	• Added newly FDA-approved biosimilars Ahzantive (aflibercept-mrbb), Enzeevu (aflibercept-abzv) and Pavblu (aflibercept-ayyh) to Level 3. • Moved Lucentis (ranibizumab) from a Level 3 to Level 2 product. • Added HCPCS code for Cimerli (ranibizumab-eqrn).
6/20/2024	• Added newly FDA-approved biosimilars Opuviz (aflibercept-yszy) and Yesafili (aflibercept-jbvf) to policy. • HCPCS Appendix updated with new Eylea HD code (J0177).
3/21/2024	Removed 90-day lookback in criterion II.A.2 (certain agents have a 4-month dosing schedule or response to therapy may dictate an extended dosing schedule).
12/7/2023	Added Eylea HD, a new aflibercept higher dose product, to policy.
9/14/2023	No criteria changes with this annual review. Added information about retinopathy of prematurity (ROP) to backend of policy.
3/16/2023	No changes to criteria with this annual update.
9/23/2022	• Updated format of step therapy requirements for operational clarity. No change to intent. • Added Cimerli (ranibizumab-eqrn) to policy as a Level 2 product.

Revision Date	Revision Summary
3/18/2022	• Updated step therapy with lower-cost VEGFs (bevacizumab, biosimilars) to a claim look-back, for operational consistency. • Added step therapy with Lucentis (ranibizumab) to the ranibizumab injection via ocular implant (Susvimo) criteria. • Clarified name of formulation: ranibizumab injection via ocular implant (Susvimo). • Added Vabysmo (faricimab-svoa) per charter.
10/15/2021	Effective 1/1/2022: • Added newly FDA-approved biosimilar Byooviz (ranibizumab-nuna) to policy. • Updated step therapy criteria to require use of Byooviz (ranibizumab-nuna) prior to coverage of Eylea (aflibercept), Beovu (brolucizumab), or Lucentis (ranibizumab) in addition to bevacizumab. • Added Susvimo (ranibizumab) per charter.
4/21/2021	COT language added; no other changes to criteria with this annual update.
4/22/2020	No changes to criteria with this annual update.
1/22/2020	• New policy (effective 2/15/2020. Replaces individual drug coverage policies for Lucentis (ranibizumab) and Eylea (aflibercept). • Coverage criteria for Beovu (brolucizumab) have been added. • Limits use to those patients in which bevacizumab has been ineffective when used in the eye, unless contraindicated.

Drug names identified in this policy are the trademarks of their respective owners.

Medication Policy Manual | **Policy No:** dru622

Topic: Padcev, enfortumab vedotin | **Date of Origin:** May 15, 2020

Committee Approval Date: June 20, 2024 | **Next Review Date:** 2025

Effective Date: July 15, 2024

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Padcev (enfortumab vedotin) is an antibody-drug conjugate that delivers chemotherapy to bladder cancer cells (cells that express nectin-4). It is given via intravenous infusion and is indicated for use in bladder cancer that has spread outside of the bladder.

Policy/Criteria

Most contracts require prior authorization approval of Padcev (enfortumab vedotin) prior to coverage.

I. Continuation of therapy (COT): Padcev (enfortumab vedotin) may be considered medically necessary for COT when criterion A, B, or C below is met.

A. For diagnoses NOT listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND there is documentation that the medication was covered by another health plan. Examples of documentation include the coverage approval letter from the previous health plan or paid claim.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

B. For diagnoses listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

C. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

Please note*: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Padcev (enfortumab vedotin) may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) that criteria A and B below are met.

A. A diagnosis of **locally advanced (unresectable) or metastatic urothelial carcinoma (bladder cancer).**

AND

B. Padcev (enfortumab vedotin) will be used in one of the following settings (1 or 2):

1. First-line in advanced disease setting: when the following criteria are met (a, b, c, and d):

a. The patient has not had prior systemic therapy (chemotherapy or immunotherapy) in the advanced disease setting (locally advanced or metastatic disease).

AND

b. The patient is ineligible for any platinum-containing chemotherapy (such as cisplatin or carboplatin).

PLEASE NOTE: Any platinum ineligibility may include poor kidney function (CrCl<60), poor performance status (≥2), significant hearing loss (≥ 25 dB), grade 2-4 peripheral neuropathy, heart failure, other comorbidities, etc.

AND

c. Padcev (enfortumab vedotin) will be used in combination with Keytruda (pembrolizumab).

AND

d. No prior therapy with PD-1/PD-L1 blocking antibody therapy (see *Appendix 1*).

OR

2. Subsequent line: The patient has relapsed or refractory disease and the following criteria are met (a and b):

a. Disease has progressed on or after each of the following prior therapies (i and ii):

i. A platinum-containing chemotherapy regimen (such as cisplatin, carboplatin), unless patient is ineligible for platinum-containing chemotherapy.

PLEASE NOTE: Use may have been in the neoadjuvant (before surgical resection)/adjuvant (after surgical resection), locally advanced, or metastatic settings]

AND

ii. Therapy with a programmed death receptor-1 (PD-1) or programmed death-ligand 1 (PD-L1) inhibitor (see *Appendix 1*) unless contraindicated or not tolerated.

AND

b. Padcev (enfortumab vedotin) will be used as monotherapy.

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers Padcev (enfortumab vedotin) coverable only under the medical benefit (as a provider-administered medication).

B. When pre-authorization is approved, Padcev (enfortumab vedotin) may be authorized in quantities listed in the table below, until disease progression.

Treatment setting	Dose	Quantity
First-line in combination with Keytruda (pembrolizumab)	Up to 125 mg per dose	Up to two doses every 21 days
Subsequent line as monotherapy	Up to 125 mg per dose	Up to three doses every 28 days

C. Authorization **may** be reviewed at least annually. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, such as disease stability or improvement.

IV. Padcev (enfortumab vedotin) is considered investigational when used for all other conditions.

Position Statement

Summary

- Padcev (enfortumab vedotin) is an intravenously administered antibody-drug conjugate that delivers cytotoxic chemotherapy to cells that express nectin-4 (e.g., bladder cancer cells).
- It is indicated as monotherapy for use in patients with advanced (unresectable locally advanced or metastatic) urothelial carcinoma (UC; bladder cancer) when disease progresses after therapy with platinum-based chemotherapy (unless ineligible for platinum-based therapy) and a PD-1/PD-L1 inhibitor, and in combination with Keytruda (pembrolizumab) as a front-line therapy for locally advanced or metastatic UC.
- The intent of this policy is to allow coverage of Padcev (enfortumab vedotin) for patients with advanced (locally advanced or metastatic) UC as a monotherapy for disease that has progressed on or after prior therapy in the advanced setting, or in combination with Keytruda (pembrolizumab) as a front-line therapy for patients who are not eligible for cisplatin-containing chemotherapy, up to the dose shown to be safe and effective in clinical trials.
- The evidence for Padcev (enfortumab vedotin) in combination with Keytruda (pembrolizumab) as a front-line therapy for locally advanced or metastatic UC is based on a randomized controlled trial (RCT) that demonstrated a clinically relevant improvement in overall survival (OS) relative to a standard of care platinum-based chemotherapy regimen. However, it is not known how Padcev (enfortumab vedotin) plus Keytruda (pembrolizumab) compares with front-line platinum-based chemotherapy followed by maintenance therapy with a PD-1 inhibitor, a combination which has also been shown to improve median OS relative to platinum-based chemotherapy alone. Additionally, the use of front-line Padcev (enfortumab vedotin) plus Keytruda (pembrolizumab) has not been compared with the sequential use of these two medications.
- The use of Padcev (enfortumab vedotin) as a monotherapy in the subsequent-line therapy for locally advanced or metastatic UC is based on a small, single-arm trial that measured tumor response rates (early-phase, low quality evidence). All of the patients in the trial had disease progression on prior therapy with platinum-based chemotherapy and a PD-1 or PD-L1 inhibitor.
- A confirmatory trial later showed that Padcev (enfortumab vedotin) improves median overall survival (OS) relative to single-agent chemotherapy (e.g., docetaxel or paclitaxel) in patients with locally advanced or metastatic bladder cancer who had disease progression during or after cytotoxic chemotherapy and immune checkpoint inhibitor therapy (PD-1 or PD-L1 inhibitors).

- Padcev (enfortumab vedotin) has a boxed warning describing the risk of potentially serious and fatal skin reactions. Similar to chemotherapy, it may cause nausea and vomiting, fatigue, neutropenia and infections. Additionally, high blood glucose (including diabetes mellitus and diabetic ketoacidosis), and peripheral neuropathy have been reported.
- The NCCN bladder cancer guideline lists Padcev (enfortumab vedotin) among potential therapies for locally advanced or metastatic bladder cancer in the treatment settings described above. In the front-line setting the strongest guideline recommendations are for chemotherapy followed by maintenance therapy with Bavencio (avelumab).
- Padcev (enfortumab vedotin) is given via IV infusion over 30 minutes at a dose of 1.25 mg/kg (maximum of 125 mg per dose). As monotherapy it is given every week for 3 consecutive weeks out of every 28-day cycle. When given in combination with Keytruda (pembrolizumab) it is given weekly for 2 consecutive weeks out of each 21-day cycle. It is administered until disease progression or unacceptable toxicity.

Regence Pharmacy Services performs independent analyses of oncology medication evidence, to establish coverability per the contracts with the health plan.

- Most contracts define coverability based on established clinical benefit in published, peer-reviewed literature, along with consideration of regulatory status.
- FDA approval does not in itself establish medical necessity, as unpublished, low-quality evidence, including exploratory analyses and unvalidated surrogate endpoints, may be used as the basis of approval. Regulatory approval may or may not reflect clinical benefit relative to standard of care and the recommendations of expert clinical advisors such as the Oncologic Drugs Advisory Committee (ODAC). FDA approvals generally do not consider cost compared to established therapies, or value to members.
- Likewise, NCCN clinical practice guidelines assignment of a recommendation (category 1, 2a, or 2b) does not necessarily establish medically necessity. NCCN recommendations are inconsistently supported by published, peer-reviewed literature and do not uniformly consider value of new therapies relative to existing potentially higher-value treatment options, considering effectiveness, safety, and cost.
- Medication coverage criteria are developed based on the 'medical necessity' assessment, as described above.

Regence Pharmacy Services analysis and coverage policy may differ from FDA labeled indication and/or NCCN clinical practice guidelines.

Clinical Efficacy

- The approval of Padcev (enfortumab vedotin) was based on a small, single-arm, non-blinded study in patients with locally advanced or metastatic urothelial carcinoma (bladder cancer) who had two prior lines of therapy for their disease. [1,2] The overall quality of this evidence is poor.
    * All patients had prior therapy with a platinum-based chemotherapy regimen and a checkpoint inhibitor (either a PD-1 or PD-L1 inhibitor). The chemotherapy was administered in the adjuvant or neoadjuvant setting if there was progression within 12 months, or in the locally advanced or metastatic disease settings.

    * Additional characteristics of patients enrolled in the trial included good performance status, no active CNS disease, no sensory or motor neuropathy, and no uncontrolled diabetes.
    * The trial evaluated tumor response (overall response rate) as the primary endpoint. Tumor response (stabilization of shrinking of tumor size on an x-ray) has not been shown to accurately predict improvement in survival, function, or quality of life in the advanced bladder cancer setting.
    * Approximately one in three patients enrolled in the trial stopped treatment for reasons other than meeting a study endpoint (an adverse event, or physician or patient decision).
- A confirmatory trial later showed that Padcev (enfortumab vedotin) improves median overall survival (OS) in this population. [3]
    * Patients with locally advanced or metastatic urothelial carcinoma who had disease progression on a platinum-based chemotherapy regimen and a check-point inhibitor (either a PD-1 or PD-L1 inhibitor) were randomized (N=608) to receive either Padcev (enfortumab vedotin) or single-agent chemotherapy (docetaxel, paclitaxel, or vinflunine).
    * The median age of patients in the trial was 68 years. Seventy-seven percent of the population were men. Seventy-eight percent had visceral disease.
    * The median OS, the primary endpoint, was 12.9 months and 9.0 months in the Padcev (enfortumab vedotin) and chemotherapy treatment arms, respectively. [HR for death, 0.70 (95% CI: 0.56, 0.89); p=0.001]
- Padcev (enfortumab vedotin) was also evaluated as a front-line therapy for locally advanced or metastatic UC in combination with Keytruda (pembrolizumab) [Study EV-302/ KEYNOTE-A39]. The evidence is based on a large (N=886), open-label RCT that compared this combination with a platinum-based chemotherapy regimen. [4]
    * Patients enrolled in the study had no prior therapy for advanced disease and were eligible to receive platinum-based chemotherapy. Prior neoadjuvant or adjuvant chemotherapy was allowed if there had been no disease recurrence within 12 months after its completion.
    * Padcev (enfortumab vedotin) was given in 21-day cycles until disease progression. Keytruda (pembrolizumab) was given in 21-day cycles until disease progression or for a maximum of 35 cycles (2 years).
    * Ninety-five percent of the population had metastatic disease. Approximately 27% had upper tract UC while the remaining 73% had lower tract UC.
    * The median OS was 31.5 months and 16.1 months in the Padcev (enfortumab vedotin) plus Keytruda (pembrolizumab) and chemotherapy treatment arms, respectively.

Guidelines [5]

- The NCCN bladder cancer guideline lists the following recommendations for locally advanced or metastatic UC (bladder cancer):
    * *Front-line:* Preferred, category 1 recommendations include cisplatin plus gemcitabine followed by Bavencio (avelumab) maintenance, and dose-dense methotrexate/vinblastine/doxorubicin/cisplatin followed by Bavencio (avelumab).

Padcev (enfortumab vedotin) plus Keytruda (pembrolizumab) is included as a category 2A recommendation, including in patients ineligible for cisplatin.

* *Second- and subsequent-line:* Keytruda (pembrolizumab) after initial therapy with a platinum-containing regimen when used as monotherapy [preferred, category 1]; and Padcev (enfortumab vedotin) monotherapy is listed among several category 2A recommendations.

Investigational Uses

- Padcev (enfortumab vedotin) is a nectin-4-directed antibody-drug conjugate (ADC). Nearly all bladder cancers overexpress this protein. There is interest in using this ADC in other types of cancer that overexpress nectin-4 (e.g., ovarian cancer, hepatocellular carcinoma); however, there is no evidence to support the use of enfortumab vedotin (Padcev) outside of the locally advanced or metastatic bladder cancer setting at this time.

Safety [6]

- Since its initial approval, Padcev (enfortumab vedotin) has picked up a boxed warning for serious skin reactions, including Stevens-Johnson syndrome and toxic epidermal necrolysis (TEN).
- Systemic adverse events (AEs) occurred with a high frequency in the Padcev (enfortumab vedotin) pivotal trial:
  * Grade 3 and 4 AEs occurred in 68% of patients.
  * Dose reductions were required in 34% of the patients.
  * The discontinuation rate due to AEs was 16%.
  * The most common serious AEs included urinary tract infections, cellulitis, febrile neutropenia, diarrhea, sepsis, acute kidney injury, dyspnea, and rash.
  * Peripheral neuropathy occurred in 56% of patients. Four percent of these cases were Grade 3 or 4 AEs.
  * Grade 3 or 4 hyperglycemia occurred in 8% of patients.
- There is a greater risk of AEs when Padcev (enfortumab vedotin) is used in combination with Keytruda (pembrolizumab) based on a significant numerical increase in overall AEs observed across studies; however, the difference is difficult to accurately quantify as there were no direct comparators in the combination study.

Dosing [6]

- The labeled dose of Padcev (enfortumab vedotin) is 1.25 mg/kg, up to a maximum of 125 mg per dose. It is given via intravenous infusion with the following frequency:
  * ***Monotherapy:*** On Days 1, 8, and 15 of every 28-day cycle until disease progression or unacceptable toxicity.
  * ***In combination with Keytruda (pembrolizumab):*** On Days 1, and 8 of every 21-day cycle until disease progression or unacceptable toxicity
- Doses are withheld, adjusted, or discontinued based on the severity of certain side effects (e.g., hyperglycemia, peripheral neuropathy, skin reactions). Refer to package labeling for specific recommendations.

Revision History

Revision Date	Revision Summary
6/20/2024	• Added 'in the locally advanced or metastatic disease setting' to UC, first-line criterion II.B.1.a to clarify intent. • Corrected the quantity limits under Quantity Limitations (III.B). (the approvable quantities for the two covered settings were reversed). No change to intent.
12/7/2023	No criteria changes with this annual review.
9/14/2023	Added coverage criteria for use in locally advanced or metastatic urothelial carcinoma when used in combination with Keytruda (pembrolizumab) as a front-line therapy for patients who are not eligible for cisplatin-containing chemotherapy.
12/9/2022	• Updated standard language in policy. • Changed coverage criteria to allow waiving the requirement for prior platinum-based chemotherapy if a patient is ineligible for this type of therapy.
1/20/2021	Updated continuation of therapy (COT) language. No changes to coverage criteria.
4/22/2020	New policy (effective 05/15/2020). Limits coverage to patients with unresectable locally advanced or metastatic urothelial carcinoma (bladder cancer) in patients whose disease progressed after front-line platinum-based chemotherapy and second-line checkpoint inhibitor therapy (PD-1/PD-L1 inhibitor therapy), the setting in which it was studied and has a labeled indication.

Medication Policy Manual | **Policy No:** dru623

Topic: Enhertu, fam-trastuzumab deruxtecan-nxki | **Date of Origin:** May 15, 2020

Committee Approval Date: March 6, 2025 | **Next Review Date:** 2025

Effective Date: May 1, 2025

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Enhertu (fam-trastuzumab deruxtecan-nxki) is an intravenous (IV) medication used for certain types of cancer. It is an antibody-drug conjugate that delivers chemotherapy to cancer cells that express human epidermal growth factor receptor 2 (HER2).

Policy/Criteria

Most contracts require pre-authorization approval of Enhertu (fam-trastuzumab deruxtecan-nxki) prior to coverage.

I. Continuation of therapy (COT): Enhertu (fam-trastuzumab deruxtecan-nxki) may be considered medically necessary for COT when criterion A, B, or C below is met.

A. For diagnoses NOT listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND there is documentation that the medication was covered by another health plan. Examples of documentation include the coverage approval letter from the previous health plan or paid claim.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

B. For diagnoses listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

C. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

Please note*: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Enhertu (fam-trastuzumab deruxtecan-nxki) may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) that one of the following below (A, B, C, or D) is met:

A. A diagnosis of **locally advanced or metastatic gastric or gastroesophageal junction (GEJ) cancer** when criteria 1 through 3 below are met:

1. The tumor is human epidermal growth factor 2 (HER2)-positive**.**

AND

2. There has been disease progression on, or after, two or more prior lines of therapy in the advanced disease setting, which must have included all of the following (a through c):

a. Trastuzumab.

AND

b. A platinum (such as cisplatin, carboplatin, or oxaliplatin).

AND

c. A fluoropyrimidine [such as fluorouracil (5-FU) or capecitabine.

AND

3. The patient has not had prior treatment with Enhertu (fam-trastuzumab deruxtecan-nxki).

OR

B. A diagnosis of **unresectable or metastatic breast cancer** in one of the following two settings (1 or 2):

1. There is documentation that the tumor is **HER2-positive** and all of the following criteria are met (a and b):

a. There has been disease progression on a prior HER2-directed therapy in one of the following two settings (refer to *Appendix 1*):

i. In the metastatic setting,

OR

ii. In the neoadjuvant or adjuvant setting after disease recurrence during or within six months of completing therapy.

AND

b. The patient has not had prior treatment with Enhertu (fam-trastuzumab deruxtecan-nxki).

OR

2. There is documentation that the tumor is **HER2-low (IHC 1+ or IHC 2+/ISH-negative)** and all of the following criteria are met (a through d):

[IHC = immunohistochemistry; ISH = in situ hybridization]

a. There has been disease progression on prior cytotoxic chemotherapy for metastatic disease, or within six months of completing adjuvant chemotherapy (see *Appendix 2*).

AND

b. If the disease is hormone receptor-positive (HR+), there has been disease progression on at least one prior line of endocrine therapy (see *Appendix 3*).

AND

c. Enhertu (fam-trastuzumab deruxtecan-nxki) will be used as monotherapy.

AND

d. The patient has not had prior treatment with Enhertu (fam-trastuzumab deruxtecan-nxki).

OR

C. A diagnosis of **unresectable or metastatic non-small lung cancer (NSCLC)** when criteria 1 through 4 below are met:

1. There has been disease progression on at least one prior systemic therapy given in the metastatic disease setting.

AND

2. Documentation of an activating HER2 (ERBB2) mutation as defined at oncokb.org.

AND

3. Enhertu (fam-trastuzumab deruxtecan-nxki) will be used as monotherapy.

AND

4. No prior treatment with a HER2-directed antibody (e.g., trastuzumab) or antibody-drug conjugate [e.g., Enhertu (fam-trastuzumab deruxtecan-nxki) or Kadcyla (ado-trastuzumab emtansine)].

OR

D. A diagnosis of **unresectable locally advanced or metastatic biliary tract cancer (BTC)** [includes gallbladder carcinoma, intrahepatic cholangiocarcinoma, and extrahepatic cholangiocarcinoma] when criteria 1 through 4 below are met:

1. There has been progression or recurrence of disease on or after at least one prior cytotoxic chemotherapy regimen used in the advanced disease setting.

AND

2. The tumor is HER2-postive as defined by an immunohistochemical score of 3+ (IHC 3+).

AND

3. There has been no prior use of HER2-directed therapy (refer to *Appendix 1)*.

AND

4. Enhertu (fam-trastuzumab deruxtecan) will be used as monotherapy.

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers Enhertu (fam-trastuzumab deruxtecan-nxki) coverable only under the medical benefit (as a provider-administered medication).

B. When pre-authorization is approved, Enhertu (fam-trastuzumab deruxtecan-nxki) may be authorized in the following quantities:

1. Breast cancer, NSCLC, BTC, and HER2-positive unresectable or metastatic solid tumors: Up to one infusion (5.4 mg/kg) every 21 days until disease progression.

2. Gastric or GEJ cancer: Up to one infusion (6.4 mg/kg) every 21 days until disease progression.

C. Authorization **may** be reviewed at least annually. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, such as disease stability or improvement.

IV. Enhertu (fam-trastuzumab deruxtecan-nxki) is considered investigational when used for all other conditions, including but not limited to:

A. Non-small cell lung cancer (NSCLC) with a HER2 mutations not considered 'oncogenic or likely oncogenic' as defined at oncokb.org.

B. HER2-low breast cancer when used in the front-line setting.

C. HER2-positive (IHC 3+) solid tumors not specifically described in the coverage criteria (Section II.) above.

Position Statement

Summary

- Enhertu (fam-trastuzumab deruxtecan-nxki) is an intravenously administered antibody-drug conjugate that delivers cytotoxic chemotherapy to cells that express the human epidermal growth factor receptor 2 (HER2). It is indicated for use in:
  * Unresectable or metastatic **HER2-positive** breast cancer after the disease has progressed on at least two prior lines of HER2-directed therapy.
  * Unresectable or metastatic **HER2-low** breast cancer after progression on at least one prior line of chemotherapy
  * Locally advanced or metastatic **HER2-positive** gastric or GEJ cancer after the disease has progressed on a prior trastuzumab-containing regimen.
  * Unresectable or metastatic non-small cell lung cancer (NSCLC) in tumors that have **HER2 (ERBB2) mutations** when disease has progressed on or after at least one prior systemic therapy.
  * It also received an indication for patients with unresectable locally advanced or metastatic HER2-positive (IHC 3+) solid tumors after prior therapy when there are no remaining satisfactory treatment options.
- The intent of this policy is to cover Enhertu (fam-trastuzumab deruxtecan-nxki) in settings where it has been shown to be safe and effective, as detailed in the coverage criteria, with consideration for other available treatment options.
  * Where there is lack of proven additional benefit and/or lack of demonstrated health outcome (such as overall survival or improved quality of life) relative to alternative therapies, use of Enhertu (fam-trastuzumab deruxtecan-nxki) is not coverable ("not medically necessary" or "investigational").
  * It is important to note that the fact that a medication is FDA approved for a specific indication does not, in itself, make the treatment medically reasonable and necessary.

- Enhertu (fam-trastuzumab deruxtecan-nxki) also FDA approved for use in the following conditions; however, the health plan considers these uses to be "investigational" (not covered) as Enhertu (fam-trastuzumab deruxtecan-nxki) has not demonstrated to provide any health benefit, based on the currently available evidence:
    * Unresectable locally advanced or metastatic HER2-positive (IHC 3+) solid tumors after prior therapy when there are no remaining satisfactory treatment options *(as described in the Clinical Efficacy section below).*
- Many of the clinical indications for Enhertu (fam-trastuzumab deruxtecan-nxki) have been approved by the FDA and endorsed by clinical guidelines based on surrogate measures such as overall tumor response rate (ORR) and progression-free survival (PFS) which are not proven to accurately predict clinically important outcomes such as improved overall survival or improved quality of life.
- Like other HER2-based chemotherapy regimens, Enhertu (fam-trastuzumab deruxtecan-nxki) is associated with significant side effects including decreased blood counts (e.g., neutropenia, anemia, thrombocytopenia), gastrointestinal effects (nausea, vomiting, diarrhea), fatigue. It also has a boxed warning for interstitial lung disease (ILD) and pneumonitis, a serious side effect that occurs in one in ten to eleven patients who use this medication.
- NCCN guidelines list Enhertu (fam-trastuzumab deruxtecan-nxki) among potential treatment options in the settings in which it has been approved and studied.
- Enhertu (fam-trastuzumab deruxtecan-nxki) is given via IV infusion every 3 weeks until disease progression or unacceptable toxicity.

Regence Pharmacy Services performs independent analyses of oncology medication evidence, to establish coverability per the contracts with the health plan.

- Most contracts define coverability based on established clinical benefit in published, peer-reviewed literature, along with consideration of regulatory status.
- FDA approval does not in itself establish medical necessity, as unpublished, low-quality evidence, including exploratory analyses and unvalidated surrogate endpoints, may be used as the basis of approval. Regulatory approval may or may not reflect clinical benefit relative to standard of care and the recommendations of expert clinical advisors such as the Oncologic Drugs Advisory Committee (ODAC). FDA approvals generally do not consider cost compared to established therapies, or value to members.
- Likewise, NCCN clinical practice guidelines assignment of a recommendation (category 1, 2a, or 2b) does not necessarily establish medically necessity. NCCN recommendations are inconsistently supported by published, peer-reviewed literature and do not uniformly consider value of new therapies relative to existing potentially higher-value treatment options, considering effectiveness, safety, and cost.
- Medication coverage criteria are developed based on the 'medical necessity' assessment, as described above.

Regence Pharmacy Services analysis and coverage policy may differ from FDA labeled indication and/or NCCN clinical practice guidelines.

Clinical Efficacy

GASTRIC/GEJ CANCER

- The efficacy of Enhertu (fam-trastuzumab deruxtecan-nxki) in gastric/GEJ cancer was evaluated in a phase 2, randomized, open-label trial conducted in Asia. [1] All patients had HER2-positive locally advanced or metastatic gastric or GEJ cancer that had progressed after at least two prior trastuzumab-based regimens. An increase in overall survival was seen in patients treated with fam-trastuzumab deruxtecan-nxki.
    * Patients had HER2-positive locally advanced or metastatic gastric or GEJ adenocarcinoma who had progressed on and after at least two prior regimens including trastuzumab, a fluoropyrimidine- and a platinum-containing chemotherapy.
    * Patients received treatment with fam-trastuzumab deruxtecan-nxki or physician's choice of chemotherapy (irinotecan monotherapy or paclitaxel monotherapy).
    * Overall survival (OS) was 12.5 months with fam-trastuzumab deruxtecan-nxki compared to 8.4 months with chemotherapy.
- NCCN guidelines for gastric and GEJ cancer include Enhertu (fam-trastuzumab deruxtecan-nxki) in HER2-positive gastric or GEJ cancer as a preferred regimen in second-line or subsequent therapy (category 2A) in unresectable locally advanced or metastatic disease. Other preferred regimens in the second line setting include ramucirumab/paclitaxel, docetaxel, paclitaxel, irinotecan (all category 1), and fluorouracil/irinotecan (category 2A). [2]

BREAST CANCER

- The efficacy of Enhertu (fam-trastuzumab deruxtecan-nxki) in patients with unresectable or metastatic **HER2-positive** breast cancer is based on a small, single-arm, non-blinded study that measured tumor response rates (early-phase, low-quality evidence). All patients enrolled in the clinical study had prior therapy with trastuzumab and Kadcyla (ado-trastuzumab emtansine). [3,4] The overall quality of evidence is poor. Shrinking or stabilizing the size of a tumor (measured using an x-ray) has not been shown to accurately predict relevant clinical outcomes such as improvement in survival, function, or quality of life. Additional studies are needed to show that this new therapy improves patient health. Because there was no comparator in the study, it is not known if Enhertu (fam-trastuzumab deruxtecan-nxki) is better than other HER2-based chemotherapy regimens used in the HER2-positive metastatic breast cancer setting.
    * All of the patients in the trial had prior therapy with both a trastuzumab-containing regimen and Kadcyla (ado-trastuzumab emtansine), both anti-HER-2 therapies. In addition, 66% of subjects had prior Perjeta (pertuzumab) and 54% had another anti-HER2 therapy.
    * Patients were required to have good performance status, a left ventricular ejection fraction of at least 50%, and no history of noninfectious interstitial lung disease. Additionally, patients with untreated or symptomatic brain metastasis were not allowed to enroll in the trial.

    * The trial evaluated tumor response (overall response rate) as the primary endpoint. Tumor response (stabilization of shrinking of tumor size on an x-ray) has not been shown to accurately predict improvement in survival, function, or quality of life in the metastatic breast cancer setting. Additional trials are needed to establish clinical benefit.

- The efficacy of Enhertu (fam-trastuzumab deruxtecan-nxki) was also studied in a phase 3, open-label, randomized trial compared to Kadcyla (ado-trastuzumab emtansine) in patients with HER2-positive breast cancer previously treated with trastuzumab and a taxane. At the time of the analysis, progression-free survival (PFS) was not reached in the fam-trastuzumab deruxtecan-nxki group and was 6.8 months in the trastuzumab emtansine group. [5]
    * All of the patients in the trial had unresectable or metastatic breast cancer that had progressed during or after treatment with trastuzumab and a taxane in the context of advanced or metastatic disease or that had progressed within 6 months after neoadjuvant or adjuvant treatment involving trastuzumab or a taxane.
    * The primary endpoint of the trial was progression free survival (PFS). At the time of the study analysis, PFS was not reached for patients in the fam-trastuzumab deruxtecan-nxki group and was 6.8 months in the trastuzumab emtansine group. PFS has not been correlated with a clinically meaningful outcome such as overall survival (OS). OS data is not yet mature.
- The efficacy of Enhertu (fam-trastuzumab deruxtecan-nxki) as a second- or subsequent-line therapy for recurrent, unresectable and/or metastatic **HER2-low** (IHC 1+ or IHC 2+/ISH-negative) breast cancer was based on an open-label, randomized controlled trial [DESTINY-Breast04] where it demonstrated an overall survival (OS) advantage relative to physician's choice of chemotherapy. [6] Patients in the trial had disease progression on prior cytotoxic chemotherapy and, if the tumor was hormone receptor-positive (HR+), at least one prior line of endocrine therapy.
    * Eighty-nine percent of the patients enrolled in the trial had tumors that were hormone receptor-positive (HR+) while the other 11% had triple negative breast cancer (TNBC).
    * All patients were required to have had prior chemotherapy for metastatic disease or had recurrence within 6 months of completing adjuvant therapy (median of 3 prior therapies). Targeted therapies, including hormone-targeted therapy [anticancer endocrine therapy and CDK4/6 inhibitors] and immunotherapy, were not considered as prior systemic chemotherapy treatments. If the breast cancer was HR+, patients were also required to have had at least one prior line of hormone-targeted (endocrine) therapy (71% had a prior CDK4/6 inhibitor).
    * Of the 577 enrolled patients, 100% had prior treatments with cytotoxic chemotherapy, with 27% of patients with two prior lines of therapy in the metastatic setting, and 62% with three or more.

    * The median OS in the Enhertu (fam-trastuzumab deruxtecan-nxki) and chemotherapy treatment arms was 23.4 months and 16.8 months, respectively [HR 0.64 (95%CI: 0.49, 0.84); p = 0.001].
- The NCCN breast cancer guideline lists the following: [2]
    * Trastuzumab/Perjeta (pertuzumab) plus a taxane is listed as the preferred front-line therapy for recurrent or metastatic HER2-positive breast cancer. Enhertu (fam-trastuzumab deruxtecan-nxki) is listed as a second-line option, along with Kadcyla (ado-trastuzumab emtansine) in this setting.
    * The NCCN notes that Enhertu (trastuzumab deruxtecan-nxki) may be considered in the first-line setting as an option for patients with rapid progression within 6 months of neoadjuvant or adjuvant therapy.
    * The guidelines further note that regiments such as Enhertu (fam-trastuzumab deruxtecan-nxki) and Kadcyla (trastuzumab emtansine) may also be used as an option for third-line and beyond; optimal sequencing of HER2-directed therapies has not been determined.
    * Enhertu (trastuzumab deruxtecan-nxki) is also listed among preferred therapy options for recurrent, metastatic HER2-low breast cancer as a second- or subsequent-line treatment option.

NON-SMALL CELL LUNG CANCER (NSCLC)

- The efficacy of Enhertu (fam-trastuzumab deruxtecan-nxki) in relapsed or refractory advanced NSCLC with a HER2 (ERBB2) mutation was evaluated in cohorts from two open-label, single-arm studies that measured tumor response as a surrogate endpoint. [7,8] About half of the patients had a partial response with only 1% achieving a complete response. The evidence is of poor quality as there was no blinding or control, and tumor response has not been shown to accurately predict any clinically relevant benefit. Furthermore, it is not known which HER2 mutations may contribute to the NSCLC disease process.
    * Approximately half of the patients had a partial response while on therapy; however, only 1% achieved a complete response.
    * The evidence is of poor quality as there was no blinding or control, and tumor response has not been shown to accurately predict any clinically relevant benefit.
    * Furthermore, it is not known which HER2 mutations may contribute to the NSCLC disease process. The NCCN NSCLC guideline refers clinicians to an on-line resource to determine whether a particular HER2 mutation may be ‘oncogenic or likely oncogenic’.
- Confirmatory trials are needed to determine whether Enhertu (fam-trastuzumab deruxtecan-nxki) provides any clinical benefit in this setting.
- The NCCN NSCLC guideline lists Enhertu (fam-trastuzumab deruxtecan-nxki) as a preferred therapy for metastatic, HER2 (ERBB2)-mutant NSCLC after there has been disease progression on front-line therapies.

BILIARY TRACT CANCER (BTC)

- The efficacy of Enhertu (fam-trastuzumab deruxtecan-nxki) in relapsed or refractory advanced or metastatic, HER2-positive (IHC 3+) BTC is from two open-label, single-arm studies that evaluated tumor response as the endpoint. No patients included in the study had prior use of HER2-directed therapy. The evidence is of poor quality as there was no blinding or control, and tumor response has not been shown to accurately predict any clinically relevant benefit; however, coverage in this setting recognizes the current lack of treatment options available for this population.
    * One study [DESTINY-Pan Tumor02] enrolled 22 patients with advanced, HER2-positive (IHC 3+) BTC and reported an ORR of 44% [95% CI: 24, 48]. [7]
    * A second study [HERB; NCCH1805] enrolled 22 patients with advanced, HER2-positive (either IHC 3+, or IHC2+ and ISH+) BTC and reported an ORR of 36% [90%CI: 20, 56]. [9]
- Of the HER2-directed therapies available for use as subsequent-line treatment options for advanced BTC, each of which has similar low-quality evidence (all are single-arm, basket trial studies), Enhertu (fam-trastuzumab deruxtecan-nxki) is the most cost-effective treatment option.

Investigational Uses [10,11]

- Early-stage breast cancer: There is no published evidence for Enhertu (fam-trastuzumab deruxtecan-nxki) in early-stage breast cancer. To date, the only evidence is in the metastatic disease setting.
- Other HER2-expressing cancers where HER-2 (ERBB2) setting [other than listed in the coverage criteria]: There is interest in the use of Enhertu (fam-trastuzumab deruxtecan-nxki) for a variety of other HER2-expressing cancers where HER-2 (ERBB2) is considered an emerging biomarker, including colorectal cancer (CRC), bladder cancer, endometrial cancer, ovarian cancer as well as other solid tumors.
- HER2-positive (IHC 3+) tumor agnostic setting [other than listed in the coverage criteria]:
    * Use of Enhertu (fam-trastuzumab deruxtecan-nxki) in the HER2-positive (IHC 3+) tumor agnostic setting is considered investigational because its clinical efficacy is uncertain in this population. Available data is limited to small numbers of patients from an observational, single-arm study that did not represent all solid tumor types. Furthermore, it is uncertain whether HER2 overexpression drives tumor growth in all solid tumors [some tumors represented in the study had no response to Enhertu (fam-trastuzumab deruxtecan-nxki)]. Additional evidence is needed to determine whether there is clinical benefit in this heterogeneous population.
    * Enhertu (fam-trastuzumab deruxtecan-nxki) received a 'tumor agnostic' indication for patients with HER2-positive unresectable or metastatic solid tumors who have received prior systemic therapy and have no remaining satisfactory treatment options.

- The pivotal trial [DESTINY-PanTumor02] was a small (N=111), single-arm, observational study that evaluated objective response rate (ORR), a non-validated surrogate endpoint, in patients with a variety of locally advanced or metastatic tumors that were HER2-positive. [7,11]
- HER2-positive was defined as a 3+ score on immunohistochemistry (IHC) assay (IHC 3+).
- There is low reliability in the evidence of efficacy for Enhertu (fam-trastuzumab deruxtecan-nxki) in this broad, heterogeneous population for reasons that include, but are not limited to, the use of very small populations that may not be representative of the greater population with a given tumor type (most tumors were represented in fewer than 20 patients), the lack of representation of all types of HER2-positive solid tumors in the study, the lack of response observed in some tumor types (HER2 overexpression may not be a driver of tumor growth in all types of solid tumors), the lack of comparator in the study, and the use of a surrogate endpoint that does not reflect improvement in any clinically relevant outcome (e.g., improved overall survival or quality of life).
- For the reasons described above, the use of Enhertu (fam-trastuzumab deruxtecan-nxki) for HER2-postive (IHC3+) unresectable locally advanced or metastatic solid tumors is considered investigational. Additional evidence is needed to define its clinical benefit in this population.

Safety [4,7]

- Enhertu (fam-trastuzumab deruxtecan-nxki) carries a boxed warning for interstitial lung disease (ILD) and pneumonitis, and the potential for embryo-fetal harm. ILD may be fatal in a small proportion (2.6%) of patients.
- Serious treatment-emergent adverse effects (TEAEs) occurred in one in five patients receiving Enhertu (fam-trastuzumab deruxtecan-nxki) in clinical trials.
- About 1 in 10 patients discontinued Enhertu (fam-trastuzumab deruxtecan-nxki) due to AEs.
- The most commons serious AEs experienced with Enhertu (fam-trastuzumab deruxtecan-nxki) in clinical trials were decreased blood counts (neutropenia, anemia, thrombocytopenia), gastrointestinal effects (nausea, vomiting, diarrhea), fatigue, and asthenia.

Dosing [7]

- Enhertu (fam-trastuzumab deruxtecan-nxki) is given in a dose of 6.4 mg/kg in gastric/GEJ cancer and 5.4 mg/kg in all other coverable cancers. It is given via intravenous infusion every three weeks until disease progression or unacceptable toxicity.
- Dosing should be interrupted for interstitial lung disease (ILD) or pneumonitis, neutropenia, febrile neutropenia, and left ventricular dysfunction.

Appendix 1: HER2-Directed Agents (a.k.a. anti-HER2 therapies)

Infused (Medical benefit)	Oral (Prescription benefit)
trastuzumab (e.g., Herceptin; biosimilars Kanjinti, Ogivri, Trazimera)	Nerlynx (neratinib)
Enhertu (fam-trastuzumab deruxtecan)	Tukysa (tucatinib)
Perjeta (pertuzumab)	lapatinib (generic, Tykerb)
Kadcyla (ado-trastuzumab emtansine)	

NOTE: Pre-authorization is required for these products with the exception of the preferred version of trastuzumab (see dru620) and lapatinib (generic, Tykerb). Please see the Medication Policy page for a complete, up-to-date list.

Appendix 2: Cytotoxic Chemotherapy Agents Used in the Treatment of Advanced Breast Cancer [4] a,b	
"Preferred" Single Agents	***Chemotherapy Combinations***
Anthracyclines	AC: doxorubicin/cyclophosphamide
doxorubicin (generic, Adriamycin)	EC: epirubicin/cyclophosphamide
doxorubicin liposomal (generic, Doxil)	CMF: cyclophosphamide/methotrexate/fluorouracil
Taxanes	docetaxel/capecitabine
paclitaxel (generic, Taxol)	GT: gemcitabine/paclitaxel
Anti-metabolites	gemcitabine/carboplatin
capecitabine (generic, Xeloda)	paclitaxel/bevacizumab
gemcitabine (generic, Gemzar)	carboplatin + paclitaxel or albumin-bound paclitaxel
Other microtubule inhibitors	
vinorelbine (generic, Navelbine)	
eribulin (generic, Halaven)	
"Other" Single Agents	
cyclophosphamide (generic Cytoxan)	cisplatin
carboplatin	epirubicin
docetaxel (generic, Taxotere)	Ixempra (ixabepilone)
Abraxane (nab-paclitaxel)	Trodelvy (sacituzumab govitecan-hziy; for TNBC)

[a] Hormone-targeted therapies (endocrine therapy and CDK4/6s) are not considered "cytotoxic chemotherapy."

[b] Neoadjuvant/adjuvant regimens are not included, as finite regimens used for non-advanced disease. Examples: ddAC+T [doxorubicin/cyclophosphamide followed by paclitaxel], TC [docetaxel/ cyclophosphamide], or carboplatin/paclitaxel/pembrolizumab followed by AC/pembrolizumab.

Appendix 3: Endocrine Therapies Used in HR-Positive Advanced Breast Cancer		
Aromatase inhibitors (AIs)	**Selective estrogen receptor degraders (SERDs)**	**Selective estrogen receptor modifiers (SERMs)**
Arimidex (anastrozole)	Orserdu (elacestrant)	tamoxifen (Nolvadex, Soltamox)
Aromasin (exemestane)	Faslodex (fulvestrant)	
Femara (letrozole)		

Appendix 4: CDK4/6 Inhibitors Used in HR-Positive Advanced Breast Cancer
Verzenio (abemaciclib)
Ibrance (palbociclib)
Kisqali (ribociclib)

Revision History

Revision Date	Revision Summary
3/6/2025	• Added coverage for use in advanced biliary tract cancer (BTC) after at least one prior systemic cytotoxic chemotherapy regimen when Enhertu (fam-trastuzumab deruxtecan) will be used as monotherapy and tumors are documented to be HER2-positive (IHC 3+). • Under the criteria for unresectable or metastatic breast cancer it was clarified that prior chemotherapy refers to 'cytotoxic' chemotherapy (criterion II.B.2.a).
9/19/2024	• Added supporting documentation to describe the rationale behind the investigational status for HER2-postive unresectable or metastatic solid tumors ('tumor agnostic' setting) [new indication]. Coverage will only be provided in settings specifically described in Section II. of the policy. • Added 'HER2-positive unresectable or metastatic solid tumors' under the 'Dosing, Quantity Limitations, and Authorization Period' section of the policy.
6/20/2024	Added 'in the advanced disease setting' to II.A.2 to clarify the intent of this criterion. No change to intent of coverage criteria with this annual review.
6/15/2023	No criteria changes with this annual update.
12/9/2022	• Added coverage criteria for patients with advanced HER2-low breast cancer in the second- or subsequent-line treatment setting (new indication). • Added coverage criteria for patients with advanced non-small cell lung cancer (NSCLC) with an activating HER2 (ERBB2) mutation as defined at oncokb.org. Use in HER2 mutations not considered 'oncogenic or likely oncogenic' as defined at oncokb.org will be considered investigational. • Updated formatting of other coverage criteria (no change to intent).
6/17/2022	Added coverage criteria for patients with unresectable or metastatic HER2-positive breast cancer after one prior anti-HER2-based regimen in the metastatic or neoadjuvant or adjuvant setting, a newly approved FDA indication.
7/16/2021	Added coverage criteria for patients with HER2-positive locally advanced or metastatic gastric or gastroesophageal junction cancer whose disease has progressed after a prior trastuzumab-based regimen, a newly approved FDA indication.
6/15/2020	Removed references to brand Herceptin (where applicable) from policy to account for upcoming changes in biosimilars policy (dru620).
4/22/2020	New policy (effective 5/15/2020). Limits coverage to patients with HER2-positive unresectable or metastatic breast cancer in patients whose disease progressed after at least two prior HER2-directed therapies, the setting in which it was studied and has a labeled indication.

Medication Policy Manual | **Policy No:** dru625

Topic: Scenesse, afamelanotide | **Date of Origin:** May 15, 2020

Committee Approval Date: September 19, 2024 | **Next Review Date:** 2025

Effective Date: December 1, 2024

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Scenesse (afamelanotide) is a medication used to treat a rare genetic condition, erythropoietic protoporphyria (EPP), and the associated skin reaction. It is administered as a subcutaneous implant.

Policy/Criteria

Most contracts require pre-authorization approval of Scenesse (afamelanotide) prior to coverage.

I. Continuation of therapy (COT): Scenesse (afamelanotide) may be considered medically necessary for COT when full policy criteria below are met, including quantity limit.

Please note: *Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Scenesse (afamelanotide) may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) that criteria A, B, and C below are met.

A. A diagnosis of **erythropoietic protoporphyria** (EPP), in consultation with a specialist in hematology or dermatology.

AND

B. Documentation that one of the following (criterion 1 or 2) below are met:

1. Biochemical confirmation of both a and b below:

a. Elevated total erythrocyte protoporphyrin (≥ 80 mcg/dL).

AND

b. Increased proportion of erythrocyte metal-free protoporphyrin versus zinc protoporphyrin (≥ 85% of total erythrocyte protoporphyrin is metal-free).

OR

2. Molecular genetic testing consistent with a diagnosis of EPP (such as biallelic mutation on the ferrochelatase [FECH] gene).

AND

C. Documented phototoxic reactions from EPP have resulted in a significant complication including 1 or 2:

1. Skin maceration with secondary infection requiring anti-infective treatment (antibiotics or antifungals).

OR

2. Documentation of significant impact on quality of life or inability to perform critical activities of daily living (such as going outside to do errands or commuting to work/school) without experiencing significant pain due to phototoxic reactions from EPP.

PLEASE NOTE: Medical treatment of phototoxicity due to EPP is considered not medically necessary in the absence of significant medical complications associated with the condition. Skin irritation or erythema (skin redness) without pain/infection are not considered to be "significant medical complications."

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers Scenesse (afamelanotide) coverable only under the medical benefit (as a provider-administered medication).

B. When pre-authorization is approved, Scenesse (afamelanotide) will be authorized in quantities up to 4 implants per 48-weeks (based on usual dosing of 1 implant every 8 weeks during seasons of increased sunlight).

C. Authorization **may** be reviewed at least every 12 months to confirm that the medication is effective as documented by provider attestation or clinical documentation (e.g., decreased pain/severity and number of phototoxic reactions, increased duration of sun exposure, increased quality of life/ability to perform ADLs).

D. Additional treatments may be authorized on a case-by-case basis if documentation supports the need for more frequent dosing are provided (e.g., residence in a locale with year-round significant sun-exposure).

IV. Scenesse (afamelanotide) is considered not medically necessary when used for skin redness, vitiligo, or other cosmetic indications.

V. Scenesse (afamelanotide) is considered investigational when used for all other conditions, including but not limited to:

A. Solar urticaria.

Position Statement

Summary

- The intent of the policy is to limit coverage of Scenesse (afamelanotide) in erythropoietic protoporphyria (EPP) when symptoms are severe and significantly impact critical activities of daily living.
- Scenesse (afamelanotide) is a melanocortin-1 receptor agonist indicated for increasing pain-free light exposure in adults with a history of phototoxic reactions from EPP.
- The efficacy of Scenesse (afamelanotide) was established in two placebo-controlled randomized trials. Scenesse (afamelanotide) incrementally increased the amount of pain-free time patients were exposed to direct sunlight compared to placebo. However, the clinical relevance of the small change in pain-free time is unknown.
- Use of Scenesse (afamelanotide) for cosmetic purposes, primarily to improve or change appearance such as redness, is considered not medically necessary.
- There is insufficient evidence to support the use of Scenesse (afamelanotide) in any other condition.
- Scenesse (afamelanotide) may be covered for up to four 16 mg doses (subcutaneous implants) in a 48-week period to account for coverage during months when sunlight is the most prominent and intense (spring-fall). Although afamelanotide may be given every 2 months per label, symptoms of EPP manifest primarily due to sunlight exposure. Therefore, use of medication should be limited to before expected, and during increased, sunlight exposure (typically from spring to early autumn) in areas where the hours and intensity of sun exposure are significantly impacted by seasonality.

Background [1 2]

- Total erythrocyte protoporphyrin that is fractionated into non-complexed (metal-free) and zinc-complexed protoporphyrin is critical for an EPP diagnosis. The diagnosis of EPP is established by an abnormally high level of total erythrocyte protoporphyrin with a higher proportion of metal-free protoporphyrin versus zinc protoporphyrin. See appendix A for reference values. An 85% or higher proportion of metal-free is indicative of EPP.
- EPP is most commonly caused by autosomal recessive mutations in the gene encoding ferrochelatase (FECH). Genetic testing may confirm the diagnosis of EPP in the presence of two FECH gene mutations in trans. It is common to identify a FECH mutation on one allele, but clinical expression requires a hypomorphic FECH allele in trans with a more severe mutation. IVS3-48T->C (also referred to as c. 315-48T>C) is one hypomorphic variant of the FECH gene. C.1231T>G is a common severe FECH mutation. The presence of both c.1231T>G with c.315-48T>C or two copies of c.1231T>G are confirmatory for EPP. Although important, not all sequence variants have been validated as pathogenic, and a small number of pathogenic mutations are not detected by gene sequencing; therefore, the biochemical profile of porphyrin precursors remains the standard for diagnosis.

Clinical Efficacy

- Scenesse (afamelanotide) has been shown to increase pain-free light exposure in patients with erythropoietic protoporphyria (EPP) relative to placebo in two low-quality, phase 3, randomized-control trials. [3]
    * The placebo-controlled trials included adults with biochemically confirmed EPP who did not have any clinically significant organ dysfunction (including hepatic), skin cancer, or premalignant lesions.
    * The primary outcome of interest was duration of time in direct sunlight where patients reported they did not have pain.
    * In both studies, pain-free duration was marginally longer for patients on Scenesse (afamelanotide) versus placebo. In one study, there was a 24-hour difference between arms spread over a six-month period. In another study, the between arm difference was five hours within a nine-month span.[4]
- The mainstay of care for phototoxicity related to EPP is sun avoidance and use of protective clothing/physical barriers. Tanning creams which increase skin pigmentation or sunscreens which contain physical reflecting agents may be beneficial to some patients. [5]
- Narrow-band ultraviolet-B (UVB) phototherapy or beta-carotene may provide benefit, but efficacy data is limited to several small studies and case series.
- Patients should maintain sun and light protection measures during treatment with Scenesse (afamelanotide).
- The National Institute for Health and Care Excellence (NICE) notes that the marketing authorization in the United Kingdom recommends administering afamelanotide every 2 months before expected and during increased sunlight exposure for a maximum of 4 implants per year and that some people may not require four doses per year.[6]

Not Medically Necessary Uses

- Use of Scenesse (afamelanotide) for skin redness, vitiligo, or other cosmetic conditions is considered not medically necessary.

Investigational Uses

- Although Scenesse (afamelanotide) is being investigated in different skin disorders (such as solar urticaria), the quality of evidence from these studies are poor because they lack controls, are not randomized or blinded, and only involve small numbers of subjects.[7]

Safety [4]

- Scenesse (afamelanotide) was generally well-tolerated in clinical trials. Adverse reactions greater than 5% included implant site reactions, nausea, oropharyngeal pain, cough, and fatigue.
- Scenesse (afamelanotide) may induce darkening of pre-existing nevi and ephelides due to its pharmacological effect. A regular full body skin examination (twice yearly) is recommended.

Revision History

Revision Date	Revision Summary
9/19/2024	No changes to intent of coverage criteria with this annual update. Wording for criteria IIA updated to be consistent with other polices.
6/15/2023	No changes in coverage criteria with this annual update.
6/17/2022	No changes in coverage criteria with this annual update. Supporting statement updated with rationale for quantity limits. Updated quantity limits.
7/16/2021	Coverage criteria modified to include molecular genetic testing as an option for confirmation of disease.
4/22/2020	New policy (effective 5/15/2020). Coverage limited to confirmed diagnosis of erythropoietic protoporphyria with disease that significantly impacts activities of daily living.

Drug names identified in this policy are the trademarks of their respective owners.

Medication Policy Manual | **Policy No:** dru628

Topic: Medications for Sickle Cell Disease | **Date of Origin:** May 15, 2020

- Adakveo, crizanlizumab-tmca
- Endari, L-glutamine
- Oxbryta, voxelotor

Committee Approval Date: June 20, 2024 | **Next Review Date:** 2025

Effective Date: September 1, 2024

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

This policy is for oral and injectable medications used in the treatment of sickle cell disease.

Policy/Criteria

Most contracts require pre-authorization approval of medications for sickle cell disease prior to coverage.

I. Continuation of therapy (COT): Medications for sickle cell disease may be considered medically necessary for COT when criterion A, B, or C **AND** D below is met.

A. For diagnoses NOT listed in the coverage criteria below, full policy criteria must be met for coverage.

OR

B. For diagnoses listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

C. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

AND

D. ***[For Adakveo (crizanlizumab-tmca)]*** Site of care administration requirements are met [refer to Medication Policy Manual, *Site of Care Review*, dru408].

Please note*: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. **For Endari (L-glutamine) new starts (treatment-naïve)**: The use of Endari (L-glutamine) is considered not medically necessary for the treatment of patients with **sickle cell disease** (SCD).

III. **For Oxbryta (voxelotor) new starts (treatment-naïve)**: The use of Oxbryta (voxelotor) may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) that criteria A through F below are met.

A. A diagnosis of **sickle cell disease** (SCD), established by or in consultation with a hematologist.

AND

B. The diagnosis of SCD has been confirmed by genetic testing (see *Appendix 1*).

AND

C. There has been at least one vaso-occlusive crisis (VOC) over the past 12 months.

AND

D. The patient's hemoglobin is ≤ 10.5 g/dL despite treatment with transfusion(s).

AND

E. Hydroxyurea has been ineffective after use for at least 6 months unless the use is not tolerated or is contraindicated. If unable to tolerate hydroxyurea, dose lowering attempts must be made to achieve the maximally tolerated therapeutic doses.

AND

F. For tablets for oral suspension: Documentation that the member weighs less than 40 kg or is unable to swallow tablets.

IV. **For Adakveo (crizanlizumab-tmca) new starts (treatment naïve):** The use of Adakveo (crizanlizumab-tmca) may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) that criteria A through E below are met.

A. A diagnosis of **sickle cell disease** (SCD), established by or in consultation with a hematologist.

AND

B. The diagnosis of SCD has been confirmed by genetic testing (see *Appendix 1*).

AND

C. There have been at least two vaso-occlusive crises (VOCs) over the past 12 months.

AND

D. Hydroxyurea has been ineffective after use for at least 6 months unless the use is not tolerated or is contraindicated. If unable to tolerate hydroxyurea, dose lowering attempts must be made to achieve the maximally tolerated therapeutic doses.

AND

E. Site of care administration requirements are met [refer to Medication Policy Manual, *Site of Care Review*, dru408].

V. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers Adakveo (crizanlizumab-tmca) coverable only under the medical benefit (as a provider-administered medication).

B. Regence Pharmacy Services considers Endari (L-glutamine) and Oxbryta (voxelotor) coverable only under the pharmacy benefit (as self-administered medications).

C. When pre-authorization is approved, medications for sickle cell disease will be authorized in quantities and authorization periods as listed in Table 1.

VI. The use of Adakveo (crizanlizumab-tmca), Endari (L-glutamine), and Oxbryta (voxelotor) in combination with each other is considered investigational.

VII. Adakveo (crizanlizumab-tmca), Endari (L-glutamine), and Oxbryta (voxelotor) are considered investigational when used for all other conditions.

Table 1.

Quantity Limit/Authorization	Initial	Re-authorization
Adakveo (crizanlizumab-tmca): Up to 5mg/kg at week 0, week 2, and then every 4 weeks thereafter.	24 weeks	Continued authorization or re-authorization (after the initial 24-week period) **shall** be reviewed at least annually to confirm that current medical necessity criteria are met, the dose is within the dose limits, and that the medication is providing clinical benefit and that there is an improvement in disease activity, such as a decrease in VOC rate, compared to baseline.
Endari (L-glutamine): Up to three packets twice daily, not to exceed 30 grams per day.	24 weeks	Continued authorization or re-authorization (after the initial 24-week period) **shall** be reviewed at least annually to confirm that current medical necessity criteria are met, the dose is within the dose limits, and that the medication is providing clinical benefit and that there is an improvement in disease activity, such as a decrease in VOC rate, compared to baseline.
Oxbryta (voxelotor): Tablets: Up to three tablets per day, not to exceed 1500mg per day. Higher doses may be covered when there is concomitant use of a moderate or strong CYP3A4 inducer (up to 4 or 5 tablets per day, respectively). Tablets for oral suspension: • ≥40 kg: Up to 5 tablets per day. o With moderate or strong CYP3A4 inducer: up to 7 or 8 tablets per day, respectively. • 20 kg to less than 40 kg: Up to 3 tablets per day. o With moderate or strong CYP3A4 inducer: Up to 4 or 5 tablets per day, respectively. • 10 kg to less than 20 kg: Up to 2 tablets per day. o With moderate or strong CYP3A4 inducer: up to 3 tablets per day.	24 weeks	Continued authorization or re-authorization (after the initial 24-week period) **shall** be reviewed at least annually to confirm the dose is within the dose limits, the medication is providing clinical benefit, and there is an improvement in disease activity compared to baseline, such as improvement in hemoglobin level or anemia signs, symptoms, or complications.

Position Statement

Summary

- The medications covered by this policy (Adakveo, Endari, and Oxbryta) are used for the treatment of patients with sickle cell disease (SCD). All are used prophylactically to reduce disease burden.
- Sickle cell disease is a recessive hemolytic anemia, cause by a mutation in the ß-globin gene. It is characterized by the formation of sickle hemoglobin (HbS), which is less soluble and less elastic, than fetal hemoglobin (HbF) or normal adult hemoglobin (HbA). [1 2]
- Patients with SCD experience chronic anemia and severe, debilitating pain events, known as vaso-occlusive crises (VOCs). These VOCs are the most frequent cause of morbidity and mortality in SCD. [1 2]
- Chronic complications of SCD include pain, anemia, pulmonary hypertension, renal impairment, cardiac dysfunction, hepatotoxicity, neurologic issues, splenic dysfunction, and retinopathy.
- Hydroxyurea has established effectiveness and is recommended by treatment guidelines to decrease VOCs in patients with SCD. It is available generically and is a less costly alternative. [1]

<u>Crizanlizumab</u>

- Adakveo (crizanlizumab-tmca) is a monoclonal antibody that binds to P-selectin, and blocks interactions between endothelial cells, platelets, red blood cells, and leukocytes. P-selectin plays a role in the formation of the multicellular aggregates, that lead to vaso-occlusive crises (VOCs). [3]
- In a randomized, double-blind, placebo-controlled trial, patients with sickle cell disease (SCD) treated with Adakveo (crizanlizumab-tmca) had less VOCs compared to patients treated with placebo during 52 weeks of treatment. [4]
- However, a recent confirmatory randomized, double-blind, placebo-controlled trial has shown inconsistent results reporting no statistical differences between Adakveo (crizanlizumab-tmca) and placebo in the rate of annualized VOC's, leading to a questionable clinical benefit. [5]
- The intent of this policy is to allow for coverage of Adakveo (crizanlizumab-tmca) for patients with SCD when hydroxyurea is ineffective or not a treatment option, in individuals that continue to experience at least 2 VOCs per year.

<u>Voxelotor</u>

- Oxbryta (voxelotor) is a hemoglobin S (HbS) polymerization inhibitor. HbS polymerization during periods of deoxygenation, leads to sickling of red blood cells, a hallmark of sickle cell disease (SCD). [6]
- In a randomized, double-blind, placebo-controlled trial, patients with SCD treated with Oxbryta (voxelotor) had a greater improvement in hemolysis markers (such as hemoglobin, indirect bilirubin, and percent reticulocytes) compared to patients treated with placebo during 24 weeks of treatment. [7]

- The intent of this policy is to allow for coverage of Oxbryta (voxelotor) for patients with SCD that continue to experience anemia signs, symptoms, or complications despite treatment with alternatives. While Oxbryta (voxelotor) has been shown to improve hemoglobin, it has not been shown to decrease vaso-occlusive crises (VOCs). It was approved through the accelerated approval process, based on an improvement in hemoglobin level.

L-glutamine

- Endari (L-glutamine) is an amino acid indicated to reduce the acute complications of sickle cell disease (SCD) in adult and pediatric patients 5 years of age and older. L-glutamine may improve the nicotinamide adenine dinucleotide (NAD) redox potential in sickle red blood cells through increasing the availability of reduced glutathione. [8]
- In a randomized, double-blind, placebo-controlled trial, patients with SCD treated with Endari (L-glutamine) had less vaso-occlusive crises (VOCs) compared to patients treated with placebo during 48 weeks of treatment. L-glutamine has not been compared to other treatment alternatives. [9]
- The use of Endari (L-glutamine) for SCD is considered not medically necessary, given the lack of proven clinical benefit and significant trial limitations. Of note, other L-glutamine products are also available as over-the-counter supplements.

Clinical Efficacy

Crizanlizumab

- Safety and efficacy data for crizanlizumab was evaluated in a phase 2, multicenter, randomized, double-blind, placebo-controlled trial, the SUSTAIN trial. [4]
- The primary endpoint in SUSTAIN was annualized rate of vaso-occlusive crises (VOCs), also referred to as a sickle cell-related pain crises (SCPC), in adults with SCD. Time to first VOC event was considered a key secondary endpoint.
    * Subjects with 2 to 10 VOCs in the previous year were included in the trial.
    * VOC was defined as an acute episode of pain with no other medically determined cause than a vaso-occlusive event that requires a medical facility visit and treatment with oral or parenteral narcotics, or parenteral non-steroidal anti-inflammatory drugs. In addition, acute chest syndrome, hepatic/splenic sequestration, priapism, and death were considered to be a VOC.
- Results of the SUTAIN trial demonstrated that crizanlizumab reduces the number of VOCs in adult patients with SCD, compared to placebo.
    * The median annualized rate of VOCs was 1.63 and 2.98 in the crizanlizumab and placebo groups, respectively.
    * The median time to first VOC was 4.07 and 1.38 months in the crizanlizumab and placebo groups, respectively.
- There were no significant changes in quality of life (QOL) assessments, or in the markers for hemolysis (hemoglobin, reticulocytes, indirect bilirubin), between the crizanlizumab and placebo treated arms, during the trial.

- A recent report out in January 2023 from an unpublished, confirmatory phase 3 multicenter, randomized, double-blind, placebo-controlled trial, the STAND trial (N=254), has reported no statistical difference between Adakveo (crizanlizumab 5 mg/kg or 7.5 mg/kg) and that of placebo in reducing annualized rates of VOC's. [5]
- These results are inconsistent with what was reported from the above phase 2 SUSTAIN trial, thus making the true clinical benefit of Adakveo questionable, compared to placebo.

Voxelotor

- Voxelotor was granted priority review by the FDA, and was approved based on one phase 3, multi-center, double-blind, placebo controlled randomized controlled trial, the HOPE trial, which demonstrated an improvement in hemoglobin response at 24 weeks compared to placebo. [7]
    * Hemoglobin response was defined as the portion of subjects with increase in hemoglobin > 1g/dL from baseline at week 24.
- Results of the HOPE trial demonstrated that voxelotor improved markers of hemolysis, including hemoglobin, indirect bilirubin, and reticulocyte counts.
    * A total of 51% (46/90) and 7% (6/92) had a hemoglobin response at week 24, in the voxelotor 1500mg and placebo treated arms, respectively.
    * The change in indirect bilirubin was -29.1% and -3.2%, in the voxelotor 1500mg and placebo treated arms, respectively.
    * The change in percentage of reticulocytes was -19.9% and -1.3%, in the voxelotor 1500mg and placebo treated arms, respectively.
    * The threshold by which a reduction in hemolysis labs, is indicative of clinical benefit, is unknown.
    * A confirmatory trial is required by the FDA, which will assess if voxelotor can reduce cerebral blood flow velocity, and lead to a reduction in stoke risk.
- Longer-term follow-up in the HOPE trial demonstrated improvement in the markers of hemolysis through week 72. [10]
- Vaso-occlusive crisis (VOC) rate, a secondary endpoint, was not significantly different between the voxelotor and placebo treated arms. In addition, the clinical trial noted numerically more transfusions in the voxelotor group than in the placebo treated group, although this was not a pre-specified endpoint.
- QOL assessments were included as exploratory endpoints, however, no differences were observed between the voxelotor and placebo groups.

L-glutamine

- The efficacy of Endari (L-glutamine) was evaluated in one randomized, double-blind, placebo-controlled trial in patients ≥5 years of age with sickle cell anemia or beta thalassemia who had two or more painful crises within the previous twelve months. [9]
    * Patients previously stabilized on hydroxyurea could continue treatment throughout the study.

    * Patients treated with L-glutamine experienced less sickle cell crises (SCC) compared to patients treated with placebo (three vs. four, respectively) throughout the 48 weeks of the trial.
- High discontinuation rates and problems with the conduct and analysis in the L-glutamine trial reduce the certainty of the clinical benefit.
- There are no studies that compare L-glutamine to other treatment alternatives.

Safety

- The most common adverse events (incidence of 10% or more) reported during trials with Adakveo (crizanlizumab-tmca) were headache, back pain, nausea, arthralgia, UTI, pain in extremity, URI , pyrexia, diarrhea, and musculoskeletal pain. [3]
- The most common adverse events (incidence of 10% or more) reported during trials with Oxbryta (voxelotor) were headache, diarrhea, nausea, arthralgia, URI, abdominal pain, fatigue, rash, pyrexia, pain in extremity, back pain, and vomiting. [6]
- The most common adverse events (incidence of 10% or more) reported with Endari (L-glutamine) were constipation, nausea, headache, abdominal pain, cough, pain in extremity, back pain, and chest pain. [8]

Revision History

Revision Date	Revision Summary
6/20/2024	Updated cross references, no changes to criteria with this annual review.
6/15/2023	Removed Adakveo (crizanlizumab-tmca) step for Oxbryta (voxelotor).
6/17/2022	• Added Oxbryta (voxelotor) coverage criteria. • Updated Adakveo (crizanlizumab-tmca) coverage criteria to require at least two vaso-occlusive crises (rather than more than two) to coincide with trial inclusion criteria.
7/16/2021	• Addition of *Appendix 1*: Sickle cell disease types. • No criteria changes with this annual update. • COT updated to standard format, no change to intent.
7/22/2020	No changes to criteria with this annual update.
4/22/2020	New policy, effective 5/15/2020.

Medication Policy Manual

Policy No: dru630

Topic: Givlaari, givosiran

Date of Origin: May 15, 2020

Committee Approval: June 20, 2024

Next Review Date: 2025

Effective Date: October 1, 2024

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of medication policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Givlaari (givosiran) is a medication used to treat a rare condition, acute hepatic porphyria (AHP), and reduce disease flare ups. It is an injectable medication (administered subcutaneously) by a healthcare provider.

Policy/Criteria

Most contracts require pre-authorization approval of Givlaari (givosiran) prior to coverage.

I. Continuation of therapy (COT): Givlaari (givosiran) may be considered medically necessary for COT when full policy criteria below are met, including quantity limit.

Please note: *Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Givlaari (givosiran) may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) that criteria A through F below are met.

A. Site of care administration requirements are met [refer to Pharmacy Services Medication Policy Manual, Site of Care Review, dru408].

AND

B. A diagnosis of **acute hepatic porphyria** (AHP) [including acute intermittent porphyria (AIP), hereditary coproporphyria (HCP), variegate porphyria (VP), and aminolevulinic acid dehydratase porphyria (ADP)].

AND

C. The diagnosis of AHP is established by or in consultation with a hepatologist, hematologist, gastroenterologist, or neurologist.

AND

D. The diagnosis of AHP has been confirmed by genetic testing, with documentation of a mutation in one of the following genes:

1. Hydroxymethylbilane synthase (diagnostic for AIP).
2. Coproporphyrinogen oxidase (diagnostic for HCP).
3. Protoporphyrinogen oxidase (diagnostic for VP).
4. Aminolevulinic acid dehydratase (diagnostic for ADP).

AND

E. Documentation of recurrent AHP, defined as greater than four attacks per year.

PLEASE NOTE: An attack is defined as a disease exacerbation requiring hospitalization, urgent healthcare visit, or administration of IV hemin (Panhematin) at home.

AND

F. Documentation of an evaluation to assess for underlying conditions or triggers for AHP (see *Appendices 1 and 2*). If identified, a documented plan is in place to address.

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers Givlaari (givosiran) coverable only under the medical benefit (as a provider-administered medication).

B. When pre-authorization is approved, Givlaari (givosiran) may be authorized up to 2.5mg/kg per month.

C. Authorization shall be reviewed as follows:

1. **Initial Authorization:** Shall be for 6 months.

2. **Continued Authorization:** After initial reauthorization, authorization **shall** be reviewed at least annually (every 12 months). Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, including a decrease in AHP attack rates (defined above) compared to baseline and reduction in the need for additional treatment, such as hospitalization, urgent healthcare visits, or need for IV hematin.

IV. Givlaari (givosiran) is considered investigational when used for all other conditions.

Position Statement

Summary [1 2]

- The intent of the policy is to allow for coverage of Givlaari (givosiran) for recurrent acute hepatic porphyria (AHP), the condition for which it has been studied, when managed by a specialist (as outlined in the coverage criteria), and to limit coverage to doses studied and shown to be safe and effective in clinical trials.
- AHP is a family of rare metabolic diseases involving the heme biosynthesis pathway. AHP consists of four distinct subtypes [acute intermittent porphyria (AIP), hereditary coproporphyria (HCP), variegate porphyria (VP), and aminolevulinic acid dehydratase porphyria (ADP)].
- Each AHP subtype involves a distinct enzymatic mutation within the pathway.
  * In AIP, HCP, and VP, these mutations reduce enzymatic activity to about 50% that of a normal patient.
  * With ADP, enzymatic activity is reduced to less than 5%.
- The first enzyme in the heme pathway, aminolevulinic acid synthase 1 (ALAS1), can be induced by numerous external triggers. An induction in ALAS1 results in the increased production of aminolevulinic acid (ALA) and porphobilinogen (PBG), two neurotoxic heme intermediates.
- The accumulation of ALA and PBG results in painful neurovisceral attacks, which consist of severe abdominal pain, peripheral neuropathy, tachycardia, hypertension, sweating, insomnia, bladder dysfunction and potential CNS involvement.

- AHP episodes are often triggered by an exacerbating factor, such as alcohol, smoking, certain medications (barbiturates, phenytoin, rifampin, etc.), lack of nutrition, hormonal fluctuations, and stress. Education and avoidance of precipitating factors is key to prevention of AHP attacks.
- A mutation in the heme biosynthesis pathway diagnostic of AHP, is relatively common, however the majority of patients are asymptomatic. Symptomatic AHP occurs in about ten per 1,000,000 patients, and disproportionately impacts women in their second through fourth decades of life.
- The majority of symptomatic AHP patients present with sporadic attacks. Only 3 to 8% of symptomatic patients have recurrent attacks, defined as greater than four attacks per year. It is this small subpopulation with frequent recurrent attacks which may benefit from Givlaari (givosiran).
- During clinical trials, Givlaari (givosiran) use resulted in a clinically relevant decrease in the annualized attack rate and use of emergency hemin in patients with AHP as compared to placebo.
- Givlaari (givosiran) was only studied in symptomatic patients with greater than two attacks within the last six months. The safety and efficacy in asymptomatic or less active disease is unknown.
- Additional controlled trials are needed to assess the long-term safety and efficacy of Givlaari (givosiran), including improvement in quality of life (QOL), overall survival, impact on long-term complications, or benefit over existing treatment options.
- Givlaari (givosiran) may be covered in doses up to 2.5mg/kg every month for AHP, the dose at which it has been shown to be safe and effective.

Clinical Efficacy [3]

The safety and efficacy of givosiran in recurrent AHP was established based on one phase 3, multi-center, double-blind, placebo controlled RCT, the ENVISION trial.

- The primary endpoint in ENVISION was annualized AIP attack rate, which was defined as an exacerbation that required hospitalization, urgent healthcare visit, or IV hemin administration.
- Subjects with greater than two attacks in the last six months were included in the trial.
- Only patients with the most common form of AHP; AIP, were included in the primary endpoint. In total, 5 patients with VP, HCP, or ADP were included in the trial, but excluded from this endpoint.
- In the ENVISION trial, givosiran reduced the absolute number of AIP attacks at six months as well as the use of rescue hemin as compared to placebo.
- The mean annualized AIP attack rate was 3.2 versus 12.5 attacks in the givosiran and placebo groups, respectively.
- The mean annualized days of hemin use in AIP patients was 6.77 versus 29.71 days in the givosiran and placebo groups, respectively.
- Daily worst pain score, using a validated pain scale, the Brief Pain Inventory- Short Form (BPI-SF), was assessed during the trial, as a key secondary endpoint. There was no statistically significant improvement in pain between the placebo and givosiran arms.

- Due to the short duration of the trial (6 months), it is unknown if givosiran will result in a clinically meaningful improvement in long-term QOL, overall survival, or a reduction in chronic complications (including hepatocellular carcinoma, chronic kidney disease, hypertension, or polyneuropathy).
- An interim analysis at month 24 of the long-term open-label extension of the ENVISION study showed continued benefit in patients that remained on givosiran, consistent with the double-blind period. [4]

Clinical Guidelines/Standard of Care Treatment [1]

- Recommendations published by the Porphyria Consortium advise of the following for the long-term management of AHP:
  * Education and avoidance of precipitating factors is key to prevention of AHP attacks.
  * Patients with recurrent attacks, defined as four or more attacks per year, are candidates for prophylactic hemin. However, hemin dosing and management is highly individualized.
  * The use of gonadotropin-releasing hormone (GnRH) analogues or switching to a low-dose hormonal contraceptive can prevent attacks in women with frequent luteal phase attacks.
  * Liver transplant in those with severe intractable attacks can provide benefit. However, due to the associated morbidity and mortality, transplant is considered a treatment of last resort.

Safety [5]

- During clinical trials the most frequent adverse events (>10% incidence) were nausea, injection site reactions, rash, serum creatinine increases, transaminase elevation, and fatigue.

Dosing [5]

- Givosiran is administered once monthly, in doses up to 2.5mg/kg/dose.
- Efficacy and dosing of givosiran in AHP patients in doses higher than 2.5mg/kg once monthly has not been established.

Medication Policy Manual | **Policy No:** dru631

Topic: Reblozyl, luspatercept-aamt | **Date of Origin:** May 15, 2020

Committee Approval Date: June 20, 2024 | **Next Review Date:** 2025

Effective Date: September 1, 2024

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Reblozyl (luspatercept-aamt) is an injected medication used to treat certain types of anemias in patients who require regular red blood cell transfusions (RBCTs).

Policy/Criteria

Most contracts require pre-authorization approval of Reblozyl (luspatercept-aamt) prior to coverage.

I. Continuation of therapy (COT): Reblozyl (luspatercept-aamt) may be considered medically necessary for COT when criterion A, B, or C **AND** D below is met.

A. For diagnoses NOT listed in the coverage criteria below, full policy criteria must be met for coverage.

OR

B. For diagnoses listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

C. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

AND

D. Site of care administration requirements are met [refer to Medication Policy Manual, *Site of Care Review*, dru408].

***Please note**: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Reblozyl (luspatercept-aamt) may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) that criteria A, B, and C below are met:

A. Site of care administration requirements are met [refer to Medication Policy Manual, *Site of Care Review*, dru408].

AND

B. Reblozyl (luspatercept-aamt) is prescribed by, or in consultation with a hematologist.

AND

C. Luspatercept will be used in one of the following settings when criterion 1 or 2 below are met:

1. A diagnosis of **beta thalassemia** when criteria (a and b) below are met.

a. Documented transfusion dependence, defined as transfusion of at least six units of packed red blood cells (PRBCs) in the previous 24 weeks.

AND

b. No transfusion-free period greater than 35 days (5 weeks) in the previous 24 weeks.

OR

2. A diagnosis of **myelodysplastic syndrome (MDS) with ring sideroblasts** when criteria (a, b, and c) below are met.

a. The MDS is classified as very low, low, or intermediate risk MDS according to the IPSS-R (see *Appendix 1*).

AND

b. Documented transfusion dependence, defined as transfusion of at least six units of packed PRBCs in the previous 24 weeks.

AND

c. Erythropoiesis-stimulating agents (ESA) treatment was ineffective, not tolerated, or is contraindicated (see *Appendix 2*).

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers Reblozyl (luspatercept-aamt) coverable only under the medical benefit (as a provider-administered medication).

B. When pre-authorization is approved, Reblozyl (luspatercept-aamt) may be approved in the following quantities:

1. Beta-thalassemia: Up to 1.25 mg/kg every 3 weeks.

2. MDS: Up to 1.75 mg/kg every 3 weeks.

C. Authorization **shall** be reviewed as follows to confirm that medical necessity criteria are met and that the medication is effective.

1. Initial authorization:

Beta-thalassemia: Authorization shall be reviewed after 18 weeks. If there is no documented decrease in transfusion burden after 18 weeks, no further Reblozyl (luspatercept-aamt) will be authorized for coverage.

NOTE: This time frame is based on response after 15 weeks (five doses) plus time to reassess the patient.

MDS: Authorization shall be reviewed after 24 weeks. If there is no documented decrease in transfusion burden after 24 weeks, no further Reblozyl (luspatercept-aamt) will be authorized for coverage.

NOTE: This time frame is based on response after 21 weeks (seven doses) plus time to reassess the patient.

2. Continued authorization (after the initial 18-week period): Authorization shall be reviewed annually.

3. <u>For all authorizations (initial and continued authorization)</u>: Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit evidenced by a reduction or sustained reduction in the need for PRBC transfusions (PRBCTs).

IV. Reblozyl (luspatercept-aamt) is considered not medically necessary when used in erythropoiesis-stimulating agent (ESA)-naïve transfusion-dependent MDS.

V. Reblozyl (luspatercept-aamt) is considered investigational when used for all other conditions.

Position Statement

Summary

- The intent of this policy is to allow for coverage of Reblozyl (luspatercept-aamt) in transfusion dependent patients with beta-thalassemia or lower-risk MDS, up to the doses shown to be safe and effective in clinical trials.
- *Beta-thalassemia:*
  * Evidence to support the use of Reblozyl (luspatercept-aamt) in beta-thalassemia was based on a phase 3, randomized, double-blind, placebo-controlled study in patients with beta thalassemia who required regular RBCTs. Reblozyl (luspatercept-aamt) reduced transfusion burden more than placebo. [1,2]
  * Current standard of care for patients with beta-thalassemia addresses the symptoms of the disease, primarily using life-long, ongoing RBCTs with additional iron chelation therapy to manage iron overload. [3]
- *MDS*:
  * The safety and efficacy of Reblozyl (luspatercept-aamt) was also evaluated in a phase 3, randomized, double-blind, placebo-controlled study in patients with very low, low, or intermediate risk MDS with ring sideroblasts who were dependent on RBCTs and unable to have treatment with ESAs. Patients treated with Reblozyl (luspatercept-aamt) needed less transfusions compared to patients treated with placebo. [4]
  * Subsequently, the FDA indication was expanded based on an open-label, comparative trial in ESA-naive transfusion-dependent anemia due to lower-risk MDS. [5] Despite an improvement in transfusion-independence with luspatercept as compared to epoetin, the clinical meaningfulness of the difference is uncertain. The trial included a higher percentage of patients with characteristics associated with better response to ESAs [lower baseline serum erythropoietin (sEPO), lower percentage of blasts, and low RBCT requirement]. Given the lack of clinical meaningful difference and the significantly higher cost of luspatercept relative to ESA therapy, the use of luspatercept in ESA-naïve transfusion-dependent MDS is considered 'not medically necessary.'

    * Guidelines by the NCCN recommend ESAs as first-line treatment for lower-risk MDS without ring sideroblasts, unless not a treatment option [such as in patients with a baseline serum erythropoietin (EPO) level over 500]. Luspatercept is listed as an option for MDS with ring sideroblasts. Other treatment options include chemotherapy (azacitidine, decitabine), targeted therapy (imatinib), immunosuppressive therapy (anti-thymocyte globulin, cyclosporine), and immunomodulators (lenalidomide). [6]

- In clinical trials, Reblozyl (luspatercept-aamt) doses were increased after six weeks (two doses) is there was suboptimal response, defined as no decrease in transfusion burden versus baseline. For the third dose (at week 9), the patient increased to the maximum dose of 1.25 mg/kg (beta-thalassemia) or 1.75 mg/kg (MDS). The majority of patients in clinical trials achieved a response within approximately four to five treatment cycles. After nine weeks of treatment at the maximum dose (after 15 weeks of treatment total), Reblozyl (luspatercept-aamt) is discontinued if there is no decrease in transfusion burden. Therefore, if a patient does not have a reduction in transfusion burden after 15 weeks of therapy, additional Reblozyl (luspatercept-aamt) may not be covered. [1,4,5,8]
- Reblozyl (luspatercept-aamt) may be covered for up to the doses shown to be safe and effective in the pivotal trials. The safety and effectiveness of higher doses have not been established.
- There is insufficient evidence to support the use of Reblozyl (luspatercept-aamt) in any other conditions.

Regence Pharmacy Services performs independent analyses of oncology medication evidence, to establish coverability per the contracts with the health plan.

- Most contracts define coverability based on established clinical benefit in published, peer-reviewed literature, along with consideration of regulatory status.
- FDA approval does not in itself establish medical necessity, as unpublished, low-quality evidence, including exploratory analyses and unvalidated surrogate endpoints, may be used as the basis of approval. Regulatory approval may or may not reflect clinical benefit relative to standard of care and the recommendations of expert clinical advisors such as the Oncologic Drugs Advisory Committee (ODAC). FDA approvals generally do not consider cost compared to established therapies, or value to members.
- Likewise, NCCN clinical practice guidelines assignment of a recommendation (category 1, 2a, or 2b) does not necessarily establish medically necessity. NCCN recommendations are inconsistently supported by published, peer-reviewed literature and do not uniformly consider value of new therapies relative to existing potentially higher-value treatment options, considering effectiveness, safety, and cost.
- Medication coverage criteria are developed based on the 'medical necessity' assessment, as described above.

Regence Pharmacy Services analysis and coverage policy may differ from FDA labeled indication and/or NCCN clinical practice guidelines.

Clinical Efficacy

Beta-thalassemia

- Safety and efficacy of luspatercept were evaluated in a phase 3, multicenter, randomized, double-blind, placebo-controlled trial in adult patients with beta-thalassemia who required regular RBCTs ("transfusion-dependent"). [2]
    * Patients were required to have received 6 to 20 RBC units within 24 weeks prior to the study and no transfusion-free periods of greater than 35 days.
    * Patients were randomized to receive 48 weeks of treatment with either luspatercept or placebo every 3 weeks. Treatments were administered in addition to best supportive care (BSC) which included RBCT and iron chelation therapy to maintain a patient's baseline hemoglobin level.
    * The primary endpoint was erythroid response defined as a ≥33% reduction from baseline in RBCT burden (with a reduction of ≥2 units).
    * Study results demonstrated a greater reduction in transfusion burden in patients treated with Reblozyl (luspatercept-aamt) compared to placebo.

MDS

- In patients with lower-risk MDS with ring sideroblasts, safety and efficacy of luspatercept were evaluated in a phase 3, multicenter, randomized, double-blind, placebo-controlled trial in patients who were refractory, intolerant, or ineligible for ESA treatment. [4]
    * Patients were required to have ≥2 RBC units in the previous 8 weeks and very low, low, or intermediate risk disease by the IPSS-R classification system.
    * Patients received treatment with Reblozyl (luspatercept-aamt) or placebo every 3 weeks.
    * The primary endpoint was RBC-transfusion independence (RBC-TI) ≥8 weeks between week 1 and 24, which was demonstrated in more patients in the luspatercept treatment group than in the placebo group.
- Subsequently, the FDA indication was expanded based on a published, phase 3, multicenter, randomized, open-label, comparative trial in patients with transfusion-dependent anemia due to lower-risk MDS and not previously treated with ESAs. [5]
    * The primary endpoint was RBC-transfusion independence (RBC-TI) ≥ 12 weeks AND a concurrent mean Hgb increase of at least 1.5 g/dL (between week 1 and 24), assessed in the intention-to-treat population.
    * All patients had:
        - Anemia due to very-low, low, or intermediate risk MDS [excluding MDS with del(5q)] [9% very low, 72% low]
        - Required 2–6 PRBC units per 8 weeks for ≥8 weeks immediately before randomization [median 3 RBCTs in prior 8 weeks* [63% with <4 RBCTs in 8 weeks)]
        - sEPO < 500 U/L [79% had sEPO <200].
        - No prior use of ESA.

* Patients were randomized to receive 24 weeks of open-label treatment: luspatercept or epoetin alfa, stratified by baseline transfusion burden (<4 units per 8 weeks vs ≥4 units per 8 weeks), endogenous serum EPO (≤200 U/L vs >200 to <500 U/L), and ring sideroblast status (positive vs negative). Of randomized patients, 73% with ring sideroblasts. Baseline Hgb 7.8 (7-8).
* Treatment was continued in patients with clinical benefit (defined as a transfusion reduction of ≥2 units RBCs per 8 weeks vs baseline) until evidence of disease progression, death, unacceptable toxicity, or withdrawal of consent.
* There was a statistically higher rate of transfusion-independence at 12 weeks with luspatercept (67%) as compared to epoetin (46%). However, the clinical meaningfulness of the difference in the reductions in RBCT burden or in RBC-TI between luspatercept and epoetin is unknown. Of note, the trial included a higher percentage of patients with characteristics associated with better response to ESA [sEPO <500, lower percentage of blasts, and pretreatment RBCTs <2/month ("low RBCT requirement")]. In addition, durability of response is also unknown. Given the lack of clinical meaningful difference and the significantly higher cost of luspatercept relative to ESA therapy, the use of luspatercept in ESA-naïve transfusion-dependent MDS is considered 'not medically necessary'.
* Although there is interest in the effect of biomarkers (ring sideroblasts or mutations such as SF3B1) on response to treatment of MDS-related anemia, the data from the exploratory analyses of these markers remain inconclusive as this study was not powered to establish cause and effect. Therefore, any associate of baseline mutations and response to either therapy remains unproven.
* Of note, the presence of ring sideroblasts is a favorable prognostic marker in MDS, whereas favorable response to ESAs is associated with baseline sEPO<500, lower percentage of blasts, and lower RBCT requirements at baseline. Because most subjects in this trial had ring sideroblasts (73%) and all had low sEPO (<500), the efficacy in ring-sideroblast negative ESA-naïve MDS-associated anemia is less clear.

- *Guidelines* [5]
  * Treatment goals for patients with lower-risk MDS include transfusion independence, improvement in hemoglobin levels, and maintenance of or improvement in quality of life.
  * For initial management of MDS-associated anemia, iron, folate, and B12 replacement are used in combination with RBCTs.
  * Erythropoiesis-stimulating agents (ESAs), epoetin alfa or darbepoetin, are a first-line medication treatment for anemia with lower-risk MDS, targeting early stages of erythropoiesis by inhibiting apoptosis and stimulating erythropoietin-responsive erythroid precursor proliferation (40-60% response rate). Lower baseline serum erythropoietin (sEPO) (<500), lower percentage of blasts, and lower pretreatment RBCTs (<2 per month) is associated with better response to ESAs. ESAs are dosed to a target Hgb of 10 to 12 g/dL (not to exceed 12). For lack

of efficacy with ESAs, dose escalation is recommended. After 6-8 weeks, treatment is stopped if ≤1.5 g/dL increase in Hgb or no reduction in RBCTs from baseline.

* Luspatercept (Reblozyl) is an option in anemic patients with ring sideroblasts if refractory to ESAs (or unlikely to respond to ESAs, namely those with sEPO above 500 at baseline).
* Other MDS-targeted options include chemotherapy (azacitidine, decitabine), targeted therapy (imatinib), immunosuppressive therapy (anti-thymocyte globulin, cyclosporine), and immunomodulators (lenalidomide).

Investigational Uses

- There is insufficient evidence to establish the efficacy of Reblozyl (luspatercept-aamt) for the treatment of other conditions, including non-proliferative chronic myelomonocytic leukemia, myelofibrosis, or non-transfusion dependent thalassemia. Data is limited to small, unpublished, phase 2 trials. Although the preliminary evidence is promising, larger, well controlled trials are needed to establish the safety and efficacy of Reblozyl (luspatercept-aamt) in these settings. Additional trials are ongoing. [7]

Safety [8]

- The most common adverse reactions associated with Reblozyl (luspatercept-aamt) include headache, bone pain, arthralgia, fatigue, cough, abdominal pain, diarrhea, and dizziness.

Dosing [8]

- The recommended dose of Reblozyl (luspatercept-aamt) in patients with beta thalassemia is 1 mg/kg (up to 1.25 mg/kg) every 3 weeks by subcutaneous injection. Safety and effectiveness of higher doses have not been established.
- In clinical trials of MDS, the dose of Reblozyl (luspatercept-aamt) was 1 mg/kg (up to 1.75 mg/kg) administered every 3 weeks by subcutaneous injection. The safety and effectiveness of higher doses have not been established.

Appendix 1: IPSS-R Prognostic Risk Categories/scores [9]	
Risk category	**Risk score**
Very low	≤ 1.5
Low	> 1.5 – 3
Intermediate	> 3 – 4.5
High	> 4.5 – 6
Very high	> 6

Appendix 2: Erythropoiesis-stimulating Agents (ESAs) [a]	
Aranesp	darbepoetin alfa
Epogen	epoetin alfa
Procrit	epoetin alfa
Retacrit	epoetin alfa-epbx

[a] For lack of efficacy with ESAs, dose escalation is recommended.[6]

Revision History

Revision Date	Revision Summary
6/20/2024	No criteria changes with this annual review.
3/21/2024	Added the use in ESA-treatment-naïve transfusion-dependent MDS (a new FDA indication) as not medically necessary.
6/15/2023	No criteria changes with this annual update.
6/17/2022	No criteria changes with this annual update.
7/16/2021	No criteria changes with this annual update.
7/22/2020	Updated initial authorization periods to differentiate between beta-thalassemia and MDS and to be consistent with labeling.
4/22/2020	New policy (effective 5/15/2020). Limits coverage to patients with beta-thalassemia who require regular red blood cell transfusions. Coverage criteria also allows for patients with lower risk MDS who require regular red blood cell transfusions and are refractory, intolerant, or ineligible for ESA treatment, the settings in which luspatercept was studied.

Medication Policy Manual | **Policy No:** dru632

Topic: Tepezza, teprotumumab | **Date of Origin:** May 15, 2020

Committee Approval Date: March 21, 2024 | **Next Review Date:** 2025

Effective Date: April 15, 2024

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Teprotumumab (Tepezza) is an infused medication used to treat thyroid eye disease. It is administered by a healthcare provider.

Policy/Criteria

Most contracts require pre-authorization approval of Tepezza (teprotumumab) prior to coverage.

I. Continuation of therapy (COT): Tepezza (teprotumumab) may be considered medically necessary for COT when criterion A or B plus criteria C **AND** D below is met.

A. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

OR

B. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

AND

C. The requested number of doses (infusions) is within the policy limits below.

PLEASE NOTE: Doses (infusions) already administered will be counted towards the coverable maximum quantity.

AND

D. Site of care administration requirements are met [refer to Medication Policy Manual, *Site of Care Review*, dru408].

***Please note**: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Tepezza (teprotumumab) may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) that criteria A through F below are met.

A. Site of care administration requirements are met [refer to Medication Policy Manual, *Site of Care Review*, dru408].

AND

B. A diagnosis of **Graves' disease**.

AND

C. Tepezza (teprotumumab) is prescribed by, or in consultation with an ophthalmologist.

AND

D. The patient has treated thyroid disease (normalized or normalizing) based on thyroid function testing, as defined by meeting one of the following criteria (1 or 2):

1. Normal thyroid function ("euthyroid"), defined as both thyroxine [T4] and triiodothyronine [T3] within normal limits of the lab.

OR

2. Normalizing thyroid function, defined as both T4 and free T3 levels less than 50% above OR 50% below normal limits of the lab.

AND

E. No prior surgical treatment for thyroid eye disease.

AND

F. Documentation of disease activity when criteria 1 or 2 below are met:

1. Significant (moderate to severe) symptoms of thyroid eye disease as defined by the following (a and b):

a. Clinical activity score (CAS) of at least 4 in at least one eye (see *Appendix 1*).

AND

b. The patient meets one of the following criteria (i, ii, or iii):

i. Presence of significant proptosis impacting daily life (attestation).

OR

ii. Presence of diplopia.

OR

iii. Treatment with an adequate course of intravenous glucocorticoids (IVGC) has been ineffective after at least 6 weeks, not tolerated, or is contraindicated

PLEASE NOTE: Standard dosing with IVGC consists of IV methylprednisolone (IVMP) at cumulative doses of 4.5 g over approximately 3 months (0.5 g weekly x 6 weeks followed by 0.25 g weekly for an additional 6 weeks.) A cumulative dose of IVMP > 8.0 g should be avoided.

OR

2. Stable/low to mild thyroid eye disease with proptosis as defined by the following (a. through c.):

a. Clinical activity score (CAS) of less than 4 in both eyes (see *Appendix 1*).

AND

b. Proptosis ≥3 mm above normal values for race and sex.

AND

c. The proptosis has resulted in a significant medical complication such as one of the following:

i. Diplopia

OR

ii. Eye pain due to proptosis

OR

iii. Documentation of inability to perform critical activities of daily living or demands of employment due to proptosis.

*PLEASE NOTE: Medical treatment of persistent proptosis is considered not medically necessary in the absence of significant medical complications associated with the condition. Treatment directed at improving the aesthetic appearance of proptosis alone does not qualify as a significant medical complication.

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers Tepezza (teprotumumab) coverable only under the medical benefit (as a provider-administered medication).

B. When pre-authorization is approved, Tepezza (teprotumumab) will be approved for up to a total of eight infusions (one treatment course) per lifetime, based on dosing of up to a maximum of 20 mg/kg/dose every three weeks.

C. No additional doses beyond the maximum number of doses stated above will be authorized.

IV. The use of Tepezza (teprotumumab) for less severe thyroid eye disease without proptosis resulting in a significant medical complication is considered cosmetic. Use of Tepezza (teprotumumab) for cosmetic indications is considered not medically necessary and not coverable.

V. Tepezza (teprotumumab) is considered investigational when used for all other conditions, including but not limited to:

A. Diabetic macular edema.

B. Cutaneous systemic sclerosis.

C. Repeated treatment courses of Tepezza (teprotumumab).

Position Statement

Summary

- The intent of this policy is to allow for coverage of Tepezza (teprotumumab) in patients with thyroid eye disease (TED) due to Graves' disease, when lower-cost standard of care alternatives are not effective, up to the doses shown to be safe and effective in clinical trials (as detailed in the coverage criteria).
- Evidence to support the use of Tepezza (teprotumumab) in moderate to severe TED was based on two phase 3 trials. Patients included in the trials were required to have moderate to severe TED due to Graves' disease and treated thyroid disease (normalized

or normalizing). Previous treatment with Tepezza (teprotumumab), orbital irradiation, and/or surgery for thyroid eye disease was not allowed.

- Evidence to support the use of Tepezza (teprotumumab) in low-activity TED was established in one phase 4 trial in patients with stable or inactive disease, the presence of proptosis, and treated thyroid disease (normalized or normalizing). Those with previous treatment with Tepezza (teprotumumab) were excluded from the trial.
- Goals of treatment for TED include achieving a euthyroid state and symptom management. Overall, most patients with TED will benefit from supportive care with ocular lubrication and lifestyle modification.
- There are no clinical trials that compared the safety and efficacy of Tepezza (teprotumumab) over current first line treatment with intravenous glucocorticoids (IVGC). Therefore, the use of Tepezza (teprotumumab) before an adequate trial of IVGC is not coverable, unless a patient has diplopia or significant proptosis.
- The American Thyroid Association and European Thyroid Association TED guidelines state IVGC therapy is a preferred treatment for active moderate-to-severe TED when disease activity is the prominent feature in the absence of either significant proptosis or diplopia. Because available evidence for glucocorticoids shows negligible benefit for diplopia and proptosis, Tepezza (teprotumumab) is a preferred therapy for these patients. In patients with mild TED, watchful monitoring is recommended by the guidelines.
- There is insufficient evidence to support the use of Tepezza (teprotumumab) in any other conditions.
- Tepezza (teprotumumab) may be covered for up to the dose studied in clinical trials, as detailed in the coverage criteria.
- Clinical trials of multiple treatment courses (e.g., Optic X trial) are limited to small numbers of subjects with moderate to severe disease. Given the potential risk for permanent hearing impairment and intracerebral hemorrhage, there is insufficient data to establish the safety and effectiveness of higher or additional doses, included repeated treatment courses, have not been established. Therefore, the use of repeated treatment courses of Tepezza (teprotumumab) is considered investigational and not covered.

Disease Background *[1-3]*

- TED due to Graves' disease, also known as Graves' ophthalmopathy (GO), is a rare autoimmune condition caused by antibodies directed against receptors in the thyroid cells and on the surface of the cells behind the eyes. Muscles and fatty tissues behind the eye become inflamed, causing the eyes to be pushed forward and bulge outwards (proptosis). It can cause also cause eye pain, double vision, light sensitivity, or difficulty closing the eye.
- TED develops in approximately 40% of patients with Graves' disease, an autoimmune disease that causes hyperthyroidism. TED can occur in patients when their thyroid is overactive, underactive, or functioning normally. TED often improves on its own; however, in some patients, symptoms may persist despite treatment of the overactive thyroid gland.

- Tepezza (teprotumumab) may have a role in interfering with the receptors responsible for causing inflammation, pain, swelling, and other symptoms associated with TED.
- Goals of treatment in TED consists of achieving a euthyroid state and symptom management.
    * Initial treatment is for the underlying Graves' disease-related hyperthyroidism. Treatment options include medications [such as methimazole or propylthiouracil (PTU)], radioiodine therapy, and/or thyroid surgery.
    * The majority of patients with TED have mild-to-moderate disease. Supportive care with ocular lubrication (eyedrops and ointment), topical cyclosporine, and lifestyle modification (smoking cessation, sodium restriction, sunglasses) is the primary approach and sufficient for these patients.
    * Treatment for TED should start in the early months of the active inflammatory phase, as treatment becomes less effective as the disease progresses.

Clinical Guidelines [9]

- The American Thyroid Association and European Thyroid Association TED recently issued a consensus statement for the management of TED:
    * IVGC therapy is a preferred treatment for active moderate-to-severe TED when disease activity is the prominent feature in the absence of either significant proptosis or diplopia. Available evidence for glucocorticoids shows negligible benefit for diplopia and proptosis.
    * Standard dosing with IVGC consists of IV methylprednisolone (IVMP) at cumulative doses of 4.5 g over approximately 3 months (0.5 g weekly for 6 weeks followed by 0.25 g weekly for an additional 6 weeks). A cumulative dose of IVMP greater than 8.0 g should be avoided due to associated risk of severe hepatotoxicity.
    * Poor response to IVMP at 6 weeks should prompt consideration for treatment withdrawal and evaluation of other therapies.
    * Tepezza (teprotumumab) is a preferred therapy in patients with active moderate-to-severe TED with significant proptosis or diplopia based on clinical trials showing improvement in both symptoms.
    * In patients with mild TED, watchful monitoring is the preferred therapeutic option recommended by the guidelines. However, in patients with symptomatic inflammatory soft tissue involvement, oral glucocorticoids are an acceptable therapy.

Clinical Efficacy

- Tepezza (teprotumumab) is a human monoclonal antibody against the insulin-like growth factor-1 receptor inhibitor. Tepezza (teprotumumab) may interfere with the signaling pathway that mediates the symptoms associated with thyroid eye disease.
- In moderate to severe disease, the safety and efficacy of Tepezza (teprotumumab) were evaluated in two phase 3, multicenter, randomized, double-masked, placebo-controlled trials in patients with TED. [3,5-7]

    * Patients were required to have a diagnosis of Graves' disease with active, moderate-to-severe TED with significant symptoms, such as significant lid retraction, moderate or severe soft-tissue involvement, proptosis, and diplopia.
    * All patients had a CAS ≥4 and symptoms less than 9 months from the onset of thyroid eye disease.
    * All patients were euthyroid or with mild hypo- or hyperthyroidism.
    * Patients with previous orbital irradiation or surgery for TED were not allowed.
    * The primary endpoint in the first trial was a composite endpoint of reduction of ≥2 points in the CAS and a reduction of ≥2 mm in proptosis. The primary endpoint in the second trial was a reduction in proptosis of ≥2 mm. In both trials, significantly more patients treated with Tepezza (teprotumumab) demonstrated *less symptoms of TED than patients treated with placebo.*
- In stable disease/low clinical activity, the safety and efficacy of Tepezza (teprotumumab) were evaluated in one phase 4, multicenter, randomized, double-masked, placebo-controlled trial in patients with TED.[11]
    * Patients were required to have a diagnosis of TED with a CAS ≤1 in both eyes for at least one year or no additional inflammation or progression in proptosis/diplopia for at least one year.
    * All patients were also required to have proptosis of at least a 3 mm increase in proptosis before the diagnosis of TED and/or proptosis at least 3 mm above normal values for race and sex.
    * All patients were euthyroid or with mild hypo- or hyperthyroidism.
    * Previous treatment with Tepezza (teprotumumab) was not allowed.
    * The primary endpoint, reduction in proptosis measurement (mm), was significantly greater for patients in the Tepezza (teprotumumab) group compared with placebo.

Safety

- Data regarding retreatment with Tepezza (teprotumumab) is limited to 14 subjects enrolled in the Optic-X trial. Intracerebral hemorrhage was reported in 7.1% of study subjects, and hearing impairment was reported in 14.3%. There is insufficient safety data to support re-treatment with Tepezza (teprotumumab) at this time. [10]

Not Medically Necessary Uses

- There is no evidence to support the use of Tepezza (teprotumumab) in patients with less severe TED without proptosis. Clinical trials limited the patient population to patients with stable/inactive disease with proptosis or in patients with moderate to severe disease. Therefore, safety and efficacy in patients with less severe TED without proptosis have not been established. Therefore, the use of Tepezza (teprotumumab) for less severe thyroid eye disease without proptosis is considered not medically necessary and not coverable, given the lack of pain/functional impairment.

Investigational Uses

- There is insufficient evidence to establish the efficacy of Tepezza (teprotumumab) for any other conditions, including for the treatment of diabetic macular edema and cutaneous systemic sclerosis. Data is limited to small, early-stage trials. Well controlled trials are needed to establish the safety and efficacy of Tepezza (teprotumumab) in these settings. Trials are ongoing. [8]
- Repeated treatment courses:
  * Clinical trials of multiple treatment courses (e.g., Optic X trial) are limited to small numbers of subjects with moderate to severe disease. [10] Given the potential risk for permanent hearing impairment and intracerebral hemorrhage, there is insufficient data to establish the safety and effectiveness of higher or additional doses, included repeated treatment courses, have not been established. [7,9]
  * There is no evidence for the use of repeated treatment courses of Tepezza (teprotumumab) in patients with stable disease/low clinical activity.
  * Therefore, the use of repeated treatment courses of Tepezza (teprotumumab) is considered investigational and not covered.

Dosing [7]

- The recommended dose of Tepezza (teprotumumab) is 10 mg/kg for the first infusion, followed by 20 mg/kg every 3 weeks for 7 additional infusions (for a total of eight infusions for a single treatment course). The safety and effectiveness of higher doses or additional doses (or treatment course) have not been established.
- The use of repeated treatment courses of Tepezza (teprotumumab) is considered investigational (*see above section for more information*).

Appendix 1: Clinical Activity Score (CAS)	
The 7-point scale is comprised of 2 patient-reported outcomes and 5 clinician-reported outcomes. Each component is scored as present or absent, 1 or 0. The sum of these points is the total score, i.e., giving a range of 0-7, where 0 or 1 constitutes inactive disease and 7 severe active ophthalmopathy. A change of ≥2 points is considered clinically meaningful.	
1	Spontaneous orbital pain
2	Gaze evoked orbital pain
3	Eyelid swelling that is considered to be due to active Graves' ophthalmopathy
4	Eyelid erythema
5	Conjunctival redness considered due to active Graves' ophthalmopathy
6	Chemosis
7	Inflammation of caruncle or plica

Revision History

Revision Date	Revision Summary
3/21/2024	Added coverage criteria for stable/low to mild TED with proptosis. In addition, added repeated treatment courses of Tepezza as investigational.
10/15/2023	Removed DMARD from step therapy requirements due to updated US/EU guidelines and evidence review. Kept step through IV glucocorticoids, unless member with diplopia or significant proptosis, which is in line with new US/EU guidelines.
3/18/2022	Clarified steroid step therapy requirement (IV steroids or oral steroids in combination with an oral csDMARD). No change to intent.
4/21/2021	Removed criterion requiring thyroid eye disease symptoms present for less than nine months; added Clinical Activity score in Appendix (effective 5/15/21).
7/22/2020	Updated criterion II ("New Starts") to read "A through G." No other changes to criteria.
April 22, 2020	New policy (effective 05/15/2020). Limits coverage to patients with moderate to severe thyroid eye disease when lower-cost standard of care alternatives are not effective.

Drug names identified in this policy are the trademarks of their respective owners.

Medication Policy Manual

Policy No: dru633

Topic: Medications for pulmonary arterial hypertension (PAH)

Date of Origin: July 1, 2020

- Adempas (riociguat oral)
- ambrisentan oral (Letairis, generic)
- bosentan oral (Tracleer, generic)
- Opsumit (macitentan oral)
- Opsynvi (macitentan and tadalafil)
- Orenitram (treprostinil oral)
- Tyvaso, Tyvaso DPI (treprostinil inhalation)
- Uptravi (selexipag oral)
- Uptravi IV (selexipag injection)
- Ventavis (iloprost inhalation)
- Winrevair (sotatercept-csrk)

Committee Approval Date: June 20, 2024

Next Review Date: 2025

Effective Date: September 1, 2024

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

This policy is for medications used in the treatment of pulmonary arterial hypertension (PAH) and other specific forms of pulmonary hypertension.

Policy/Criteria

Most contracts require pre-authorization approval of medications for pulmonary arterial hypertension (PAH) prior to coverage.

I. Continuation of therapy (COT): Medications for PAH may be considered medically necessary for COT when criterion A, B or C below is met.

A. For diagnoses NOT listed in the coverage criteria below, criteria 1, 2, and 3 below must be met:

1. The patient was established on therapy prior to current health plan membership AND there is documentation that the medication was covered by another health plan. Examples of documentation include the coverage approval letter from the previous health plan or paid claim.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

AND

3. **For branded bosentan (Tracleer) or branded ambrisentan (Letairis) only:** There is clinical documentation (including, but not limited to chart notes) of an intolerance or contraindication to an inactive ingredient in the generic equivalent medication (bosentan or ambrisentan).

OR

B. For diagnoses listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

C. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

***Please note**: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve): Medications for PAH (as listed in *Table 1*) may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) that criterion A, B, or C below are met.

A. **Pulmonary arterial hypertension** (PAH) - Medications for PAH (as listed in *Table 1*), when criteria 1 and 2 below are met:

1. There is a diagnosis of **WHO Group 1 pulmonary arterial hypertension** (PAH) (see *Appendix I*). Note: This criterion is NOT met for patients with a diagnosis of pulmonary hypertension (PH), but group unspecified, or with the diagnostic workup ongoing.

AND

2. For the following medications only, specific criteria for PAH must also be met:

Medication	Criteria
• Opsumit (macitentan) • Opsynvi (macitentan and tadalafil) • Letairis (branded ambrisentan) • Tracleer (branded bosentan)	**i.** Generic bosentan and generic ambrisentan have been ineffective, not tolerated, or are contraindicated. **AND** **ii.** **For branded bosentan (Tracleer) or branded ambrisentan (Letairis) only:** There is clinical documentation (including, but not limited to chart notes) of an intolerance or contraindication to an inactive ingredient in the generic equivalent medication (bosentan or ambrisentan).
• Adempas (riociguat) • Uptravi (selexipag oral) • Orenitram (treprostinil oral)	**i.** Sildenafil or tadalafil have been ineffective, not tolerated, or are contraindicated. **AND** **ii.** Generic bosentan or generic ambrisentan have been ineffective, not tolerated, or contraindicated. **AND** **iii.** **For Orenitram (treprostinil oral)**: will be used as monotherapy.
Winrevair (sotatercept)	**i**. Will be used as **add-on** therapy: Documentation that the patient is currently being treated with a double or triple regimen of a**t least two** medications for PAH (as listed in *Table 1*) **AND** those PAH medications will be continued with Winrevair (sotatercept). **AND** **ii.** Persistent PAH: Documentation of WHO functional class (FC) II or III (see *Appendix III*).

OR

B. **<u>For Adempas (riociguat) only:</u>**

Pulmonary hypertension (PH) associated with chronic thrombotic and/or embolic disease (CTEPH) [WHO Group 4, see *Appendix II*], that is inoperable or with residual PH after pulmonary thromboendarterectomy (PTE).

OR

C. **<u>For Tyvaso (inhaled treprostinil) only:</u>**

Pulmonary hypertension (PH) associated with interstitial lung disease (PH-ILD) [WHO Group 3, see *Appendix II*] when there is documentation or attestation of diffuse parenchymal disease, based on lung imaging.

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers all oral, inhaled, and subcutaneous medications for PAH coverable only under the pharmacy benefit (as self-administered medications).

B. Regence Pharmacy Services considers all intravenous (IV) medications for PAH coverable only under the medical benefit (as a provider-administered medication).

C. When pre-authorization is approved, medications for PAH will be authorized in quantities as listed in *Table 1*.

TABLE 1. Medications for Pulmonary Arterial Hypertension (PAH)

Product	Quantity Limit
Adempas (riociguat oral)	90 tablets per month
ambrisentan oral (Letairis, generic)	30 tablets per month
bosentan oral (Tracleer, generic)	60 tablets per month
Opsumit (macitentan oral)	30 tablets per month
Opsynvi (macitentan and tadalafil)	30 tablets per month
Orenitram (treprostinil oral)	not to exceed 42 mg per day
Tyvaso (treprostinil inhalation)	28 ampules (81.2 mL) per 28 days (one refill pack)
Tyvaso DPI (treprostinil inhalation)	up to dosing limits described in FDA-approved prescribing information
Uptravi (selexipag oral)	3,200 mcg per day (up to 1,600 mcg twice daily)
Uptravi IV (selexipag injection)	60 of the 1,800 mcg vials per month (up to 1,800 mcg twice daily)

<table>
<tr><td>Ventavis (iloprost inhalation)</td><td>540 ampules per month</td></tr>
<tr><td>Winrevair (sotatercept subcutaneous)</td><td><u>0.3mg/kg dose (initial dose):</u>
<table><tr><th>Weight</th><th>Quantity</th></tr><tr><td>158 kg or less</td><td>One 45 mg kit (one 45mg vial) per 21 days</td></tr><tr><td>Above 158kg</td><td>One 60mg kit (one 60mg vial) per 21 days</td></tr></table>
<u>0.7mg/kg dose (target dose):</u>
<table><tr><th>Weight</th><th>Quantity</th></tr><tr><td>67 kg or less</td><td>45mg kit (one 45mg vial) per 21 days</td></tr><tr><td>68-89 kg</td><td>60mg kit (one 60mg vial) per 21 days</td></tr><tr><td>90-132 kg</td><td>90mg kit (two 45 mg vials) per 21 days</td></tr><tr><td>133 kg and above</td><td>One 120mg kit (two 60mg vials) per 21 days</td></tr></table></td></tr>
</table>

D. Authorization:

1. For Winrevair (sotatercept) ONLY:

a. <u>Initial authorization</u> shall be limited to 6 months.

b. <u>Reauthorization</u> **shall** occur every 12 months thereafter with clinical documentation (including but not limited to chart notes) that current medical necessity criteria are met, and that the medication is providing clinical benefit, such as disease stability or improvement.

2. Medications for PAH, except for Winrevair (as noted above) **may** be reviewed at least annually. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, such as disease stability or improvement.

IV. Bosentan (Tracleer, generic) is considered not medically necessary when used for essential hypertension.

V. Uptravi IV (selexipag injection) is considered not medically necessary (for outpatient use).

VI. Medications for PAH are considered investigational when used for all other conditions, unless specified above in the coverage criteria, including but not limited to:

A. All other types of pulmonary hypertension (PH) [WHO Groups 2-5, see *Appendix II*], including PH associated with the following (unless specified above in the coverage criteria):

1. Left heart disease, including congestive heart failure (CHF) [WHO Group 2].

2. Lung diseases, including chronic obstructive pulmonary disease (COPD) and idiopathic pulmonary fibrosis (IPF) [WHO Group 3] except as noted in the coverage criteria.

3. Miscellaneous causes, such as sarcoidosis (WHO Group 5).

B. **Specific oral therapies [Opsumit (macitentan), Opsynvi (macitentan and tadalafil), Adempas (riociguat), Uptravi (selexipag oral), Orenitram (treprostinil oral) only]:** Digital ischemia and/or ulcers, including Raynaud's phenomenon, due to systemic sclerosis, scleroderma, or other causes.

C. **Ambrisentan (Letairis, generic), Opsumit (macitentan), Opsynvi (macitentan and tadalafil), bosentan (Tracleer, generic), and Adempas (riociguat) only:** Idiopathic pulmonary fibrosis (IPF), with or without pulmonary hypertension.

D. **Adempas (riociguat) only:** Use in combination with any phosphodiesterase inhibitor, including sildenafil (generic Revatio), tadalafil (generic Adcirca), dipyridamole, or theophylline.

E. **Bosentan (Tracleer, generic) only:** Behçet's disease.

F. **Orenitram (treprostinil oral) only:** Use in combination with other PAH-specific medications, including all medications listed in Table 1, as well as sildenafil, tadalafil, epoprostenol injection, and treprostinil injection.

G. **Winrevair (sotatercept subcutaneous) only:** Use as monotherapy or in WHO Functional class I or IV or in treatment naive patients with PAH.

Position Statement

Summary

- The intent of this policy is to cover medications for PAH for the indications and dose for which they have been shown to be safe and effective, as detailed in the coverage criteria:
  * WHO Group 1 pulmonary arterial hypertension (PAH), when treatment with lower cost generic therapies are ineffective or not a treatment option.
  * Adempas (riociguat) only: Group 4 pulmonary hypertension (PH) associated with chronic thrombotic and/or embolic disease (CTEPH), when pulmonary thromboendarterectomy (PTE) is ineffective or not a treatment option.
  * Tyvaso (treprostinil inhalation) only: Group 3 pulmonary hypertension (PH) associated with interstitial lung disease (ILD), with diffuse parenchymal disease, based on lung imaging.

* Winrevair (sotatercept) only: as add-on therapy for persistent PAH (functional class II/III), despite current double or triple background PAH regimens.

- *Pulmonary Arterial Hypertension (PAH)*
  * There is insufficient evidence to establish any one oral therapy for PAH is clearly superior to another. Generic sildenafil is the lowest-cost oral medication for PAH and a treatment option for most treatment-naïve PAH patients, along with generic tadalafil, both phosphodiesterase-5 inhibitors (PDE5is).
  * Among the endothelin receptor antagonists (ERAs), generic ambrisentan and generic bosentan are the lowest cost. There is no evidence that any one ERA is safer or more effective than another. However, among the medications for PAH with an available generic product, including ambrisentan and bosentan (see *Table 1*), the generic product is the lower cost option. Therefore, the branded products are covered only when the generic equivalent is not a treatment option.
  * Injectable prostanoids epoprostenol and treprostinil are available as lower-cost generic options. The branded prostanoids (prostacyclin analogues or PCAs) for PAH [Ventavis (iloprost inhalation), Tyvaso (treprostinil inhalation), and Orenitram (treprostinil oral)] have been studied individually in the treatment of PAH. To date, there is insufficient evidence that any one of these products is safer or more effective than the other.
  * The addition of Orenitram (treprostinil oral) to other PAH-specific medications, such as oral phosphodiesterase-5 inhibitors (PDE5is) or endothelin-receptor antagonists (ERAs), has not been shown not improve exercise tolerance over monotherapies for PAH. [1 2]
  * New therapies [Adempas (riociguat), Uptravi (selexipag oral) and Orenitram (treprostinil oral)] are coverable when low-cost generics are not an option, given the lack of superiority to lower cost oral step therapy options, as well as lower cost generic PCAs. Adempas (riociguat) and Uptravi (selexipag oral) have been studied when used for PAH inadequately managed with oral PDE-5is and ERAs.
- *Other Coverable Pulmonary Hypertension Uses*
  * For pulmonary hypertension due to CTEPH, surgical clot removal with pulmonary thromboendarterectomy (PTE) is the treatment of choice and standard of care therapy. PAH-specific medication therapies may be considered for patients unable to have surgery or with residual PH; however, the evidence for efficacy is limited. All CTEPH patients should receive along with lifelong anticoagulation. [3] Adempas (riociguat) has been FDA-approved for and may be a treatment option for inoperable or recurrent CTEPH. Other PAH medications are being studied for use in CTEPH; however, there is insufficient evidence at this time to support the use of any other PAH medications for this indication.
  * Pulmonary hypertension (PH) due to interstitial lung disease (PH-ILD) is a specific type of PH associated with fibrotic lung disease. Tyvaso (treprostinil inhalation) has been FDA-approved for and may be a treatment option for PH-ILD. Other PAH medications are being studied for use in PH-ILD; however,

there is insufficient evidence at this time to support the use of any other PAH medications for this indication.

- The World Health Organization (WHO) classifies pulmonary hypertension (PH) in five groups, based on underlying etiology of PH. [4]
  * Group 1 (pulmonary arterial hypertension) patients have generally irreversible, progressive disease and may require treatment with PAH-specific therapies.
  * For patients with Groups 2-5, PH may be reversible. Therapy should be directed at treating the underlying cause, such as clot removal for PH due to chronic thromboembolic (CTEPH) with pulmonary thromboendarterectomy (PTE). For pulmonary hypertension due to lung disease (Group 3 PH), the underlying lung disease should be treated, along with supportive therapies. [4 5]
- Pharmacologic treatment of PAH includes oral anticoagulants, diuretics, oxygen, inotropic agents (digoxin and dobutamine), calcium channel blockers, prostacyclin, and prostacyclin analogs (PCAs) [epoprostenol, treprostinil (generic Remodulin, Tyvaso), Ventavis (iloprost), and Uptravi (selexipag)], endothelin-receptor antagonists (ERAs) [ambrisentan, bosentan, Opsumit (macitentan), Opsynvi (macitentan and tadalafil)], PDE-5 inhibitors (PDE5is) (sildenafil, tadalafil), the soluble guanylate cyclase stimulator (sGCs) Adempas (riociguat), and the activin signaling inhibitor Winrevair (sotatercept SC).
- For the treatment of PAH, a stepwise approach is generally used to manage patients. In early disease or with less severe symptoms, oral therapies are used. As symptoms progress, inhaled or injectable therapies, such as epoprostenol injectable, iloprost inhaled and treprostinil injectable/inhaled may be used [4]
- Medications for PAH may be covered at the doses been shown to be effective (as detailed in the coverage criteria). There is no insufficient evidence that doses of medications for PAH exceeding those listed in the coverage criteria provide any additional clinical benefit when used in the treatment of coverable indications.
- There is currently insufficient evidence, except as noted in the efficacy section below, for ambrisentan, bosentan, Ventavis (iloprost inhalation), Uptravi (selexipag oral), or Orenitram (treprostinil oral) in patients with Groups 2-5 PH. In addition, medications for PAH may be harmful in some situations and raises the overall cost of care.
- The pivotal PAH trial of Adempas (riociguat) allowed use in combination with bosentan or inhaled prostanoids (PCAs). However, use of Adempas (riociguat) with any phosphodiesterase-5 inhibitor (e.g., sildenafil, tadalafil, dipyridamole, theophylline) is contraindicated due to excessive hypotension in combination.

Clinical Efficacy

- Medications for PAH are used for the treatment of pulmonary arterial hypertension (PAH), Adempas (riociguat) for both PAH and CTEPH, and Tyvaso (treprostinil inhalation) for both PAH and PH-ILD to improve exercise ability, symptoms and time to clinical worsening. [6]
- For the covered indications, medications for PAH were found to improve performance on the 6-minute walk test, as well as symptoms (functional class) relative to placebo. The

six-minute walk test (6MWD) is a measure of exercise tolerance and measures the distance that is covered in a 6-minute timeframe. Improvements in this test have been correlated to improved survival in PAH patients. WHO functional class is a measure of activity level and correlated with disease severity and outcomes but can be prone to reporting bias.

The 6MWD is the standard used by the FDA for the approval of new drugs in the treatment of PAH; however, the clinical relevance of less than a 10% improvement in 6MWD is not known.

Endothelin receptor antagonists (ERAs)

- *Ambrisentan (generic, Letairis):* In two reliable pivotal randomized, controlled studies in adults with PAH found ambrisentan improved exercise capacity at 12-weeks, based on the six-minute walk test compared to placebo. [7 8]
- *Bosentan (generic, Tracleer):* In four unreliable randomized, controlled studies adults with PAH found bosentan may improve ability to exercise at 16-24 weeks based on 6MWD compared to placebo.[9-12] All of the studies were significantly flawed, due to short trial duration, incomplete reporting of results, high dropout rates, and use of a non-clinical primary endpoint (pulmonary vascular resistance index).
- *Opsumit (macitentan):* In one low confidence randomized, controlled study, in adults with PAH, Opsumit (macitentan) reduced occurrence of the primary endpoint compared to placebo. [13] The primary composite endpoint was time to death, a significant morbidity event or worsening of PAH (symptoms or the need for additional treatment). Significant events were defined as atrial septostomy, lung transplantation, or initiation of injectable prostacyclin and prostacyclin analogs (PCAs).
    * The majority of the benefit was in reduction in percentage of patients with PAH clinical worsening (-12.8% placebo-subtracted), which includes measurement of 6MWD. Effect on the rate of death and need for PCA therapy was small (absolute difference -0.2% and -2%). The trial was not powered for reduction of mortality, the most meaningful outcome for PAH.
    * Significant flaws in the trial included assessment bias for morbidity events, moderately high attrition and inclusion of few patients from North America. [14]
    * There are no head-to-head studies of Opsumit (macitentan) with other PAH therapies. However, 64% of the patients in the pivotal trial continued on stable doses of PAH medications (61% PDE5is; 6% oral or inhaled PCAs). Opsumit (macitentan) has not been studied in combination with injectable PCAs [e.g., epoprostenol or treprostinil subcutaneous].

Combination Products

- *Opsynvi (macitentan and tadalafil):* The approval of Opsynvi (macitentan and tadalafil) was based on efficacy and safety data from studies to support the approval of Opsumit (macitentan) and Adcirca (tadalafil) individually. In an additional phase 3 trial including 187 patients with PAH, either treatment naïve or on background ERA or PDE5i therapy, Opsynvi (macitentan and tadalafil) demonstrated a 28% reduction in pulmonary artery resistance (PVR) compared to each macitentan or tadalafil

monotherapy alone.[15 16] However, no studies have compared Opsynvi (macitentan and tadalafil) to a combination of Opsumit (macitentan) + tadalafil or any other ERA+PDE5i combination treatment; therefore, any difference in efficacy or safety between the combination product, Opsynvi (macitentan and tadalafil), and a combination of its individual components as separate products, is unknown. Soluble guanylate cyclase stimulator (sGCs)

- *Adempas (riociguat)*: The efficacy and safety of riociguat was evaluated in two published randomized, double-blind, placebo-controlled trials in both CTEPH (n =261) and PAH patients (n = 443). The primary endpoint for both trials was improvement in exercise capacity, as measured by six minute walking distance (6MWD), a validated surrogate marker for PH treatment response. [17 18]
  * CTEPH: [17]
    - All enrolled patients were ineligible for or had PH refractory to surgical clot resection (pulmonary endarterectomy).
    - Adempas (riociguat) was superior to placebo for improvement in 6MWD at 16 weeks (+ 46 meters (m), placebo-adjusted; mean baseline 347 m). In addition, symptoms (functional class) improved more frequently (33% vs. 15% placebo).
    - There are no trials of Adempas (riociguat) for CTEPH in combination with any other PAH medications.
  * PAH: [18]
    - The pivotal trial enrolled both patients naïve to PAH-specific therapy as well as those stable on PAH-specific medications, including ERAs or prostanoids (n=443).
      - Patients on PDE-5is were excluded, given the risk of hypotension when used with Adempas (riociguat). The majority of randomized patients (50%) were previously treated with an ERA or PCA and continued on therapy (44% bosentan, 6% non-intravenous PCA).
      - Adempas (riociguat) 2.5 mg three times daily was superior to placebo for improvement in 6MWD at 12 weeks (+ 36 m, placebo-adjusted; mean baseline 363 m). In addition, symptoms improved more frequently (21% vs. 14% placebo) and time to clinical worsening delayed.
    - Subsequently, an open-label switch trial evaluated transition of patients with uncontrolled PAH symptoms on PDE-5 inhibitor (PDE5i) therapy to riociguat, as compared to continuation of baseline PDE-5 inhibitor therapy (n=226) [REPLACE]. [19] Of note, 71% of randomized patients were on both PDE-5 inhibitor (PDE5i) and ERA therapy at baseline.
    - There is insufficient evidence to establish that Adempas (riociguat) is superior to PDE-5i or ERA therapy for PAH. Most patients in clinical trials were previously treated with a PDE-5i and/or ERA therapy. [18 19]

Therefore, Adempas (riociguat) for PAH is coverable only after step therapy with both PDE-5i and ERA therapy.

Prostacyclin, and prostacyclin analogs (PCAs) (epoprostenol, treprostinil, iloprost, and selexipag)

- *Injectable PCAs (epoprostenol, treprostinil injection):* Pivotal trials for PAH suggested improvement in exercise capacity based on the 6MWD compared to placebo. [20 21]
- *Ventavis (iloprost inhalation):*
  * One published randomized study compared Ventavis (iloprost inhalation) to placebo. The pivotal reliable placebo-controlled study found Ventavis (iloprost inhalation) improved PAH symptoms, based on exercise tolerance (by ≥ 10%) measured using 6MWD and improvement in New York Heart Association (NYHA) functional status class (composite endpoint). The trial was only 12 weeks duration.
  * Two unreliable trials of Ventavis (iloprost inhalation) as add-on therapy in adults with PAH who remain symptomatic on bosentan had mixed results. Ventavis (iloprost inhalation) improved exercise capacity at 12-weeks based on the 6MWD compared to placebo in one trial. [22] A second trial was terminated early for lack of clinical benefit. [12]
- *Tyvaso (treprostinil inhalation):* The efficacy and safety of Tyvaso (treprostinil inhalation) was evaluated in two randomized, double-blind, placebo-controlled trials in both PH-ILD (n =326) and PAH (n = 235). [23 24] The primary endpoint for both trials was improvement in exercise capacity, as measured by 6MWD, a validated surrogate marker for PH treatment response.
  * PAH: Tyvaso (treprostinil inhalation) improved PAH symptoms based on exercise tolerance measured using 6MWD and quality of life in patients who remained symptomatic on bosentan or sildenafil; however, no other secondary endpoints were statistically significantly improved, such as time to clinical worsening, dyspnea, functional status, and other PAH signs and symptoms. The study was significantly flawed including excessive differential dropout rate between treatment arms (5.7%) combined with low overall completion rate of 86%, and short trial duration (only 12 weeks).
  * PH-ILD: Tyvaso (treprostinil inhalation) improved exercise tolerance using 6MWD; however, there is a lack of long-term data as well as evidence for improvement on overall quality of life and mortality. In addition, several study flaws, including the heterogeneity of ILD types in the clinical trial make it difficult to identify patients who would benefit most.
- *Orenitram (treprostinil oral):*
  * In one low-confidence randomized, controlled study in adults with PAH: [25]
    - The trial enrolled only patients naïve to PAH-specific therapy, as initial trials found no benefit from use of Orenitram (treprostinil oral) as add-on therapy.

- Orenitram (treprostinil oral) up to 12 mg twice daily modestly improved 6MWD compared to placebo. The mean dose at week 12 was 3.4±1.9 mg twice daily.
- However, the trial was not powered for reduction of mortality, the most meaningful outcome for PAH. This limited duration trial with a modest change in a surrogate endpoint provides little information about long-term treatment benefit.
- The study was significantly flawed, including a significant loss of the intent-to-treat population, moderately high attrition, differential loss, and a protocol amendment post-randomization.

* There is insufficient evidence to establish that Orenitram (treprostinil oral) is superior to PDE-5i or ERA therapy for PAH. There are no head-to-head studies of Orenitram (treprostinil oral) with other PAH therapies. Therefore, Orenitram (treprostinil oral) for PAH is coverable only after step therapy with both PDE-5i and ERA therapy.
* Orenitram (treprostinil oral) has not been proven effective as add-on therapy to other PAH-specific medications. In two Phase 3 trials, addition of Orenitram (treprostinil oral) did not significantly increase 6MWD in patients on a PDE5i, ERA, or both as compared with placebo (10 to 11 meters more than placebo). [1 2] A third combination therapy study protocol was withdrawn, prior to trial enrollment. [26]

- *Uptravi (selexipag oral):*

* The efficacy of Uptravi (selexipag oral) was initially established as add-on therapy for PAH. In the pivotal randomized, controlled study of adults (n=1,156) with previously treated PAH, Uptravi (selexipag oral) up to 1,600 mcg twice resulted in a 40% reduction in the occurrence of the primary endpoint compared to placebo. [GRIPHON] [27]
  - The trial enrolled both patients naïve to PAH-specific therapy as well as those stable on PAH-specific medications. The majority of randomized patients (80%) continued on stable doses of PAH medications (15% ERAs, 32% PDE5is; both 33%).
  - The primary composite endpoint was time to death, a significant morbidity event or disease progression (symptoms or the need for additional treatment). Significant events were defined as hospitalization, atrial septostomy, lung transplantation, or initiation of injectable prostacyclin/prostacyclin analogs (PCAs) or long-term oxygen. Disease progression was defined as a 15% decrease in 6MWD accompanied by a worsening in WHO functional class or the need for additional treatment of PAH.
  - The majority of the benefit was in reduction in percentage of patients with hospitalization (-4.9% placebo-subtracted) and PAH clinical worsening (-10.6% placebo-subtracted), which includes measurement of 6MWD.

- Effect on the rate of death and need for PCA therapy was small (absolute difference -1.8% and -0.5%). The trial was not powered for reduction of mortality, the most meaningful outcome for PAH.
- The study was significantly flawed including assessment bias for morbidity events, moderately high attrition (19%), high differential attrition between treatment arms (> 5%), and inclusion of few patients from North America.

* Subsequently, one small (n=34) open-label, observational (single-arm) switch trial evaluated transition of patients with stable PAH symptoms on Tyvaso (treprostinil inhalation) to Uptravi (selexipag oral) [TRANSIT-1]. [28]
  - All patients were on at least one baseline oral PAH therapy (PDE-5i ERA, and/or sGC). Notably, 56% of patients were on both PDE-5i and ERA therapy.
  - The trial did not compare Uptravi (selexipag oral) with any other therapies to allow any conclusion regarding comparative safety or efficacy.
* There is insufficient evidence to establish that Uptravi (selexipag oral) is superior to any other medication for PAH. There is insufficient data from head-to-head studies of Uptravi (selexipag oral) with other PAH therapies to establish superiority over other treatment options, including PDE-5is, ERAs, or other PCAs, as add-on therapy or as initial therapy.
  - Most patients in the available clinical trials were previously treated with PDE-5i and/or ERA therapy. [27 28] Therefore, Uptravi (selexipag oral) for PAH is coverable only after step therapy with both PDE-5i and ERA therapy.
  - One comparative RCT of double- versus triple-therapy in treatment-naïve patients with PAH compared PDE-5i/ERA (tadalafil, macitentan) with or without Uptravi (selexipag oral) [TRITON].[29] Both regimens were effective, but neither superior. Therefore, superiority of Uptravi (selexipag oral) remains unproven. A subsequent phase 4 trial found no difference in daily activity levels with addition of Uptravi (selexipag oral) to stable PDE-5i/ERA therapy. [30]

- Uptravi (selexipag oral) has not been studied in combination with other PCAs. One trial compared switch therapy from Tyvaso (treprostinil inhalation) to Uptravi (selexipag oral), but not combination therapy (detailed above). [28] The TRITON combination therapy trial did not include combination therapy with other PCAs (detailed above). [29]

Uptravi IV (selexipag injection)

- Subsequently, Uptravi IV (selexipag injection) was approved for short-term use in patients with PAH who were established and stable on Uptravi (selexipag oral). The approval was based on results from a small switch trial (n=20). The primary outcome for the 3-day trial was safety.[31]

- Use of Uptravi IV (selexipag injection) is considered "not medically necessary" for use in the outpatient setting and is not coverable for outpatient use.
    * All patients enrolled in the Uptravi IV (selexipag injection) trial were hospitalized for the IV infusions.
    * The FDA label specifies for use "in patients who are temporarily unable to take oral therapy." It is not labeled for self-administration or long-term use.

Activin Signaling Inhibitors

Winrevair [sotatercept subcutaneous (SC)]

- The available evidence for efficacy and safety of Winrevair (sotatercept SC) is limited to one pivotal phase 3, randomized, placebo-controlled trial in patients with persistent PAH despite current PAH-specific therapy (n=323). [32]
    * All enrolled patients had a confirmed diagnosis of PAH and documented persistent PAH symptoms, with a WHO functional class II or III, despite stable PAH-specific therapies.
    * Patients were on stable background double or triple standard of care PAH-specific therapies. Winrevair (sotatercept SC) or placebo were started as add-on therapy to the double/triple PAH-specific therapy regimens.
    * The primary endpoint was the change from baseline at week 24 in the 6MWD, a validated measure of functional capacity and symptomatic improvement in daily activities in PAH patients. The primary endpoint favored Winrevair (sotatercept SC) over placebo with a difference of 40.8 meters in 6MWD (95% CI 28 to 54, $p<0.001$).
- The safety and efficacy of Winrevair (sotatercept SC) in settings other than those studied in the pivotal trial are unknown, including the following:
    * In treatment-naïve patients.
    * As monotherapy.
    * In less/more severe PAH (WHO functional classes I or IV).
    * In other types of pulmonary hypertension (WHO Group 2-5).
- At this time, there is no evidence to compare the safety or efficacy of add-on therapies for persistent PAH (patients on ≥ 2 PAH-specific therapies), including add-on Winrevair (sotatercept SC) versus standard of care add-on prostacyclin/prostacyclin analogs (e.g. injectable epoprostenol or treprostinil), which have years of safety and efficacy experience. However, Winrevair (sotatercept) is significantly higher cost as compared to usual dosing of treprostinil injection or epoprostenol injection. Therefore, as aligned with the available clinical trial evidence, Winrevair (sotatercept) is coverable only as add-on therapy in patients with persistent PAH (FC II/III) despite current regimens of ≥ 2 PAH-specific therapies.

Guidelines

- Pulmonary arterial hypertension guidelines from the 2019 CHEST Guideline and Expert Panel Report [33]
    * Guidelines recommend the use of medications for PAH in WHO Group 1 PAH (see Appendix I) based on systematic review of the literature.
    * Graded recommendations and ungraded consensus statements for specific therapy are rated based on the available evidence.
    * For treatment-naïve individuals with WHO functional class (FC) I, continued monitoring is recommended for the development of symptoms what would signal disease progression and warrant initiation of pharmacotherapy (ungraded consensus-based statement).
    * For treatment-naïve PAH patients with WHO functional class (FC) II/III:
        o For individuals who are willing or able to tolerate combination therapy, a recommendation for combination therapy with ambrisentan and tadalafil is listed (weak recommendation, moderate quality evidence). For individuals unwilling or unable to tolerate combination therapy, a recommendation for monotherapy with either bosentan, macitentan, ambrisentan, riociguat, sildenafil, or tadalafil is listed, with no specific preference for one monotherapy agent over another.
    * For PAH patients with WHO FC IV symptoms and select WHO FC III (with rapid disease progression or poor prognostic markers) initial therapy with an injectable prostacyclin analog is listed, based on consensus. Inhaled or injectable prostacyclin may be added for WHO FC III patients with progressive symptoms despite one or two classes of oral PAH medications.
    * For uncontrolled PAH FC III/IV, step-wise approach to add-on therapy is advised, with most suggested therapies based on consensus statement.
    * Guidelines have not been updated since the approval of Winrevair (sotatercept).
- For suspected PH due to interstitial lung disease (PH-ILD), a specific subset of PH due to lung disease (PH Group 3), guidelines recommend: [4]
    * Management approach includes optimal treatment of the fibrotic lung disease and supportive therapies when indicated (e.g., oxygen, diuretics).
    * Additionally, referral to pulmonary rehabilitation and evaluation for lung transplantation are recommended in appropriate cases.
    * Of note: guidelines for PH Group 3 (2009) have not been updated since the approval of Tyvaso (treprostinil inhalation) for PH-ILD.
- Management of CTEPH consensus statement (ISHLT): [34]
    * Medications for PAH, including sildenafil, bosentan, Adempas (riociguat), and treprostinil injection, have been studied in CTEPH patients who are not candidates for surgery [pulmonary thromboendarterectomy (PTE)] and those with residual PH after PTE. However, Adempas (riociguat) remains the only FDA-approved agent for inoperable or residual/recurrent CTEPH following PTE.

    * There is currently no evidence to support using targeted PH therapy before PTE in patients with operable CTEPH, meaning use prior to (or in lieu of) surgery.

Safety

- Ambrisentan (generic, Letairis), bosentan (generic, Tracleer), Opsumit (macitentan), Opsynvi (macitentan and tadalafil), and Adempas (riociguat) are only available through a Risk Evaluation and Mitigation Strategy (REMs) program, to education patients about the risks fetal toxicity and ensure they are not used in pregnant women, due to the risk of fetal harm. The bosentan (generic, Tracleer) REMs program also requires monitoring for liver dysfunction. [35]
- Coadministration of phosphodiesterase (PDE) inhibitors, including specific PDE-5 inhibitors (such as sildenafil, tadalafil, or vardenafil) or nonspecific PDE inhibitors (such as dipyridamole or theophylline), with Adempas (riociguat) is contraindicated, due to additive hypotension leading to a high rate of discontinuation. [6] In addition, there was one death possibly related to the combination of riociguat and sildenafil. Warnings and precautions for Winrevair (sotatercept SC) include increased hemoglobin levels, thrombocytopenia, bleeding risk (mainly epistaxis and gingival bleeding) and telangiectasia. [36]

Investigational Uses

- Guidelines do not support the use of PAH medications for treatment of pulmonary hypertension (PH) in WHO Groups 2-5 (unless noted above), including PH related to chronic left heart disease (WHO Group 2) or chronic hypoxic states (WHO Group 3). Instead, these patients require optimization of therapies targeting their underlying disease state. [4]
- Raynaud's phenomenon: [26]
    * Trials of Adempas (riociguat) in Raynaud's phenomenon, for improvement of digital blood flow, are ongoing. Adempas (riociguat) was not found to significantly improve modified Rodnan skin scores (mRSS) versus placebo in patients with systemic sclerosis (SSc).[37]
    * Uptravi (selexipag oral) had no benefit over placebo in reducing the frequency of Raynaud's phenomenon attacks related to systemic sclerosis (SSc) in one placebo-controlled trial.[38]
    * Orenitram (treprostinil oral) is being studied in patients with digital ulcers and/or digital ischemia related to Raynaud's phenomenon, systemic sclerosis (SSc), or scleroderma, to improve peripheral blood flow and reduce digital ulcers. Results are not yet available. [26 39 40]
- Idiopathic pulmonary fibrosis (IPF):
    * The use of ambrisentan (generic, Letairis) is contraindicated in patients with IPF. [6] A placebo-controlled trial in patients with idiopathic pulmonary fibrosis (IPF), with or without pulmonary hypertension (WHO Group 3), found ambrisentan increased the risk of disease progression or death versus placebo.

    * One placebo-controlled study of bosentan (generic, Tracleer) in patients with idiopathic pulmonary fibrosis (IPF) (n=158) found no significant difference between bosentan and placebo treatment based on improvement in exercise capacity (6-minute walk distance).[41] A subsequent larger trial failed to demonstrate delays in IPF worsening or death with bosentan.[42]
    * A phase 2b placebo-controlled study of Adempas (riociguat) in patients with IPF was terminated early due to an increased number of deaths and no benefit for 6MWD. [43]
    * A phase 2b placebo-controlled study evaluated sildenafil as add-on therapy to Esbriet (pirfenidone) in patients with IPF. There was no benefit with sildenafil for the composite primary endpoint (disease progression and all-cause mortality).[44]

- Valvular heart disease: Use of sildenafil in patients with persistent pulmonary hypertension after valvular heart disease surgery [PH related to chronic left heart disease (WHO Group 2)] was associated with worse outcomes as compared to placebo. [45]
- CTEPH: One small (n=28) phase 2 trial of Uptravi (selexipag oral) for CTEPH failed to meet the primary endpoint [change in pulmonary vascular resistance (PVR)]. [46] A subsequent larger (n=78) phase 2 trial met the primary endpoint of PVR, but not the secondary health outcomes of 6MWD and WHO functional class. [47]
- Behçet's disease: One small randomized, placebo-controlled trial (n=10) found no reduction in disease activity with bosentan (Tracleer, generic) in patients with Behçet's disease.[48]

Appendix I: Revised World Health Organization (WHO) Classification of pulmonary hypertension (PH) – Group 1 [4]

Group 1. Pulmonary arterial hypertension (PAH)

- Idiopathic (IPAH)
- Familial (FPAH)
- Associated with (APAH):*
    - Connective tissue disorder (e.g., rheumatoid arthritis (RA), systemic lupus erythematosus (SLE), scleroderma, systemic sclerosis (formerly known as CREST syndrome)
    - Congenital systemic-to-pulmonary shunts (e.g., congenital heart disease (CHD), including atrial or ventricular septal defect, patent ductus arteriosus (PDA), patent foramen ovale (PFO), truncus arteriosus, Eisenmenger syndrome, tetralogy of Fallot, transposition of the great vessels)
    - Portal hypertension
    - HIV infection
    - Drugs and toxins (e.g., anorexic agents, cocaine, methamphetamine, L-tryptophan)
    - Other (thyroid disorders, glycogen storage disease, Gaucher's disease, hereditary hemorrhagic telangiectasia, hemoglobinopathies (e.g., sickle cell anemia, thalassemia), chronic myeloproliferative disorders, splenectomy)
- Associated with significant venous or capillary involvement
    - Pulmonary veno-occlusive disease (PVOD)
    - Pulmonary capillary hemangiomatosis (PCH)
- Persistent pulmonary hypertension of the newborn

* Diagnoses, include, but are not limited to these common diagnoses.

Appendix II: Revised WHO Classification of PH – Groups 2-5 [4]

Group 2. Pulmonary hypertension with left heart disease

- Left-sided atrial or ventricular heart disease (systolic dysfunction, diastolic dysfunction)
- Left-sided valvular heart disease

Group 3. Pulmonary hypertension associated with lung diseases and/or hypoxemia

- Chronic obstructive pulmonary disease (COPD)
- Interstitial lung disease (e.g., idiopathic pulmonary fibrosis)
- Sleep disordered breathing (e.g., obstructive sleep apnea (OSA))
- Alveolar hypoventilation disorders
- Chronic exposure to high altitude
- Developmental abnormalities

Group 4. Pulmonary hypertension due to chronic thrombotic and/or embolic disease (CTEPH)

- Thromboembolic obstruction of proximal pulmonary arteries
- Thromboembolic obstruction of distal pulmonary arteries
- Nonthrombotic pulmonary embolism (tumor, parasites, foreign material)

Group 5. Miscellaneous

- Sarcoidosis, histiocytosis X, lymphangiomatosis, compression of pulmonary vessels (adenopathy, tumor, fibrosing mediastinitis)

Appendix III: Functional Status with Heart Failure

World Health Organization (WHO) functional class (FC) assessment classification: [49]

Class I:	Patients with pulmonary hypertension (PH) but without resulting limitation of physical activity. Ordinary physical activity does not cause undue dyspnea or fatigue, chest pain, or near syncope.
Class II:	Patients with PH resulting in slight limitation of physical activity. They are comfortable at rest. Ordinary physical activity causes undue dyspnea or fatigue, chest pain, or near syncope.
Class III:	Patients with PH resulting in marked limitation of physical activity. They are comfortable at rest. Less than ordinary activity causes undue dyspnea or fatigue, chest pain, or near syncope.
Class IV:	Patients with PH with inability to carry out any physical activity without symptoms. These patients manifest signs of right-heart failure. Dyspnea and/or fatigue may even be present at rest. Discomfort is increased by physical activity.

New York Heart Association (NYHA) Heart Failure Classification: [50]

Class I:	Patients with no limitation of activities; they suffer no symptoms from ordinary activities.
Class II:	Patients with slight, mild limitation of activity; they are comfortable with rest or with mild exertion.
Class III:	Patients with marked limitation of activity; they are comfortable only at rest.
Class IV:	Patients who should be at complete rest, confined to bed or chair; any physical activity brings on discomfort and symptoms occur at rest.

Revision History

Revision Date	Revision Summary
6/20/2024	• Added Opsynvi (macitentan and tadalafil), a newly approved combination product, to coverage criteria. • Added Winrevair (sotatercept), a newly approved subcutaneous agent, for use as an add-on to current dual or triple standard of care background PAH regimens, in those with WHO functional class II or III only. • Tyvaso DPI (treprostinil inhalation) to policy.
03/21/2024	• Updated coverage criteria/step therapy for Adempas (riociguat), Uptravi (selexipag oral), and Orenitram (treprostinil oral) to include tadalafil in criterion i and use of *either* generic ambrisentan OR generic bosentan in criterion ii.
3/16/2023	• Clarification of step therapy for branded medications with an available generic, to be consistent with COT criteria. • Added bosentan for Behçet's disease to "Investigational Uses."
3/18/2022	Effective 6/1/2022: • Clarification of Continuation of Therapy (COT) criteria, with addition of step therapy for branded medications with an available generic. • Added Uptravi IV, a newly approved formulation. Use of Uptravi IV is considered "not medically necessary" in the outpatient setting. Use in the acute (inpatient) setting is not subject to pre-authorization UM review. • Add step therapy with bosentan and ambrisentan for coverage of highest cost options (Uptravi, Orenitram, and Adempas). • Removed treprostinil injection (generic, Remodulin) from the policy (no UM).
7/16/2021	Effective 10/1/2021: • Removed sildenafil step therapy requirement from criteria for oral endothelin receptor antagonists (ERAs). • Added step therapy with generic treprostinil injection as a requirement for coverage of brand treprostinil injection (Remodulin). • Added coverage criteria for use of Tyvaso (treprostinil inhalation) in pulmonary hypertension (PH) associated with interstitial lung disease (PH-ILD), a newly FDA-approved indication.
4/22/2020	New policy (effective 7/1/2020). Replaces individual drug coverage policies for medications for PAH (dru218, dru219, dru220, dru221, dru222, dru322, dru324, dru337, dru446). No change to intent of coverage from previous: limits coverage to patients with Group 1 PAH (or CTEPH for riociguat only), step therapy with low-cost generics for oral medications for PAH (sildenafil, ambrisentan and bosentan) and use of quantity limits.

Drug names identified in this policy are the trademarks of their respective owners.

Medication Policy Manual

Policy No: dru634

Topic: Palforzia, peanut (Arachis hypogaea) allergen oral powder-dnfp

Date of Origin: May 15, 2020

Committee Approval Date: March 21, 2024

Next Review Date: 2025

Effective Date: June 1, 2024

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Peanut (Arachis hypogaea) allergen oral powder-dnfp (Palforzia) is a medication used for people with severe peanut allergy to reduce the risk of allergic reactions due to accidental exposure to peanut.

Policy/Criteria

I. Continuation of therapy (COT): Palforzia may be considered medically necessary for COT when criterion A, B, or C below is met.

A. For diagnoses NOT listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND there is documentation that the medication was covered by another health plan. Examples of documentation include the coverage approval letter from the previous health plan or paid claim.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

B. For diagnoses listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

C. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

Please note*: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Palforzia may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) that criteria A through C are met.

A. Palforzia is prescribed by an allergist or immunologist.

AND

B. The member has a **confirmed diagnosis of peanut allergy** based on one of the following:

1. A positive peanut specific immunoglobulin E (IgE) test for peanut allergy.

OR

2. A positive skin prick test (SPT) to peanut protein.

OR

3. Oral food challenge.

AND

C. The patient is age 4 to 17 years at the time of initiating treatment with Palforzia.

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers Palforzia coverable under the pharmacy benefit (as a self-administered medication) OR coverable under the medical benefit (as a provider-administered medication) depending on dose phase.

B. When pre-authorization is approved, Palforzia will be authorized in a quantity sufficient for up to a 30-day supply.

C. Authorization may be reviewed at least annually. Clinical documentation (including, but not limited to chart notes) may be required to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, such as disease stability or improvement including reduction in the frequency and severity of peanut allergy reactions as compared to prior to starting.

Position Statement

Summary

- The intent of this policy is to limit coverage of Palforzia for the indication and dose for which it has been shown to be safe and effective in clinical trials (i.e., patients age 4 to 17 years with a confirmed diagnosis of peanut allergy as specified in the coverage criteria above).
- Palforzia is FDA approved to for the mitigation of allergic reactions, including anaphylaxis, that may occur with accidental exposure to peanut. [1]
- Clinical trials of Palforzia showed an increase in the percentage of patients who could ingest peanut protein during a food challenge (600 mg of peanut protein). [2] The clinical meaningfulness of the ability to tolerate 600 mg of peanut protein is uncertain, and it is unclear if treatment provides benefit over strict avoidance of peanuts alone. In addition, there was an increase in systemic allergic reactions and the need for epinephrine, such that the risk versus benefit must be carefully considered.
- In clinical trials for Palforzia, the diagnosis of peanut allergy was confirmed through skin prick testing or serum peanut specific IgE levels. [2] Oral food challenges may also be used to confirm the diagnosis. [3]
- Palforzia has a complex dosing regimen which requires strict adherence. Dose initiation and dose increases must be done under the supervision of a healthcare provider. [1]
- Palforzia has several serious warnings related to its use, including: anaphylaxis (can occur at any time during therapy), not for use in patients with uncontrolled, severe, or steroid-dependent asthma, risk of eosinophilic esophagitis, and GI adverse events. [1 4]

- There is limited data on long-term durability and safety for Palforzia. Initial Palforzia trials were limited to 20 to 40 weeks of up-dosing followed by 24 to 28 weeks of maintenance dosing. A two-year open-label follow-on study found that daily dosing regimens were better tolerated than nondaily regimens. [5] However, it is currently unknown if Palforzia maintains safety and efficacy if patients are not consistently adherent. If patients do not continuously adhere to treatment, including the specifics of the dose titration, they may become allergic to the treatment itself and have a reaction if they restart. [1 6]
- The use of Palforzia for any other condition or type of allergy is considered investigational. In addition, the use of more than one peanut allergy treatment at a time is considered investigational.

Clinical Efficacy - Palforzia

- Palforzia was evaluated in one phase 3, double-blind, randomized, placebo-controlled trial (PALISADE) for desensitization and improvement in ability to ingest peanut protein during a food challenge. [2]
    * The study included patients ages 4 to 55 years with confirmed peanut allergy. However, efficacy was only evaluated in patients from 4 to 17 years of age. There is no safety or efficacy data in patients less than 4 years of age.
    * The primary endpoint was desensitization in patients ages 4 to 17 after 24 to 28 weeks of maintenance therapy.
    * Desensitization was defined as the proportion of subjects able to ingest 600 mg or more of peanut protein during a double-blind, placebo-controlled, food challenge (DBPCFC).
    * 67% of patients who received Palforzia were able to tolerate 600 mg of peanut protein compared to 4% of patients who received placebo.
    * The ability to tolerate 600 mg of peanut protein is of uncertain clinical relevance. There is no consensus on what tolerated dose is considered clinically relevant. [6]
    * Endpoints such as a decrease in reactions to accidental exposure to peanuts, need for emergency medical treatment (such as epinephrine use, emergency department visits, or hospitalization), quality of life, or other patient centric outcomes would be more meaningful.
- Patients were randomized to receive Palforzia or placebo. Doses of Palforzia were escalated to 300 mg daily with an increase every two weeks within a 40-week period. All dose-escalations took place in-office. Maintenance therapy of 300 mg daily was then continued for 24 weeks. At the end of 24 weeks of maintenance therapy, patients completed a DBPCFC to assess the primary endpoint.
- Although a significantly higher percentage of patients were able to tolerate 600 mg of peanut protein, the rate of systemic allergic reactions and use of epinephrine was higher in patients who received Palforzia.

PALISADE Study	Palforzia (n = 372)	Placebo (n = 124)	P-value
Proportion of Subjects Able to Ingest 600 mg of peanut protein or more, without dose-limiting symptoms (n, %)	250 (67.2%)	5 (4.0%)	P<0.001
Systemic allergic reactions	14.2%	3.2%	N/A
Use of epinephrine outside of the DBPCFC	14.0.%	6.5%	N/A

Investigational Uses:

- At this time, Palforzia has not been studied for any indication other than peanut allergy. Therefore, the use of Palforzia for any other condition or type of allergy is considered investigational.

Dosing [1]

- Palforzia is given in three phases (see Prescribing Information for full details). The first two phases are complex and require strict adherence. The maintenance dose is 300 mg per day.
    * Initial dosing and each dose increase during the up-dosing phase must be administered by a healthcare professional in a certified setting. Patients must be monitored for at least 60 minutes to following each provider-administered dose.
    * Preparation: The Palforzia capsules or sachets are opened, and the enclosed powder is mixed into semisolid food prior to consuming by mouth immediately.
    * Initial Dose Escalation: Single doses of 0.5 mg up to 6 mg are administered at 20- to 30-minute intervals on day 1. On day 2, tolerability for 3 mg is confirmed and the patient moves into the up-dosing phase.
    * Up-Dosing: The dose is gradually increased from 3 mg to 300 mg with dose increases every two weeks.
    * Maintenance: 300 mg daily
    * For up-dosing, if the patient tolerates the first dose of the increased dose level, the patient may continue that dose level at home.

Safety [1]

- Due to safety concerns, Palforzia is only available through a restricted program called the PALFORZIA REMS. The program requires that providers, pharmacies, and healthcare settings are certified prior to use of Palforzia. Patients must also be enrolled in the REMS program. The program is designed to ensure that all stakeholders are aware of the risks and benefits of Palforzia, the signs of anaphylaxis, monitoring requirements, and that patients have access to injectable epinephrine at all times. [1 4]
- Palforzia has several serious warnings related to its use, including:
    * Palforzia oral can cause anaphylaxis that can occur at any time during therapy.
    * Palforzia oral should not be started in patients with uncontrolled asthma. It is a risk factor for worse outcomes with any anaphylactic reaction. Additionally, Palforzia oral has not been studied in patients with severe asthma, persistently uncontrolled asthma, or patients on long-term systemic corticosteroid therapy.

* Palforzia oral is associated with eosinophilic esophagitis, a serious form of inflammation in the esophagus.
* Palforzia oral is associated with high rates of mild to moderate gastrointestinal adverse reactions, such as abdominal pain, vomiting, nausea, oral pruritus, and oral paresthesia, which may impact tolerability.

- Palforzia has an unclear long-term risk-benefit profile due to the risk of serious allergic reactions and anaphylaxis and limited evidence for improvements in quality of life or reductions in systemic allergic reactions compared to strict avoidance of peanuts alone. Additional long-term studies will be needed to determine impacts on these endpoints and further assess the long-term safety profile.

Appendix 1: Palforzia: Commercial Packaging for Self-Administration		
Packaging	**Kit Components (Capsules or Sachets)**	**Number of Doses per Kit**
Initial Dosing Escalation	Each pack contains 13 capsules: ▪ 0.5 mg (Level A) One 0.5 mg capsule ▪ 1 mg (Level B) One 1 mg capsule ▪ 1.5 mg (Level C) One 0.5 mg capsule; One 1 mg capsule ▪ 3 mg (Level D) Three 1 mg capsules ▪ 6 mg (Level E) Six 1 mg capsules	5
Up-Dosing		
3 mg (Level 1)	Forty-five 1 mg capsules	15
6 mg (Level 2)	Ninety 1 mg capsules	15
12 mg (Level 3)	Thirty 1 mg capsules; Fifteen 10 mg capsules	15
20 mg (Level 4)	Fifteen 20 mg capsules	15
40 mg (Level 5)	Thirty 20 mg capsules	15
80 mg (Level 6)	Sixty 20 mg capsules	15
120 mg (Level 7)	Fifteen 20 mg capsules; Fifteen 100 mg capsules	15
160 mg (Level 8)	Forty-five 20 mg capsules; Fifteen 100 mg capsules	15
200 mg (Level 9)	Thirty 100 mg capsules	15
240 mg (Level 10)	Thirty 20 mg capsules; Thirty 100 mg capsules	15
300 mg (Level 11)	Fifteen 300 mg sachets	15
Maintenance		
300 mg (Level 11)	Thirty 300 mg sachets	30

Medication Policy Manual	**Policy No:** dru637
Topic: Jelmyto, mitomycin for pyelocalyceal solution (mitomycin hydrogel)	**Date of Origin:** August 15, 2020
Committee Approval Date: December 7, 2023	**Next Review Date:** 2024
Effective Date: March 1, 2024	

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Jelmyto (mitomycin hydrogel for pyelocalyceal use) is chemotherapy medication used for specific types of cancer [low-grade Upper Tract Urothelial Cancer (LG-UTUC)]. It is a new formulation of mitomycin that is given directly into the urinary tract (ureters). It is administered by a trained provider via a catheter (ureteral catheter or nephrostomy tube). It is **not** for intravenous (IV) use.

PLEASE NOTE: This policy and the coverage criteria below do not apply to mitomycin injection (generic Mitomycin-C). Generic mitomycin injection (Mitomycin-C) does not require pre-authorization.

Policy/Criteria

Most contracts require pre-authorization approval of Jelmyto (mitomycin hydrogel for pyelocalyceal use) prior to coverage.

I. Continuation of therapy (COT): Jelmyto (mitomycin hydrogel for pyelocalyceal use) may be considered medically necessary for COT when criterion A, B, or C below is met.

A. For diagnoses NOT listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND there is documentation that the medication was covered by another health plan. Examples of documentation include the coverage approval letter from the previous health plan or paid claim.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

B. For diagnoses listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

C. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

Please note*: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Jelmyto (mitomycin hydrogel for pyelocalyceal use) may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) that the patient has a diagnosis of **low-grade Upper Tract Urothelial Carcinoma (LG-UTUC)**.

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers Jelmyto (mitomycin hydrogel for pyelocalyceal use) coverable only under the medical benefit (as a provider-administered medication).

B. When pre-authorization is approved, up to 17 Jelmyto (mitomycin hydrogel for pyelocalyceal use) single-dose cartons (2x 40-mg vials) may be authorized per treatment course (up to 14 months).

IV. Jelmyto (mitomycin hydrogel for pyelocalyceal use) is considered investigational when used for all other conditions, including use for intravenous (IV) infusion.

Position Statement

Summary

- Jelmyto (mitomycin hydrogel for pyelocalyceal use) is a new formulation of mitomycin that is instilled into the ureters via a ureteral catheter or nephrostomy tube in patients with low-grade Upper Tract Urothelial Carcinoma (LG-UTUC). It is administered in a provider's office.
- The intent of this policy is to allow coverage of Jelmyto (mitomycin hydrogel for pyelocalyceal use) where it has been evaluated and shown to be effective, up to the dose shown to be safe and effective in clinical trials.
- The evidence for Jelmyto (mitomycin hydrogel for pyelocalyceal use) is based on a small, non-comparative, non-blinded trial that evaluated tumor response rates in patients with LG-UTUC (low quality evidence). Although this therapy appears promising based on the disappearance of tumors in a fair proportion of patients, additional study is needed to better define its clinical benefit (e.g., preserve kidneys, improve overall survival).
- The National Comprehensive Cancer Network (NCCN) urothelial carcinoma guideline recommends using Jelmyto (mitomycin hydrogel for pyelocalyceal use) for LG-UTUC after complete or near complete endoscopic resection or ablation for low-volume (5 mm to 15 mm) residual tumors.
- Jelmyto (mitomycin hydrogel for pyelocalyceal use) is instilled weekly for six weeks in the providers office. Patients with a complete response three months after therapy is initiated may receive up to 11 additional monthly maintenance doses.
- The maximum dose of Jelmyto (mitomycin hydrogel for pyelocalyceal use) is 15 ml (60 mg of mitomycin) per instillation. Each single-dose carton contains two 40 mg vials.
- There is insufficient evidence to support the use of Jelmyto (mitomycin hydrogel for pyelocalyceal use) for any other indication.

Regence Pharmacy Services performs independent analyses of oncology medication evidence, to establish coverability per the contracts with the health plan.

- Most contracts define coverability based on established clinical benefit in published, peer-reviewed literature, along with consideration of regulatory status.
- FDA approval does not in itself establish medical necessity, as unpublished, low-quality evidence, including exploratory analyses and unvalidated surrogate endpoints, may be used as the basis of approval. Regulatory approval may or may not reflect clinical benefit relative to standard of care and the recommendations of expert clinical advisors such as the Oncologic Drugs Advisory Committee (ODAC). FDA approvals generally do not consider cost compared to established therapies, or value to members.
- Likewise, NCCN clinical practice guidelines assignment of a recommendation (category 1, 2a, or 2b) does not necessarily establish medically necessity. NCCN recommendations are inconsistently supported by published, peer-reviewed literature and do not uniformly consider value of new therapies relative to existing potentially higher-value treatment options, considering effectiveness, safety, and cost.

- Medication coverage criteria are developed based on the 'medical necessity' assessment, as described above.

Regence Pharmacy Services analysis and coverage policy may differ from FDA labeled indication and/or NCCN clinical practice guidelines.

Clinical Efficacy

- The evidence for Jelmyto (mitomycin hydrogel for pyelocalyceal use) is based on a small, non-comparative, non-blinded trial [OLYMPUS] that evaluated complete tumor response at 3 months in adult patients with LG-UTUC. [1,2]
    * Patients had either newly diagnosed or recurrent disease, and had at least one papillary low-grade tumor measuring at least 5 mm but no larger than 15 mm.
    * A complete response (tumor disappearance) was seen in 58% of patients at 3 months. Forty-six percent of patients had an ongoing complete response at the 12-month visit.
- Tumor response is a surrogate endpoint. Although the high number of complete responses is promising, additional study is needed to evaluate meaningful clinical outcomes such as preservation of kidneys, or improved overall survival or quality of life.
- The National Comprehensive Cancer Network (NCCN) urothelial carcinoma guideline recommends using Jelmyto (mitomycin hydrogel for pyelocalyceal use) for LG-UTUC after complete or near complete endoscopic resection or ablation for low-volume (5 mm to 15 mm) residual tumors (category 2A recommendation). [3]

Investigational Uses

- The safety and efficacy of Jelmyto (mitomycin hydrogel for pyelocalyceal use) have only been evaluated in adult patients with LG-UTUC.
- There are no other accepted therapeutic uses for this new mitomycin formulation.

Safety [1]

- Grade 3 or greater adverse events (AEs) that occurred in at least 2% of subjects in the pivotal Jelmyto (mitomycin hydrogel for pyelocalyceal use) clinical trial included ureteric stenosis, hydronephrosis, flank pain, urinary tract infection, hematuria, renal dysfunction, and vomiting.
- About one-quarter of patients enrolled in the pivotal trial discontinued Jelmyto (mitomycin hydrogel for pyelocalyceal use) due to a side effect.

Dosing [1]

- Each Jelmyto (mitomycin hydrogel for pyelocalyceal use) kit (containing two 40-mg single-dose vials of and one vial of sterile hydrogel for reconstitution) is suitable for one instillation.
- Jelmyto (mitomycin hydrogel for pyelocalyceal use) must be administered by a trained provider.
- The actual dose of Jelmyto (mitomycin hydrogel for pyelocalyceal use) is determined based on volumetric measurements using pyelography. The maximum dose per instillation is 15 ml (60 mg mitomycin).
- Dosing schedule:
    * ***Initial dose:*** one instillation weekly for six weeks.

* ***Maintenance:*** If a complete response is maintained three months from the initiation of therapy, up to 11 additional monthly instillations of Jelmyto (mitomycin hydrogel for pyelocalyceal use) may be given.
* The safety and efficacy of Jelmyto (mitomycin hydrogel for pyelocalyceal use) beyond 17 total instillations (one treatment course) has not been studied.

Medication Policy Manual

Policy No: dru640

Topic: Viltepso, viltolarsen

Date of Origin: June 15, 2020

Committee Approval Date: June 20, 2024

Next Review Date: 2024

Effective Date October 1, 2024

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Viltepso (viltolarsen) is an intravenous medication that may be used for Duchenne muscular dystrophy (DMD) when patients have a specific gene mutation. A clinical benefit, such as improved ambulation, of Viltepso (viltolarsen) has not been established.

Policy/Criteria

Most contracts require pre-authorization approval of Viltepso (viltolarsen) prior to coverage.

I. Continuation of therapy (COT): Viltepso (viltolarsen) is considered investigational for all conditions, per the full policy criteria below.

Please note: *Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Viltepso (viltolarsen) is considered investigational for all conditions, including Duchenne muscular dystrophy (DMD) that is amenable to exon 53 skipping (Table 1). However, if found to be medically necessary, criteria A must also be met:

A. Site of care administration requirements are met [refer to Pharmacy Services Medication Policy Manual, Site of Care Review, dru408].

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers Viltepso (viltolarsen) coverable under the medical benefit (as a provider administered medication).

B. Although the use of Viltepso (viltolarsen) is considered investigational for all conditions, including DMD that is amenable to exon 53 skipping, if pre-authorization is approved, Viltepso (viltolarsen) will be authorized in doses up to 80 mg/kg every week. (52 infusions per year).

C. Authorization shall be reviewed at least every twelve months for documented benefit. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met. Specifically, documentation that the medication is providing clinical benefit, including disease stability or improvement, and lack of disease progression.

Position Statement

Summary

- Viltepso (viltolarsen) is an intravenous therapy indicated for the treatment of Duchenne muscular dystrophy (DMD) when there is a confirmed mutation of the DMD gene that is amenable to exon 53 skipping. It was approved through the FDA Accelerated Approval Program based on an increase in dystrophin in skeletal muscles observed in some patients during a phase II trial. [1]
- A clinical benefit (e.g. prolongation of independent ambulation, improved quality of life, or prevention of disease progression and disability) of Viltepso (viltolarsen) has not been established.
  * In one open-label trial in a total of 16 patients, of which only 8 received the approved dose, Viltepso (viltolarsen) was shown to increase dystrophin levels. However, it has not been proven that an increase in dystrophin will translate to improved clinical outcomes, such as improved motor function.

- The U.S. Centers for Disease Control and Prevention (CDC) has developed general management guidelines for DMD. The CDC recommends corticosteroids and supportive care to slow disease progression. These guidelines were published prior to the submission of Viltepso (viltolarsen) to the FDA, thus the use of Viltepso (viltolarsen) for DMD has not yet been addressed. [2-4]

Clinical Efficacy[5]

- Evidence regarding the effect of Viltepso (viltolarsen) on dystrophin levels is inconclusive. Data is limited to a small, two-part, dose escalation, phase II trial. Additional, larger, well-controlled trials are needed to establish the safety and efficacy of Viltepso (viltolarsen) in Duchenne muscular dystrophy (DMD).
- In the phase II trial, 16 patients were initially randomized to receive either placebo (n=5), Viltepso (viltolarsen) 40 mg/kg (n=6), or Viltepso (viltolarsen) 80 mg/kg (n=5) via intravenous route weekly for 4 weeks. After 4 weeks, all patients, received open-label Viltepso (viltolarsen) at a dose of either 40 mg/kg (n=8) or 80 mg/kg (n=8) intravenously once weekly. The mean dystrophin levels increased to 5.9% of normal in the Viltepso (viltolarsen) 80 mg/kg group; the approved dose, at 25 weeks.
    * Dystrophin production is a surrogate biomarker of disease improvement with an unknown correlation to health outcomes.
    * An absolute increase in dystrophin levels has not been correlated to improved ambulation or muscle function and a minimal clinically important difference in dystrophin levels has not yet been established. Experts have proposed that dystrophin levels greater than or equal to 10% of normal may be clinically meaningful; however, validation is needed
- Lack of an appropriate control group, duration, and size of the Viltepso (viltolarsen) trial, makes it impossible to demonstrate any meaningful conclusions regarding endpoints with functional outcomes, including 6MWT and pulmonary function resulting from Viltepso (viltolarsen) treatment. Long-term comparative evidence is needed to further clarify the role of Viltepso (viltolarsen).[6]
- Viltepso (viltolarsen) has not yet been shown to improve any clinical outcomes such as quality of life, prolongation of independent ambulation, or prevention of disease progression and disability.

Safety [1]

- Limited safety data is available, however, the most common adverse reactions reported with Viltepso (viltolarsen) during trials included upper respiratory tract infections, injection site reactions, cough, and pyrexia.
- Viltepso (viltolarsen) contains a warning for kidney toxicity based on experience with other antisense oligonucleotides. Monitoring of kidney function is recommended.

Revision History

Revision Date	Revision Summary
6/20/2024	Added Viltepso to site of care (SOC) program (effective 10/1/2024).
12/7/2023	• Added quantity limit and reauthorization criteria (no change to intent) • Updated cross references.
12/9/2022	No criteria changes with this annual update.
1/20/2021	No criteria changes with this annual update.
10/28/2020	Updated policy name and position statement based on FDA approved prescribing information. No change to intent of policy.
6/15/2020	New policy. Effective 6/15/2020. Use of viltolarsen is considered investigational in the treatment of all conditions, including Duchenne muscular dystrophy (DMD) that is amenable to exon 53 skipping. The available clinical trial data was insufficient to demonstrate safety or efficacy of viltolarsen in the treatment of DMD.

Drug names identified in this policy are the trademarks of their respective owners.

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Valoctocogene roxaparvovec (Roctavian) is a gene therapy for the treatment of adults with severe hemophilia A, a rare hematologic condition that results in impaired clotting and bleeding episodes. It is given as a single, one-time intravenous (IV) infusion.

Policy/Criteria

I. Roctavian (valoctocogene roxaparvovec) is considered investigational, except for those situations specifically addressed in the policy criteria below.

PLEASE NOTE: Under this criterion, any gene therapy products for hemophilia B not specifically addressed in this policy will be considered investigational.

II. Continuation of therapy (COT): Roctavian (valoctocogene roxaparvovec) may be considered medically necessary when full policy criteria below are met, including quantity limit. However, Roctavian (valoctocogene roxaparvovec) is not coverable for repeated doses and is not coverable if a patient has previously received prior Roctavian (valoctocogene roxaparvovec) or any other gene therapy products for hemophilia A.

***Please note**: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

III. New starts (treatment-naïve patients): The use of Roctavian (valoctocogene roxaparvovec) is considered not medically necessary for the treatment of patients with severe hemophilia A.

IV. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers Roctavian (valoctocogene roxaparvovec) coverable only under the medical benefit (as a provider-administered medication).

B. Although the use of Roctavian (valoctocogene roxaparvovec) for hemophilia A is considered not medically necessary. If pre-authorization is approved, Roctavian (valoctocogene roxaparvovec) may be authorized in a quantity up to 6×10^{13} vg/kg given intravenously once, for one treatment course per lifetime.

C. Additional infusions of Roctavian (valoctocogene roxaparvovec) will not be authorized.

V. Investigational Uses

A. Repeated doses of Roctavian (valoctocogene roxaparvovec) or any other gene therapy products for hemophilia A, including Roctavian (valoctocogene roxaparvovec) previously given as part of a clinical trial.

B. Combination use with Hemlibra (emicizumab).

C. Use in all other conditions not otherwise specified in the coverage criteria above.

Position Statement

Summary

- Hemophilia A (SMA) is a rare X-linked congenital bleeding disorder caused by a deficiency of coagulation FVIII, part of the intrinsic coagulation pathway. A deficiency in circulating FVIII leads to impaired clotting and bleeding episodes.
- Severe hemophilia A is characterized by a FVIII level of less than 1 IU/dL and spontaneous bleeding into the joints and muscles. Symptoms often begin in early infancy.
- Roctavian (valoctocogene roxaparvovec) is an adeno-associated virus (AAV) vector-based gene therapy which replaces the defective FVIII gene.
- Safety and efficacy data comes from what has been reported in two ongoing clinical trials of Roctavian (valoctocogene roxaparvovec). This includes a small phase 1/2, single-arm safety trial, of which only seven patients received the proposed therapeutic dose, and the pivotal non-comparative phase 3 trial.
    * All enrolled patients were >18 years of age, with severe hemophilia A (baseline FVIII level ≤ 1 IU/dL) and no history of inhibitors to FVIII or antibodies to the viral vector (AAV5).
    * Patients were followed for a period of 3 years after the Roctavian (valoctocogene roxaparvovec) infusion in both trials.
    * In the pivotal phase 3 GENEr8-1 trial, Roctavian (valoctocogene roxaparvovec) reported non-inferiority based on a 2.8 average annual bleed rate (ABR) reduction for all bleeds (2.6 vs 5.4), when compared to a 6-month run in phase of exogenous FVIII therapy.[1]
- Treatment of hemophilia A is highly individualized and differs by region and provider preference. Existing treatment options, including Hemlibra (emicizumab) and exogenous FVIII therapies, have a high clinical burden due to life-long use. However, they are very effective in reducing bleeds and improving quality of life (QOL) in patients with hemophilia and are guidelines recommended standard of care therapy. Furthermore, exogenous FVIII products have decades of clinical data backing up their safety and efficacy in this population. [2]
- Currently available data has not established that Roctavian (valoctocogene roxaparvovec) improves clinically meaningful endpoints such as bleeding rates or joint complications compared to standard of care.
    * There is no comparative data.
    * The published phase 3 trial did not optimize prophylaxis with exogenous factor products during the run-in period.
    * A significant difference between reported median and mean bleeding rate suggests a highly heterogenous degree of control during the run-in period.
    * Due to differing standards of care across trial sites, there is insufficient data to draw conclusions regarding the comparative effectiveness of Roctavian (valoctocogene roxaparvovec) versus prophylaxis with exogenous factor or Hemlibra (emicizumab).

- Observed bleeding rates in clinical trials and low overall factor usage in the trial population have established that Roctavian (valoctocogene roxaparvovec) is effective in controlling bleeding in patients with Hemophilia A; however, long-term safety and durability of response have yet to be established.
- Trial subjects were eligible only if they received prophylaxis with exogenous factor VIII; there is no data on crossover from Hemlibra (emicizumab). Phase III data has also shown that FVIII expression will decrease over time. The timing, safety, and best practice standards for the inevitable transition back to regular prophylaxis with infused exogenous factor VIII or Hemlibra (emicizumab) has yet to be established.
- Given the current costs, the unclear safety record, the uncertain durability of response, and the availability of standard of care FVIII replacement therapies the use of Roctavian (valoctocogene roxaparvovec) in hemophilia A is considered not medically necessary.

Clinical Efficacy

Severe Hemophilia A[1, 3-5]

Roctavian (valoctocogene roxaparvovec) was FDA approved based on the results of two open-label trials in patients with severe hemophilia A (baseline FVIII level <1 IU/dL). Patients in both trials were greater than 18 years of age and did not have a history FVIII inhibitors, antibodies to AAV5, or any existing liver abnormalities.

- The first trial is an ongoing phase 1/2 dose-finding and safety trial. Although the trial enrolled a total of 15 patients, only seven received the proposed therapeutic dose ($6x10^{13}$ vg/kg). Patients were to be followed for five years.
    * The primary endpoints were the number of treatment-related adverse events and a dose determination of valoctocogene roxaparvovec required to achieve expression of FVIII at or above 5% of normal activity (≥5 IU/dL).
    * Secondary endpoints with clinical relevance included annualized bleeding events and frequency of exogenous FVIII replacement. These endpoints are available out to three years post infusion in the therapeutic cohort (n=7).
        - A significant reduction in mean FVIII expression was seen between year 1 and 2 (64 IU/dL vs 36 IU/dL), followed by a smaller reduction between year 2 and 3 (36IU/dL vs 33 IU/dL).
        - The mean annualized bleeding rate (ABR) decreased to 0.7±1.6, a significant decrease from the baseline of 16.3 ±15.7.
- The second pivotal trial, GENEr8-1 (N=134), is an unpublished ongoing multicenter, single arm (non-comparative), phase 3, non-inferiority trial in which all subjects receive a single infusion of Roctavian (valoctocogene roxaparvovec) at a dose of $6x10^{13}$ vg/kg.
    * The primary endpoint for this trial was the change from baseline in ABR for all bleeds during the efficacy evaluation period (EEP), which ranged from 1.7 to 3.7 years post-infusion at the last data analysis.
    * Clinically relevant secondary endpoints included the change in the annualized utilization of exogenous FVIII replacement therapy and the annualized number of bleeding episodes requiring exogenous FVIII replacement treatment during the EEP.

    * At the EEP, non-inferiority was achieved as the reported average ABR was 2.6 for all bleeds, which was a reduction from the average ABR of 5.4 that was reported during the 6-month run in on FVIII treatment.
    * At the year 3 data analysis, only 10.6% of subjects had factor VIII activity > 40 IU/dL. 24.2%, and 56.1% of subjects had factor VIII activity consistent with moderate-severe and mild hemophilia, respectively.
    * The available trial data and modelling suggest that bleeding risk will rise at factor VIII activity of approximately 5 IU/dL; 33.3% of study subjects were observed to have factor levels < 5 IU/dL at year 3. Models developed from trial data suggest that median factor VIII activity will decline to 5.7 IU/dL by week 260.
    * Seventeen subjects (12.6%) resumed prophylactic therapy across the entire trial population (N=134) at 3 years post treatment.
- This trial had the following significant limitations which impact the confidence in the data:
    * Lack of control comparison: There was no placebo arm in the trial; it relied on using the historical bleeding rate and factor utilization in a small number of patients. Treatment for hemophilia A is highly individualized, and the data does not allow for an assessment of the magnitude of benefit compared to therapies with proven efficacy in this population. Comparison of an active therapy to a historical control can overestimate the benefit seen with Roctavian (valoctocogene roxaparvovec).
    * Uncertainty of duration of response: The durability of treatment effect is unknown. While models have been developed based on data up to 3 years, the durability of response past that is not known.[4]
- To date, no subjects developed inhibitors to FVIII during the clinical trials.
- Subjects in the phase 3 GENEr8-1 trial had a lower FVIII response than was seen during the phase I/II trial. Outside of unexplained patient variability, it was hypothesized that this was partly attributed to differences in steroid regimens used in each trial.
    * Patients in the phase 1/2 trial began steroids earlier post-infusion (week 3 vs. week 10.9) to manage ALT elevations than in the phase 3 GENEr8-1 trial.
    * ALT elevations were associated with decreased FVIII activity in a greater percentage of patients in the phase 3 GENEr8-1 trial.

Investigational Uses

- Use in pediatrics, patients with inhibitors, or liver dysfunction: There are no proposed or ongoing trials that will look at the safety or efficacy of Roctavian (valoctocogene roxaparvovec) in patients less than 18, with inhibitors to FVIII, liver dysfunction, or with antibodies to the viral vector.
- Repeated doses: There is no evidence to establish the safety or efficacy of repeat doses of Roctavian (valoctocogene roxaparvovec). Anti-AAV5 antibodies were observed in 100% of treated subjects in clinical trials. If medical necessity criteria are met, only a single dose of Roctavian will be covered per lifetime.

Safety [1 5]

- A majority (96%) of trial subjects experienced elevated ALT levels which required treatment with immunosuppressants such as glucocorticoids. The median duration of glucocorticoid use was 35 weeks. The safety of Roctavian (valoctocogene roxaparvovec) in patients with pre-existing liver dysfunction or disease has not been established.
- No new cancers have been observed to date. There is insufficient data to assess any potential increased risk of cancers, including liver cancers.
- Although some subjects achieved supra-physiologic levels of factor VIII activity, no thromboembolic adverse events were observed.
- The most common side effects (>20% incidence) experienced during the clinical trials include ALT/AST elevations, arthralgia, nasopharyngitis, headache, back pain, fatigue, upper respiratory tract infection, arthropathy, cough, insomnia, oropharyngeal pain, diarrhea, extremity pain, acne, elevated lactate dehydrogenase, nausea, and rhinitis.
- Due to the small number of patients treated with Roctavian (valoctocogene roxaparvovec) during clinical trials, additional data is necessary to further define the safety profile.

Medication Policy Manual

Policy No: dru645

Topic: Trodelvy, sacituzumab govitecan-hziy

Date of Origin: August 15, 2020

Committee Approval Date: March 6, 2025

Next Review Date: 2025

Effective Date: May 1, 2025

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Trodelvy (sacituzumab govitecan-hziy) is an intravenous medication that is used in the treatment of specific types of cancer.

Policy/Criteria

Most contracts require pre-authorization approval of Trodelvy (sacituzumab govitecan-hziy) prior to coverage.

I. Continuation of therapy (COT): Trodelvy (sacituzumab govitecan-hziy) may be considered medically necessary for COT when criterion A, B, or C below is met.

A. For diagnoses NOT listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND there is documentation that the medication was covered by another health plan. Examples of documentation include the coverage approval letter from the previous health plan or paid claim.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

B. For diagnoses listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

C. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

***Please note**: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Trodelvy (sacituzumab govitecan-hziy) may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) that criterion A or B below is met.

A. A diagnosis of **HER-2 negative breast cancer, advanced (locally advanced or metastatic)** when criteria 1, 2, and 3 below are met:

1. Use in one of the following settings (a or b):

a. **Triple-negative breast cancer** (TNBC)

OR

b. **Hormone receptor positive (HR+), HER-2 negative** [IHC 0, IHC 1+, or IHC2+/ISH-]

[IHC = immunohistochemistry; ISH = in situ hybridization]

AND

2. There has been disease progression on, or after, all of the following:

a. At least <u>two</u> prior lines of cytotoxic chemotherapy, at least one of which was used in the advanced setting (locally advanced or metastatic) (see *Appendix 1*).

AND

b. **<u>For HR+ only</u>**, both of the following (i and ii):

i. Prior anticancer endocrine therapy (see *Appendix 2*).

AND

ii. A CDK4/6 inhibitor (see *Appendix 3*).

AND

3. Trodelvy (sacituzumab govitecan-hziy) is used as monotherapy.

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers Trodelvy (sacituzumab govitecan-hziy) coverable only under the medical benefit (as a provider-administered medication).

B. When pre-authorization is approved, Trodelvy (sacituzumab govitecan-hziy) will be authorized in quantities of up to two doses of 10 mg/kg every 21 days until disease progression.

C. Authorization **may** be reviewed at least annually. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, such as disease stability or improvement.

IV. Trodelvy (sacituzumab govitecan-hziy) is considered investigational when used for all

V. other conditions, including previously treated urothelial carcinoma.

Position Statement

Summary

- Trodelvy (sacituzumab govitecan-hziy) is a Trop-2-directed antibody and topoisomerase inhibitor conjugate that binds to Trop-2-expressing cancer cells and causes cell death.
- The intent of this policy is to allow coverage of Trodelvy (sacituzumab govitecan-hziy) where it has been shown to be effective, up to the dose shown to be safe and effective in clinical trials (as detailed in the coverage criteria).
- ***Triple-negative breast cancer (TNBC):*** The initial approval of Trodelvy (sacituzumab govitecan-hziy) was based on a single-arm, open-label, basket trial. Subsequently, Trodelvy (sacituzumab govitecan-hziy) was studied in a multicenter, open-label, randomized Phase 3 trial in patients with relapsed advanced TNBC after two prior standard (cytotoxic) chemotherapy regimens in the advanced setting. Despite the limited evidence, given the context in which it has been studied as salvage therapy, Trodelvy (sacituzumab govitecan-hziy) may offer value in this salvage clinical setting when standard therapies for advanced TNBC are exhausted. Recently, the NCCN added a recommendation for the use of Trodelvy (sacituzumab govitecan-hziy) in the second-line setting for mTNBC. However, the recommendation is not supported by the clinical trial evidence, as the trial required two prior regimens.
- ***Hormone-receptor (HR)-positive, human epidermal growth factor 2 (HER2)-negative breast cancer:*** The approval of Trodelvy (sacituzumab govitecan-hziy) in pretreated, unresectable locally advanced or metastatic HR-positive, HER2-negative breast cancer was based on one open-label, randomized controlled trial. The use of Trodelvy (sacituzumab govitecan-hziy) as monotherapy was found to improve overall survival (OS) relative to single-agent chemotherapy in patients whose disease had progressed after endocrine therapies, CDK4/6 inhibitors, and cytotoxic chemotherapy (which included a prior taxane-based regimen, and at least one other regimen administered in the metastatic disease setting).
- The use of Trodelvy (sacituzumab govitecan-hziy) is associated with significant side effects, which may limit clinical utility.
- The NCCN guideline lists Trodelvy (sacituzumab govitecan-hziy) among many other potential therapies for advanced TNBC and HR-positive, HER2-negative advanced breast cancer.
- The use of Trodelvy (sacituzumab govitecan-hziy) is considered investigational for all other uses, including previously treated advanced urothelial cancer (FDA indication withdrawn due to failed confirmatory trial).

Regence Pharmacy Services performs independent analyses of oncology medication evidence, to establish coverability per the contracts with the health plan.

- Most contracts define coverability based on established clinical benefit in published, peer-reviewed literature, along with consideration of regulatory status.
- FDA approval does not in itself establish medical necessity, as unpublished, low-quality evidence, including exploratory analyses and unvalidated surrogate endpoints, may be used as the basis of approval. Regulatory approval may or may not reflect clinical benefit

relative to standard of care and the recommendations of expert clinical advisors such as the Oncologic Drugs Advisory Committee (ODAC). FDA approvals generally do not consider cost compared to established therapies, or value to members.

- Likewise, NCCN clinical practice guidelines assignment of a recommendation (category 1, 2a, or 2b) does not necessarily establish medically necessity. NCCN recommendations are inconsistently supported by published, peer-reviewed literature and do not uniformly consider value of new therapies relative to existing potentially higher-value treatment options, considering effectiveness, safety, and cost.
- Medication coverage criteria are developed based on the 'medical necessity' assessment, as described above.

Regence Pharmacy Services analysis and coverage policy may differ from FDA labeled indication and/or NCCN clinical practice guidelines.

Clinical Efficacy

Triple-Negative Breast Cancer (TNBC)

- The initial efficacy of Trodelvy (sacituzumab govitecan-hziy) for FDA approval in mTNBC was based on a multicenter, phase 1/2, open-label, single-arm, basket-trial. [1]
    * Patients had at least two prior systemic regimens in the metastatic setting (median of 3) and ~70% had prior platinum (carboplatin or cisplatin).
    * At the time of data cutoff used for the FDA review, the median duration of follow-up was 9.7 months. Approximately one-third of patients demonstrated an objective response rate (ORR), and 2.8% of patients achieved a complete response.
    * While an ORR was observed, ORR is a surrogate endpoint which has not been shown to reliably predict clinically relevant outcomes such improved overall survival (OS). The lack of clinically meaningful outcomes such as OS makes interpretation of ORR difficult.
- Subsequently, a multicenter, open-label, randomized Phase 3 trial, studied Trodelvy (sacituzumab govitecan-hziy) in patients with unresectable locally advanced or mTNBC, relapsed to at least two prior standard (cytotoxic) chemotherapy regimens [ASCENT]. [2]
    * Patients had relapsed after at least two prior standard chemotherapy regimens for breast cancer (one of which could be in the neoadjuvant or adjuvant setting). Previous therapy had to include a taxane (for any indication). Of the 468 enrolled patients, prior treatments included cytotoxic chemotherapy with taxanes (100%), anthracyclines (82%), cyclophosphamide (82%), carboplatin (66%), and capecitabine (65%). PARP inhibitors (7%) were counted as a prior "chemotherapy regimen" in patients with a documented BRCA1/BRCA2 germline mutation.
    * Patients were randomized to sacituzumab govitecan or physician's choice of single agent chemotherapy (eribulin, capecitabine, gemcitabine, or vinorelbine).
    * The median overall survival (OS) was 12.1 months in the sacituzumab govitecan treatment group and 6.7 months in the chemotherapy treatment group.

- The National Comprehensive Cancer Network (NCCN) guidelines for the management of recurrent or mTNBC breast cancer recognizes Trodelvy (sacituzumab govitecan-hziy) among many potential treatment options in the advanced setting. It is listed as a lower-level recommended treatment option meaning the quality of evidence is low, but there was a consensus among oncologists on the panel for inclusion on the guideline. [4]

Advanced HR-Positive, HER2-Negative Breast Cancer

- The safety and efficacy of Trodelvy (sacituzumab govitecan-hziy) was evaluated in an open-label, randomized controlled trial (TROPiCS-02) in women (N=543) with HR-positive, HER2-negative unresectable or metastatic breast cancer who had progression of disease on or after at least two, but no more than four prior systemic chemotherapy regimens in the metastatic setting. [3]
    * All women had prior anticancer endocrine therapy, a CDK4/6 inhibitor, and at least two prior cytotoxic chemotherapy regimens, at least one of which included a taxane, and at least one of which was administered in the metastatic disease setting. Hormone-targeted therapies [anticancer endocrine therapy and CDK4/6 inhibitors] were not considered as prior systemic chemotherapy treatments.
    * Of the 543 enrolled patients, prior treatments included cytotoxic chemotherapy with taxanes (100%), capecitabine (85%), anthracyclines (84%), cyclophosphamide (76%), eribulin (36%), and fluorouracil (26%). Nearly all patients had at least two prior systemic chemotherapy regimens, with thirty-eight percent of patients had two prior systemic chemotherapy regimens, and 58% had three or more prior chemotherapy regimens).
    * Ninety-five percent of enrolled patients had visceral metastasis.
    * Trodelvy (sacituzumab govitecan-hziy) was administered every 21 days until disease progression. It was compared with physician's choice of single-agent chemotherapy which could have included eribulin, capecitabine, gemcitabine, or vinorelbine.
    * Prior treatment with a topoisomerase 1 inhibitor (e.g., irinotecan, topotecan) was not allowed as Trodelvy (sacituzumab govitecan-hziy) delivers a topoisomerase 1 inhibitor payload.
    * Median OS was 14.4 months and 11.2 months in the Trodelvy (sacituzumab govitecan-hziy) and single-agent chemotherapy treatment arms, respectively. This difference is both statistically significant and clinically relevant.
- The NCCN breast cancer guideline lists Trodelvy (sacituzumab govitecan-hziy) as a treatment option for patients who have received prior endocrine therapy, a CDK4/6 inhibitor, and at least two lines of prior chemotherapy, one of which was a taxane, and at least one of which was in the metastatic setting. [4]

Investigational Uses

Advanced Urothelial Cancer (UC)

The use of Trodelvy (sacituzumab govitecan-hziy) for treatment of previously treated advanced UC is considered 'investigational,' as the confirmatory trial failed to meet the endpoint of overall survival and the FDA indication was withdrawn.

- Trodelvy (sacituzumab govitecan-hziy) was initially approved for previously treated advanced UC based on a single-arm, multicenter Phase 2 trial (TROPHY-U-01) via the Accelerated Approval pathway. [5]
- Subsequently, the confirmatory trial (TROPICS4) failed to demonstrate an overall survival improvement as compared to standard subsequent-line chemotherapy. [6] As a result, the manufacturer voluntarily removed the FDA indication. [7,8]

Safety [9]

- The most common adverse events (incidence of 25% or more) reported with Trodelvy (sacituzumab govitecan-hziy) include nausea, neutropenia, diarrhea, fatigue, anemia, vomiting, alopecia, constipation, rash, decreased appetite, and abdominal pain. [1]
- Trodelvy (sacituzumab govitecan-hziy) has a Boxed Warning for neutropenia and diarrhea.

Dosing [9]

- The recommended dose of Trodelvy (sacituzumab govitecan-hziy) is 10 mg/kg administered as an intravenous infusion once weekly on days 1 and 8 of 21-day treatment cycles for all indications.

Appendix 1: Cytotoxic Chemotherapy Agents Used in the Treatment of Advanced Breast Cancer [4] a,b,c

"Preferred" Single Agents	***Chemotherapy Combinations***
Anthracyclines	AC: doxorubicin/cyclophosphamide
doxorubicin (generic, Adriamycin)	EC: epirubicin/cyclophosphamide
doxorubicin liposomal (generic, Doxil)	CMF: cyclophosphamide/methotrexate/fluorouracil
Taxanes	docetaxel/capecitabine
paclitaxel (generic Taxol)	GT: gemcitabine/paclitaxel
Anti-metabolites	gemcitabine/carboplatin
capecitabine (generic, Xeloda)	paclitaxel/bevacizumab
gemcitabine (generic, Gemzar)	carboplatin + paclitaxel or albumin-bound paclitaxel
Other microtubule inhibitors	
vinorelbine (generic, Navelbine)	
eribulin (generic, Halaven)	
"Other" Single Agents	
cyclophosphamide (generic, Cytoxan)	cisplatin
carboplatin	epirubicin
docetaxel (generic, Taxotere)	Ixempra (ixabepilone)
Abraxane (nab-paclitaxel)	Trodelvy (sacituzumab govitecan-hziy; for TNBC)

[a] Hormone-targeted therapies (endocrine therapy and CDK4/6s) are not considered "cytotoxic chemotherapy."

[b] PARP inhibitors may be counted as a prior "chemotherapy regimen" in patients with a documented BRCA1/BRCA2 germline mutation. [3]

[c] Neoadjuvant/adjuvant regimens are not included, as finite regimens used for non-advanced disease. Examples: ddAC+T [doxorubicin/cyclophosphamide followed by paclitaxel], TC [docetaxel/ cyclophosphamide], or carboplatin/paclitaxel/pembrolizumab followed by AC/pembrolizumab.

Appendix 2: Endocrine Therapies Used in HR-Positive Advanced Breast Cancer		
Aromatase inhibitors (AIs)	**Selective estrogen receptor degraders (SERDs)**	**Selective estrogen receptor modifiers (SERMs)**
Arimidex (anastrozole)	Orserdu (elacestrant)	tamoxifen (Nolvadex, Soltamox)
Aromasin (exemestane)	Faslodex (fulvestrant)	
Femara (letrozole)		

Appendix 3: CDK4/6 Inhibitors Used in HR-Positive Advanced Breast Cancer
Verzenio (abemaciclib)
Ibrance (palbociclib)
Kisqali (ribociclib)

Revision History

Revision Date	Revision Summary
3/6/2025	• Added to Investigational Uses: previously treated advanced urothelial carcinoma, due to FDA withdrawal of this indication (previously "not medically necessary"). • Clarified language for step therapy with cytotoxic chemotherapy for HER2-negative breast cancer [no change to intent].
12/12/2024	Removed coverage of previously treated advanced urothelial carcinoma due to manufacturer withdrawal of indication.
6/20/2024	Simplification of step therapy for HER2-negative breast cancer criteria (TNBC and HR-positive, HER2-negative). No change to overall intent of coverage criteria.
9/14/2023	Added "locally advanced" verbiage to coverage criteria for unresectable locally advanced or metastatic HR-positive, HER2-negative breast cancer for clarity. No change to intent.
6/15/2023	Added coverage for a new indication in unresectable locally advanced or metastatic HR-positive, HER2-negative breast cancer after prior endocrine therapy, CKK4/6 inhibitor therapy, and at least two prior lines of chemotherapy which must have included a taxane, and at least one of which was administered in the metastatic setting.
6/17/2022	No criteria changes with this annual update.
10/15/2021	Added coverage for new indication in advanced urothelial cancer.
7/16/2021	Updated diagnosis criterion from "metastatic triple-negative breast cancer" to "advanced triple-negative breast cancer" based on FDA indication update.
1/20/2021	Removed platin requirement from coverage criteria.
7/22/2020	New policy (effective 8/15/2020). The intent of this policy is to allow coverage of Trodelvy (sacituzumab govitecan-hziy) where it has been shown to be effective, up to the dose shown to be safe and effective in clinical trials

Medication Policy Manual **Policy No:** dru648

Topic: Medications for thrombocytopenia **Date of Origin:** October 1, 2020

- Alvaiz (eltrombopag)
- Doptelet, avatrombopag
- Mulpleta, lusutrombopag
- Nplate, romiplostim
- Promacta, eltrombopag
- Tavalisse, fostamatinib

Committee Approval Date: June 20, 2024 **Next Review Date:** 2025

Effective Date: September 1, 2024

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

This policy is for specific medications used in the treatment of thrombocytopenia, both oral and injectable.

PLEASE NOTE: For IVIG coverage requirements, see the IVIG-specific medication policy (dru020).

Policy/Criteria

Most contracts require pre-authorization approval of medications for thrombocytopenia prior to coverage.

I. Continuation of therapy (COT): Medications for thrombocytopenia may be considered medically necessary for COT when criterion A, B, or C below is met.

A. For diagnoses NOT listed in the coverage criteria below, full policy criteria must be met for coverage.

OR

B. For diagnoses listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

C. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

Please note*: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve): Medications for thrombocytopenia may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) that one of the following criterion A through E below are met.

A. **Chronic idiopathic thrombocytopenia** (ITP), also known as "immune thrombocytopenia," when criteria 1, 2, and 3 below are met:

For Doptelet (avatrombopag), Nplate (romiplostim), Promacta (eltrombopag), Tavalisse (fostamatinib), and Alvaiz (eltrombopag) Only:

1. The diagnosis of **chronic ITP** has been made by, or in consultation with, a specialist in hematology.

AND

2. The patient is at risk of spontaneous bleeding as demonstrated by either one of the following criteria (a or b) below:

a. Platelet count less than 20 x 10^9/L.

OR

b. Platelet count less than 30 x 10^9/L accompanied by symptoms of bleeding.

AND

3. Prior treatment with an adequate course of systemic corticosteroids (e.g., prednisone 1 to 2 mg/kg for 2 to 4 weeks, or pulse dexamethasone 40 mg daily for 4 days).

OR

B. **Thrombocytopenia in adult patients with chronic liver disease** (CLD) who are scheduled to undergo a procedure when criteria 1 through 4 below are met.

For Doptelet (avatrombopag) and Mulpleta (lusutrombopag) Only:

1. A diagnosis of **thrombocytopenia** and **chronic liver disease** (CLD) established by or in consultation with a specialist in hematology or hepatology.

AND

2. Platelet count less than 50 x 10^9/L.

AND

3. Planned invasive procedure within the next 14 days.

AND

4. **Mulpleta (lusutrombopag) Only*:*** Treatment with Doptelet (avatrombopag) was not effective, not tolerated or use is contraindicated.

OR

C. **Thrombocytopenia associated with hepatitis C** (HCV) when criterion 1 below is met.

For Promacta (eltrombopag) and Alvaiz (eltrombopag) Only:

1. A diagnosis of **thrombocytopenia** associated with **hepatitis C** (HCV) and the patient is unable to initiate or maintain interferon (IFN) therapy due to platelet count less than 75 x 10^9/L, and a Child-Pugh level A (score 5-6) (see *Appendix A*).

OR

D. **Severe aplastic anemia** when criteria 1, 2, and 3 below are met:

For Promacta (eltrombopag) and Alvaiz (eltrombopag) Only:

1. The diagnosis of **severe aplastic anemia** has been made by, or in consultation with a specialist in hematology.

AND

2. Documentation of a baseline severe cytopenia (severe aplastic anemia), with **at least two** of the following three criteria:

a. Reticulocyte count less than 20 x 10^9/L

b. Platelet count less than 20 x 10^9/L

c. Absolute neutrophil count (ANC) less than 500 cells/mm^3

AND

3. Baseline platelet count of less than 30,000/mm^3.

OR

E. **Hematopoietic syndrome of acute radiation syndrome (HSARS)** when criterion 1 below is met:

For Nplate (romiplostim) Only:

1. A diagnosis of **hematopoietic syndrome** of **acute radiation syndrome**.

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers Nplate (romiplostim) coverable only under the medical benefit (as a provider-administered medication).

B. Regence Pharmacy Services considers all oral medications coverable only under the pharmacy benefit (as self-administered medications).

C. When pre-authorization is approved, medications for thrombocytopenia will be authorized in quantities and authorization periods as listed in Table 1.

TABLE 1.

Quantity Limit	Initial:	Re-authorization:
Chronic ITP		
Doptelet (avatrombopag): Up to 40 mg per day. **Promacta (eltrombopag):** Up to 75 mg per day. **Tavalisse (fostamatinib):** Up to 300 mg per day. **Nplate (romiplostim):** Up to 10 mcg/kg/dose per week. **Alvaiz (eltrombopag):** Up to 54 mg per day.	12 weeks	Continued authorization (after the initial 12-week period) **shall** be reviewed at least annually to confirm that current medical necessity criteria are met, the dose is within the dose limits, and that the patient's recent (within the last 90 days) platelet count is either: **1.** Equal to or greater than 30 x 10^9/L but not more than 150 x 10^9/L. **OR** **2.** Less than 30 x 10^9/L but platelet counts have increased from baseline accompanied with a resolution of previous bleeding.
CLD, scheduled to undergo a procedure		
Doptelet (avatrombopag): 15 tablets per treatment course. **Mulpleta (lusutrombopag)**: 7 tablets per treatment course.	One treatment course	No reauthorization. Apply Initial authorization criteria for any additional procedures.
Thrombocytopenia associated with HCV		
Promacta (eltrombopag): Up to 100 mg per day. **Alvaiz (eltrombopag):** Up to 72 mg per day.	12 weeks	Continued authorization (after the initial 12-week period) **shall** be reviewed at least annually to confirm that current medical necessity criteria are met, the dose is within the dose limits, and the patient remains on interferon/ribavirin therapy and platelet count is less than 400 x 10^9/L.

Quantity Limit	Initial:	Re-authorization:
Severe aplastic anemia		
Promacta (eltrombopag): Up to 150 mg per day. **Alvaiz (eltrombopag):** Up to 108 mg per day.	16 weeks	The patient has a documented hematologic response, based on blood counts AND/OR a reduced need for blood products as defined below. **<u>Initial Reauthorization:</u>** Initial authorization **shall** be reviewed at 16 weeks. Ongoing coverage requires the patient's recent (within the last 90 days) blood counts and that the patient has a demonstrated hematologic response, defined as one of the following (a through d). The documented baseline cytopenia and/or transfusion needs will be used for demonstration of hematologic response. If initial reauthorization is approved, a subsequent 16-week period will be authorized. **a.** Platelet count equal to or greater than 30 x 10^9/L but not more than 150 x 10^9/L AND transfusion independence (no blood product transfusions given) for 8 consecutive weeks. **OR** **b.** Platelet count less than 30 x 10^9/L but 20 x 10^9/L more than baseline. **OR** **c.** Reduction in RBC transfusions (of at least 4 units) for 8 consecutive weeks or hemoglobin increase of at least 1.5 g/dL from baseline. **OR** **d.** Absolute neutrophil count (ANC) increase of 100% from baseline or an ANC increase greater than 500/mm^3. **<u>Continued Authorization:</u>** Continued authorization (following the initial combined 32-week period) **shall** be reviewed at least annually to confirm that current medical necessity criteria are met, the dose is within the dose limits, and there is documentation of recent blood counts/transfusion records (within the last 90 days) that the patient is able to maintain blood counts or ongoing reduced need for blood products, as defined in the initial re-authorization above.
Hematopoietic syndrome of acute radiation syndrome		
Nplate (romiplostim): Up to 10 mcg/kg/dose	One treatment course	No reauthorization. Apply Initial authorization criteria for any additional exposures.

IV. Medications for thrombocytopenia are considered investigational when used for all other conditions, including but not limited to:

A. Acute thrombocytopenia.

B. Low platelet counts secondary to other conditions or diseases [including, but not limited to, cancer, HIV, and myelodysplastic syndrome (MDS)], except as listed in the coverage criteria.

C. Drug-induced thrombocytopenia [e.g., chemotherapy, heparin (HIT)], except as listed in the coverage criteria.

D. Thrombocytopenia secondary to disseminated intravascular coagulation, hemangiomas, or platelet loss (massive bleeding).

E. Thrombotic thrombocytopenic purpura/hemolytic-uremic syndrome (TTP/HUS).

F. Pancytopenia (other than aplastic anemia).

G. *For Promacta (eltrombopag) and Alvaiz (eltrombopag):* Use in combination with ATG (or within 4 months) for aplastic anemia.

H. *For Tavalisse (fostamatinib):* Rheumatoid arthritis.

Position Statement

Summary

- The intent of this policy is to cover medications for thrombocytopenia (as listed in Table 1) for the indications and dose for which they have been shown to be safe and effective, as detailed in the coverage criteria above:
  - * Chronic idiopathic thrombocytopenia (ITP), when traditional first line therapies are ineffective or not a treatment option, as detailed in the coverage criteria.
  - * Aplastic anemia, when traditional first line therapies are ineffective or not a treatment option, as detailed in the coverage criteria [*Promacta (eltrombopag) and Alvaiz (eltrombopag) only*].
  - * Patients with hepatitis C virus (HCV), when the patient is unable to remain on interferon (IFN) therapy due to thrombocytopenia [*Promacta (eltrombopag) and Alvaiz (eltrombopag) only*].
  - * Prior to a planned invasive procedure in patients with chronic liver disease (CLD) and significant thrombocytopenia [*Doptelet (avatrombopag) and Mulpleta (lusutrombopag) only*].
  - * Hematopoietic Syndrome of Acute Radiation Syndrome [*Nplate (romiplostim) only*].
- Medications for thrombocytopenia (as listed in Table 1) in this policy include:
  - * Thrombopoietin receptor agonists (TPO RAs): Nplate (romiplostim), Promacta (eltrombopag), Doptelet (avatrombopag), Mulpleta (lusutrombopag), and Alvaiz (eltrombopag).
  - * Kinase inhibitor: Tavalisse (fostamatinib).

* Alvaiz (eltrombopag) is the choline salt form of eltrombopag, whereas Promacta (eltrombopag) is the olamine salt form of eltrombopag. Alvaiz (eltrombopag) has demonstrated bioequivalency to Promacta (eltrombopag) and is considered a pharmaceutical alternative (not generic) to Promacta (eltrombopag). The effectiveness of Alvaiz (eltrombopag) for its FDA- approved indications was based on clinical trials of Promacta (eltrombopag) and an additional study to establish its bioequivalency to Promacta (eltrombopag).

Chronic ITP

- Medications for thrombocytopenia used for ITP [Doptelet (avatrombopag), Nplate (romiplostim), Promacta (eltrombopag), Alvaiz (eltrombopag), Tavalisse (fostamatinib)] have only been studied in patients for whom traditional treatments have been ineffective. Current guidelines recommend steroids as a first-line treatment for ITP. Splenectomy (a surgical treatment option), rituximab, and TPO RAs are among recommended treatment options for refractory chronic ITP. Splenectomy and rituximab can put patients into long-term clinical remission. TPO RAs on the other hand, must be dosed continually to see benefit. [1]
- The safety and efficacy of TPO RAs or Tavalisse (fostamatinib) used for ITP were established in placebo-controlled trials in patients with low platelet counts despite at least one prior treatment for ITP.
- There are no clinical trials that have demonstrated a superior benefit of TPO RAs or Tavalisse (fostamatinib) over therapies such as corticosteroids, immunoglobulin, splenectomy, rituximab, or thrombopoietin receptor agonists.

Thrombocytopenia associated with HCV

- Eltrombopag is also used to treat thrombocytopenia in patients with chronic hepatitis C to allow the initiation and maintenance of interferon-based therapy. Safety and efficacy of eltrombopag has not been established for use in combination with direct-acting antivirals, such as protease inhibitors or polymerase inhibitors. [2 3]

Aplastic anemia

- Aplastic anemia is a rare, life-threatening condition, characterized by trilineage bone marrow hypoplasia, which leads to anemia, neutropenia, and thrombocytopenia.[4-7]
    * Aplastic anemia is usually treatable with allogeneic stem cell transplantation (HSCT), the only curative therapy, or immunosuppression therapy (IST) of antithymocyte globulin (ATG) with cyclosporine. Response to IST is delayed, usually three to four months; therefore, ongoing support of cytopenias is expected.
    * There is no standard therapy for refractory aplastic anemia patients who are unable to undergo a HSCT. Treatment is generally supportive with red cell and platelet transfusions and treatment of infections but may include eltrombopag as a treatment option.
    * In clinical trials, hematologic response to eltrombopag was based on improvement in blood counts and/or a reduced need for blood products. A patient's baseline cytopenia(s) and/or transfusion dependence must be considered when evaluating response to eltrombopag and the need for continued therapy.

Chronic Liver Disease (CLD), scheduled to undergo a procedure

- The safety and efficacy of both Doptelet (avatrombopag) and lusutrombopag in patients with CLD who were scheduled to undergo a procedure was established in two placebo-controlled trials. The trials evaluated a reduction in platelet transfusions or rescue therapy; however, reductions in bleeding rates were not assessed. [8]
- There are no trials comparing Doptelet (avatrombopag) or Mulpleta (lusutrombopag) to each other or any other medication or treatment for CLD associated thrombocytopenia. There is no evidence that one is superior to one another in terms of safety or efficacy; however, Doptelet (avatrombopag) is the lowest cost.
- "Medications for thrombocytopenia" may be covered for up to the doses shown to be safe and effective in clinical trials, as detailed in the coverage criteria above.
- There is insufficient evidence to support the safety or efficacy of "medications for thrombocytopenia" in any other condition or type of thrombocytopenia, including chemotherapy-induced thrombocytopenia, except as listed in the coverage criteria.

Clinical Efficacy

<u>Refractory ITP</u>

- Avatrombopag was studied in one small, phase 3, randomized, double-blind, placebo-controlled trial in patients with ITP refractory to one or more ITP therapies (corticosteroids, immunoglobulins, azathioprine, danazol, cyclophosphamide, rituximab).[8]
    * Patients had a baseline platelet count of less than 30 x 10^9/L.
    * Although the study demonstrated that avatrombopag improves platelet levels compared to placebo, its effect on more clinically meaningful outcomes (e.g., overall survival, decreased incidence of bleeding, need for rescue therapies) is unknown.
- Tavalisse (fostamatinib) was studied in two phase 3, randomized, double-blind, placebo-controlled trials in patients with ITP refractory to one or more ITP therapies (including corticosteroids, immunoglobulins, splenectomy, rituximab or a TPO RA). Patients were allowed to continue with their stable concurrent ITP therapy. [9]
    * The primary endpoint was a stable platelet response (defined as platelets ≥50 x 10^9/L).
    * In the first trial, significantly more patients achieved a stable platelet response when treated with fostamatinib compared to placebo. In the second trial, the difference in stable platelet response was numerically greater, but did not reach statistical significance. Although increases in platelet count were observed in clinical trials, it is unknown how platelet response correlates to more clinically meaningful outcomes (e.g., overall survival, decreased incidence of bleeding).
- Romiplostim has been proven in clinical studies to be more effective for increasing platelets than placebo. [1 11]
    * For every two non-splenectomized patients who received romiplostim, one patient-maintained platelet counts above 50 x 10^9/L for 6 weeks during the last 8 weeks of the trial.

    * For every three splenectomized patients who received romiplostim, one patient-maintained platelet counts above 50 x 10^9/L for 6 weeks during the last 8 weeks of the trial.

- Eltrombopag has been proven in clinical studies to be more effective for increasing platelets than placebo. [1 11]
    * Eltrombopag may increase platelet counts; however, its effectiveness past 6 months is uncertain.
    * Because the risk of bleeding is only prominent when platelet count drops below 20 x 10^9/L, it is difficult to quantify the clinical benefit of treatment when half of the patients in the studies had platelet count above 20 x 10^9/L at baseline.
- It is uncertain whether the increase in platelets with "medications for ITP" is sustainable long term (beyond 24 to 52 weeks) and whether "medications for ITP" decreases bleeding episodes or other complications in patients with chronic ITP. Effect on overall survival is unknown, given the lack of evidence. [11] Overall, long term data are lacking.
- Standard of care therapies are effective for many patients with chronic ITP.
    * Around one-third of patients may expect a long-term response from treatment with an oral corticosteroid. Corticosteroids should be rapidly tapered and stopped in patients who fail to respond after 4 weeks.[1]
    * Up to two-thirds of patients with ITP who undergo splenectomy may achieve a normal platelet count, which is often sustained with no additional therapy. [1]
- Principles of treatment for ITP
    * A normal platelet count in a healthy person is between 150 x 10^9/L and 400 x 10^9/L. The goal of treatment for chronic ITP should be to maintain a safe platelet count, not to achieve a normal platelet count.[1]
    * Choosing Wisely, an evidence-based initiative to promote wise use of medical resources, states that patients with ITP should not be treated in the absence of bleeding or a very low platelet count. Only rarely should patients be treated when platelet counts are above 30 x 10^9/L, such a preparation of surgery or an invasive procedure. Unnecessary treatment exposes patients to potential adverse events and raises the overall cost of care, with unknown clinical benefit.
    * The risk of bleeding and mortality increases as platelet counts drops below 20 or 30 x 10^9/L. but there are large individual variations. [14 15]
    * Taking in to account the slow time to response of TPO receptor agonists or TKIs and frequent platelet lability in refractory ITP patients, ongoing use of medications for ITP may be needed for patients with platelets well above the critical threshold, such as over 30 x 10^9/L but less than 150 x 10^9/L.
- There are no studies evaluating the efficacy of "medications for ITP" compared to other refractory ITP treatment options. Trials of "medications for ITP" were conducted in patients refractory to standard treatments, such as corticosteroids, immunoglobulins, rituximab, cytotoxic therapies, danazol, and azathioprine.

Thrombocytopenia in HCV

- Two randomized-controlled studies for the treatment of thrombocytopenia in adult patients with chronic hepatitis C compare eltrombopag to placebo. Eltrombopag was administered in combination with pegylated interferon and ribavirin for up to 48 weeks. The primary efficacy endpoint for both trials was sustained virologic response (SVR) defined as the percentage of patients with undetectable HCV-RNA at 24 weeks after completion of antiviral treatment. The median time to achieve the target platelet count ≥90 x 10^9/L was approximately 2 weeks. Ninety-five percent of patients were able to initiate interferon therapy. In both trials, a significantly greater proportion of patients treated with eltrombopag achieved SVR.
- Eltrombopag was only studied in patients trying to receive interferon therapy.
    * There is no data on the safety and efficacy of eltrombopag in HCV patients on direct-acting antivirals.
    * There is insufficient evidence to support the use of eltrombopag in patients with thrombocytopenia associated with chronic liver disease (CLD), in the absence of trying to initiate and maintain interferon therapy for HCV. This includes CLD patients with liver failure and/or cirrhosis and patients undergoing an invasive procedure. [8,9]
- Eltrombopag doses should be lowered when platelet levels are between 200 x 10^9/L and 400 x 10^9/L and stopped when platelets are over 400,000 x 10^9/L. [1]

Chronic Liver Disease (CLD)

- Avatrombopag was studied in two phase 3, randomized, double-blind, placebo-controlled, clinical trials (ADAPT-1 and ADAPT-2) in patients with chronic liver disease and platelet counts less than 50 x 10^9/L who were scheduled to undergo an invasive procedure. [8]
    * The studies found that significantly more patients treated with avatrombopag did not require a platelet transfusion or rescue therapy for bleeding up to 7 days after the scheduled procedure compared to patients treated with placebo.
    * In addition, more patients across both trials achieved the target platelet count of ≥50 x10^9/L on the day of the procedure.
- Lusutrombopag was evaluated in two phase 3, randomized, double-blind, placebo-controlled trials (L-PLUS 1 and L-PLUS 2) in patients with chronic liver disease and platelet counts less than 50 x 10^9/L who were scheduled to undergo an invasive procedure.
    * In both trials, a greater proportion of patients who received lusutrombopag did not require a platelet transfusion prior to the primary procedure compared to the placebo treatment group.
    * Additionally, in L-PLUS 2 a higher proportion of patients treated with lusutrombopag did not require rescue therapy from bleeding compared to the placebo treatment group.

Aplastic Anemia

- One non-randomized, open-label single-arm study evaluated the use of eltrombopag in combination with immunosuppressive therapy (ATG plus cyclosporine) as first-line treatment in 92 patients with severe aplastic anemia. [17]
    * Efficacy was established on the basis of complete hematological response at 6 months. A complete response was defined as hematological parameters meeting all 3 of the following values on 2 consecutive serial blood count measurements at least one week apart: absolute neutrophil count (ANC) > 1,000/mcL, platelet count > 100 x 10^9/L and hemoglobin > 10 g/dL.
    * At six months 38 people (44%) of patients had a complete response. The overall and complete hematological response rates at Year 1 (N=78) are 56.4% and 38.5% and at Year 2 (N=62) are 38.7% and 30.6%, respectively.
- One non-randomized, open-label single-arm study evaluated the use of eltrombopag in 43 adult patients with severe aplastic anemia refractory to immunosuppressive therapy (ATG plus cyclosporine). [3 4]
    * All patients had a confirmed diagnosis of severe aplastic anemia, prior use of ATG with cyclosporine, and a baseline platelet count of ≤ 30 x 10^9/L.
    * Eltrombopag was initiated at 50 mg per day for up to 12 weeks. Doses were titrated by 50 mg per day every 2 weeks, up to a maximum of 150 mg per day.
    * The primary efficacy endpoint was hematologic response, defined as a clinically significant change in blood counts or transfusion independence (uni- or multilineage response) at 12 weeks. Response was defined as at least of the following criteria:
        1. Platelet response: increases ≥ 20 x 10^9/L from baseline, or stable platelet counts with transfusion independence for ≥ 8 weeks.
        2. Erythroid response (if HgB < 9 at baseline): Hemoglobin increase ≥1.5 g/dL, or a reduction in greater than or equal to 4 units of RBC transfusions for 8 consecutive weeks.
        3. Neutrophil response (if ANC<500 at baseline): ANC increase of 100% or an ANC increase ≥ 500.
    * Eltrombopag was discontinued after 16 weeks if no hematologic response was observed. Patients who responded continued therapy in an extension phase of the trial.
    * Forty percent of patients (17 of 43 patients) demonstrated a hematologic response in at least one lineage. One response had a trilineage response and four had a bi lineage response. The median time to initial hematologic response was approximately 12 weeks (range 8-14 weeks).
- Aplastic anemia is a rare, life-threatening condition, characterized by trilineage bone marrow hypoplasia, with low hematopoietic stem and progenitor cells, resulting in low red blood cell, white blood cell, and platelet counts (anemia, neutropenia, and thrombocytopenia). [7]

- Aplastic anemia is usually treatable with allogeneic stem cell transplantation (HSCT) or immunosuppression therapy (IST). [7]
    * Early spontaneous recovery is infrequent. Treatment should start as soon as the patient is stabilized, and the diagnosis confirmed.
    * Curative therapy with HSCT is preferred for newly-diagnosed patients less than 40 years of age if they have an appropriate donor.
    * For patients over the age of 40, antithymocyte globulin (ATG) with cyclosporine is recommended, with a 50 to 80% response rate. However, response is delayed and response is generally not seen until three to four months after starting IST. Ongoing transfusion support with packed RBCs and platelets may be needed, along with neutropenic support. Cyclosporin maintenance therapy is used to prevent relapse.
    * Re-treatment with ATG or another immunosuppressant can be considered after a minimum of four months, along with enrollment in a clinical trial. Use of prednisone is not recommended, as they are ineffective and increase the risk of bacterial and fungal infections.
- For patients with aplastic anemia refractory to ATG therapy and those with relapse, standard therapy is allogeneic stem cell transplantation (HSCT). [7]
- There is no standard therapy for refractory aplastic anemia patients who are unable to undergo a HSCT, due to lack of a suitable donor for HSCT (20 to 40% of patients) or other contraindication to HSCT, such as advanced age. [7]
- Treatment is generally supportive with red cell and platelet transfusions and treatment of infections.
    * Repeat immunosuppression can be used as salvage therapy, but with limited efficacy and significant toxicity.
    * Eltrombopag may be a treatment option for patients with immunosuppression-refractory thrombocytopenia.
- Delayed response to therapy for aplastic anemia is expected, including eltrombopag. [7]
    * Dose titration up to maximum allowed doses may be necessary to achieve a platelet count of $\geq 50 \times 10^9$/L, but effect may take up to 16 weeks. If no effect is seen in 16 weeks, therapy should be stopped.
    * Eltrombopag doses should be lowered when platelet levels are between 200×10^9/L and 400×10^9/L and stopped when platelets are over 400×10^9/L, for a goal of $\geq 50 \times 10^9$/L. Patients who have a complete response should be re-evaluated regularly for the need for ongoing eltrombopag therapy.

<u>Hematopoietic Syndrome of Acute Radiation Syndrome (HS-ARS)</u>

- The evidence for Nplate (romiplostim) for HS-ARS is based on animal studies and previous studies on platelet count in healthy adults. In animal studies, treatment with Nplate (romiplostim) was shown to increase survival compared to supportive therapy alone.[10 18]

- Nplate (romiplostim) may be used after medical or environmental exposure to radiation (e.g. a nuclear explosion, an accident at a nuclear reactor, a radiotherapy accident, or the escape of radioactive waste). [18]

Alvaiz (eltrombopag choline) bioequivalence study to Promacta (eltrombopag olamine)[19]

- An open label, randomized, single dose bioequivalence study was performed to assess the bioequivalence of Alvaiz (eltrombopag choline) 54mg tablets to Promacta (eltrombopag olamine) 75 mg tablets. Subjects received a single dose of either product.
- Plasma concentrations (bioavailability), the key requirement for FDA bioequivalence approval, between the two arms were similar, and both products were found to be safe and well-tolerated. Additional in-vitro studies demonstrated bioequivalence for other tablet strengths; refer to dosing section for details on specific tablet strength bioequivalence.

Laboratory measurement

- Platelet counts are measured per microliter (mcL or µL), which is equivalent to a cubic millimeter (mm^3). The measurement can also be expressed per liter ($x10^9/L$).
- A platelet count of "50" generally refers to a platelet count of 50 x 10^9/L or "50,000 per microliter."
- The following are equivalent expressions of 50,000/µL: "50,000/mm^3" or "50 x 10^9/L."

Safety

- The most common adverse reactions associated with Doptelet (avatrombopag) are pyrexia, abdominal pain, nausea, headache, fatigue, and edema peripheral.
- The most common adverse reaction with Mulpleta (lusutrombopag) is headache.
- The most common adverse reactions associated with Tavalisse (fostamatinib) are diarrhea, hypertension, nausea, respiratory infection, dizziness, increased ALT/AST, rash, abdominal pain, fatigue, chest pain, and neutropenia.
    * Nplate (romiplostim),Promacta (eltrombopag), and Alvaiz (eltrombopag) have a risk of uncommon but serious side effects which need to be weighed against its potential benefit. Due to strict monitoring requirement, safety concerns, and lack of data for self-administration, romiplostim is currently required to be administered by a health professional. Uncommon but serious side effects include:
        * **Bone marrow changes:** romiplostim increases the risk for reticulin deposition within the bone marrow. Clinical studies have not ruled out the possibility that reticulin and other fiber deposition may result in bone marrow fibrosis with cytopenias.
        * **Worsening low blood platelet count**: discontinuation of romiplostim may result in worsened thrombocytopenia than was present prior to romiplostim therapy.
        * **High platelet counts and increased risk of blood clots**: romiplostim may increase platelet counts to a level that produces thrombotic/thromboembolic complications. Portal vein thrombosis has been reported in patients with chronic liver disease taking romiplostim.

    * **Worsening hematologic conditions:** romiplostim may increase the risk for hematological malignancies, especially in patients with myelodysplastic syndrome.
    * **Alvaiz (eltrombopag) and Promacta (eltrombopag) both carry a black boxed warning for the risk of hepatic decompensation in patients with chronic hepatitis C and risk of hepatotoxicity.**
- Patients with chronic liver disease require lower initial dose or Promacta (eltrombopag) and Alvaiz (eltrombopag) due to increased risk for thromboembolic events (specifically portal vein thrombosis).

Dosing

- In refractory ITP, Doptelet (avatrombopag) is taken in doses up to 40mg once daily to maintain a platelet count above $50x10^9$/L.
- In CLD, Doptelet (avatrombopag) is taken 10 to 13 days prior to a scheduled procedure. The recommended dose is 60 mg orally once daily for five days for patients with a platelet count less than 40 x 10^9/L, and 40 mg orally once daily for five days for a platelet count 40 to less than 50 x 10^9/L. The planned procedure is to be 5 to 8 days after the last dose of avatrombopag.
- Mulpleta (lusutrombopag) is started 8 to 14 days prior to a scheduled procedure. The recommended dose is 3 mg orally once daily for 7 days. Patients undergo their procedure 2 to 8 days after the last dose of lusutrombopag.
- In CLD clinical trials with Doptelet (avatrombopag) and Mulpleta (lusutrombopag), platelet counts retuned to baseline levels approximately 30 to 35 days after the last dose. [8]
- The recommended dose of Tavalisse (fostamatinib) is 100 mg orally twice daily. After 4 weeks, the dose is increased to 150 mg twice daily, if needed, to achieve appropriate platelet count levels. The safety and effectiveness of higher doses have not been established.
- Initial dose of romiplostim for ITP is 1 mcg/kg once weekly as a subcutaneous injection. The maximum weekly dose is 10 mcg/kg and adjusted based on clinical response (platelet count and bleeding). Initial response to romiplostim is usually seen within 5 to 14 days, with a peak response in 14 to 60 days. [1]
- The dose of romiplostim for HS-ARS is 10 mcg/kg administered subcutaneously one time. It should be administered as soon as possible after suspected or confirmed radiation exposure. [1]
- Promacta (eltrombopag) may be covered in doses up to 75 mg per day for treatment of ITP, up to 100 mg per day for treatment of thrombocytopenia associated with HCV, and up to 150 mg per day for treatment of severe aplastic anemia, the doses shown to be safe and effective.
    * The initial dose of eltrombopag for most chronic ITP patients (≥ 6 years of age) is 50 mg once daily (25 mg once daily for pediatric patients aged 1 to 5 years). Maximum dose is 75 mg daily and adjusted based on clinical response (platelet count and bleeding).

    * Initial response to eltrombopag for ITP is usually seen within 7 to 28 days, with a peak response in 14 to 90 days. [1]
    * The initial dose of eltrombopag for HCV-associated thrombocytopenia is 25 mg once daily. Maximum dose is 100 mg daily and adjusted based on response of platelet count, to allow initiation of antiviral therapy.
    * The initial dose of eltrombopag for refractory aplastic anemia is 50 mg once daily. For first-line severe aplastic anemia the initial dose is 2.5 mg/kg (in pediatric patients aged 2 to 5 years old), 75 mg (pediatric patients aged 6 to 11 years old), or 150 mg for patients aged 12 years and older with standard immunosuppressive therapy. Maximum dose is 150 mg daily and adjusted based on response of platelet count, to avoid the need for platelet transfusions.

- Alvaiz (eltrombopag) may be covered in doses up to 54mg per day for treatment of ITP, up to 72mg per day for treatment of thrombocytopenia associated with HCV, and up to 108 mg/day for treatment of severe aplastic anemia, the doses shown to be safe and effective.[19]Tablet strength bioequivalence between Alvaiz (eltrombopag choline) and Promacta (eltrombopag olamine) is as follows:

Alvaiz (eltrombopag choline)	Promacta (eltrombopag olamine)
9 mg tablet	12.5 mg tablet
18 mg tablet	25 mg tablet
36 mg tablet	50 mg tablet
54 mg tablet	75 mg tablet

Investigational Uses

- Doptelet (avatrombopag) is also being studied in chemotherapy-induced thrombocytopenia; however, phase 3 trials are ongoing. There is insufficient evidence supporting safety or efficacy of avatrombopag in this setting.[22]
- Although Tavalisse (fostamatinib) is being studied for the treatment of various cancers such as lymphomas, colon cancer, non-small cell lung cancer, and renal cell carcinoma, data is limited to phase 2 trials. There is currently insufficient evidence supporting its safety or efficacy in these settings.
- There is insufficient evidence to establish the safety and efficacy of Tavalisse (fostamatinib) for the treatment of rheumatoid arthritis. While preliminary evidence from phase II trials showed promise, larger phase 3 trials did not support the evidence for safety or efficacy of fostamatinib in rheumatoid arthritis.
- Nplate (romiplostim) has been studied in chemotherapy-induced thrombocytopenia, and is listed in the NCCN guidelines; however, the evidence for support of Nplate (romiplostim) used in this indication is lacking as it is based on poor quality trials that include case series, single center trials, small phase 2 trials and retrospective observational trials that were not randomized. To date, the only improvement shown has

been in the surrogate marker of increased platelet counts. No improvements in overall survival, progression free survival, relapse-rate or non-relapse mortality have been proven. Other proven treatment options currently exist such as platelet transfusions. Therefore, use of Nplate (romiplostim) for chemotherapy-induced thrombocytopenia is considered investigational. [24] [24] [23]

- Although romiplostim and Promacta(eltrombopag) have been studied in a variety of other conditions, including but not limited to the conditions listed below, there is insufficient evidence to support its use in those settings (limited to case reports, retrospective reviews, and Phase 2 trials). Larger, well-designed trials are needed to confirm preliminary results.
    * Acute thrombocytopenia.
    * Low platelet counts secondary to other conditions or diseases, including, but not limited to, cancer, HIV, hepatitis, and aplastic anemia. [3 5]
    * Thrombocytopenia secondary to myelodysplastic syndrome (MDS).
    * Drug-induced thrombocytopenia [e.g., chemotherapy, heparin (HIT)]. [25]
    * Thrombocytopenia secondary to disseminated intravascular coagulation, hemangiomas, or platelet loss (massive bleeding).
    * Thrombotic thrombocytopenic purpura/hemolytic-uremic syndrome (TTP/HUS).

Appendix A: – Child-Pugh Classification of Severity of Liver Disease

Child-Pugh Classification	**Points**		
A: well-compensated disease	5 to 6		
B: significant functional compromise	7 to 9		
C: decompensated disease	10 to 15		
	Points Assigned		
Parameter	**1**	**2**	**3**
Ascites	*Absent*	*Slight*	*Moderate*
Bilirubin (mg/dL)	*< 2*	*2 to 3*	*> 3*
Albumin (g/dL)	*> 3.5*	*2.8 to 3.5*	*< 2.8*
Prothrombin Time			
Seconds over control	*1 to 3*	*4 to 6*	*>6*
INR	*< 1.7*	*1.8 to 2.3*	*> 2.3*
Encephalopathy	*None*	*Grade 1 to 2*	*Grade 3 to 4*

Appendix B: American Society of Hematology – Criteria for the Diagnosis of Chronic Immune Thrombocytopenic Purpura: Diagnosis of Exclusion [3]
- History compatible with the diagnosis of chronic ITP - Normal physical examination findings except for signs of thrombocytopenia (petechiae, purpura, or mucosal bleeding); no adenopathy or splenomegaly - Complete blood count showing isolated thrombocytopenia with large platelets but no anemia unless bleeding or immune hemolysis is present - Bone marrow examination showing normal or increased numbers of megakaryocytes (not required for diagnosis unless unusual manifestation or age >60 yr.) - No clinical or laboratory evidence for other causes of thrombocytopenia

Appendix C: Immunosuppression Therapy for Aplastic Anemia [4]
- Antithymocyte globulin (horse or rabbit) (ATG) with cyclosporine - Anadrol (oxymetholone) - Campath (alemtuzumab)

Revision History

Revision Date	Revision Summary
6/20/2024	• Added new drug Alvaiz (eltrombopag) to policy; criteria align with criteria for Promacta (eltrombopag). • Updated reauthorization wording in Table 1 for clarity. No change to intent.
6/15/2023	No criteria changes with this annual update.
6/17/2022	Revised reauthorization criteria for ITP from 6 months to 12 months after initial 12-week reauthorization.
7/16/2021	Added coverage criteria for hematopoietic syndrome of acute radiation syndrome (HS-ARS), a newly FDA approved indication.
7/22/2020	• New policy (effective 10/1/2020). Replaces individual drug coverage policies for medications for thrombocytopenia (dru161, dru180, dru560, dru567). • From the individual drug coverage policies: - Step therapy requirements for chronic ITP were revised based on updated guidelines. Step therapy no longer requires splenectomy, IVIG, or rituximab. - Revised quantity limits to align with the maximum dosage for each product. - Updated investigational uses. - No change to intent of coverage for other indications (CLD pre-procedure, HCV-interferon-related, and aplastic anemia). - Revised quantity limits based on current labeling. - Added Continuation of Therapy criteria.

Drug names identified in this policy are the trademarks of their respective owners.

Medication Policy Manual

Policy No: dru649

Topic: Gaucher Disease Treatments

Date of Origin: October 1, 2020

- Cerdelga (eliglustat)
- Cerezyme (imiglucerase)
- Elelyso (taliglucerase alfa)
- miglustat (generic, Yargesa, Zavesca)
- VPRIV (velaglucerase alfa)

Committee Approval Date: June 20, 2024

Next Review Date: 2025

Effective Date: October 1, 2024

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Gaucher disease is an inherited disorder caused by deficiency of -beta-glucocerebrosidase. Over time, this deficiency causes a buildup of toxic substances in cells which impact the skeleton, bone marrow, spleen, liver, and less commonly the lungs. Cerezyme (imiglucerase), VPRIV (velaglucerase alfa), and Elelyso (taliglucerase alfa) are products that replace the deficient enzyme. Two oral medications, miglustat (generic, Yargesa, Zavesca) and Cerdelga (eliglustat), may also be used in the treatment of Gaucher disease. They act as substrate reduction therapy to reduces the synthesis of GL-1, which accumulates as the result of deficiency of the enzyme glucocerebrosidase.

Policy/Criteria

Most contracts require pre-authorization approval of Gaucher disease treatments prior to coverage.

I. Continuation of therapy (COT): Gaucher disease treatments may be considered medically necessary for COT when criteria A, B, or C, **AND** D **AND** E below are met:

A. For diagnoses NOT listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND there is documentation that the medication was covered by another health plan. Examples of documentation include the coverage approval letter from the previous health plan or paid claim.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

B. For diagnoses listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

C. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

AND

D. **For provider-administered medications only:** Site of care administration requirements are met. [refer to Pharmacy Services Medication Policy Manual, Site of Care Review, dru408].

AND

E. "Administration, Quantity Limitations, and Authorization Period" below applies, as well as "Investigational Uses" for combination therapy.

***Please note**: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Gaucher disease treatments may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) confirming that criterion A or B below are met:

A. A diagnosis of **type 1 Gaucher disease** when criteria 1 through 5 below are met:

1. The diagnosis is confirmed by one of the following (a or b):

a. Biochemical assay of glucocerebrosidase activity in white blood cells or skin fibroblasts is less than or equal to 30% of normal activity. (Note: laboratory normal may vary.)

OR

b. Genotyping revealing two pathogenic mutations of the glucocerebrosidase gene.

AND

2. Clinically significant symptoms of the disease are present, such as malnutrition, growth retardation, impaired psychomotor development, anemia, thrombocytopenia, bone disease, hepatomegaly, or splenomegaly.

AND

3. **Miglustat (generic, Yargesa, Zavesca) only:** Enzyme replacement therapy (ERT) is not a therapeutic option (e.g., due to allergy, hypersensitivity, or poor venous access).

AND

4. **Cerdelga (eliglustat) Only:** There is documentation that the member's CYP2D6 metabolizer status (see *Table 2*) is one of the following (a, b, or c):

a. CYP2D6 extensive metabolizer (EM).

OR

b. CYP2D6 intermediate metabolizer (IM).

OR

c. CYP2D6 poor metabolizer (PM).

AND

5. **Cerezyme (imiglucerase), Elelyso (taliglucerase alfa), and VPRIV (velaglucerase alfa) Only:** Site of care administration requirements are met [refer to Medication Policy Manual, Site of Care Review, dru408].

OR

B. **Miglustat (generic, Yargesa, Zavesca) only:** A diagnosis of Niemann-Pick Disease type C.

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers Cerezyme (imiglucerase), VPRIV (velaglucerase alfa), and Elelyso (taliglucerase alfa) coverable only under the medical benefit (as provider-administered medications).

B. Regence Pharmacy Services considers miglustat (generic, Yargesa, Zavesca) and Cerdelga (eliglustat) coverable only under the pharmacy benefit (as self-administered medications).

C. When pre-authorization is approved, Gaucher disease treatments will be authorized in the following quantities:

TABLE 1.

Product	Quantity Limit
- Cerezyme (imiglucerase) - VPRIV (velaglucerase alfa) - Elelyso (taliglucerase alfa)	• Up to 30 units/kg every 2 weeks (or other equivalent dose). • Doses up to 60 units/kg every 2 weeks may be approved when the patient meets high risk dosing guidelines in *Appendix 1* for adults or *Appendix 2* for children.
- Cerdelga (eliglustat)	• **Extensive metabolizers** or **intermediate metabolizers**: Up to 60 capsules per 30 days. • **Poor metabolizers**: Up to 30 capsules per 30 days.
- Miglustat (generic, Yargesa, Zavesca)	Up to 90 capsules per 30 days.

D. Continued Authorization:

1. Authorization **shall** be reviewed at least annually. Current up to date clinical documentation (including, but not limited to recent chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is still providing clinical benefit, such as disease stability or improvement. This may include, but is not limited to, hematologic indicis, reduction in spleen or liver volume, MRI of spine/femurs, normalized growth, reduced dependency on oxygen, quality of life, and/or plain films of skeleton.

2. **[For Cerezyme (imiglucerase), VPRIV (velaglucerase alfa), and Elelyso (taliglucerase alfa)]:** Doses up to 60 units/kg every 2 weeks may be approved when the physician indicates by chart notes that the patient has not responded to lower doses over a period of 6 months.

PLEASE NOTE: Clinical documentation of response to initial dosing, documentation of the need for dose escalation, as well as subsequent visits for response to dose escalation, should be submitted for review.

IV. Gaucher disease treatments are considered investigational when used in combination with each other.

V. Cerezyme (imiglucerase), VPRIV (velaglucerase alfa), and Elelyso (taliglucerase alfa) are considered investigational when used for all other conditions.

VI. Cerdelga (eliglustat) is considered investigational when used for all other conditions including, but not limited to:

- **A.** Type 1 Gaucher disease with CYP2D6 ultra-rapid metabolizer status or where CYP2D6 metabolizer status cannot be determined.

VII. Miglustat (generic, Yargesa, Zavesca) is considered investigational when used for all other conditions including, but not limited to:

- **A.** Combination use with Cerdelga (eliglustat).
- **B.** Cystic fibrosis.
- **C.** Fabry's Disease.
- **D.** Juvenile GM2 gangliosidosis.
- **E.** Mucopolysaccharidosis.
- **F.** Tay-Sachs disease.

Position Statement

Summary

- Cerezyme (imiglucerase), VPRIV (velaglucerase alfa), and Elelyso (taliglucerase alfa) work by replacing or supplementing the deficient enzyme (i.e., glucocerebrosidase) in order to allow excess material to be degraded.
- Cerdelga (eliglustat) and miglustat (generic, Yargesa, Zavesca) are considered a substrate reduction therapy (SRT) and work by minimizing the amount of GL1 that a cell makes.
- The intent of this policy is to allow coverage of Cerezyme (imiglucerase), VPRIV (velaglucerase alfa), Elelyso (taliglucerase alfa), Cerdelga (eliglustat), or miglustat (generic, Yargesa, Zavesca) for Gaucher disease type 1 in patients with a confirmed diagnosis, symptomatic disease, and other drug-specific criteria as described in the criteria. Miglustat (generic, Yargesa, Zavesca) may also be covered in patients Niemann-Pick Disease type C.
- Enzyme replacement therapy (ERT) with Cerezyme (imiglucerase), Elelyso (taliglucerase alfa), or VPRIV (velaglucerase alfa) is considered the preferred treatment option for all patients with type 1 Gaucher disease requiring pharmacologic treatment. [1,2]

- Treatment should be reserved for symptomatic children (including those with malnutrition, growth retardation, impaired psychomotor development, and/or fatigue), and for adults with symptomatic disease (e.g. platelet count < 60,000/mm^3, liver volume > 2.5 times normal size, spleen volume > 15 times normal size, radiological evidence of skeletal disease). [1]
- Treatment goals are elimination or improvement in symptoms, prevention of irreversible complications, and improvement in the overall health and quality of life. [1]
- ERT has not been shown to improve health outcomes in adult patients with Type 1 Gaucher disease without clinical signs or symptoms of the disease. In addition, ERT does not provide benefit in reversing or decreasing neurologic symptoms associated with Type 2 (acute neuronopathic) or Type 3 (chronic neuronopathic) Gaucher disease. [3]
- The diagnosis of Gaucher disease is usually confirmed by identifying reduced glucocerebrosidase activity in peripheral leukocytes. Targeted DNA analysis to detect the most common mutations is an effective method for confirming the diagnosis. [1]
- SRT with Cerdelga (eliglustat) or miglustat (generic, Yargesa, Zavesca) should not be used in neuronopathic (type 2 or type 3) Gaucher disease and is generally only appropriate for mild systemic disease. [4]
- The addition of miglustat (generic, Yargesa, Zavesca) to ERT has not been shown to provide a substantial benefit over ERT alone. [5]
- CYP enzymes play an important role in the metabolism of Cerdelga (eliglustat) since it is metabolized by the CYP2D6 protein. CYP2D6 genotyping is a simple blood test to determine who is eligible for treatment with Cerdelga (eliglustat) and how often the medication should be given.
- Patients who are CYP2D6 ultra-rapid metabolizers may not achieve adequate concentrations of Cerdelga (eliglustat) to achieve therapeutic effect and a specific dosage cannot be recommended for those patients whose CYP2D6 genotype cannot be determined (indeterminate metabolizers).
- A starting dose of 30 units/kg of body weight every other week is reasonable in the absence of high-risk disease. The mean ERT dose used for long-term therapy in the United States is approximately 30 units/kg every other week. [1,3,6,7]
- Cerezyme (imiglucerase) is approved for doses ranging from 2.5 units/kg three times per week up to 60 units/kg every other week. VPRIV (velaglucerase alfa) and Elelyso (taliglucerase alfa) have been shown to be equivalent to Cerezyme (imiglucerase) on a unit-for-unit basis, and patients switching from Cerezyme (imiglucerase) can be maintained on the same dose. [4,5,6,7,8]
- Cerdelga (eliglustat) is administered orally in doses of 84 mg once or twice daily depending on CYP2D6 metabolizer status and the presence of medications that inhibit the metabolism of eliglustat.
- The addition of miglustat (generic, Yargesa, Zavesca), an oral substrate reduction therapy (SRT) to ERT has not been shown to provide a substantial benefit over ERT alone. [5] However, miglustat (generic, Yargesa, Zavesca) may be an appropriate treatment when ERT is not an option (e.g., allergic hypersensitivity, lack of venous access, patients unwilling to receive intravenous infusions).

- There is no evidence evaluating the addition of Cerdelga (eliglustat) to any ERT product. It is unknown if the combination is safe and effective for Gaucher disease.

Clinical Efficacy

Enzyme Replacement Products

- All ERT products used in the treatment of Gaucher disease have demonstrated improvements in some disease-associated parameters (e.g., hemoglobin level, platelet count, spleen and liver volume). [5]
- In studies of patients with Type 1 Gaucher disease switched from Cerezyme (imiglucerase) to the same dose and frequency of either VPRIV (velaglucerase alfa) or Elelyso (taliglucerase alfa), control of disease parameters such as spleen and liver volume, hemoglobin concentration, and platelet counts were maintained. [5]
- ERT with Cerezyme (imiglucerase) improved quality of life in patients with skeletal manifestations of Gaucher disease as measured by The Short Form-36 Health Survey. [8]
- The U.S. Regional Coordinators of the International Collaborative Gaucher Group (ICGG), a panel of physicians who have extensive experience in the care of Gaucher patients, have made recommendations for therapy and dosing based on risk assessment for irreversible morbid complications (see Appendix 1 and 2). [3,6]
    * Initial doses of ERT of 30-60 units/kg of body weight every other week are considered safe and effective in demonstrating improvements in hepatosplenomegaly, anemia, and thrombocytopenia.
    * Dose adjustments should be based on the patient's initial risk and achievement of therapeutic goals based on individual patient characteristics.
    * The time required to achieve therapeutic goals varies by organ system, but usually requires at least 12 to 36 months.
- The ICGG U.S. Regional Coordinators recommend that all children with Gaucher disease be treated with ERT due to high risk for irreversible, morbid complications. [6,7]
    * Diagnosis of Gaucher disease in the first and second decades of life is indicative of a rapidly progressive course.
    * Early intervention is necessary for these children, during the time when the skeleton is immature, to enable them to attain their peak skeletal mass by early adulthood.

Cerdelga (eliglustat) in Gaucher Disease

- The evidence of efficacy for Cerdelga (eliglustat) is of low quality and is based on two randomized controlled trials.
- Cerdelga (eliglustat) was evaluated versus placebo in 40 treatment naïve, type 1 patients (defined as no SRT within the past six months and no ERT within the last nine months) for percent change in spleen volume from baseline to nine months. [9]
    * At nine months spleen volume had decreased by 27.8% in the Cerdelga (eliglustat) groups versus a 2.3% increase in the placebo group (difference -30.0%; 95% confidence interval: -36.8, -23.2; p-value < 0.0001).

    * This trial was appraised as low confidence due primarily to potential confounding and uncertain generalizability of the results as some patients were treated with a dose of Cerdelga (eliglustat) that is not currently FDA-approved.

- A comparative study evaluated Cerdelga (eliglustat) versus Cerezyme (imiglucerase) in 159 type 1 patients currently receiving ERT. [10]
    * The primary endpoint assessed was a composite of stability in Hgb level (defined as < 1.5 g/dL decrease), platelet count (defined as < 25% decrease), and liver and spleen volume (defined as < 20% and < 25% increase, respectively).
    * At 12 months, 84.8% and 93.6% of patients met the primary endpoint in the Cerdelga (eliglustat) and Cerezyme (imiglucerase) groups, respectively, which met the pre-specified definition for non-inferiority.

miglustat (generic, Yargesa, Zavesca) in Gaucher Disease

- Miglustat (generic, Yargesa, Zavesca) has only been studied in patients with mild-to-moderate symptomatic Gaucher disease. It has not been evaluated for efficacy in patients with severe disease (such as patients with skeletal manifestations, hemoglobin concentrations less than 9 mg/L, and/or platelet counts less than 50 x 10^9/L). [1]
- Two prospective, open-label, non-comparative trials described the safety and efficacy of miglustat (generic, Yargesa, Zavesca) in patients with mild-to-moderate type 1 Gaucher disease. Over a period of 12 to 24 months, miglustat (generic, Yargesa, Zavesca) therapy resulted in improvement in liver and spleen volume, increases in hemoglobin, and stable or improved platelet counts and bone involvement. [11,12]

miglustat (generic, Yargesa, Zavesca) in Niemann Pick Disease Type C

- There is evidence which suggests that miglustat (generic, Yargesa, Zavesca) in doses of 200 mg three times daily improves clinical markers for Niemann-Pick disease type C (NPC) and stabilizes neurological disease progression. Although the small numbers of patients studied and concomitant medications make the results uncertain, patients with NPC have few other treatment options. [13-15]

Investigational Uses

- A small study evaluated the use of miglustat (generic, Yargesa, Zavesca) in the management of five patients with juvenile GM2 gangliosidosis. There was no clear benefit observed, but the study was small and did not include a comparator. Larger, well-designed randomized controlled trials are needed to establish the safety and efficacy of miglustat (generic, Yargesa, Zavesca) in this condition. [16]
- One small, randomized, placebo-controlled, study evaluated the use of miglustat (generic, Yargesa, Zavesca) in patients with Fabry's disease. After 6 months of treatment, miglustat (generic, Yargesa, Zavesca) did not significantly reduce the number of globotriaosylceramide inclusions per kidney interstitial capillary compared to placebo.
- One single-center, placebo-controlled study evaluated the use of miglustat (generic, Yargesa, Zavesca) for improvement in Vineland Adaptive Behavior Scales in patients with mucopolysaccharidosis type III. No improvement or stabilization in behavior was seen in the miglustat (generic, Yargesa, Zavesca) group. [17]

- A small study evaluated the use of miglustat (generic, Yargesa, Zavesca) in the management of late-onset Tay-Sachs disease. Though the study had flaws that make the results uncertain, the study authors concluded that miglustat (generic, Yargesa, Zavesca) did not lead to measurable benefits. [18]
- A small, single-center, double-blind, placebo-controlled study evaluated the use of miglustat (generic, Yargesa, Zavesca) in 11 patients with cystic fibrosis. No statistically significant changes in total chloride secretion, sweat chloride value, or FEV1 were detected. Further study is required to assess any potential benefit of miglustat (generic, Yargesa, Zavesca) in the condition. [19]

Dosing [20]

- Dose adjustments for ERT are made on an individual basis and should consider patient-specific factors.
    * Increases in ERT dose may be necessary to achieve therapeutic goals or for relapse following dose reduction. An increased dose may also be indicated if visceromegaly, anemia, thrombocytopenia, and biomarkers fail to improve after six months of therapy. However, an increased dose is unlikely to reverse certain types of pathology (e.g., osteonecrosis and fibrosis of the liver, spleen, or lung)
- The recommended dosage of miglustat (generic, Yargesa, Zavesca) is 100 mg three times daily. The dose should be reduced in patients with tremor, diarrhea, or renal impairment.
- The recommended dosage of Cerdelga (eliglustat) is 84 mg twice daily in CYP2D6 extensive metabolizers and intermediate metabolizers and 84 mg once daily in CYP2D6 poor metabolizers.
    * Drugs that inhibit CYP2D6 and CYP3A pathways may significantly increase exposure to Cerdelga (eliglustat) and result in cardiac arrhythmias.
    * Co-administration of Cerdelga (eliglustat) with other CYP2D6 and CYP3A inhibitors may require dosage adjustment depending on the CYP2D6 metabolizer status to reduce the risk of potential significant adverse reactions.
    * The following table includes dosing recommendations when Cerdelga (eliglustat) is co-administered with other CYP2D6 and CYP3A inhibitors:

TABLE 2:

CYP450 Inhibitors	Recommended Cerdelga (eliglustat) dosage, by CYP2D6 Status			
	Ultra-Rapid Metabolizer (URM)	Extensive Metabolizer (EM)	Intermediate metabolizer (IM)	Poor metabolizer (PM)
Strong or moderate CYP2D6 inhibitors concomitantly with strong or moderate CYP3A inhibitors	Not indicated	Contraindicated	Contraindicated	N/A
Strong CYP2D6 inhibitors	Not indicated	84 mg once daily	84 mg once daily	N/A
Moderate CYP2D6 inhibitors	Not indicated	84 mg once daily	84 mg once daily	N/A
Strong CYP3A4 inhibitors	Not indicated	84 mg once daily	Contraindicated	Contraindicated
Moderate CYP3A inhibitors	Not indicated	84 mg once daily	Not recommended	Not recommended
Weak CYP3A inhibitors	Not indicated	N/A	N/A	Not recommended

Appendix 1: Adults with Type 1 Gaucher Disease: Risk Assessment and Dosage Recommendations [6]

Initial Dose	Highest Risk: 60 units/kg every 2 weeks	Lowest Risk: 30 units/kg or less every 2 weeks
Risk Criteria	At least one or more of the following: - **Symptomatic skeletal disease:** * Moderate to severe osteopenia defined as reduced bone mineral density (BMD) of > 1 S.D. below the mean (which predicts a relative fracture risk of 2.5 using the World Health Organization criteria). * Chronic bone pain * Bone crises * Avascular necrosis * Pathological fractures * Joint replacement(s) - **Cardiopulmonary disease, including pulmonary hypertension** - **Hematologic symptoms** * Platelet count ≤ 60,000 mm^3 or documented abnormal bleeding episodes * Symptomatic anemia or hemoglobin ≤ 8.0 g/dL * Transfusion dependency - **Significant liver disease** * Severe hepatomegaly defined as liver volume ≥ to 2.5 x norm * Infarcts * Portal hypertension * Hepatitis - **Significant splenic disease** * Severe splenomegaly defined as spleen volume > 15 x normal * Infarcts * Significant renal disease such as evidence of bilaterally reduced (< 8.5 cm) kidney size by imaging studies	- Normal liver, cardiac, lung, and renal function - Skeletal disease limited to mild osteopenia (low bone density) and Erlenmeyer flask deformity - Hemoglobin as follows: **Males: ≤** 12.5 g/dL and > 11.5 g/dL; **Females: ≤** 11.5 g/dL and > 10.5 g/dL; or overall < 2.0 g/dL below lower limit of normal for age and sex - Platelet count ≤ 120,000 per mm^3 and > 60,000 mm^3 on three determinations - Liver volume < 2.5 x normal - Spleen volume < 15 x normal

Appendix 2: Children (less than 18 years) with Type 1 Gaucher Disease: Risk Assessment and Dosage Recommendations [6]

Initial Dose	Highest Risk: 60 units/kg every 2 weeks	Lowest Risk: < 60 units/kg every 2 weeks
Risk Criteria	One or more of the following in addition to physical signs: - Symptomatic disease (manifestations of abdominal/bone pain, fatigue, exertional limitations, weakness, cachexia) - Growth failure - Evidence of skeletal involvement including Erlenmeyer flask deformity - Platelet count < 60,000 mm3 and/or documented abnormal bleeding episode(s) - Hemoglobin < 2.0 g/dL below lower limit of normal for age and sex - Impaired quality of life	Children with relevant physical signs without additional criteria described for highest risk patients.

Revision History

Revision Date	Revision Summary
6/20/2024	• Added Elelyso (taliglucerase alfa) back into site of care program. • Updated cross references. No change to intent with update.
12/7/2023	Added Yargesa, a new generic form of miglustat to policy. No changes to criteria.
6/15/2023	No criteria changes with this annual update.
12/9/2022	Removed Elelyso (taliglucerase alfa) from site of care requirements (effective 1/15/2023).
6/17/2022	Updated reauthorization language to include current/recent clinical documentation.
7/16/2021	• Updated continuation of therapy (COT) language, as well as criteria for dose escalation, such that it applies to COT. • Clarified criteria for Niemann Pick Type C.
10/28/2020	Added back in quantity limit language to continued authorization section for Cerezyme (imiglucerase), VPRIV (velaglucerase alfa), and Elelyso (taliglucerase alfa). This was mistakenly left out when combining policies. No change to intent of criteria.
7/22/2020	New combination policy (effective 10/1/2020). Replaces individual drug coverage policies for Gaucher Disease (dru002, dru109, and dru370).

Drug names identified in this policy are the trademarks of their respective owners.

Medication Policy Manual

Policy No: dru652

Topic: Monjuvi, tafasitamab-cxix

Date of Origin: April 1, 2021

Committee Approval Date: March 6, 2025

Next Review Date: 2026

Effective Date: May 1, 2025

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Monjuvi (tafasitamab-cxix) is a monoclonal antibody that binds to the CD19 antigen on B-lymphocytes and on several B-cell cancers, including diffuse large B-cell lymphoma (DLBCL), which ultimately causes cell death. It is given via intravenous infusion and is indicated for patients with relapsed or refractory DLBCL who are not eligible for an autologous stem cell transplant (SCT). Monjuvi (tafasitamab-cxix) is given in combination with oral Revlimid (lenalidomide).

Policy/Criteria

Most contracts require pre-authorization approval of Monjuvi (tafasitamab-cxix) prior to coverage.

I. Continuation of therapy (COT): Monjuvi (tafasitamab-cxix) may be considered medically necessary for COT when criterion A, B, or C below is met.

A. For diagnoses NOT listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND there is documentation that the medication was covered by another health plan. Examples of documentation include the coverage approval letter from the previous health plan or paid claim.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

B. For diagnoses listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

C. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

Please note*: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Monjuvi (tafasitamab-cxix) may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) that criteria A through E below are met.

A. A diagnosis of **relapsed and/or refractory diffuse large B-cell lymphoma (DLBCL) not otherwise specified (NOS)** [see *Appendix 1*].

AND

B. There has been disease progression on or after at least one prior anti-CD20-based regimen (e.g., rituximab).

AND

C. The patient is not a candidate for an autologous stem cell transplant (SCT).

AND

D. Monjuvi (tafasitamab-cxix) will be initiated in combination with Revlimid (lenalidomide).

AND

E. There has been no prior use of Monjuvi (tafasitamab-cxix) or Revlimid (lenalidomide).

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers Monjuvi (tafasitamab-cxix) coverable only under the medical benefit (as a provider-administered medication).

B. When pre-authorization is approved, Monjuvi (tafasitamab-cxix) will be authorized in doses up to 12 mg/kg in quantities not to exceed the following number of infusions per 28-day cycle: five infusions in cycle 1, four infusions each in cycles 2 and 3, then two infusions per cycle thereafter, until disease progression.

C. Authorization **may** be reviewed at least annually. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, such as disease stability or improvement.

IV. Monjuvi (tafasitamab-cxix) is considered investigational when used for all other conditions.

Position Statement

Summary

- Monjuvi (tafasitamab-cxix) is an intravenously administered monoclonal antibody directed against the CD19 antigen on B-lymphocytes which is present on some B-cell malignancies, including diffuse large B-cell lymphoma (DLBCL). In binding to these cells, Monjuvi (tafasitamab-cxix) ultimately causes cell death.
- Monjuvi (tafasitamab-cxix) is indicated in combination with Revlimid (lenalidomide) for the treatment of relapsed or refractory DLBCL, not otherwise specified (NOS) for patients who are not a candidate for an autologous stem cell transplant (SCT) and whose disease has progressed after at least one prior anti-CD20-based (e.g., rituximab) regimen.
- The intent of this policy is to allow coverage of Monjuvi (tafasitamab-cxix) for relapsed and refractory DLBCL NOS after progression of disease on standard front-line therapy with a rituximab-based chemotherapy regimen when patients are not eligible for an autologous stem cell transplant as detailed in the coverage criteria.
- The efficacy of Monjuvi (tafasitamab-cxix) in DLBCL is based on a low quality, open-label, single-arm, observational study the evaluated overall response rate (ORR) the primary endpoint. ORR is a surrogate endpoint that has <u>not</u> been shown to reliably predict clinically meaningful benefit such as improved survival or quality of life. Patients in the pivotal trial received concomitant Revlimid (lenalidomide) for up to 12 cycles.

- It is not known how Monjuvi (tafasitamab-cxix) compares with any other salvage DLBCL therapy.
- The most commonly reported serious adverse effects (AEs) with Monjuvi (tafasitamab-cxix) plus Revlimid (lenalidomide) included neutropenia, thrombocytopenia, anemia, pneumonia, low serum potassium, and pulmonary embolism. Approximately one in four patients stopped either one or both drugs due to an AE.
- The National Comprehensive Cancer Network (NCCN) B-cell lymphoma guideline lists Monjuvi (tafasitamab-cxix) plus Revlimid (lenalidomide) among several salvage therapy options for DLBCL NOS.
- Monjuvi (tafasitamab-cxix) is administered intravenously in a dose of 12 mg/kg on a 28-day cycle. It is given at least weekly in the first three cycles, and then every two weeks thereafter, starting with cycle 4. It is given until disease progression. Concomitant Revlimid (lenalidomide) is given daily for a maximum of 12 cycles.

Regence Pharmacy Services performs independent analyses of oncology medication evidence, to establish coverability per the contracts with the health plan.

- Most contracts define coverability based on established clinical benefit in published, peer-reviewed literature, along with consideration of regulatory status.
- FDA approval does not in itself establish medical necessity, as unpublished, low-quality evidence, including exploratory analyses and unvalidated surrogate endpoints, may be used as the basis of approval. Regulatory approval may or may not reflect clinical benefit relative to standard of care and the recommendations of expert clinical advisors such as the Oncologic Drugs Advisory Committee (ODAC). FDA approvals generally do not consider cost compared to established therapies, or value to members.
- Likewise, NCCN clinical practice guidelines assignment of a recommendation (category 1, 2a, or 2b) does not necessarily establish medically necessity. NCCN recommendations are inconsistently supported by published, peer-reviewed literature and do not uniformly consider value of new therapies relative to existing potentially higher-value treatment options, considering effectiveness, safety, and cost.
- Medication coverage criteria are developed based on the 'medical necessity' assessment, as described above.

Regence Pharmacy Services analysis and coverage policy may differ from FDA labeled indication and/or NCCN clinical practice guidelines.

Clinical Efficacy

The efficacy of Monjuvi (tafasitamab-cxix) is based on a low quality, open-label (non-blinded), single-arm (no comparator) trial that evaluated tumor response as a surrogate endpoint in patients with relapsed or refractory DLBCL NOS. [1,2] This was an FDA accelerated approval meaning that clinical benefit has not been confirmed.

- Patients enrolled in the study had a confirmed diagnosis of DBLCL NOS. This included a subset of patients that had transformed indolent lymphoma with a subsequent DLBCL relapse.

- All patients had a disease that had relapsed after, or were refractory to at least one, but no more than three systemic regimes for their DLBCL. At least one prior therapy must have included an anti-CD20-based (e.g., rituximab) chemotherapy regimen.
- Additionally, patients were not candidates for high-dose chemotherapy with a subsequent autologous stem cell transplant (SCT) based on age, other comorbidities, or inability to successfully collect peripheral blood stem cells.
- There was a 55% overall response rate (partial response plus complete remissions). The complete remission rate was 37% based on the FDA analysis of the data set (the manufacturer analysis reported higher rates).
- Neither of these medications has been shown to improve any clinically important outcome in DLBCL when used alone. A well-conducted randomized controlled trial is needed to establish whether the combination of Monjuvi (tafasitamab-cxix) and Revlimid (lenalidomide) is superior at improving clinical outcomes relative to other therapies or either agent alone.

Guidelines [3]

- The NCCN B-cell lymphoma guideline lists Monjuvi (tafasitamab-cxix) plus Revlimid (lenalidomide) among several category 2A salvage regimens for DLBCL. This recommendation applies to patients who are not candidates for transplant.

Investigational Uses

- There is no published evidence for Monjuvi (tafasitamab-cxix) outside of the relapsed or refractory DLBCL treatment setting.
- The clinicaltrials.gov database lists several planned or ongoing studies that will evaluate Monjuvi (tafasitamab-cxix) in combination with medications other than Revlimid (lenalidomide); [4] however, there is currently no information that establishes the safety or efficacy of these combinations.

Safety [2,5]

- The most commonly reported treatment-emergent adverse effects (AEs) in the pivotal Monjuvi (tafasitamab-cxix) trial included bone marrow suppression (neutropenia, anemia, and thrombocytopenia), pneumonia, hypokalemia, and pulmonary embolism.
- Deaths due to an AE occurred in 4.9% of the study population within 60 days of the last dose of Monjuvi (tafasitamab-cxix).
- Discontinuation of study drug (either drug alone, or both) occurred in about one in four patients in the trial and 70% or patients required dose modifications (either drug alone, or both) suggesting tolerability issues with this regimen in a fair number of patients.

Dosing [5]

- Monjuvi (tafasitamab-cxix) is given intravenously at a dose of 12 mg/kg in 28-day cycles on the following schedule:
    * Cycle 1: Days 1, 4, 8, 15, and 22
    * Cycles 2 & 3: Days 1, 8, 15, and 22
    * Cycle 4 and beyond: Days 1 and 15

- Revlimid (lenalidomide) is initiated with Monjuvi (tafasitamab-cxix) on the following schedule:
    * 25 mg (one capsule) orally daily on Days 1 through 21 of each 28-day cycle for a maximum of 12 cycles.

Appendix 1: DLBCL, not otherwise specified (NOS)
• Defined in the World Health Organization (WHO) classification of mature lymphoid neoplasms • Diagnosis of exclusion • ICD10 codes(s): C83.30 to C83.39, depending on site of tumor

Revision History

Revision Date	Revision Summary
3/6/2025	No changes to coverage criteria with this annual review.
3/21/2024	No criteria changes with this annual review.
3/16/2023	No changes to coverage criteria with this annual update.
3/18/2022	• No changes to coverage criteria with this annual update • Policy language updated so standard template language (no change to intent).
1/20/2021	New policy. Limits coverage of Monjuvi (tafasitamab-cxix) to patients with relapsed or refractory DLBCL NOS when used in combination with lenalidomide in patients who are not candidates for a stem cell transplant (SCT) and whose disease has progressed after at least one prior anti-CD20-based regimen. Patients who have had progression of disease on Monjuvi (tafasitamab-cxix) and/or Revlimid (lenalidomide) are not eligible for coverage as retreatment has not been shown to be effective.

Medication Policy Manual **Policy No:** dru657

Topic: Uplizna, inebilizumab-cdon **Date of Origin:** January 1, 2021

Committee Approval Date: September 14, 2023 **Next Review Date:** 2024

Effective Date: December 1, 2023

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Uplizna (inebilizumab-cdon) is an intravenous medication (monoclonal antibody) for neuromyelitis optica spectrum disorder (NMOSD), a rare inflammatory condition.

Policy/Criteria

Most contracts require pre-authorization approval of Uplizna (inebilizumab-cdon) prior to coverage.

I. Continuation of therapy (COT): Uplizna (inebilizumab-cdon) may be considered medically necessary for COT when criteria A, B, or C, **AND** D **AND** E below are met:

A. For diagnoses NOT listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND there is documentation that the medication was covered by another health plan. Examples of documentation include the coverage approval letter from the previous health plan or paid claim.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

B. For diagnoses listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

C. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

AND

D. Site of care administration requirements are met [refer to Pharmacy Services Medication Policy Manual, Site of Care Review, dru408].

AND

E. "Administration, Quantity Limitations, and Authorization Period" below applies, as well as "Investigational Uses" for combination therapy.

Please note*: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Uplizna (inebilizumab-cdon) may be considered medically necessary when clinical documentation (including, but not limited to chart notes), that criteria A through D below are met.

A. Site of care administration requirements are met [refer to Pharmacy Services Medication Policy Manual, Site of Care Review, dru408].

AND

B. A diagnosis of neuromyelitis optica spectrum disorder (NMOSD) has been established by or in consultation with a neurologist.

AND

C. Documentation of a positive serologic test for aquaporin-4 immunoglobulin (AQP4-IgG) antibodies.

AND

D. Rituximab has been ineffective as documented by symptom relapse after completion of induction (at least one month after the first dose of rituximab) or not tolerated, unless there is a documented medical contraindication to use.

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers Uplizna (inebilizumab) coverable only under the medical benefit (as a provider-administered medication).

B. When pre-authorization is approved, Uplizna (inebilizumab-cdon) will be authorized in quantities as follows:

Authorization Period	**Quantity Limit**
Initial Authorization	A maximum of 9 vials (100 mg/vial) in a 48-week period based on 300 mg on week 0, 2, then 300 mg every 24 weeks (starting 24 weeks from the first infusion).
Continued Authorization	A maximum of 6 vials (100 mg/vial) per 48 weeks, based on a max dose of 300 mg every 24 weeks.

C. Authorization shall be reviewed at least annually. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit including disease stability or improvement, relative to baseline symptoms. Specifically, there must be a reduction of clinical relapse OR provider attestation has been received that the patient is continuing to have clinical benefit (stability or improvement) and clinical therapy is medically necessary.

IV. Investigational Uses:

A. Uplizna (inebilizumab-cdon) is considered investigational when used for all other conditions.

B. The use of Uplizna (inebilizumab-cdon) in combination with other targeted therapies for NMOSD, including, but not limited to, anti-CD20 therapy [rituximab product], anti-CD19 therapy [Enspryng (satralizumab-mwge)], anti-IL6 therapy [Actemra (tocilizumab)], or complement inhibitors [such as Soliris (eculizumab).

C. The use Uplizna (inebilizumab-cdon) in doses/ frequencies exceeding limits in the FDA-approved prescribing information.

Position Statement

Summary

- Uplizna (inebilizumab-cdon) is a monoclonal antibody that binds to CD19. [1]
- The intent of the policy is to allow for coverage of Uplizna (inebilizumab-cdon) for the specific diagnosis for which it has been studied (as outlined in the coverage criteria), when managed by a specialist, encourage the use of lower cost therapy (when appropriate), and limit coverage to doses studied and shown to be safe and effective in clinical trials.
- Uplizna (inebilizumab-cdon) has been studied for use in neuromyelitis optica spectrum disorder (NMOSD), also known as Devic disease or neuromyelitis optica (NMO). It is a chronic demyelinating disease of the central nervous system dominated by inflammation of the optic nerve and spinal cord and may often be misdiagnosed as multiple sclerosis (MS). [2-5]
    * Stepwise deterioration due to disease relapse/attack causes an accumulation of disability. Hallmark features of NMOSD include acute nerve inflammation that leads to severe visual loss, limb weakness, sensory loss, pain, paralysis, bladder dysfunction, and intractable nausea/vomiting and hiccups.
    * Patients with NMOSD are treated for acute episodes/ relapse with steroids. Plasma exchange (plasmapheresis, PLEX) is used acutely for incomplete response to steroids.
    * Immunosuppressive therapy (IST; corticosteroids, azathioprine, mycophenolate mofetil, or rituximab) is therapy to reduce the frequency of relapse (maintenance therapy).
- Not all patients with NMOSD test positive for AQP4-IgG. Only a small percentage of patients in the clinical trial of Uplizna (inebilizumab-cdon) in NMOSD were AQP4-IgG negative (n=17, 7%). Due to the small sample size, the efficacy and safety in AQP4 seronegative patients is unknown.
- There is limited clinical experience for the use of Uplizna (inebilizumab-cdon) and the long-term safety and efficacy is unknown.

- Uplizna (inebilizumab-cdon) has not been directly compared to any other IST for NMOSD. However, use of rituximab for NMOSD is supported by clinical evidence for reducing relapse rate [including a single randomized controlled trial (RCT)[6]], is recommended by guidelines, and has years of experience in clinical practice. [2,5,7-9] Therefore, Uplizna (inebilizumab-cdon) is coverable only when rituximab is ineffective or not a treatment option.
- The evidence for Uplizna (inebilizumab-cdon) in NMOSD is limited to a single phase 3 trial. Although Uplizna (inebilizumab-cdon) reduced the frequency of NMOSD relapse compared to placebo, its effect on quality of life (QoL) and disability are unknown.
- The safety and efficacy of Uplizna (inebilizumab-cdon) in combination with other targeted therapies for NMOSD, including rituximab, Soliris (eculizumab), and Enspryng (satralizumab-mwge) have not been established. Uplizna (inebilizumab-cdon) may be covered for up to 300 mg on days 0 and 14 (initial) and every six months thereafter starting 6 months from the first infusion (maintenance), the dose studied in clinical trials. The safety and effectiveness of higher doses have not been established.
- The safety and effectiveness of Uplizna (inebilizumab-cdon) in conditions other than NMOSD have not been established.

Clinical Efficacy[10-12]

- The evidence for Uplizna (inebilizumab-cdon) in NMOSD is limited to one phase 2/3, time-to-event trial that showed that Uplizna (inebilizumab-cdon) reduced the frequency of first adjudicated relapsed compared to placebo (N-Momentum)[13].
    * Uplizna (inebilizumab-cdon) monotherapy was compared to placebo.
    * Patients enrolled in the trial had at least one relapse within the year prior to screening or at least two relapses within the two years prior to screening and had a median Expanded Disability Status Scale (EDSS) of 4.
    * The primary endpoint of first adjudicated relapse occurred in 11% in the Uplizna (inebilizumab-cdon) arm versus 42% of the placebo arm, HR 0.23 [95% CI 0.12 to 0.42].
    * The sample size of patients who were aquaporin 4 (AQP4) seronegative (n=17) was too small to determine efficacy in AQP4 seronegative patients. In AQP4 seronegative patients, three of the 13 patients who received Uplizna (inebilizumab-cdon) had a relapse versus none of the four in the placebo arm.
- Guidelines recommend treatment of acute episodes/ relapse and use of maintenance immunosuppressive therapy (IST), to reduce the frequency of relapse. [2,5,8,9,14]
    * Treatment of Relapse: Patients are usually treated with 1 g of intravenous (IV) methylprednisolone (IVMP) for 3–5 days. Relapses that do not respond to IV steroids may benefit from five to seven plasma exchange (PLEX) procedures over a 2-week period. Oral prednisone (1 mg/kg) for 1–6 months can be initiated after IVMP or PLEX to ensure a prolonged effect on inflammation until steroid sparing immunosuppressants take effect.
    * Maintenance Therapy: A variety of immunosuppressive therapy (IST) are regarded by many clinicians as first-line therapy based on primarily observational or single-arm data. The most widely prescribed treatments include:

corticosteroids, azathioprine, mycophenolate mofetil, and rituximab. The use of azathioprine and mycophenolate mofetil has fallen out of favor due to lack of efficacy and side effect profile. However, if given, they are often prescribed with low doses of corticosteroids. Rituximab has evidence for reduction of relapse rates and disability in neuromyelitis optica, based on one RCT (n=68)[6] and dozens of case series, including in patients who fail oral immunosuppressive treatments. [7-9,15-19] Paradoxical relapses may occur shortly after initiation of rituximab therapy so it is important to allow enough time for the rituximab to become effective. Complete suppression of CD20+B lymphocytes takes one month. [17]

Investigational Uses

- There are no published clinical trials evaluating the safety or efficacy of Uplizna (inebilizumab-cdon) for the treatment of other conditions not covered in this policy, or in combination with other targeted therapies for NMOSD, including, but not limited to, anti-CD20 therapy [rituximab product], anti-CD19 therapy [Enspryng (satralizumab-mwge)], anti-IL6 therapy [Actemra (tocilizumab)], or complement inhibitors [Soliris (eculizumab)].
- The safety and efficacy of Uplizna (inebilizumab-cdon) in doses exceeding FDA-label have not been studied in clinical trials.

Safety

- There is no reliable evidence to conclude that Uplizna (inebilizumab-cdon) is safer than alternatives used in NMOSD, including rituximab products.
- The recommended dose of Uplizna (inebilizumab-cdon) is 3000 mg at day 0 and 14, followed by 300 mg every 6 months as maintenance. The safety and effectiveness of higher doses have not been established.
- Uplizna (inebilizumab-cdon) is not considered a self-injectable medication for safety reasons; therefore, it is only coverable under the medical benefit. Medical observation for hypersensitivity reactions is necessary following Uplizna (inebilizumab-cdon) administration.

Medication Policy Manual | **Policy No:** dru658

Topic: Zepzelca, lurbinectedin | **Date of Origin:** November 15, 2020

Committee Approval Date: December 7, 2023 | **Next Review Date:** 2024

Effective Date: March 1, 2024

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Zepzelca (lurbinectedin) is an intravenous (IV) medication use for the treatment of metastatic small cell lung cancer (SCLC). It is used for patients with disease despite use of previous therapies.

Policy/Criteria

Most contracts require pre-authorization approval of Zepzelca (lurbinectedin) prior to coverage.

I. Continuation of therapy (COT): Zepzelca (lurbinectedin) may be considered medically necessary for COT when criterion A, B, or C below is met:

A. For diagnoses NOT listed in the coverage criteria below, criteria 1 and 2 below must be met:

1. The patient was established on therapy prior to current health plan membership AND there is documentation that the medication was covered by another health plan. Examples of documentation include the coverage approval letter from the previous health plan or paid claim.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

B. For diagnoses listed in the coverage criteria below, criteria 1 and 2 below must be met:

1. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

C. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

Please note*: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Zepzelca (lurbinectedin) may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) confirming that criteria A through C below are met.

A. A diagnosis of **metastatic small cell lung cancer** (SCLC).

AND

B. There has been disease progression on or after a cisplatin- or carboplatin-containing regimen.

AND

C. Zepzelca (lurbinectedin) will be used as a monotherapy.

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers Zepzelca (lurbinectedin) coverable only under the medical benefit (as a provider-administered medication).

B. When pre-authorization is approved, Zepzelca (lurbinectedin) may be authorized in quantities of up to 3.2 mg/m^2 IV every 21 days until disease progression.

C. Authorization may be reviewed at least annually. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, such as disease stability or improvement.

IV. Zepzelca (lurbinectedin) is considered investigational when used for all other conditions.

Position Statement

Summary

- The intent of this policy is to allow coverage of Zepzelca (lurbinectedin) in the clinical setting described above (in the coverage criteria), where it has been evaluated for efficacy, up to the dose shown to be safe in clinical trials.
- Zepzelca (lurbinectedin) is indicated for metastatic small cell lung cancer as a single agent after progression of disease on or after platinum-based chemotherapy.
- Efficacy was based on a small, single-arm trial (poor quality evidence) that evaluated tumor response as an endpoint. Zepzelca (lurbinectedin) was administered as monotherapy.
    * Approval in this setting is conditional (FDA Accelerated approval). Additional studies are needed to establish clinical benefit Indications. [1]
- The NCCN small cell lung cancer guideline lists Zepzelca (lurbinectedin) as a category 2A recommendation for subsequent treatment of metastatic SCLC along with many other chemotherapy regimens. [2]
- Zepzelca (lurbinectedin) may be covered for up to 3.2 mg/m^2 every 21 days, the dose studied in clinical trials. The safety and effectiveness of higher doses have not been established. [1]
- The safety and effectiveness of Zepzelca (lurbinectedin) in conditions other than metastatic small cell lung cancer have not been established. Zepzelca (lurbinectedin) is currently being evaluated for multiple other solid tumors, however the evidence is preliminary.

Regence Pharmacy Services performs independent analyses of oncology medication evidence, to establish coverability per the contracts with the health plan.

- Most contracts define coverability based on established clinical benefit in published, peer-reviewed literature, along with consideration of regulatory status.
- FDA approval does not in itself establish medical necessity, as unpublished, low-quality evidence, including exploratory analyses and unvalidated surrogate endpoints, may be

used as the basis of approval. Regulatory approval may or may not reflect clinical benefit relative to standard of care and the recommendations of expert clinical advisors such as the Oncologic Drugs Advisory Committee (ODAC). FDA approvals generally do not consider cost compared to established therapies, or value to members.

- Likewise, NCCN clinical practice guidelines assignment of a recommendation (category 1, 2a, or 2b) does not necessarily establish medically necessity. NCCN recommendations are inconsistently supported by published, peer-reviewed literature and do not uniformly consider value of new therapies relative to existing potentially higher-value treatment options, considering effectiveness, safety, and cost.
- Medication coverage criteria are developed based on the 'medical necessity' assessment, as described above.

Regence Pharmacy Services analysis and coverage policy may differ from FDA labeled indication and/or NCCN clinical practice guidelines.

Clinical Efficacy [3]

- The evidence for Zepzelca (lurbinectedin) is based on a single, open-label, single-arm trial in patients with SCLC who had disease progression on or after platinum-based chemotherapy. Based on the poor quality of the evidence, Zepzelca (lurbinectedin) was approved via the FDA Accelerated approval pathway. Confirmatory trials are needed to establish that there is clinical benefit with this therapy.
- Zepzelca (lurbinectedin) was given as monotherapy until disease progression or unacceptable toxicity.
- Tumor response was evaluated as the primary endpoint; however, tumor response in not a validated surrogate for any clinically relevant endpoint in SCLC.
- A phase 3, randomized controlled trial (RCT) [ATLANTIS study] that was intended to be the confirmatory trial for the Accelerated approval of Zepzelca (lurbinectedin) recently failed to achieve its prespecified overall survival endpoint. [4] The manufacturer plans to perform an additional confirmatory trial using a new dosage regimen after discussions with the FDA.

Investigational Uses [5]

- Although Zepzelca (lurbinectedin) is being studied for the treatment of other types of solid tumors, there is currently no published evidence supporting its safety or efficacy in these Clinicaltrials.gov.

Medication Policy Manual

Policy No: dru661

Topic: Amondys 45, casimersen

Date of Origin: February 15, 2021

Committee Approval Date: June 20, 2024

Next Review Date: 2024

Effective Date: October 1, 2024

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Amondys 45 (casimersen) is an intravenous medication that may be used for Duchenne muscular dystrophy (DMD) when patients have a specific gene mutation. A clinical benefit, such as improved ambulation, of Amondys 45 (casimersen) has not been established.

Policy/Criteria

Most contracts require pre-authorization approval of Amondys 45 (casimersen) prior to coverage.

I. Continuation of therapy (COT): Amondys 45 (casimersen) is considered investigational for all conditions, per the full policy criteria below.

Please note: *Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Amondys 45 (casimersen) is considered investigational for all conditions, including Duchenne muscular dystrophy (DMD) that is amenable to exon 45 skipping (*Table 1*). However, if found to be medically necessary, criteria A must also be met:

A. Site of care administration requirements are met [refer to Pharmacy Services Medication Policy Manual, Site of Care Review, dru408].

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers Amondys 45 (casimersen) coverable under the medical benefit (as a provider administered medication).

B. Although the use of Amondys 45 (casimersen) is considered investigational for all conditions, including Duchenne muscular dystrophy (DMD) that is amenable to exon 45 skipping, if pre-authorization is approved, Amondys 45 (casimersen) will be authorized in doses up to 30 mg/kg every week. (52 infusions per year).

C. Authorization shall be reviewed at least every twelve months for documented benefit. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met. Specifically, documentation that the medication is providing clinical benefit, including disease stability or improvement, and lack of disease progression.

Position Statement

Summary

- Amondys 45 (casimersen) is an intravenous therapy under FDA review for the treatment of Duchenne muscular dystrophy (DMD) when there is a confirmed mutation of the DMD gene that is amenable to exon 45 skipping. It is under evaluation through the FDA Accelerated Approval Program based on an increase in dystrophin in skeletal muscles observed in some patients during a phase III trial.
- A clinical benefit (e.g. prolongation of independent ambulation, improved quality of life, or prevention of disease progression and disability) of Amondys 45 (casimersen) has not been established.

    * In one ongoing trial, Amondys 45 (casimersen) was shown to increase dystrophin levels. However, it has not been proven that an increase in dystrophin will translate to improved clinical outcomes, such as improved motor function.

- The U.S. Centers for Disease Control and Prevention (CDC) has developed general management guidelines for DMD. The CDC recommends corticosteroids and supportive care to slow disease progression. These guidelines were published prior to the submission of Amondys 45 (casimersen) to the FDA, thus the use of Amondys 45 (casimersen) for DMD has not yet been addressed. [1-3]

Clinical Efficacy [4]

- Evidence regarding the effect of casimersen on dystrophin levels is inconclusive. Data is limited to the small, unpublished, two-part, double-blind, placebo-controlled phase III ESSENCE trial, which is ongoing. Additional trial data is needed to establish the safety and efficacy of casimersen in Duchenne muscular dystrophy (DMD).
- The primary endpoint of the ESSENCE trial is the change from baseline in the total distance walked during the 6-minute walk test (6MWT) at week 96. Change in dystrophin protein levels, change in forced vital capacity percent (FVC%), and muscular function tests (such as the ability to rise independently, time to loss of ambulation, and the North Star Ambulatory Assessment (NSAA), at week 96, were key secondary endpoints.
- In the ESSENCE trial, 43 patients were initially randomized to receive either placebo (n=17) or casimersen 30 mg/kg (n=27) via intravenous route weekly for 96 weeks. However, available data is limited to week 48. At week 48, mean dystrophin levels increased to 1.736% of normal in the casimersen 30 mg/kg group. In the casimersen treated group, the baseline dystrophin level was 0.925% of normal, therefore the absolute change in dystrophin was 0.81%. As previously mentioned, the ESSENCE trial is ongoing, and the results of all other endpoints, including the primary endpoint, have not been reported.
    * Dystrophin production is a surrogate biomarker of disease improvement with an unknown correlation to health outcomes.
    * An absolute increase in dystrophin levels has not been correlated to improved ambulation or muscle function and a minimal clinically important difference in dystrophin levels has not yet been established. Experts have proposed that dystrophin levels greater than or equal to 10% of normal may be clinically meaningful; however, validation is needed
- Lack of available trial data makes it impossible to demonstrate any meaningful conclusions regarding endpoints with functional outcomes, including 6MWT and pulmonary function resulting from casimersen treatment. Long-term comparative evidence is needed to further clarify the role of casimersen.
- Casimersen has not yet been shown to improve any clinical outcomes such as quality of life, prolongation of independent ambulation, or prevention of disease progression and disability.

Safety [4]

- Limited safety data is available, however, the most common adverse reactions reported with casimersen during phase I/II trials included procedural pain and nasopharyngitis. Safety data for the phase III trial has not been published.

Table 1: Mutations Amenable to Exon 45 skipping			
7-44	46-78	46-49	46-48
12-44	18-44	46-59	46-57
44	46	46-47	46-75
46-51	46-53	46-55	
46-60	46-67	46-69

Medication Policy Manual | **Policy No:** dru662

Topic: Margenza, margetuximab-cmkb | **Date of Origin:** May 15, 2021

Committee Approval Date: June 20, 2024 | **Next Review Date:** 2025

Effective Date: September 1, 2024

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Margenza (margetuximab-cmkb) is an intravenously administered monoclonal antibody that blocks the human epidermal growth factor 2 (HER2) receptor. It is used in the treatment of HER2-positive breast cancer. It is similar to Herceptin (trastuzumab).

Policy/Criteria

I. Most contracts require pre-authorization approval of Margenza (margetuximab-cmkb) prior to coverage.

A. New starts (treatment-naïve patients): Margenza (margetuximab-cmkb) is considered not medically necessary when used in the treatment of metastatic HER2-positive breast cancer**.**

OR

B. Continuation of therapy (COT): Margenza (margetuximab-cmkb) may be considered medically necessary for COT when there is clinical documentation (including, but not limited to chart notes) confirming that criteria 1 and 2 below are met.

1. The patient is established on this therapy AND one of the following situations applies (criterion a or b below):

a. Prior to current health plan membership AND the medication was covered by another health plan.

OR

b. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission AND there is documented clinical benefit.

AND

2. Documentation of clinical benefit is provided.

Please note*: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers Margenza (margetuximab-cmkb) coverable only under the medical benefit (as a provider-administered medication).

B. Although the use of Margenza (margetuximab-cmkb) is considered "not medically necessary," if pre-authorization is approved, Margenza (margetuximab-cmkb) will be authorized in doses up to 15 mg/kg every three weeks until disease progression.

C. Authorization **may** be reviewed at least annually. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, such as disease stability or improvement.

III. Margenza (margetuximab-cmkb) is considered investigational when used for all other conditions, including but not limited to:

A. Use in combination with other HER2-directed medications (see *Appendix 1*).

B. HER2-positive gastric cancer.

Position Statement

Summary

- Similar to trastuzumab (Herceptin, biosimilars), Margenza (margetuximab-cmkb) is an intravenously administered monoclonal antibody that slows cancer growth by blocking the human epidermal growth factor receptor 2 protein (HER2).
- Margenza (margetuximab-cmkb) is approved for use in adults with metastatic HER2-positive breast cancer (BC) who have had two or more prior HER2-directed regimens, at least one of which was given in the metastatic disease setting. It is given in combination with chemotherapy.
- This policy considers the use of Margenza (margetuximab-cmkb) in patients with metastatic HER2-positive BC to be 'not medically necessary' because it has similar safety and efficacy to currently available products but is more costly. There is no evidence of superior safety or efficacy, to suggest additional health outcome benefit, such as improved overall survival (OS), for the higher cost.
- The efficacy of Margenza (margetuximab-cmkb) is similar to the efficacy of trastuzumab (Herceptin, biosimilars). In the final efficacy analysis of the pivotal trial (SOPHIA) no difference in OS between Margenza (margetuximab-cmkb) and trastuzumab was detected.
- The safety of Margenza (margetuximab-cmkb) is also similar to that of trastuzumab (Herceptin, biosimilars), including the box warning describing the potential for left ventricular dysfunction.
- The NCCN breast cancer guideline lists several HER2-directed regimens among recommended options for use in metastatic HER2-postive BC. Ideal sequencing of regimens in the second- and subsequent-line treatment settings has not been determined.
- Margenza (margetuximab-cmkb) is dosed as 15 mg/kg intravenously every 3 weeks until disease progression.
- Margenza (margetuximab-cmkb) is being evaluated in other HER2-postive tumors (e.g. gastric cancers); however, efficacy in cancers other than metastatic HER2-positive breast cancer has not been established.

Regence Pharmacy Services performs independent analyses of oncology medication evidence, to establish coverability per the contracts with the health plan.

- Most contracts define coverability based on established clinical benefit in published, peer-reviewed literature, along with consideration of regulatory status.
- FDA approval does not in itself establish medical necessity, as unpublished, low-quality evidence, including exploratory analyses and unvalidated surrogate endpoints, may be used as the basis of approval. Regulatory approval may or may not reflect clinical benefit

relative to standard of care and the recommendations of expert clinical advisors such as the Oncologic Drugs Advisory Committee (ODAC). FDA approvals generally do not consider cost compared to established therapies, or value to members.

- Likewise, NCCN clinical practice guidelines assignment of a recommendation (category 1, 2a, or 2b) does not necessarily establish medically necessity. NCCN recommendations are inconsistently supported by published, peer-reviewed literature and do not uniformly consider value of new therapies relative to existing potentially higher-value treatment options, considering effectiveness, safety, and cost.
- Medication coverage criteria are developed based on the 'medical necessity' assessment, as described above.

Regence Pharmacy Services analysis and coverage policy may differ from FDA labeled indication and/or NCCN clinical practice guidelines.

Clinical Efficacy

- The available evidence for Margenza (margetuximab-cmkb) is of fair quality. The primary study (SOPHIA) compared Margenza (margetuximab-cmkb) plus investigator's choice of single-agent chemotherapy with trastuzumab plus single-agent chemotherapy in patients with metastatic HER2-positive breast cancer. [1,2]
    * All patients in the study had received prior trastuzumab and pertuzumab (Perjeta), and 91% received prior Kadcyla (ado-trastuzumab emtansine).
    * Overall, 92% of patients received at least two prior lines of therapy in the metastatic treatment setting.
- There was a 0.9-month improvement in median progression-free survival (PFS) with Margenza (margetuximab-cmkb) relative to trastuzumab. Although this difference was statistically significant, it is not likely clinically relevant. Furthermore, PFS (a surrogate endpoint) has not been shown to accurately predict improvement in clinical outcomes in breast cancer.
- Overall survival (OS) was a coprimary endpoint in this study. The final survival analysis from the pivotal trial (SOPHIA) found there was no difference in OS between Margenza (margetuximab-cmkb) and trastuzumab. [3]
- Margenza (margetuximab-cmkb) is a 'me-too' product that works via a similar mechanism as trastuzumab. It was thought that Margenza (margetuximab-cmkb) might have a theoretical advantage over trastuzumab based on increased binding activity to Fc receptor FCGR3A (CD16A); however, there is currently no clinical data to support any superiority in patients with tumors with CD16A genotypes (FF, FV, VV). Ultimately, the final OS analysis showed no difference between the two HER2-blocking antibodies.

Guidelines

- The National Comprehensive Cancer Network (NCCN) breast cancer guideline lists several HER2-directed therapies (both category 1 and 2A recommendations) among potential options for use in managing HER2-positive breast cancer. [4]
- Optimal sequencing of HER2-directed therapies in the second- and subsequent-line metastatic breast cancer setting has not been determined.

Investigational Uses

- Margenza (margetuximab-cmkb) has only been studied in combination with single-agent chemotherapy in the pretreated, metastatic breast cancer setting. There is currently no evidence evaluating its use in combination with other HER2-directed therapies. Therefore, this use is considered investigational.
- The clinicaltrials.gov database describes an ongoing trial with Margenza (margetuximab-cmkb) in HER2-positive gastric cancer. Whether there is any clinical benefit in this setting has not been adequately defined. Therefore, this use is considered investigational. [5]

Safety [6]

- The safety and warnings associated with the use of Margenza (margetuximab-cmkb) are similar to those experienced with trastuzumab.
- Similar to trastuzumab, adverse effects (AEs) requiring some sort of an intervention (Grade 3 or 4 AEs) occurred in just over half the patients who received Margenza (margetuximab-cmkb).

Dosing [6]

- Margenza (margetuximab-cmkb) is dosed as 15 mg/kg intravenously every three weeks until disease progression. It is given in combination with single-agent chemotherapy.
- Dosing of Margenza (margetuximab-cmkb) may be interrupted or permanently discontinued for decreases in left ventricular ejection fraction (LVEF). Refer to package labeling for specific parameters.

Appendix 1: HER2-Directed Medications Used in Treating HER2-Positive Breast Cancer [a]

Infused Medications (Medical Benefit)	Oral Medications (Pharmacy Benefit)

Medication Policy Manual **Policy No:** dru668

Topic: Medications for Primary Hyperoxaluria **Date of Origin:** May 15, 2021

- Oxlumo, lumasiran
- Rivfloza, nedosiran

Committee Approval Date: June 20, 2024 **Next Review Date:** 2025

Effective Date: September 1, 2024

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Medications in this policy are used to treat primary hyperoxaluria type 1 (PH1), a rare genetic condition that can lead to kidney disease. They are given by subcutaneous (SC) injection.

Policy/Criteria

Most contracts require pre-authorization approval of Medications for Primary Hyperoxaluria (as listed in Table 1) prior to coverage.

I. Continuation of therapy (COT): Medications for Primary Hyperoxaluria (as listed in *Table 1*) may be considered medically necessary for COT when criterion A, B, or C below is met.

A. For diagnoses NOT listed in the coverage criteria below, full policy criteria must be met for coverage.

OR

B. For diagnoses listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

C. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

Please note*: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Medications for Primary Hyperoxaluria (as listed in *Table 1*) may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) that criteria A through D are met.

A. A diagnosis of **primary hyperoxaluria type 1** (PH1) has been established by, or in consultation with, a hepatologist, nephrologist, or urologist.

AND

B. The diagnosis of PH1 has been confirmed by genetic testing, with documentation of a mutation to the alanine-glyoxylate aminotransferase (AGT) gene.

AND

C. Confirmation of objective kidney dysfunction such as a decrease in renal function (reduced glomerular filtration rate, GFR, recurrent kidney stones [nephrolithiasis], or nephrocalcinosis).

AND

D. Medical management has been ineffective in reducing urinary oxalate levels as defined by a trial of ALL of the following (1 through 3), unless contraindicated:

1. Hydration therapy.

AND

2. Crystallization inhibitors (such as neutral phosphate, potassium citrate-citric acid, and magnesium oxide).

AND

3. Pyridoxine (vitamin B6).

PLEASE NOTE: Ineffective is defined as having a 24-hour urine oxalate excretion ≥ 0.7 mmol/24 hr/1.73 m^2 for those over 6 years of age, or urinary oxalate-to-creatinine ratio greater than the upper limit of normal for those less than 6 years of age.

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers Oxlumo (lumasiran) coverable only under the medical benefit (as a provider-administered medication).

B. Regence Pharmacy Services considers Rivfloza (nedosiran) coverable under the medical or pharmacy benefit (as either a provider or self-administered medication).

C. When pre-authorization is approved, Medications for Primary Hyperoxaluria may be authorized in quantities up to those listed below in *Table 1*:

Table 1: Medications for Primary Hyperoxaluria

Medication	Age	Weight	Dose
Oxlumo (lumasiran)	not age-based	Less than 10 kg	6 mg/kg subcutaneously (SC) once monthly for 3 doses, followed by 3 mg/kg SC once monthly thereafter
		10 to less than 20 kg	6 mg/kg SC once monthly for 3 doses, followed by 6 mg/kg SC every three months thereafter
		20 kg or greater	3 mg/kg SC once monthly for 3 doses, followed by 3 mg/kg SC every three months thereafter
Rivfloza (nedosiran)	12 years and older	Less than 50 kg	128 mg SC once monthly
		50 kg or greater	160 mg SC once monthly
	9 to 11 years	Less than 50 kg	3.3 mg/kg SC once monthly, not to exceed 128 mg
		50 kg or greater	160 mg SC once monthly

D. Authorization **shall** be reviewed at 6 months (initial reauthorization), then **shall** be reviewed every 12 months thereafter. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, as defined by ALL of the following:

1. A reduction in urinary oxalate excretion, kidney stone events, nephrocalcinosis, or plasma oxalate levels, as compared to baseline.

AND

2. Patient is not on dialysis.

AND

3. Patient has not had a liver transplant,

IV. Medications for Primary Hyperoxaluria are considered not medically necessary for use in patients that are currently on dialysis, or after a liver transplant.

V. Medications for Primary Hyperoxaluria are considered investigational when used for all other conditions, including primary hyperoxaluria types 2 and 3 (PH2 and PH3).

VI. The concomitant use of Medications for Primary Hyperoxaluria, such as Oxlumo (lumasiran) with Rivfloza (nedosiran), is considered investigational.

Position Statement

Summary

- Medications for Primary Hyperoxaluria are subcutaneous therapies indicated for the treatment of primary hyperoxaluria type 1 (PH1), a rare genetic condition that leads to oxalate-related renal dysfunction and may include renal failure, systemic oxalosis, and associated sequelae.
- Medications for Primary Hyperoxaluria (as listed in Table 1) are a small interfering ribonucleic acids (siRNAs) that inhibit the messenger RNA of specific enzymes hydroxyacid oxidase 1 (HAO1) and hepatic lactate dehydrogenase (LDHA), respectively], both of which are involved in the pathway that leads to excessive oxalate production. The intent of this policy is to cover Medications for Primary Hyperoxaluria (as listed in Table 1) for the indication and dose for which they have been shown to be safe and effective, for genetically confirmed, clinically significant PH1 when medical management has been ineffective in controlling urinary oxalate excretion, as detailed in the coverage criteria.
- The approval of Oxlumo (lumasiran) was based on two phase 3 trials which demonstrated a reduction in urine oxalate (Uox) excretion in patients with PH1 and relatively preserved renal function. High urinary oxalate levels at diagnosis, and upon follow-up, have been strongly correlated with worse kidney outcomes, including long-term renal survival. Subsequently, Oxlumo (lumasiran) was also studied and shown to be effective for reduction in plasma oxalate (Pox) in patients with advanced kidney disease (including those on dialysis).

- The approval of Rivfloza (nedosiran) was based on one phase 3 trial in patients with PH1 and PH2 and relatively preserved renal function. Statistically significant reductions in urinary oxalate excretion were demonstrated in the PH1 population, but not in the primary hyperoxaluria type 2 (PH2) population.
- PH1 is a heterogenous disease, with a range of phenotypes, from mildly symptomatic to severe infantile oxalosis and kidney failure. Due to the cost, Medications for Primary Hyperoxaluria are coverable only in patients with PH1 and objective evidence of clinically significant kidney disease despite use of standard of care medical management (hydration therapy, crystallization inhibitors, and pyridoxine) for reduction of urinary calcium oxalate levels.
- Liver transplant is the functional cure for PH1, as it corrects the underlying metabolic defect. Therefore, use of Medications for Primary Hyperoxaluria (as listed in Table 1) after liver transplant is considered not medically necessary.
- There is limited evidence for the use of Medications for Primary Hyperoxaluria in patients with PH1 who are on dialysis. Chronic high urinary oxalate levels can lead to end-stage kidney disease (ESKD) and need for dialysis. A renal transplant is often warranted in patients on dialysis. Based on one trial. Oxlumo (lumasiran) reduces production of oxalate but would not reverse hyperoxaluria-related renal failure. Although Medications for Primary Hyperoxaluria can be used for reduction of plasma oxalate, dialysis also clears excess plasma oxalate. The additional benefit of use of Medications for Primary Hyperoxaluria in patients already on dialysis is unknown. Therefore, the use of Medications for Primary Hyperoxaluria in patients on dialysis is considered 'not medically necessary.'

Disease background: [1-3]

- PH1 is caused by mutations in the alanine-glyoxylate aminotransferase (AGT) gene, AGXT, which results in the absence or defect in AGT. This leads to a significant increase in oxalate production by the liver.
- In the early stages of PH1, excess oxalate is excreted by the kidney. Urinary calcium oxalate supersaturation in the kidneys leads to bladder/kidney stones and nephrocalcinosis (deposits of calcium oxalate crystals in kidney parenchyma). Over time, renal inflammation, fibrosis and, if persistent, end-stage kidney disease (ESKD) occurs.
- Once a patient develops ESKD, oxalate cannot be excreted, leading to oxalate accumulation in the plasma and subsequent systemic oxalosis. Resulting non-renal complications may include cardiac arrest, poor circulation, bone pain, decreased visual acuity and hypothyroidism, among other manifestations, all of which are associated with significant morbidity and mortality.
- Medical management with the use of hydration therapy, crystallization inhibitors, and pyridoxine can effectively reduce urinary calcium oxalate levels and is considered the standard of care.
- Normal urinary oxalate excretion levels are < 0.5mmol or < 45mg per 1.73 m^2 per 24 hours.
- Liver transplant is the functional cure for PH1, as it corrects the underlying metabolic defect.

Clinical Efficacy

- Oxlumo (lumasiran)
  - The initial efficacy of Oxlumo (lumasiran) was based on interim data from two multicenter phase 3 trials, which measured reduction in urinary oxalate (Uox) excretion in patients with genetically confirmed PH1 and relatively preserved kidney function. [1 4-6]
    - ILLUMINATE-A: A multicenter, double-blind, placebo-controlled randomized controlled trial in patients ≥ 6 years and an estimated glomerular filtration rate (eGFR) of at least 30 ml/min/1.73 m^2 (n=39). [6]
      - Patients were randomized to 2:1 to lumasiran or placebo.
      - The majority of patients (82%) had an eGFR of ≥ 60 ml/min/1.73 m^2.
      - The primary endpoint was percent change in 24-hour urinary oxalate (Uox) excretion from baseline to month 6.
      - At 6 months, there was a -65.4% and -11.8% reduction change 24-hour Uox with Oxlumo (lumasiran) and placebo groups, respectively. The translates into an absolute change of -1.24 mmol/24hr/1.73m^2 and -0.27 mmol/24hr/1.73m^2, in the Oxlumo (lumasiran) and placebo groups, respectively.
    - ILLUMINATE-B: A single-arm, open-label trial in patients < 6 years of age and an eGFR of at least 45 ml/min/1.73 m^2 (or 'normal' eGFR for those < 12 months old). [5 7]
      - A total of 18 patients were enrolled, but only the first 16 were used in the primary analysis.
      - Median eGFR was 111 ml/min/1.73 m^2 (65-174).
      - The primary endpoint was percent change in spot urinary oxalate to creatinine ratio (Uox:Cr) from baseline to month 6.
      - Use of Oxlumo (lumasiran) resulted in a 71.1% reduction in spot Uox:Cr ratio at month 6 in those treated with Oxlumo (lumasiran).
      - A follow-up 12-month analysis showed sustained reduction in spot Uox:Cr at month 12. [5]

- Rivfloza (nedosiran)
  - The efficacy of Rivfloza (nedosiran) in the treatment of PH1 was based on results from a multinational, randomized, double-blind, placebo-controlled trial, PHOX2, and interim data from an ongoing phase 3 extension trial (PHYOX3). [8-10]
    - PHYOX2 enrolled 35 patients, 6 years of age and older, with PH1 or PH2, who received treatment with nedosiran or placebo, in a 2:1 randomization, respectively.
    - All subjects had relatively preserved kidney function (eGFR ≥30ml/min/1.73m^2), urinary oxalate excretion levels ≥0.7mmol/24hr/1.73m^2, the majority of subjects (>75%) had eGFR

≥60ml/min/1.73m^2 (stage 1 or 2 kidney disease), 60% were on pyridoxine, and subjects with a history of a liver or kidney transplant or on dialysis were excluded.

* PHYOX2 met its primary endpoint, demonstrating a statistically significant reduction in 24-hour urinary oxalate excretion (Uox) in subjects with PH1, from baseline to month 6.
    - At 6 months, in the PH1 population (n=29) , there was a -50% and 6% reduction change in 24-hour urinary oxalate excretion with Rivfloza (nedosiran) and placebo groups, respectively. The between group difference was a -56% reduction.
    - Despite the inclusion of a small number of subjects (n=6) with primary hyperoxaluria type 2 (PH2) in the pivotal trial (PHYOX2), there was no treatment benefit observed in this subject population. Therefore, the use of Rivfloza (nedosiran) is considered investigational given the absence of evidence, in patient populations other than primary hyperoxaluria type 1 (PH1) only.
* In PHYOX3: Reductions in 24-hour urinary oxalate excretion were maintained in the 13 patients with PH1 assigned to nedosiran treatment, over an additional 6 months.
* Secondary endpoints relating to improvements in eGFR, reduction in plasma oxalate levels, reduction in kidney stone size and occurrence were not met with statistical significance; more trials are needed to assess efficacy for these outcomes.
* Despite the causal role of urinary oxalate in kidney stone formation and kidney damage, the clinically pertinent magnitude of reduction during excretion is unknown and to what extent the reduction could predict a clinical benefit. Additional evidence is needed to establish the clinical benefit (e.g., prolongation of renal function, a decrease in kidney stone events, avoidance of systemic oxalosis complications, and a decrease in the need for liver/renal transplantation).

- Current available evidence for both available Medications for Primary Hyperoxaluria is limited to reduction in urinary oxalate, as well as plasma oxalate with Oxlumo (lumasiran) only. Additional evidence is needed to establish the clinical benefit (e.g., prolongation of renal function, a decrease in kidney stone events, avoidance of systemic oxalosis complications, and a decrease in the need for liver/renal transplantation). Evidence for any of these health outcomes is limited to very small exploratory analyses.
- Liver transplant is a functional cure for PH1. Therefore, use of Medications for Primary Hyperoxaluria after liver transplant is considered 'not medically necessary,' as the underlying metabolic issue has been reversed by the transplant.
- Dialysis can be used to clear excess oxalate; therefore, the use of Medications for Primary Hyperoxaluria in patients on dialysis is considered 'not medically necessary.' There is insufficient evidence to establish that Medications for Primary Hyperoxaluria provide additional benefit as compared to hemodialysis (HD) alone for patients on HD.

* The available evidence is limited to one single-arm, open-label phase 3 trial (ILLUMINATE-C) which evaluated Oxlumo (lumasiran) for reduction in plasma oxalate (Pox) excretion in patients with PH1 and advanced kidney disease, defined as eGFR < 45 ml/min/1.73 m^2 including patients on HD (n=21). [11]
    - The trial included two cohorts:
        - Cohort A (n=6): those not receiving hemodialysis (HD) at study enrollment. Median eGFR was 16.5 ml/min/1.73 m^2 (8.6-34.1).
        - Cohort B (n=9): those on HD at study enrollment.
    - All enrolled patients had a plasma oxalate level of ≥ 20 µmol/L at screening, including patients with or without systemic oxalosis.
    - Baseline median Pox level was 57.9 in Cohort A and 103.7 in Cohort B. Note: upper limit of normal in healthy patients is 12.11 µmol/L.
    - The primary endpoint was percent change in plasma oxalate (Pox) from baseline to month 6 for Cohort A (non-dialysis) and percent change in pre-dialysis Pox from baseline to month 6 for Cohort B (patients on dialysis).
    - At 6 months, there was a -33.3% and -42.4% reduction in Pox levels for Cohorts A and B, respectively.
    - This trial is additional evidence that Oxlumo (lumasiran) reduces plasma oxalate levels in patients with PH1. However, key health outcomes, such as improvement in renal function or reversal of other sequelae from elevated POx/Uox, remains unknown.
* Although there was a reduction in Pox in patients on hemodialysis (Cohort B), the benefit of Oxlumo (lumasiran) relative to the use of hemodialysis alone for removal of oxalate is unknown.
* Rivfloza (nedosiran) has not specifically been studied in patients on hemodialysis; however, similar to Oxlumo (lumasiran), dialysis can be used to clear excess oxalate and the superiority of use of Rivfloza (nedosiran) with dialysis versus dialysis alone is unknown.
* Therefore, the use of Medications for Primary Hyperoxaluria in patients on dialysis is considered 'not medically necessary.'

Investigational Uses

- There is the potential for off-label use of Medications for Primary Hyperoxaluria in secondary hyperoxaluria or other forms of primary hyperoxaluria, such as type 2 or 3. Medications for Primary Hyperoxaluria [Oxlumo (lumasiran) and Rivfloza (nedosiran)] have so far not been shown to be effective in these populations. Therefore, the use in any other condition is considered investigational.

Dosing and Administration [4 8]

- Oxlumo (lumasiran) is administered only by a healthcare provider.
- Rivfloza (nedosiran) may be administered by a healthcare provider or caregiver/patient,

Codes	Number	Description
		Injection, nedosiran (Rivfloza), 80 mg, 128 mg, 160 mg
HCPCS	J0224	Injection, lumasiran (Oxlumo), 0.5 mg

Medication Policy Manual

Policy No: dru669

Topic: Cosela, trilaciclib

Date of Origin: August 15, 2021

Committee Approval Date: June 20, 2024

Next Review Date: 2025

Effective Date: September 1, 2024

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Cosela (trilaciclib) is an intravenous medication that is intended to protect the bone marrow in patients with small cell lung cancer (SCLC) who are receiving specific chemotherapy regimens.

Policy/Criteria

Most contracts require pre-authorization approval of Cosela (trilaciclib) prior to coverage.

I. Continuation of therapy (COT): Cosela (trilaciclib) may be considered medically necessary for COT when criterion A, B, or C below is met.

A. For diagnoses NOT listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND there is documentation that the medication was covered by another health plan. Examples of documentation include the coverage approval letter from the previous health plan or paid claim.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

B. For diagnoses listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

C. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

Please note*: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Cosela (trilaciclib) may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) that criteria A and B below are met.

A. A diagnosis of **extensive-stage small cell lung cancer** (ES-SCLC).

AND

B. The patient is being treated with a platinum/etoposide- or a topotecan-containing chemotherapy regimen.

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers Cosela (trilaciclib) coverable only under the medical benefit (as a provider-administered medication).

B. When pre-authorization is approved, Cosela (trilaciclib) may be approved in doses up to 240 mg/m^2 given daily prior to each scheduled chemotherapy administration.

C. Authorization **shall** be reviewed at least every six months. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, such as disease stability or improvement.

IV. Cosela (trilaciclib) is considered investigational when used for all other conditions, and with cytotoxic chemotherapy other than what is described in the coverage criterion above.

Position Statement

Summary

- Cosela (trilaciclib) is a transient inhibitor of cyclin-dependent kinase (CDK) 4 and 6. When given prior to certain cytotoxic chemotherapy regimens, it temporarily stops the development of hematopoietic stem and progenitor cells which may protect the bone marrow from chemotherapy-induced damage.
- Based on its mechanism of action, there is the concern that Cosela (trilaciclib) might also interfere with the effectiveness of cytotoxic chemotherapy. Longer term follow-up in post-marketing studies is needed to evaluate this risk.
- Cosela (trilaciclib) is approved to decrease the incidence of chemotherapy-induced myelosuppression in adult patients when administered prior to a platinum/etoposide- or topotecan-containing regimen for extensive-stage small cell lung cancer (ES-SCLC).
- The intent of this policy is to provide coverage for Cosela (trilaciclib) in the setting in which it was studied and was subsequently approved.
- In clinical trials, Cosela (trilaciclib) decreased the duration of severe neutropenia as well as the proportion of patients experiencing severe neutropenia relative to placebo. These endpoints are surrogates for fever and neutropenia and infections, which were not measured in the trials.
- The Cosela (trilaciclib) studies did not evaluate overall survival which is necessary to give important insight into whether this therapy may interfere with the effectiveness of cytotoxic chemotherapy.
- The National Comprehensive Cancer Network (NCCN) lists Cosela (trilaciclib) as an option in the population in which it is indicated in package labeling.
- Cosela (trilaciclib) is given as an intravenous infusion just prior to each dose of cytotoxic chemotherapy in a dose of 240 mg/m^2.

- Use of Cosela (trilaciclib) with chemotherapy regimens or in conditions outside of its labeled indication has not been adequately evaluated is considered investigational.

Regence Pharmacy Services performs independent analyses of oncology medication evidence, to establish coverability per the contracts with the health plan.

- Most contracts define coverability based on established clinical benefit in published, peer-reviewed literature, along with consideration of regulatory status.
- FDA approval does not in itself establish medical necessity, as unpublished, low-quality evidence, including exploratory analyses and unvalidated surrogate endpoints, may be used as the basis of approval. Regulatory approval may or may not reflect clinical benefit relative to standard of care and the recommendations of expert clinical advisors such as the Oncologic Drugs Advisory Committee (ODAC). FDA approvals generally do not consider cost compared to established therapies, or value to members.
- Likewise, NCCN clinical practice guidelines assignment of a recommendation (category 1, 2a, or 2b) does not necessarily establish medically necessity. NCCN recommendations are inconsistently supported by published, peer-reviewed literature and do not uniformly consider value of new therapies relative to existing potentially higher-value treatment options, considering effectiveness, safety, and cost.
- Medication coverage criteria are developed based on the 'medical necessity' assessment, as described above.

Regence Pharmacy Services analysis and coverage policy may differ from FDA labeled indication and/or NCCN clinical practice guidelines.

Clinical Efficacy [1-4]

- The evidence for Cosela (trilaciclib) is based on three, small trials (GIT28-02, GIT28-03, GIT28-05) in patients with extensive-stage small cell lung cancer (ES-SCLC) who were receiving a platinum/etoposide- or topotecan-based chemotherapy regimen. These chemotherapy regimens are notable for their myelotoxicity.
- Cosela (trilaciclib) was administered as part of supportive care prior to each dose of chemotherapy.
    * The trials evaluated duration of severe neutropenia (DSN) and the proportion of patients with severe neutropenia (SN) as coprimary endpoints. DSN and SN are surrogate markers for fever and neutropenia which was not measured as an outcome in the trial.
        - The DSN was generally decreased by approximately 3.5 days in the Cosela (trilaciclib) versus the placebo arm in each of the trials.
        - The proportion of patients with SN decreased by approximately 35% in the Cosela (trilaciclib) versus the placebo arm in each of the trials.
    * An FDA supplementary analysis of the trials found that the numerical advantage for Cosela (trilaciclib) to reduce infection risk, the clinical outcome of importance,

was numerically small. Four of 122 patients (3%) and 7 of 118 patients (6%) in the Cosela (trilaciclib) and placebo groups were identified as having the severe AE of fever and neutropenia, respectively. The proportion of patients with grade 3 or higher pneumonia was identical in the two treatment arms.

* Though there was an incremental decrease in the number of patients who received filgrastim during the first treatment cycle in the trials, the majority of patients still required filgrastim as part of their supportive care.

- The National Comprehensive Cancer Network (NCCN) Small Cell Lung Cancer guideline lists Cosela (trilaciclib) as a potential supportive care option when given prior to platinum/etoposide- (with or without a checkpoint inhibitor) or topotecan-containing regimens for ES-SCLC. [5]

Investigational Uses [6]

- Use of Cosela (trilaciclib) in cancers other than ES-SCLC, or prior to cytotoxic chemotherapy other than that which is listed in package labeling is considered investigational.
- There is interest in using Cosela (trilaciclib) prior to cytotoxic chemotherapy for triple negative breast cancer (TNBC); however, benefit in this population has not been established.

Safety [1]

- Based on its mechanism of action (temporarily arrests the development of hematopoietic stem and progenitor cells), Cosela (trilaciclib) could theoretically protect tumor cells from the cytotoxic effects of chemotherapy. This potential risk was alluded to in one of the pivotal trials (GIT28-03) where a numeric difference in discontinuations due to disease progression disfavoring Cosela (trilaciclib) was observed. As a result of this finding, there is a post-marketing commitment (requiring at least two additional years of follow up) to assess its potential effects on chemotherapy efficacy.
- In the safety population the proportion of deaths related to treatment-emergent adverse effects (AEs) was numerically higher in the Cosela (trilaciclib) treatment arm than in the placebo treatment arm (5% versus 3%, respectively).

Dosing [7]

- Cosela (trilaciclib) is a prophylactic medication which is administered prior to chemotherapy on each day that chemotherapy is administered. The infusion must be completed within 4 hours prior to the start of chemotherapy.
- In patients with ES-SCLC, platinum/etoposide-based regimens are generally given on Days 1, 2, and 3 of each cycle for four total cycles. Cycles are 21 to 28 days in length. Topotecan-based regimens are typically given on Days 1 through 5 of each 21-day cycle. A course of therapy is generally 4 cycles but may range up to until there is disease progression.
- Cosela (trilaciclib) is administered intravenously over 30 minutes in a dose of 240 mg/m^2.

Medication Policy Manual

Policy No: dru670

Topic: Aduhelm, aducanumab

Date of Origin: August 15, 2021

Committee Approval Date: July 16, 2021

Next Review Date: January 2022

Effective Date: August 15, 2021

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Aducanumab (Aduhelm) is an intravenous medication that is used for Alzheimer's disease (AD). A clinical benefit, such as slowing of disease progression, of aducanumab (Aduhelm) has not been established.

Policy/Criteria

Most contracts require pre-authorization approval of aducanumab (Aduhelm) prior to coverage.

I. Continuation of therapy (COT): Aducanumab (Aduhelm) may be considered medically necessary for COT when full policy criteria below are met, including quantity limit.

Please note: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.

II. New starts (treatment-naïve patients): Aducanumab (Aduhelm) is considered investigational for all conditions, including Alzheimer's disease (AD).

Position Statement

Summary

- Aducanumab (Aduhelm) is an intravenous therapy indicated for the treatment of Alzheimer's disease. Aducanumab was approved via the accelerated approval pathway; continued approval may be contingent upon verification of clinical benefit in confirmatory trials.
- A clinical benefit (e.g. prolongation of independence, improved quality of life, prevention of disease progression and disability) of aducanumab (Aduhelm) has not been established.[1]
    * The results of two nearly identical unpublished studies (EMERGE and ENGAGE)[1 2] of aducanumab (Aduhelm) had inconsistent clinical benefit after 18 months of treatment. Of the two trials, one demonstrated cognitive and functional improvements based on clinical scores in a subgroup who received high-dose aducanumab while no endpoint was met in a second study regardless of dose.
    * The same studies demonstrated dose-dependent improvements in amyloid beta imaging in a subgroup population. However, the reduction of beta-amyloid plaque is a surrogate endpoint whose causal link to clinical benefit has not been established.
    * The use of aducanumab (Aduhelm) for AD is considered investigational, given the lack of overall clinical benefit and potential for harms.
- Treatment of AD is largely supportive and may include the avoidance of poly-pharmacy as well as treatment of comorbid conditions. Currently available pharmacological therapy focuses on symptom management but does not modify disease course.[3]

Clinical Efficacy

- The results of two nearly identical studies did not have consistent clinical benefit after 18 months of treatment. The FDA standard is typically 2 demonstrative clinical trials with positive data on patient reported outcomes/symptoms.
- The evidence regarding the effect of aducanumab (Aduhelm) is based on the change from baseline on the CDR-Sum of Boxes is inconclusive. The (CDR-SB) is an extensive cognitive and functional assessment tool used primarily in clinical trials. Higher scores suggest greater disease severity; a minimal clinically significant difference (MCID) is estimated to be 1-2 points.[4]
- Patients in the pivotal trials had prodromal or mild AD along with confirmed amyloid pathology [positive amyloid positron emission tomography (PET) scan]. All patients in the trials had either mild cognitive impairment associated with AD or mild AD; patients with more severe disease were not studied.
    * EMERGE: A statistically significant improvement in CDR-SB was observed in the high-dose aducanumab arm (difference vs. placebo -0.39 [95% CI -0.69 to -0.09]) but not the low-dose arm. Although the results were statistically significant in the high-dose arm, the change in CDR-SB was less than the 1-2 point change that has been suggested as the MCID.
    * ENGAGE: Neither low dose or high dose had any statistically significant improvement vs placebo in CDR-SB or any secondary efficacy endpoints.
- Both studies demonstrated significant improvements in amyloid plaques based on PET imaging; however, the effect of amyloid beta on clinical outcomes has not yet been established. There have been 16 trials of other drugs in which the treatment arm did worse than placebo despite reduction of amyloid, albeit typically in a population with more severe disease.
- Although the existing evidence is promising, an additional confirmatory trial is needed to establish the safety and efficacy of aducanumab (Aduhelm) in AD. Aducanumab has not yet proven to improve clinically relevant outcomes such as quality of life, prolongation of independent functioning, or prevention of disease progression and disability, or mortality.
- The FDA advisory committee as well as the Institute for Clinical and Economic Review (ICER) openly advised against approval of aducanumab.[5 6] Prior to approval, the American Academy of Neurology (AAN) advised against a broad label approval and that further characterization of patients who would benefit most is warranted.[3]
- At this time, there is not enough data available to determine that the benefits of aducanumab use would outweigh the risks or provide any meaningful benefit in the AD population. Aducanumab has uncertain benefit in the face of known harms.

Safety

- 40% of patients on the high-dose aducanumab (Aduhelm) had amyloid related imaging abnormalities (ARIA) which may be linked to brain bleeds/swelling.
- Labeling includes periodic brain magnetic resonance imaging (MRI) to monitor for ARIA.

Medication Policy Manual | **Policy No:** dru671

Topic: Nulibry, fosdenopterin | **Date of Origin:** August 15, 2021

Committee Approval Date: March 21, 2023 | **Next Review Date:** 2025

Effective Date: June 1, 2024

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Nulibry (fosdenopterin) is an intravenous medication used in the treatment of molybdenum cofactor deficiency type A.

Policy/Criteria

Most contracts require pre-authorization approval of Nulibry (fosdenopterin) prior to coverage.

I. Continuation of therapy (COT): Nulibry (fosdenopterin) may be considered medically necessary for COT when criterion A, B, or C below is met.

A. For diagnoses NOT listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND there is documentation that the medication was covered by another health plan. Examples of documentation include the coverage approval letter from the previous health plan or paid claim.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

B. For diagnoses listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

C. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

Please note*: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Nulibry (fosdenopterin) may be considered medically necessary when criteria A and B below are met.

A. A diagnosis of **molybdenum cofactor deficiency (MoCD) type A** that is confirmed by genetic testing, which shows a mutation in the MOCS1 gene.

AND

B. Attestation that the patient does not have advanced disease that is unlikely to respond to treatment, as evidenced by extensive cerebral necrosis on MRI or severe encephalopathy.

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers Nulibry (fosdenopterin) coverable only under the medical benefit (as a provider-administered medication).

B. When pre-authorization is approved, Nulibry (fosdenopterin) will be authorized in quantities sufficient for up to a 30-day supply at a dose of up to 0.9 mg/kg once daily.

C. Authorization may be reviewed at least every 6 months. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, including disease stability or improvement.

IV. Nulibry (fosdenopterin) is considered investigational when used for all other conditions, including but not limited to:

A. Other types of MoCD (e.g., type B or C).

B. Sulfite oxidase deficiency.

Position Statement

Summary

- Molybdenum cofactor deficiency (MoCD) is an ultra-rare, autosomal recessive, inborn error of metabolism caused by disruption in molybdenum cofactor (MoCo) synthesis which is vital to prevent buildup of s-sulfocysteine, a neurotoxic metabolite of sulfite. Accumulation of this neurotoxin causes severe encephalopathy and intractable seizures with a high infant mortality rate.
- There are three types (A, B, and C) of MoCD, each caused by a different genetic mutation, but clinically indistinguishable.
- In patients with type A, a genetic mutation in the MOCS1 gene results in a deficiency in the production of cyclic pyranopterin monophosphate (cPMP), a necessary step in the biochemical pathway for MoCo production.
- Nulibry (fosdenopterin) is synthetic form of cPMP, allowing for MoCo synthesis to occur and prevent the buildup of the neurotoxic s-sulfocysteine.
- The intent of this policy is to cover Nulibry (fosdenopterin) for the indication and dose for which it has been shown to be safe and effective, for MoCD type A, as detailed in the coverage criteria.
- In the pooled analysis of three studies of patients with MoCD type A, Nulibry (fosdenopterin) improved survival compared with genotype matched controls.
- Patients with very advanced disease, including those with extensive cerebral necrosis, did not have a clinically relevant response to treatment.
- The diagnosis of MoCD type A may be challenging and requires genetic testing in combination with clinical features.

- Nulibry (fosdenopterin) may be covered in doses of up to 0.9 mg/kg/day, the highest dose studied in clinical trials. The safety and effectiveness of higher doses have not been established.
- The use of Nulibry (fosdenopterin) for any other indication, including other types of MoCD, is considered investigational.

Clinical Efficacy [1 2]

- Efficacy for Nulibry (fosdenopterin) was based on the pooled results of three low quality trials (MCD-201, MCD 202, and MCD 501); which enrolled a total of 13 patients with MoCD Type A. Survival results from the three studies were compared to untreated genotype-matched MoCD type A patients from a natural history study.
- The estimated survival probability was 84% in patients that received daily fosdenopterin, compared to 55% in the untreated genotype-matched cohort from a natural history trial, at year 3.
- In trial MCD-501, the only trial with published clinical results, efficacy was dependent on the severity of disease and extent of encephalopathy prior to initiation of the investigational version of fosdenopterin (recombinant cPMP).
    * Patients that were started on recombinant cPMP treatment prior to the onset of severe encephalopathy (n=3) were spared from significant disability. They acquired motor milestones and have "low normal" cognitive development, without sensory deficits or seizures. Speech delay and mild muscular hypotonia were noted in these patients.
    * Patients with advanced encephalopathy (n=3) had severe neurodevelopmental disability and there was no progress in motor skills.
    * Patients with extensive cerebral necrosis on MRI (n=3) received no benefit from the therapy, and it was discontinued, as their disease was deemed too severe to benefit from recombinant cPMP treatment.

Investigational Uses [2]

- The safety and effectiveness of Nulibry (fosdenopterin) in conditions other than MoCD type A have not been established.
- MoCD type B patients, enrolled in MCD-501, received no benefit from recombinant cPMP therapy. This is further validated by the mechanism of action of Nulibry (fosdenopterin), which would not be expected to provide benefit in MoCD type B or C.

Safety [3]

- During clinical trials the most frequent adverse events (>25% incidence) were catheter-related complications, pyrexia, viral infection, pneumonia, otitis media, vomiting, cough/sneezing, viral upper respiratory infection, gastroenteritis, bacteremia, and diarrhea.

Dosing [3]

- Nulibry (fosdenopterin) is administered intravenously once daily, in doses up to 0.9 mg/kg.
- Efficacy and dosing of Nulibry (fosdenopterin) in MoCD type A patients in doses higher than 0.9 mg/kg IV once daily has not been established.

Medication Policy Manual

Policy No: dru672

Topic: Medications for Multiple Myeloma, other cancers, and other hematologic disorders

- Darzalex, daratumumab
- Darzalex Faspro, daratumumab and hyaluronidase-fihj
- Elrexfio (elranatamab-bcmm)
- Empliciti, elotuzumab
- Kyprolis, carfilzomib
- Ninlaro, ixazomib
- Pomalyst, pomalidomide
- Sarclisa, isatuximab-irfc
- Talvey (talquetamab-tgvs)
- Tecvayli, teclistamab-cqyv

Date of Origin: October 1, 2021

Committee Approval Date: September 19, 2024

Next Review Date: 2025

Effective Date: January 1, 2025

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Medications included in this policy are used primarily to treat multiple myeloma, but also include various other cancers, and other hematologic disorders.

Policy/Criteria

Most contracts require pre-authorization approval of Medications for Multiple Myeloma, other cancers, and other hematologic disorders ("Medications for MM") prior to coverage.

I. Continuation of therapy (COT): Medications for MM may be considered medically necessary for COT when criteria A and B below are met.

A. The patient is established on this therapy AND one of the following situations applies (criterion 1 or 2 below):

1. Prior to current health plan membership AND the medication was covered by another health plan.

PLEASE NOTE: *If the diagnosis is not listed in the coverage criteria below, written documentation of coverage must be provided, such as an approval letter or paid claim.*

OR

2. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

AND

B. If the diagnosis is listed in the 'Not Medically Necessary Uses' or 'Investigational Uses' coverage criteria below, documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria must be provided.

Please note*: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve) patients – Medically Necessary Uses:

Medications for multiple myeloma (MM) (as listed in Table 1) may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) that the applicable diagnosis-based criteria below are met.

Table 1.

Diagnosis	Coverable medication(s)	AND the following are met:
Kaposi sarcoma (KS)	- Pomalyst (pomalidomide)	**1.** If the KS is associated with acquired immune deficiency syndrome (AIDS-related), highly active antiretroviral therapy (HAART) was not effective.
Multiple myeloma (MM)	- Kyprolis (carfilzomib) - Darzalex (daratumumab) - Darzalex Faspro (daratumumab and hyaluronidase-fihj) - Elrexfio (elranatamab) - Empliciti (elotuzumab) - Ninlaro (ixazomib) - Pomalyst (pomalidomide) - Sarclisa (isatuximab-irfc) - Talvey (talquetamab) - Tecvayli (teclistamab-cqyv)	**1.** A diagnosis of MM. **AND** **2.** ***For Darzalex, Darzalex Faspro, Empliciti, Sarclisa only***: Will not be used in combination with another monoclonal antibody [such as listed in *Appendix 1*]. **AND** **3.** ***For Empliciti, Sarclisa, Ninlaro only:*** The MM is relapsed or refractory to at least one prior therapy. **AND** **4.** ***For Sarclisa only*:** The MM was not refractory to prior daratumumab *(refractory is defined as disease progression while on therapy, or within 60 days of the last dose).* **AND** **5.** ***For Tecvayli, Elrexfio, and Talvey only*:** Criteria a, b, and c below are met: **a.** There has been disease progression on or after at least four prior MM regimens including all of the following (i, ii, and iii): **i.** An anti-CD38 monoclonal antibody. **ii.** A proteosome inhibitor. **iii.** An immunomodulatory (IMID) agent. **b.** Tecvayli, Elrexfio, or Talvey will be used as monotherapy. **c.** For Tecvayli and Elrexfio only: No prior treatment with a therapy directed against B-cell maturation antigen (BCMA). (refer to *Appendix 1*)
Light chain amyloidosis (AL)	- Darzalex (daratumumab) - Darzalex Faspro (daratumumab and hyaluronidase-fihj)	**1.** A diagnosis of light chain amyloidosis (AL). **AND** **2.** The patient has had no prior therapy for AL (newly diagnosed). **AND** **3.** Daratumumab will be administered in combination with bortezomib, cyclophosphamide, and dexamethasone. **AND** **4.** No prior treatment with daratumumab.

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers oral medications [including Ninlaro (ixazomib), Pomalyst (pomalidomide)] coverable only under the pharmacy benefit (as self-administered medications).

B. Regence Pharmacy Services considers injectable medications [including Kyprolis (carfilzomib), Darzalex (daratumumab), Darzalex Faspro (daratumumab and hyaluronidase-fihj), Empliciti (elotuzumab), Elrexfio (elranatamab-bcmm), Sarclisa (isatuximab-irfc), Talvey (talquetamab-tgvs) and Tecvayli (teclistamab-cqyv)] coverable only under the medical benefit (as provider-administered medications).

C. When pre-authorization is approved, each drug will be authorized as follows:

1. **Self-administered medications:** Up to the limits in Table 2 until disease progression.

2. **Provider-administered medications:** Up to FDA-recommended dose and frequency limits until disease progression.

Table 2. Self-Administered Medication Quantity Limits

Product	Quantity Limit
Ninlaro (ixazomib)	3 capsules per 28 days.
Pomalyst (pomalidomide)	- **MM:** Up to 21 capsules per 28 days. - **KS:** Up to 42 capsules per 28 days.

Key: KS=Kaposi sarcoma; MM=multiple myeloma

D. Authorization **may** be reviewed at least annually. For any ongoing authorization, clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, such as disease stability or improvement.

IV. Investigational Uses

A. Combination use of any medications in this policy, if specifically excluded in the coverage criteria above, including use of any two monoclonal antibodies for MM, including but not limited to Darzalex (daratumumab), Empliciti (elotuzumab), or Sarclisa (isatuximab-irfc) [see *Appendix 1*].

B. Unless otherwise specified in the coverage criteria above, medications included in this policy are considered investigational when used for all other conditions, due to lack of published data, lack of high-quality data, or lack of positive data.

Position Statement

Summary

- The intent of this policy is to cover medications for multiple myeloma, other cancers, and hematologic disorders ("medications for MM") in settings where they have been shown to be safe and effective, as detailed in the coverage criteria, with consideration for other available treatment options.
    * Where there is lack of proven additional benefit and/or lack of demonstrated health outcomes (such as overall survival or improved quality of life) relative to alternative therapies, use of medications for MM is not coverable ("not medically necessary" or "investigational").
    * It is important to note that the fact that a medication is FDA approved for a specific indication does not, in itself, make the treatment medically reasonable and necessary.
- Many of the clinical indications for medications for MM have been approved by the FDA and endorsed by clinical guidelines based on surrogate measures such as overall tumor response rate (ORR) and progression-free survival (PFS), measurements of tumor markers, which are not proven to accurately predict clinically important outcomes for MM, such as improved overall survival (OS), symptom control, or improved quality of life (QoL).
- Triplet MM regimens (drug regimens that combine medications from three different MM medication classes) have become the standard of care in treating MM. However, there are insufficient studies that compare regimens to clearly establish superiority of any one regimen or medication within a class (by mechanism of action).
- The safety and efficacy of monoclonal antibodies (mAbs) for MM in combination with other monoclonal antibodies for MM, or in conditions not included in coverage criteria (as listed above), have not been established. Currently, there are no published trials of the use of combination anti-MM monoclonal antibodies. Additional trials are ongoing.
- The National Comprehensive Cancer Network (NCCN) multiple myeloma guideline lists all drugs in this policy for use in MM in various settings, as well as other associated cancers and hematologic disorders. Choice of initial MM therapy is frequently based on transplant eligibility.
- Medications for MM are coverable for up to the dose and quantity as specified in the coverage criteria. For many medications for MM, they are given until disease progression, unacceptable toxicity, where others may be given for a specific duration (refer to coverage criteria). There is no conclusive additional benefit with higher doses or when given for longer durations except as specified in the coverage criteria.
- There are ongoing studies using medications for MM in a variety of other settings and other cancers. However, although initial evidence may be promising, the potential for clinical benefit in these conditions is still being investigated.

Regence Pharmacy Services performs independent analyses of oncology medication evidence, to establish coverability per the contracts with the health plan.

- Most contracts define coverability based on established clinical benefit in published, peer-reviewed literature, along with consideration of regulatory status.
- FDA approval does not in itself establish medical necessity, as unpublished, low-quality evidence, including exploratory analyses and unvalidated surrogate endpoints, may be used as the basis of approval. Regulatory approval may or may not reflect clinical benefit relative to standard of care and the recommendations of expert clinical advisors such as the Oncologic Drugs Advisory Committee (ODAC). FDA approvals generally do not consider cost compared to established therapies, or value to members.
- Likewise, NCCN clinical practice guidelines assignment of a recommendation (category 1, 2a, or 2b) does not necessarily establish medically necessity. NCCN recommendations are inconsistently supported by published, peer-reviewed literature and do not uniformly consider value of new therapies relative to existing potentially higher-value treatment options, considering effectiveness, safety, and cost.
- Medication coverage criteria are developed based on the 'medical necessity' assessment, as described above.

Regence Pharmacy Services analysis and coverage policy may differ from FDA labeled indication and/or NCCN clinical practice guidelines.

Clinical Efficacy

Multiple Myeloma (MM)

- Medications for multiple myeloma may be covered as detailed in the coverage criteria when there is documentation of a diagnosis of multiple myeloma.
- MM is a malignant neoplasm of plasma cells. The cells accumulate in bone marrow which leads to bone destruction and marrow failure. Skeletal destruction can lead to osteolytic lesions, osteopenia, and/or pathologic fractures. Bone pain is present at diagnosis in approximately 60% of patients. [1]
- MM is not curable using current approaches. Nearly all patients relapse on their initial treatment and require further therapy. The duration of response is generally shorter with each successive therapy. The five-year survival rate is approximately 52%. [2]
- Several subtypes of MM have been identified at the genetic and molecular level. Specific chromosomal translocations, deletions, and amplifications can be used to stratify disease risk (high, intermediate-, or standard-risk). [2]
- Choice of therapy may be based on several characteristics including whether the patient is a candidate for transplant, the disease risk category, genetic markers, and response to prior therapy. [2]
- Existing treatment approach usually involves use of multi-drug therapy regimens, referred to as doublet-, triplet-, or quad-therapy, with medications such as steroids, cytotoxic chemotherapy, immunomodulators (IMIDs), proteosome inhibitors (PIs), and monoclonal antibodies (mAbs). However, there is insufficient evidence to establish the safety or efficacy of the use of combination of monoclonal antibodies for MM.

- The evidence for some medications for MM is limited to the relapsed/refractory (r/r) setting, such as with the proteosome inhibitor, Ninlaro (ixazomib), as detailed in the coverage criteria. Similarly, Tecvayli (teclistamab-cqyv) is only coverable as a monotherapy for MM refractory to multiple other therapies.
- There is insufficient evidence that any one medication for MM (by mechanism of action/class) is superior to another. There is limited comparative efficacy for MM.

Pomalyst (pomalidomide) for MM

- Approval of pomalidomide was based on a single, open-label trial in 221 patients with r/r MM, comparing pomalidomide alone vs. pomalidomide plus low-dose dexamethasone. [3, 4]
    * Patients enrolled in the trial had a minimum of two prior MM therapies. Prior therapies must have included lenalidomide, and bortezomib.
    * ORRs were 7.4% and 29.2% with pomalidomide and pomalidomide plus dexamethasone, respectively.
- A second open-label trial compared pomalidomide plus low-dose dexamethasone versus high-dose dexamethasone in 455 refractory MM patients. Subjects in the pomalidomide group had a longer median overall survival at 15.4 months of follow-up (13.1 vs. 8.1 months, HR 0.75, p = 0.009). Confidence in this result is reduced by high attrition rate during the trial, the lack of blinding, and crossover between treatment groups. [5]

Kyprolis (carfilzomib) for MM

- Initial approval of carfilzomib was based on one single-arm trial in 266 subjects that evaluated ORR in patients with relapsed MM. [6]
    * Patients enrolled in the trial had received at least two prior therapies (including bortezomib and an immunomodulator [IMID], lenalidomide or thalidomide).
    * The median number of prior therapies was five and 95% were refractory to their last line of therapy.
    * The study reported an ORR of 23.7% (17.7% partial responses, 4.9% very good partial response, and 0.4% complete response).
    * There is low confidence in the evidence from the study because a cause effect relationship cannot be established due to the lack of comparator.
- A single large, randomized, open-label trial evaluated the combination of carfilzomib plus lenalidomide/dexamethasone vs. lenalidomide/dexamethasone (control group) in relapsed MM. Subjects enrolled in the trial had between one and three prior therapies. [7]
    * The median PFS was 26.3 months and 17.6 months in the carfilzomib and control arm, respectively. Corresponding ORRs were 87.1 and 66.7%.
    * Although a lower HR for death was observed in the treatment group (HR 0.79, p = 0.04), survival data is not mature; the durability and clinical meaningfulness of this difference is not fully elucidated.
    * There is low confidence in these data due to high attrition (~30%) and lack of blinding.
- Carfilzomib/dexamethasone was shown to improve median OS relative to bortezomib/dexamethasone as a subsequent therapy for r/r MM. The clinical relevance of this finding is uncertain as the majority of patients had relapsed after prior bortezomib,

which likely disadvantages the bortezomib treatment arm. However, it is supportive of the efficacy of carfilzomib as a subsequent proteosome inhibitor therapy for MM. [8]

Ninlaro (ixazomib) for MM

- The evidence for efficacy for ixazomib comes from a single randomized, controlled trial that demonstrated improvements in PFS, a surrogate endpoint, in patients who had r/r MM who had received at least one prior line of therapy. [9, 10]
    - All patients had at least one prior therapy for MM. A majority had prior bortezomib or melphalan. Patients refractory to lenalidomide or proteosome inhibitors were excluded.
    - Ixazomib improved PFS vs. lenalidomide/dexamethasone alone (20.6 vs 14.7 months).
    - A more recent RCT evaluated ixazomib as a maintenance therapy after hematopoietic stem cell transplant (HSCT). [11] An interim analysis reported a PFS advantage relative to placebo; however, OS data are not mature. The trial remains blinded and is ongoing. Ixazomib is not currently approved for use in this treatment setting.

Farydak (panobinostat) for MM

- Farydak (panobinostat) was a histone deacetylase inhibitor that received accelerated approval for relapsed or refractory MM. It was withdrawn from the US commercial market in early 2022. [12, 13, 14]
- The manufacturer is making Farydak (panobinostat) available to certain MM patients in the US who are currently receiving it. Refer to www.farydak.com/notice/ for more information.

Darzalex (daratumumab) for MM

- Darzalex (daratumumab) and Darzalex Faspro (daratumumab and hyaluronidase-fihj) are CD38-directed monoclonal antibody products for the treatment of MM. Darzalex is given intravenously (IV), while Darzalex Faspro is given subcutaneously (SC). [15, 16]
- Darzalex (daratumumab) demonstrated improved overall survival (OS) when added to a backbone regimen of either Revlimid (lenalidomide) plus dexamethasone (Rd) or Velcade (bortezomib) plus dexamethasone (Vd) in patients with relapsed or refractory MM relative to either Rd or Vd alone.
- Although there may be differences in FDA-approved indications between products, the guidelines support interchangeability. There are ongoing studies evaluating Darzalex Faspro (daratumumab and hyaluronidase-fihj) in combination with other MM medications (other than those regimens that have already been approved as safe and effective). The NCCN MM guideline footnotes Darzalex Faspro (daratumumab and hyaluronidase-fihj) as being alternative to Darzalex (daratumumab) across all of the settings for which Darzalex (daratumumab) is recommended. [2]
- Darzalex (daratumumab) is given in a dose of 16 mg/kg IV, whereas Darzalex Faspro (daratumumab and hyaluronidase-fihj) is given in a dose of 1,800 mg – 30,000 units SC. [15, 16]

Darzalex (daratumumab) intravenous (IV) formulation:

As monotherapy for relapsed and/or refractory MM:

- The efficacy of Darzalex (daratumumab) IV is based on two single-arm, unblinded clinical studies in patients with r/r MM. Patients had received a median of 4-5 prior lines of therapy. [17, 18]
    - Common prior therapies included Velcade (bortezomib), Revlimid (lenalidomide), and Pomalyst (pomalidomide).
    - A majority of patients were refractory to both a proteosome inhibitor (PI) [such as Velcade (bortezomib)] and an immunomodulatory agent (iMiD) [e.g., Revlimid (lenalidomide)].
    - Efficacy was evaluated based on ORR. The ORR in one study was 29.2% and 36% in the second study.

As an add-on to standard therapy for relapsed and/or refractory MM:

- Two RCTs evaluated Darzalex (daratumumab) IV as an add-on to backbone therapy with either Revlimid (lenalidomide) plus dexamethasone (Rd), or Velcade (bortezomib) plus dexamethasone (Vd) in patients with r/r MM who had at least one prior therapy. [20, 21]
    - In a final analysis of these two trials a significant improvement in OS was reported with add-on Darzalex (daratumumab) relative to Rd or Vd alone. [50, 51]
    - The following flaws may lower confidence in the reported results: Neither study was blinded, and performance bias due to high attrition cannot be ruled out.
- An uncontrolled (single-arm), open-label trial evaluated Darzalex (daratumumab) IV as an add-on to backbone therapy with dexamethasone plus Pomalyst (pomalidomide). Patients enrolled in the study had a median of four prior MM therapies. [22]
    - The ORR was 59.2%, with 5.8% complete responses. Although results may appear impressive relative to historical controls, it cannot be concluded that add-on Darzalex (daratumumab) IV improves any clinical outcome relative to dexamethasone and Pomalyst (pomalidomide) alone.
    - Evidence from this trial is of very low quality due to the lack of comparator and use of an unvalidated surrogate endpoint.

As a primary MM therapy when autologous stem cell transplant is not an option:

- A randomized, open-label trial showed improved PFS at 18 months with Velcade (bortezomib)/melphalan/prednisone (BMP) plus Darzalex (daratumumab) IV vs. BMP alone, in newly diagnosed MM not eligible for an autologous stem cell transplant (ASCT). [23]
    - Patients enrolled in the trial either had coexisting conditions which precluded them from receiving high-dose chemotherapy with ASCT, or were 65 years of age or older (92% of the population).
    - The 18-month PFS was 71.6% [95% CI, 65.5, 76.8] and 50.2% [43.2, 56.7%] in the daratumumab and control groups, respectively. Median follow up at the time of the interim analysis was 16.5 months.

Darzalex Faspro (daratumumab and hyaluronidase-fihj) subcutaneous (SC) formulation: [16]

- The safety and efficacy of Darzalex Faspro (daratumumab and hyaluronidase-fihj) SC is based on previous Darzalex (daratumumab) IV studies. Pharmacokinetic studies and small, single-arm, observational trials evaluating PFS in the following settings were used as confirmatory evidence for Darzalex Faspro (daratumumab and hyaluronidase-fihj):
    * Newly diagnosed MM in combination with Velcade (bortezomib), melphalan, and prednisone.
    * r/r MM in combination with Revlimid (lenalidomide) and dexamethasone.
    * r/r MM as a monotherapy after disease progression on at least three prior therapies (including a proteosome inhibitor and immunomodulator), or progression after at least two prior PI and iMiD combination regimens.

Sarclisa (isatuximab-irfc) for MM

- Sarclisa (isatuximab-irfc) is an intravenously administered CD38-directed monoclonal antibody. Its mechanism of action is similar to that of Darzalex (daratumumab) IV.
- The initial FDA approval was based on low-quality data from a single, open-label (non-blinded), randomized, controlled trial in r/r MM. The trial compared Sarclisa (isatuximab-irfc), Pomalyst (pomalidomide) and dexamethasone (IPD) with PD alone. The overall confidence in the study results is limited due to several concerns (lack of blinding, potential imbalance in populations, and high rate of differential attrition). [24, 25]
    * Patients had been treated with a minimum of two prior MM therapies.
    * All patients had no response to prior Revlimid (lenalidomide) and proteosome inhibitors (used either separately or in combination). Non-response was defined as disease progression on or within 60 days, intolerance to Revlimid (lenalidomide) or the proteosome inhibitor, or disease progression within 6 months after achieving at least a partial response.
    * Patients with prior use of Pomalyst (pomalidomide) were not allowed in the study, nor were those with disease refractory to prior therapy with daratumumab, another CD-38 monoclonal antibody. *Refractory was defined as having achieved an initial response with subsequent disease progression while on therapy, or progression within 60 days of the last dose.*
    * The trial reported a PFS benefit with the addition of Sarclisa (isatuximab-irfc) to PD, a surrogate endpoint. OS will be analyzed as a secondary endpoint; however, no significant difference in survival between the study arms has been noted to date.

Empliciti (elotuzumab) for MM

- Empliciti (elotuzumab) is an intravenously administered SLAMF7-directed immunostimulatory monoclonal antibody for the treatment of r/r MM.
- The initial evidence for efficacy of Empliciti (elotuzumab) was based on a single, phase 3, randomized, open-label trial in patients who had received one to three prior therapies for MM [ELOQUENT-2 (NCT01239797)]. [26] The median number of prior treatments was two. Velcade (bortezomib) was the most common prior therapy (70%), followed by melphalan (65%), Thalomid (thalidomide) (48%), and Revlimid (lenalidomide) (6%).

Empliciti (elotuzumab) improved PFS, a surrogate endpoint. However, the effect of Empliciti (elotuzumab) on clinically relevant outcomes such as overall survival or quality of life is not known.

  * Empliciti (elotuzumab) plus Revlimid (lenalidomide)/dexamethasone was compared to Revlimid (lenalidomide)/dexamethasone alone.
  * Elotuzumab resulted in a 4.5-month PFS advantage compared to Revlimid (lenalidomide) and dexamethasone alone (19.4 months vs 14.9 months, respectively).

- Subsequently, Empliciti (elotuzumab) was studied in combination with Pomalyst (pomalidomide)/dexamethasone vs. Pomalyst (pomalidomide)/dexamethasone in a single, phase 3, randomized, open-label trial (n=117) in patients with r/r MM [ELOQUENT-3]. [27] Empliciti (elotuzumab) improved ORR, as well as PFS, surrogate endpoints. However, the effect of Empliciti (elotuzumab) on clinically relevant outcomes such as overall survival or quality of life is not known.
  * The median number of prior treatments was three. Prior therapies included stem cell transplant (55%), Velcade (bortezomib) (100%), Revlimid (lenalidomide) (99%), cyclophosphamide (66%), melphalan (63%), Kyprolis (carfilzomib) (21%), and Darzalex (daratumumab) IV (3%).
  * The patient population was highly-refractory to prior therapies: Revlimid (lenalidomide)-refractory (87%); proteosome inhibitor-refractory (80%); Revlimid (lenalidomide)- and proteosome inhibitor-refractory (70%).
  * Empliciti (elotuzumab) improved PFS by 5.58-months vs. Pomalyst (pomalidomide)/dexamethasone alone (10.25 months vs 4.67 months, respectively).
- A smaller, preliminary (phase 2) trial evaluated elotuzumab as an add-on to Velcade (bortezomib) plus dexamethasone. [28, 29] A 2.8-month PFS advantage was reported.

Blenrep (belantamab mafodotin-blmf) for MM [30, 38]

- Blenrep (belantamab mafodotin-blmf) was recently withdrawn from the market and is no longer available. The reason for withdrawal is failure to show a clinical benefit over standard therapy in the trial intended to confirm efficacy for regular FDA approval.
- Patients who are already enrolled in the Blenrep REMS program will have the option to enroll in a Compassionate use program through the manufacturer. (www.blenrep.com)

Pepaxto (melphalan flufenamide) for MM

- Pepaxto (melphalan flufenamide) has been withdrawn from the market because harms were found to exceed any potential for benefit in MM.

Tecvayli (teclistamab-cqyv) and Elrexfio (elranatamab-bcmm) for MM [47-49, 54, 55]

- Tecvayli (teclistamab-cqyv) and Elrexfio (elranatamab-bcmm) are intravenously administered bispecific B-cell maturation antigen (BCMA)-directed T-cell engagers for the treatment of multi-refractory MM.
- Tecvayli (teclistamab-cqyv) and Elrexfio (elranatamab-bcmm) each received FDA accelerated approval based on small, single-arm observational studies that evaluated objective response rate (ORR) in patients with triple class exposed (immunomodulator,

proteosome inhibitor, CD38-directed monoclonal antibody) patients with relapsed or refractory MM.

  * Patients in each of the studies had a median of five prior therapies.
  * The studies evaluated tumor response as the primary surrogate endpoint:
    - *Tecvayli (teclistamab-cqyv):* The ORR was 62%, with 28% of subjects having a complete response or better.
    - Elrexfio (elranatamab-bcmm): The ORR was 58%, with 26% of subjects having a complete response or better.

- It has not been determined whether Tecvayli (teclistamab-cqyv) or Elrexfio (elranatamab-bcmm) improve any clinically important outcomes (e.g., overall survival), or whether the potential for benefit is greater than the risks of therapy.
- Access to both Tecvayli (teclistamab-cqyv) and Elrexfio (elranatamab-bcmm) is restricted via Risk Evaluation and Mitigation Strategies (REMS).

Talvey (talquetamab-tgvs) for MM [52, 53]

- Talvey (talquetamab-tgvs) is an intravenously administered bispecific GPRC5D-directed T-cell engager for the treatment of MM.
- Talvey (talquetamab-tgvs) received FDA accelerated approval based on a small, single-arm observational study that evaluated objective response rate (ORR) in patients with triple class exposed (immunomodulator, proteosome inhibitor, CD38-directed monoclonal antibody) patients with relapsed or refractory MM.
  * Patients enrolled in the study had a median of five prior MM therapies.
  * The ORR was 73%, with 35% of subjects having a complete response or better.
- It has not been determined whether Talvey (talquetamab-tgvs) improves any clinically important outcome (e.g., overall survival) or whether the potential for benefit is greater than the risks of therapy.
- Access to Talvey (talquetamab-tgvs) is restricted via the Talvey Risk Evaluation and Mitigation Strategy (REMS).

Kaposi Sarcoma (KS)

- The approval of Pomalyst (pomalidomide) in KS is based on an observational trial that followed 18 patients who were HIV-positive, and 10 patients who were HIV-negative. The trial evaluated tumor response as the endpoint. [35]
- The trial excluded patients with symptomatic pulmonary or visceral KS.
- The majority (75%) of subjects in the trial had received prior chemotherapy for their KS. Patients who were HIV-positive also had to have been receiving highly active anti-retroviral therapy (HAART) for a minimum of two to three months without regression of their KS prior to being treated with pomalidomide. [35]
- The NCCN AIDS-related KS guideline recommends liposomal doxorubicin as the preferred front-line therapy for KS. Treatment in HIV-negative patients parallels treatment in the HIV-positive population. Pomalidomide is a preferred regimen after failure of front-line chemotherapy. [36]

Light chain amyloidosis (AL)

- The approval (FDA Accelerated approval) of Darzalex Faspro (daratumumab and hyaluronidase-fihj) SC in light chain amyloidosis (AL) is based on an open-label RCT [ANDROMEDA] that evaluated an unvalidated surrogate as the primary endpoint. As per FDA Accelerated approval regulations, additional evidence is needed to confirm there is a clinical benefit for continued approval. [16]
    * The trial compared the addition of Darzalex Faspro to Velcade (bortezomib)/ cyclophosphamide/dexamethasone (D-VCd) with VCd alone.
    * Patients enrolled in the study had newly diagnosed, measurable (hematologic) disease that affected at least one organ (e.g., heart, liver, kidney).
    * Patients with certain cardiac disease (e.g., NYHA Class IIIB and IV) where not allowed to enroll in the trial.
    * Per protocol, therapy was administered for a maximum of two years, or until there was disease progression.
    * Complete hematologic response HemCR, the primary endpoint, was achieved in 42% and 13% of the D-VCd and VCd treatment groups, respectively.
    * HemCR has not been shown to accurately predict any clinically important outcome (e.g., improved survival or quality of life).
- The NCCN Systemic Light Chain Amyloidosis guideline lists D-VCd among the preferred treatment options for front-line use in AL. [44]

Safety [37]

- Overall, medications for MM, by class/mechanism of action, appear to have similar safety profiles (based on indirect comparisons). There is no reliable evidence to allow conclusion that any one medication for MM (by class) is safer or more tolerable that another, given lack of comparative safety data. Common adverse events include:
    * IMIDs: Neutropenia, fatigue, anemia, constipation, nausea, diarrhea, dyspnea, upper respiratory tract infections, back pain, and pyrexia. Boxed warnings for embryo-fetal toxicity, venous thromboembolism, and hematologic toxicity. A restricted distribution program (Risk Evaluation and Management Strategy, "REMS") is in place to prevent accidental fetal exposure. Doses may be modified for hematologic toxicity.
    * Proteosome inhibitors: gastrointestinal toxicity, thrombocytopenia, and peripheral neuropathy; severe: cardiac toxicity.
    * Monoclonal antibodies: infusion-related reactions, neutropenia, upper respiratory tract infections, and diarrhea. Premedication with antihistamines, antipyretics, and corticosteroids is recommended. Of note: The safety of Darzalex Faspro (daratumumab and hyaluronidase-fihj) parallels that of the intravenous product.
    * Alkylating Agents: bone marrow suppression (including anemia, leukopenia, lymphocytopenia, neutropenia, and thrombocytopenia), gastrointestinal toxicity (including nausea and vomiting), renal toxicity, fatigue. Boxed warnings for severe marrow suppression leading to infection or bleeding, hypersensitivity reactions (including anaphylaxis), and potential secondary malignancy.

- Overall tolerability of some medications for MM may limit utility:
    * HDAC inhibitor Farydak (panobinostat): labeling contains a boxed warning for severe diarrhea (25% severe), and cardiac toxicity, including severe and fatal cardiac ischemic events, as well as severe arrhythmias. Therapy should be interrupted at the onset of moderate diarrhea (4 to 6 stools per day). Other serious toxicities include hemorrhage, hepatotoxicity, and embryo-fetal toxicity. Electrolyte abnormalities are also common. [13]
    * Tecvayli (teclistamab-cqyv): labeling contains a boxed warning for cytokine release syndrome (CRS) and neurological toxicity, including Immune Effector Cell-Associated Neurotoxicity Syndrome (ICANS). Use is restricted through the Tecvayli Risk Evaluation and Mitigation Strategy (REMS). [47-49]
    * Xpovio (selinexor): is associated with significant toxicity, need for dose modifications, and treatment-related deaths (see Xpovio policy for details). [39-42]

Appendix 1: Classification of Medications used for Multiple Myeloma		
Chemotherapy	**Immunomodulators (IMIDs)**	**Proteosome Inhibitors (PIs)**
- cyclophosphamide - doxorubicin - Doxil (liposomal doxorubicin) - melphalan HCl (generic, Evomela) - vincristine	- Revlimid (lenalidomide) - Pomalyst (pomalidomide) - Thalomid (thalidomide)	- bortezomib (generic Velcade) - Kyprolis (carfilzomib) - Ninlaro (ixazomib)
Exportin 1 inhibitor	**Anti-BCMA therapy**	**Monoclonal Antibodies (mAbs)**
- Xpovio (selinexor)	- Abecma (idecabtagene vicleucel) - Carvykti (ciltacabtagene autoleucel) - Elrexfio (elranatamab-bcmm) - Tecvayli (teclistamab-cqyv)	- Anti-CD38 - Darzalex (daratumumab) - Sarclisa (isatuximab-irfc) - Anti-SLAMF7 - Empliciti (elotuzumab)
GPRC5D-Directed therapy		
- Talvey (talquetamab-tgvs)	-	-

Table 3. Investigational Uses	
There is insufficient evidence to establish the safety or efficacy of the medications for MM (as listed below) for the treatment of the listed conditions. Additional studies are ongoing for many of these conditions. [43]	
Front-line treatment of MM	Empliciti (elotuzumab), Ninlaro (ixazomib), and Sarclisa (isatuximab-irfc) are being studied in the front-line multiple myeloma setting. However, the evidence is considered preliminary.
Sequential use of BCMA-directed agents	There is unpublished, low-quality evidence suggesting Elrexfio (elranatamab) may have some activity in patients who had prior exposure to BCMA-directed therapy; however, data is limited to tumor responses in small numbers of patients. Additional information is needed to establish efficacy in these patients. Sequential use of BCMA-directed therapies remains investigational.
Myelofibrosis	There are several small, published studies that evaluate the use of Pomalyst (pomalidomide) in patients with myelofibrosis. Several other medications for MM are also being studied. The evidence is considered insufficient at this time.
Smoldering multiple myeloma	There are several ongoing studies to evaluate various MM therapies [Kyprolis (carfilzomib), Darzalex (daratumumab), Darzalex Faspro (daratumumab and hyaluronidase-fihj), Empliciti (elotuzumab), Ninlaro (ixazomib), and Sarclisa (isatuximab-irfc)] in smoldering plasma cell myeloma. The evidence is considered insufficient at this time.
Systemic light chain amyloidosis (AL), in the absence of multiple myeloma	- Pomalyst (pomalidomide) in combination with dexamethasone is one of many potential treatment regimens listed in the NCCN Systemic Light Chain Amyloidosis guidelines; however, the guidelines state that optimal therapy for systemic light chain amyloidosis remains unknown and treatment in the context of a clinical trial is strongly encouraged when possible. Other listed treatment options include, but are not limited to, cyclophosphamide/thalidomide/dexamethasone, dexamethasone/alpha-interferon, oral melphalan/dexamethasone, and thalidomide/dexamethasone. [44] - There are several ongoing studies listed in clinicaltrials.gov that are designed to evaluate Sarclisa (isatuximab-irfc) in other disease settings including amyloidosis. There are no results posted to date.
Waldenström's macroglobulinemia	- There are ongoing trials that are studying Pomalyst (pomalidomide) and Kyprolis (carfilzomib) in Waldenström's macroglobulinemia. There is no published data supporting the safety and efficacy of Pomalyst (pomalidomide) in these populations. - There is currently insufficient evidence to support the use of Kyprolis (carfilzomib) in combination with rituximab and dexamethasone for the treatment of Waldenström's macroglobulinemia. Although Kyprolis (carfilzomib)/rituximab/dexamethasone is listed in NCCN guidelines as a category 2A recommendation, the only information to date consists of a single-center, uncontrolled phase 2 study in 31 patients. [45] Well-designed studies are necessary to establish efficacy and benefit in these populations.
Solid tumors	There are also several ongoing trials that are studying Pomalyst (pomalidomide) in soft tissue sarcoma. There is no published data supporting the safety and efficacy of Pomalyst (pomalidomide) in these populations.

Revision History

Revision Date	Revision Summary
09/19/2024	Removed prior chemotherapy step for treatment of Kaposi sarcoma with pomalidomide (Pomalyst) based on practical considerations and improved member access.
6/20/2024	No criteria changes with this annual review.
3/21/2024	No criteria changes with this annual review.
12/7/2023	Coverage for Elrexfio (elranatamab-bcmm) was added to the policy when used as a monotherapy for patients with MM who have had at least four prior MM regimens which must have included an anti-CD38 mAb, a proteosome inhibitor, and an immunomodulatory agent when there has been no prior therapy with therapy directed against BCMA. Coverage for Talvey (talquetamab-tgvs) was added to the policy when used as a monotherapy for patients with MM who have had at least four prior MM regimens which must have included an anti-CD38 mAb, a proteosome inhibitor, and an immunomodulatory agent.
6/15/2023	No changes to policy criteria with this annual update.
3/16/2023	• Blenrep (belantamab mafodotin) was removed from the policy because the manufacturer has ceased marketing of this product in the U.S. • Coverage for Tecvayli (teclistamab-cqyv) was added to the policy when used as a monotherapy for patients with MM who have had at least four prior MM regimens which must have included an anti-CD38 mAb, a proteosome inhibitor, and an immunomodulatory agent when there has been no prior therapy with therapy directed against BCMA.
6/17/2022	Effective 9/1/2022: • Farydak (panobinostat) was removed from this policy because the manufacturer has ceased marketing of this product in the US. • Pepaxto (melphalan flufenamide) removed from policy due to withdrawal from the market. *Note: Revisions were made to update to current standard policy language; however, there was no change to the intent of this policy.*
10/15/2021	Pepaxto (melphalan flufenamide) changed to investigational for all indications due to a safety signal that indicates numerically higher incidence of death with melphalan flufenamide versus standard of care.
7/16/2021	New combination policy (effective 10/1/2021): • The individual Multiple Myeloma policies were combined, with the exception of selinexor (Xpovio, dru607) and idecabtagene vicleucel (Abecma; a newer CAR-T therapy, dru523). • Revlimid will no longer require pre-authorization. • The newly FDA approved Pepaxto (melphalan flufenamide) added to policy. The use of Pepaxto for multiple myeloma will be considered not medically necessary and therefore not covered due to lack of proven additional benefit versus lower-cost intravenous melphalan HCl.

Revision Date	Revision Summary
	• Added coverage criteria for Darzalex (daratumumab), Darzalex Faspro (daratumumab and hyaluronidase-fihj) in systemic light chain amyloidosis, a newly FDA approved indication. • Coverage criteria now explicitly list that combination of any two monoclonal antibodies (Darzalex, Empliciti, Sarclisa; per Appendix 1) is not coverable. No change to intent. • Investigational Uses were simplified (any use without coverage criteria is "Investigational"). • Clarification of quantity limits, for operational consistency. • Removed metastatic castration-resistant prostate cancer (for lenalidomide) from the list of 'Not Medically Necessary' uses (this indication was also listed under 'Investigational Uses').

Drug names identified in this policy are the trademarks of their respective owners.

Medication Policy Manual | **Policy No:** dru673

Topic: Jemperli, dostarlimab | **Date of Origin:** November 15, 2021

Committee Approval Date: September 19, 2024 | **Next Review Date:** 2025

Effective Date: January 1, 2025

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Jemperli (dostarlimab) is an intravenously infused immunotherapy that is used in the treatment of advanced endometrial cancer.

Policy/Criteria

Most contracts require pre-authorization approval of Jemperli (dostarlimab) prior to coverage.

I. Continuation of therapy (COT): Jemperli (dostarlimab) may be considered medically necessary for COT when criterion A, B, or C below is met.

A. For diagnoses NOT listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND there is documentation that the medication was covered by another health plan. Examples of documentation include the coverage approval letter from the previous health plan or paid claim.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

B. For diagnoses listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

C. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

Please note*: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Jemperli (dostarlimab) may be considered medically necessary when criteria A through C below are met:

A. A confirmed diagnosis of **endometrial carcinoma**, advanced (not curable with resection).

AND

B. No prior programmed death receptor-1 (PD-1) blocking antibody (PD-1 inhibitor) or programmed death-ligand 1 (PD-L1) blocking antibody therapy (*see Appendix 1*).

AND

C. Jemperli (dostarlimab) will be used in one of the following two settings (1 or 2):

1. **Front line:** As part of a front-line regimen, when both criteria below are met (a and b):

a. No prior systemic therapy for endometrial carcinoma in the advanced treatment setting.

AND

b. Jemperli (dostarlimab) will be initiated in combination with carboplatin and paclitaxel.

OR

2. **Subsequent therapy**, when all criteria below are met (a to c):

a. Disease progression on or following prior treatment with a platinum-based chemotherapy regimen.

AND

b. The tumor is mismatch repair deficient (dMMR) by immunohistochemistry (IHC) or polymerase chain reaction (PCR) testing.

AND

c. Jemperli (dostarlimab) will be used as monotherapy.

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers Jemperli (dostarlimab) coverable only under the medical benefit (as a provider- administered medication).

B. When pre-authorization is approved, Jemperli (dostarlimab) may be approved in the quantities below:

Setting	Quantity Limit	Duration
Endometrial cancer, front-line setting initiated with chemotherapy	Initial: 500 mg IV every three weeks for six doses, followed by 1,000 mg IV every six weeks Continued: 1,000 mg IV every six weeks	Initial / Continued: 24 weeks, until disease progression
Endometrial cancer, subsequent-line setting as monotherapy	Initial: 500 mg IV every three weeks for four doses, followed by 1,000 mg IV every six weeks Continued: 1,000 mg IV every six weeks	Initial / Continued: 24 weeks, until disease progression

C. Reauthorization: Authorization **shall** be reviewed at least every 24 weeks for documented benefit. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met. Specifically, documentation that the medication is providing clinical benefit, including disease stability or improvement, and lack of disease progression, based on an assessment of change in tumor burden. If there is documentation of potential disease progression, a shortened authorization (up to three months)

may be approved to allow time for clarification of response to Jemperli (dostarlimab), including clinical re-evaluation of the patient and reimaging.

PLEASE NOTE: Additional doses of Jemperli (dostarlimab) will not be authorized without a documented recent assessment by the treating provider (such as oncologist) with objective evidence of response to therapy, such as by re-imaging and use of iRECIST criteria.

IV. Jemperli (dostarlimab) is considered investigational when used for all other conditions, including but not limited to:

A. Microsatellite instability high (MSI-H) or mismatch repair deficient (dMMR) tumors [unless specified in the sections above].

Position Statement

Summary

- Jemperli (dostarlimab) is a human programmed death receptor-1 (PD-1) blocking monoclonal antibody (immunotherapy) used in the treatment of specific types of cancers.
- The intent of this policy is to cover Jemperli (dostarlimab) in settings where it has been shown to be safe and effective, as detailed in the coverage criteria, with consideration for other available treatment options.
  * Where there is lack of proven additional benefit and/or lack of demonstrated health outcome (such as overall survival or improved quality of life) relative to alternative therapies, use of dostarlimab (Jemperli) alone or in combination with other therapies is not coverable ("not medically necessary" or "investigational").
  * It is important to note that the fact that a medication is FDA approved for a specific indication does not, in itself, make the treatment medically reasonable and necessary.
- Jemperli (dostarlimab) is FDA approved for use in the following conditions; however, the health plan considers these uses to be "investigational" (not covered) as Jemperli (dostarlimab) has not demonstrated any health benefit, based on the currently available evidence:
  * MSI-H tumors, other than endometrial carcinoma *(as described in the Clinical Efficacy section below).*
- Many of the clinical indications for immunotherapies (PD-1, PD-L1, and others) have been approved by the FDA and endorsed by clinical guidelines based on surrogate measures such as overall tumor response rate (ORR) and progression-free survival (PFS), which are not proven to accurately predict clinically important outcomes such as improved overall survival or improved quality of life.
- National Comprehensive Cancer Network (NCCN) guidelines recommend Jemperli (dostarlimab) as a potential option in each of the treatment settings listed in the coverage criteria. In general, NCCN recommendations parallel the FDA approved indications.

- The PD-1 and PD-L1 inhibitors have the potential to cause immune-mediated adverse reactions that can result in pneumonitis, colitis, hepatitis, endocrinopathies, and nephritis.
- Jemperli (dostarlimab) is coverable up to the dose and quantity that is specified in the coverage criteria. It is administered until disease progression or unacceptable toxicity.
- Optimal sequencing of chemotherapy and immunotherapy in many cancers is unknown or the data is evolving. At this time, sequential use of immunotherapies is not supported by current evidence. Specifically, there is no evidence to support the sequential use of different PD-1 or PD-L1 inhibitors once there is disease progression on prior PD-1 or PD-L1 inhibitor therapy, as well as use of adjuvant PD-1/PD-L1 inhibitor after neoadjuvant PD-1/PD-L1 inhibitor therapy (unless explicitly listed in the coverage criteria). Therefore, the use of sequential courses of PD-1/PD-L1 immunotherapy is not coverable.
- There are ongoing studies using Jemperli (dostarlimab) in a variety of other cancers. However, although initial evidence may be promising, the potential for clinical benefit in these conditions is still being investigated.
- *Reauthorization Criteria*: When coverage criteria are met, Jemperli (dostarlimab) is authorized for six months (24 weeks) of therapy, after which time documentation must be provided to establish that the medication is effective. Specifically, there must be documentation of clinical benefit, including disease stability or improvement and there is a lack of disease progression, based on an assessment of change in tumor burden. Documentation of benefit must include an assessment of the most recent imaging ("restaging scans") and/or re-biopsy by the treating oncologist.

Regence Pharmacy Services performs independent analyses of oncology medication evidence, to establish coverability per the contracts with the health plan.

- Most contracts define coverability based on established clinical benefit in published, peer-reviewed literature, along with consideration of regulatory status.
- FDA approval does not in itself establish medical necessity, as unpublished, low-quality evidence, including exploratory analyses and unvalidated surrogate endpoints, may be used as the basis of approval. Regulatory approval may or may not reflect clinical benefit relative to standard of care and the recommendations of expert clinical advisors such as the Oncologic Drugs Advisory Committee (ODAC). FDA approvals generally do not consider cost compared to established therapies, or value to members.
- Likewise, NCCN clinical practice guidelines assignment of a recommendation (category 1, 2a, or 2b) does not necessarily establish medically necessity. NCCN recommendations are inconsistently supported by published, peer-reviewed literature and do not uniformly consider value of new therapies relative to existing potentially higher-value treatment options, considering effectiveness, safety, and cost.
- Medication coverage criteria are developed based on the 'medical necessity' assessment, as described above.

Regence Pharmacy Services analysis and coverage policy may differ from FDA labeled indication and/or NCCN clinical practice guidelines.

Clinical Efficacy

ENDOMETRIAL CANCER (EC)

- *Disease Background [1]*
  - Endometrial cancer (EC) is the most commonly occurring gynecologic cancer in the U.S. Most cases (75%) are diagnosed at an early stage and can be cured with surgery. However, approximately 25% are diagnosed in advanced stages.
  - For advanced disease, first-line therapy with surgery and platinum-containing chemotherapy (standard of care) results in overall survival ranging between 13 and 29 months with tumor response rates of 40 to 62%.
  - Upon disease progression in the advanced disease setting, tumor response rates are generally in the 7 to 14% range with single-agent chemotherapy.
  - It is estimated that approximately 25% to 30% of endometrial tumors may have a high frequency of somatic mutations which are attributable to deficiencies in DNA mismatch repair (dMMR) making these tumors a possible target of immunotherapies such as programmed death receptor-1 inhibitors.
- The efficacy of Jemperli (dostarlimab) was evaluated in a small, non-comparative, non-blinded study (GARNET) that evaluated tumor response in patients with advanced EC. *[2 3]* The quality of this data is poor due to the lack of randomization, blinding, and comparator. Furthermore, tumor response is not predictive of improvement in any clinically relevant outcome.
  - The population evaluated for the EC indication was a specific cohort from a larger study that included patients with many different types of solid tumors. All patients in the EC cohort had mismatch repair deficient (dMMR) EC that could not be cured with surgery (advanced or metastatic disease) and had progressed on or after platinum doublet therapy.
  - Tumor response (objective response rate) was 42% with 12.7% complete responses. Seventy three percent of patients had a duration of response of 6 months or longer.
  - The following patients were excluded from the study: Patients with endometrial sarcoma and patients who had prior therapy with a PD-1/PD-L1 inhibitor.
- Subsequently, Jemperli (dostarlimab) was evaluated in a large, randomized, double-blind, placebo-controlled trial (RUBY study) as part of a front-line regimen for patients with advanced endometrial cancer for tumors that are dMMR or microsatellite instability-high (MSI-H). [4]
  - Patients enrolled in the study had no prior systemic therapy in the advanced disease setting, including no prior PD-1/PD-L1 inhibitor therapy. More specifically, patients included in the study had:
    - Primary advanced stage III or IV disease,
    - Initial recurrent disease without prior systemic therapy, or
    - Recurrent disease previously treated with neoadjuvant or adjuvant systemic therapy with recurrence or progression at least 6 months after completion or treatment (first recurrence).

    * Jemperli (dostarlimab) or placebo was initiated in combination with carboplatin plus paclitaxel chemotherapy for six cycles and was then continued as a single agent until disease progression.
    * The study enrolled patients with both mismatch repair deficient (dMMR) and mismatch repair proficient (pMMR) tumors. Though an initial interim analysis of progression-free survival (PFS) concluded that the any benefit was attributable to the dMMR subgroup, a later analysis of the mature overall survival (OS) endpoint demonstrated a statistically significant and clinically relevant OS advantage that extended to patients with tumor that were MMR proficient (pMMR tumors). [5]
    * The median OS reported in the study was 44.6 months and 28.2 months in the Jemperli (dostarlimab) and placebo treatment arms, respectively (HR 0.69 [95% CI 0.54, 0.89]; p = 0.002).
- The National Comprehensive Cancer Network (NCCN) Uterine Neoplasms guideline lists Jemperli (dostarlimab) as a monotherapy among potential treatment options for progressive/advanced dMMR or MSI-H endometrial carcinoma in the subsequent-line treatment setting. It is also listed among preferred front-line regimens for recurrent disease when used in combination with carboplatin and paclitaxel, regardless of MMR status. [1]

REAUTHORIZATION CRITERIA:

- When coverage criteria are met, Jemperli (dostarlimab) is authorized for six months (24 weeks) of therapy, after which time documentation must be provided to establish that the medication is effective. Specifically, there must be documentation of clinical benefit, including disease stability or improvement and there is a lack of disease progression, based on an assessment of change in tumor burden.
    * The standard of care for evaluation of response to cancer immunotherapy, such as Jemperli (dostarlimab), is use of the iRECIST criteria for assessment of tumor burden. [6]
    * The iRECIST criteria include use of quantitative and qualitative criteria for assessment of change in tumor burden for target lesions and non-target lesions. [7]
        ▪ Quantitative measurements for target lesions (tumor size and % change)
        ▪ Qualitative evaluation for non-target lesions (present/disappeared/ unequivocal progression)
    * Documentation of benefit must include an assessment of the most recent imaging (“restaging scans”) by the treating oncologist. Given the complexity of the evaluation, including use of the iRECIST criteria, Jemperli (dostarlimab) will not be reauthorized without an assessment of response to therapy, such a partial response (iPR), complete response (iCR), or stable disease (iSD).
    * Use of immunotherapy may result in pseudoprogression, due to immune and T-cell activation, which can appear similar to tumor flare. If there is documentation of potential disease progression [“unconfirmed progressive disease (iUPD)”], a shortened authorization (up to three months) may be approved to allow time for

clarification of response to Jemperli (dostarlimab), including clinical re-evaluation of the patient and reimaging. Guidelines recommend reimaging for iUPD after 4-8 weeks.

* If a patient has confirmed, unequivocal new lesions (progression of disease, iPD), additional Jemperli (dostarlimab) is not coverable. If a new lesion is equivocal, iUPD reassessment by the treating oncologist with repeat imaging would apply (as noted above).

INVESTIGATIONAL USES

- Jemperli (dostarlimab) is actively being studied to determine if there is benefit in treating other types of cancers including non-small cell lung cancer and malignant melanoma. [8] To date, studies are preliminary and ongoing and the risk versus potential for clinical benefit remains under investigation.
- ***dMMR Solid Tumors (other than EC)*** [9]
  * Jemperli (dostarlimab) is FDA approved as a treatment option for patients with any progressive dMMR solid tumor ("tumor agnostic") when no satisfactory treatment alternatives are available.
  * The Accelerated approval of Jemperli (dostarlimab) for all dMMR solid tumors was based on preliminary results from a 'basket trial' which included patients with any type of solid tumor as long as it was dMMR. The sample size for most tumors was very small with most tumor types being represented in only one or two patients. Additionally, the population did not include all types of solid tumors.
  * Subjects enrolled in the trial had advanced solid tumors, at least one prior chemotherapy regimen, and no acceptable treatment alternatives.
  * Although reported tumor response rates appear promising, it is not known if Jemperli (dostarlimab) improves tumor response in all dMMR solid tumors, or positively impacts any clinically relevant outcome. Confirmatory studies are necessary to establish clinical benefit. Therefore, the use of Jemperli (dostarlimab) for dMMR tumors (other than EC) is considered investigational.

Dosing [9]

- ***Jemperli (dostarlimab) as part of a front-line regimen for advanced endometrial cancer:*** 500 mg IV every 3 weeks for six doses in combination with carboplatin and paclitaxel, followed by single agent Jemperli (dostarlimab) 1,000 mg IV every six weeks until disease progression.
- ***Jemperli (dostarlimab) as a single agent for advanced endometrial cancer that has progressed on prior chemotherapy:*** 500 mg IV every 3 weeks for four doses, followed by 1000 mg IV every 6 weeks until disease progression.

Safety [9]

- Package labeling warns of the potential for immune-mediated adverse effects and infusion-related reactions.
- The overall safety profile of Jemperli (dostarlimab) appears similar to other PD-1 inhibitors.

9. Jemperli (dostarlimab) [package insert]. GlaxoSmithKline LLC; Philadelphia, PA; August 2024.

Revision History

Revision Date	Revision Summary
9/19/2024	**Effective 1/1/2025:** • Changed reauthorization from 'may' to 'shall.' Operationally, all approvals will be for 24 weeks (6 months). Ongoing therapy (beyond 24 weeks) will be subject to reauthorization review every 24 weeks, for documentation of disease stability or improvement and lack of disease progression.
9/19/2024	**Effective 12/1/2024:** • Updated criterion II.C.1.a. to read 'No prior systemic therapy for endometrial carcinoma in the advanced treatment setting' (from 'No prior systemic therapy for endometrial carcinoma') to clarify intent (no change to overall intent of coverage criteria). • Removed criterion II.C.1.b to reflect new evidence showing that Jemperli (dostarlimab) also provides benefit in the front-line setting when used with carboplatin and paclitaxel in tumors with pMMR status. *(a new FDA indication expanding use from the population with dMMR tumors to the population with either dMMR OR pMMR tumors)*
12/7/2023	Coverage for Jemperli (dostarlimab) was added for advanced endometrial cancer when used as part of a front-line regimen (no prior systemic therapy) for tumors that are mismatch repair deficient (dMMR) or microsatellite instability-high (MSI-H) when initiated in combination with carboplatin and paclitaxel and there has been no prior use of PD-1 or PD-L1 inhibitor therapies.
12/9/2022	• Updated standard language in policy. • No changes to coverage criteria with this annual update.
10/15/2021	New policy (effective 11/15/2021). • Limits coverage to patients with progressive/advanced dMMR endometrial cancer after there has been progression on standard of care front-line cytotoxic chemotherapy. • Added use in other dMMR solid tumors (a new indication since the original approval) as investigational because clinical benefit in this expanded, tumor agnostic setting has not been established. • Sequential use of PD-1/PD-L1 inhibitor therapies has not been studied or shown to be effective and is therefore not coverable.

Medication Policy Manual

Policy No: dru675

Topic: Zynlonta, loncastuximab tesirine-lpyl

Date of Origin: November 15, 2021

Committee Approval Date: March 6, 2025

Next Review Date: 2026

Effective Date: May 1, 2025

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Zynlonta (loncastuximab tesirine-lpyl) is an antibody-drug conjugate that binds to the CD19 antigen on B-lymphocytes and on several B-cell cancers. It is used in the treatment of relapsed or refractory large B-cell lymphoma where disease has progressed after at least two prior therapies.

Policy/Criteria

Most contracts require pre-authorization approval of Zynlonta (loncastuximab tesirine-lpyl) prior to coverage.

I. Continuation of therapy (COT): Zynlonta (loncastuximab tesirine-lpyl) may be considered medically necessary for COT when criterion A, B, or C below is met.

A. For diagnoses NOT listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND there is documentation that the medication was covered by another health plan. Examples of documentation include the coverage approval letter from the previous health plan or paid claim.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

B. For diagnoses listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

C. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

II. New starts (treatment-naïve patients): Zynlonta (loncastuximab tesirine-lpyl) may be considered medically necessary when criteria A through D below are met.

A. A diagnosis of one of the following types of **relapsed or refractory large B-cell lymphoma**:

1. Diffuse large B-cell lymphoma, not otherwise specified (DLBCL, NOS).

2. DLBCL arising from low-grade lymphoma.

3. High-grade B-cell lymphoma.

AND

B. There was disease progression on or after at least two prior systemic lymphoma therapies.

AND

C. Zynlonta (loncastuximab tesirine-lpyl) will be used as monotherapy.

AND

D. There has been no prior use of Zynlonta (loncastuximab tesirine-lpyl).

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers Zynlonta (loncastuximab tesirine-lpyl) coverable only under the medical benefit (as a provider-administered medication).

B. When pre-authorization is approved, Zynlonta (loncastuximab tesirine-lpyl) will be authorized as follows:

1. ***Initial two cycles:*** Doses up to 150 mcg/kg for up to two infusions in six weeks.
2. ***Subsequent cycles:*** Doses up to 75 mcg/kg for up to one infusion every three weeks until disease progression.

C. Authorization **may** be reviewed at least annually. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, including disease stability or improvement, relative to baseline symptoms.

IV. Zynlonta (loncastuximab tesirine-lpyl) is considered investigational when used for all other conditions, unless otherwise specified in the coverage criteria above.

Position Statement

Summary

- Zynlonta (loncastuximab tesirine-lpyl) is a CD19-directed antibody-drug conjugate approved for use in patients with relapsed or refractory (R/R) large B-cell lymphoma, including diffuse large B-cell lymphoma not otherwise specified (DLBCL NOS), DLBCL arising from low-grade lymphoma, and high-grade B-cell lymphoma, after two or more lines of systemic therapy.
- The intent of this policy is to allow coverage of Zynlonta (loncastuximab tesirine-lpyl) in the setting described above (in the coverage criteria), where it has been evaluated for efficacy, up to the dose shown to be safe in clinical trials. The FDA approval was based on low-quality data from a single, small, non-comparative, non-blinded study that evaluated an endpoint that has not been proven to predict clinical benefit.
- Zynlonta (loncastuximab tesirine-lpyl) was evaluated in patients with relapsed or refractory DLBCL, NOS. The population included patients with transformed disease, as well as a small population of patients with high-grade lymphoma. All patients enrolled in the study had at least two prior systemic therapies for their lymphoma.
- The efficacy of Zynlonta (loncastuximab tesirine-lpyl) relative to other salvage therapies used for DLBCL is not known as head-to-head studies have not been conducted.
- Repeat use of Zynlonta (loncastuximab tesirine-lpyl) after disease progression has not been studied and is considered investigational. Based on its mechanism of action, there is the potential that it might impact the efficacy of subsequent therapies that bind to CD19, such as CAR T-cell therapies. Further study is warranted.
- The National Comprehensive Cancer Network (NCCN) B-cell lymphomas guideline lists Zynlonta (loncastuximab tesirine-lpyl) among options for DLBCL that has progressed on

or after at least two prior therapies.

- Zynlonta (loncastuximab tesirine-lpyl) is given as a 30-minute infusion in a dose of 150 mcg/kg IV every three weeks for two cycles. The dose is then decreased to 75 mcg/kg IV every three weeks until disease progression.
- The safety and effectiveness of Zynlonta (loncastuximab tesirine-lpyl) in conditions other than advanced DLBCL have not been established.

Regence Pharmacy Services performs independent analyses of oncology medication evidence, to establish coverability per the contracts with the health plan.

- Most contracts define coverability based on established clinical benefit in published, peer-reviewed literature, along with consideration of regulatory status.
- FDA approval does not in itself establish medical necessity, as unpublished, low-quality evidence, including exploratory analyses and unvalidated surrogate endpoints, may be used as the basis of approval. Regulatory approval may or may not reflect clinical benefit relative to standard of care and the recommendations of expert clinical advisors such as the Oncologic Drugs Advisory Committee (ODAC). FDA approvals generally do not consider cost compared to established therapies, or value to members.
- Likewise, NCCN clinical practice guidelines assignment of a recommendation (category 1, 2a, or 2b) does not necessarily establish medically necessity. NCCN recommendations are inconsistently supported by published, peer-reviewed literature and do not uniformly consider value of new therapies relative to existing potentially higher-value treatment options, considering effectiveness, safety, and cost.
- Medication coverage criteria are developed based on the 'medical necessity' assessment, as described above.

Regence Pharmacy Services analysis and coverage policy may differ from FDA labeled indication and/or NCCN clinical practice guidelines.

Clinical Efficacy [1,2]

- The efficacy of Zynlonta (loncastuximab tesirine-lpyl) was evaluated in a small, non-comparative, non-blinded study that evaluated tumor response as an endpoint. The quality of this data is poor due to the lack of randomization, blinding, and comparator. Furthermore, tumor response is not predictive of improvement in any clinically relevant outcome (e.g., improved survival or quality of life).
    * The study evaluated patients with relapsed or refractory diffuse large B-cell lymphoma (DLBCL) whose disease had progressed on or after at least two prior multi-agent systemic treatment regimens.
    * The majority of the population (127/145; 88%) had a diagnosis of DLBCL, not otherwise specified (NOS). There was also a small population (11/145; 8%) of patients in the trial with high-grade B-cell lymphoma. Twenty percent of the population had transformed DLBCL.
    * One percent of the study population had a prior allogeneic stem cell transplant (SCT), 14% of the population had a prior autologous SCT, and 9% of the

population had prior CAR T-cell therapy.

* Study exclusions:
  - Patients with CNS lymphoma.
  - Patients with bulky disease (tumors ≥ 10 cm) were excluded in a protocol amendment after it was found they had a poor response to this therapy.

- It is not known how the efficacy of Zynlonta (loncastuximab tesirine-lpyl) compares with any other therapy for DLBCL as no head-to-head studies have been conducted.
- The National Comprehensive Cancer Network (NCCN) B-cell lymphomas guideline lists Zynlonta (loncastuximab tesirine-lpyl) among potential treatment options for relapsed or refractory DLBCL when disease has progressed on or after at least two prior systemic therapies. [3]

Investigational Uses [4]

- There are currently no published clinical trials evaluating the safety or efficacy of Zynlonta (loncastuximab tesirine-lpyl) for the treatment of conditions other than the large B-cell lymphoma subtypes listed in the coverage criteria.
- There are future studies planned that will evaluate the use of Zynlonta (loncastuximab tesirine-lpyl) in other B-cell lymphomas and in specific non-Hodgkin lymphomas.

Safety and Tolerability [5]

- Approximately one-quarter of the patients enrolled in the Zynlonta (loncastuximab tesirine-lpyl) clinical trial discontinued therapy due to an adverse event (AE). Fifty-one percent of patients required an interruption in treatment due to an AE.
- There is a theoretical potential that Zynlonta (loncastuximab tesirine-lpyl), as well as other CD19-directed lymphoma therapies, might negatively impact the efficacy of subsequent anti-CD19 CAR T-cell therapies.

Appendix 1: DLBCL, not otherwise specified (NOS)
• Defined in the World Health Organization (WHO) classification of mature lymphoid neoplasms • Diagnosis of exclusion • ICD10 codes(s): C83.30 to C83.39, depending on site of tumor

Medication Policy Manual

Policy No: dru677

Topic: Interleukin-1 Antagonists

- Arcalyst, rilonacept
- Ilaris, canakinumab
- Kineret, anakinra

Date of Origin: October 1, 2021

Committee Approval Date: June 20, 2024

Next Review Date: 2025

Effective Date: October 1, 2024

IMPORTANT REMINDER

This Medical Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of medical policy is to provide a guide to coverage. Medical Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Arcalyst (rilonacept), Ilaris (canakinumab), and Kineret (anakinra) are medications that block the activity of interleukin-1 (IL-1), a protein involved in inflammation.

Policy/Criteria

Most contracts require pre-authorization approval of interleukin-1 antagonists prior to coverage.

I. Continuation of therapy (COT): Interleukin-1 antagonists, Arcalyst (rilonacept), Ilaris (canakinumab), and Kineret (anakinra), may be considered medically necessary for COT when criterion A **AND** B below are met.

A. One of the following (1, 2, or 3):

1. For diagnoses NOT listed in the coverage criteria below, criteria a through c below must be met:

a. The patient was established on therapy prior to current health plan membership AND there is documentation that the medication was covered by another health plan. Examples of documentation include the coverage approval letter from the previous health plan or paid claim.

AND

b. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

AND

c. Step therapy with prior use of lower cost interleukin-1 antagonists is met (i or ii):

i. For Arcalyst (rilonacept) only (1 or 2):

1. There is documentation of prior treatment with Kineret (anakinra), and treatment was ineffective or not tolerated, unless use is documented as medically contraindicated.

OR

2. The prescriber has submitted clinical rationale that establishes Kineret (anakinra) is not a treatment option. The rationale is supported by known clinical characteristics of the patient as well as clinical properties of Kineret (anakinra).

OR

ii. For Ilaris (canakinumab) only (1 or 2):

1. There is documentation of prior treatment with Arcalyst (rilonacept) and Kineret (anakinra), and each was ineffective or not tolerated, unless use is documented as medically contraindicated.

OR

2. The prescriber has submitted clinical rationale that establishes Arcalyst (rilonacept) and Kineret (anakinra) are BOTH not a treatment option. The rationale is supported by known clinical

characteristics of the patient as well as clinical properties of BOTH Arcalyst (rilonacept) and Kineret (anakinra).

PLEASE NOTE: *Documentation of prior use of and response to lower-cost therapy, including use in the distant past, must be provided for this criterion to be met.*

OR

2. For diagnoses listed in the coverage criteria below, criteria a, b, and c must be met:

a. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

b. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

AND

c. Step therapy with lower cost interleukin-1 antagonists is met (i or ii):

i. ***For Arcalyst (rilonacept) ONLY*:** There is documentation of prior treatment with Kineret (anakinra), and treatment was ineffective or not tolerated, unless use is documented as medically contraindicated.

OR

ii. ***For Ilaris (canakinumab) ONLY*:** There is documentation of prior treatment with Arcalyst (rilonacept) **AND** Kineret (anakinra), and each was ineffective or not tolerated, unless use is documented as medically contraindicated.

OR

3. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

AND

B. **For Ilaris (canakinumab) ONLY:** Site of care administration requirements are met [refer to Pharmacy Services Medication Policy Manual, Site of Care Review, dru408].

Please note*: Medications obtained as samples, coupons, or promotions, paying cash for a prescription("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Interleukin-1 antagonists may be considered medically necessary in patients when one of the diagnostic criterion A through E **AND** F below are met.

A. Recurrent pericarditis (RP)

Arcalyst (rilonacept) and Kineret (anakinra) may be considered medically necessary for RP when there is clinical documentation (including, but not limited to chart notes) that criteria 1 through 3 below are met:

1. A diagnosis of RP established by or in conjunction with a specialist in cardiology, rheumatology, or immunology.

AND

2. The patient has had an episode of recurrent pericarditis while currently taking colchicine. If colchicine is contraindicated or not tolerated, low-dose corticosteroids must have been ineffective, contraindicated, or not tolerated.

AND

3. **For Arcalyst (rilonacept) only:** Prior treatment with Kineret (anakinra) was ineffective, unless not tolerated or use is contraindicated.

OR

B. Rheumatoid arthritis (RA)

Kineret (anakinra) may be considered medically necessary for RA when criteria 1 through 3 below are met:

1. A diagnosis of RA when established by or in consultation with a specialist in rheumatology.

AND

2. Treatment with a conventional synthetic DMARD (csDMARD) for at least 6 to 12 weeks was ineffective, not tolerated, or all csDMARDs are contraindicated. csDMARDs for RA include hydroxychloroquine, leflunomide, methotrexate, and sulfasalazine.

AND

3. There is clinical documentation that treatment with **at least two** Level 1 or Level 2 self-administered therapies was not effective after at least a 12-week treatment course unless all were not tolerated or are contraindicated.

Level 1 or 2 Treatments for Rheumatoid Arthritis	
Level 1	• Enbrel (etanercept) • Humira (adalimumab)
Level 2	• Rinvoq (upadacitinib) • Xeljanz/Xeljanz XR (tofacitinib)

OR

C. Still's disease [systemic juvenile idiopathic arthritis (SJIA) or adult-onset still's disease (AOSD)]

Ilaris (canakinumab) and Kineret (anakinra) may be considered medically necessary for Still's disease (SJIA and AOSD) when there is clinical documentation (including, but not limited to chart notes) that criteria 1 through 4 below are met:

1. A diagnosis of Still's disease (SJIA; AOSD) when established by or in consultation with a specialist in rheumatology.

AND

2. There is disease activity greater than 6 weeks.

AND

3. One of the following are met:

a. Treatment with at least one oral conventional synthetic DMARD (csDMARD) was not effective after 12 weeks, not tolerated, or is contraindicated. csDMARDs for the treatment of SJIA include azathioprine, cyclosporine, leflunomide, methotrexate, systemic corticosteroids, and tacrolimus.

b. Treatment with at least one NSAID (e.g., ibuprofen, celecoxib) was not effective after 4 weeks, not tolerated, or all are contraindicated.

AND

4. **For Ilaris (canakinumab) only:** Prior treatment with both Actemra (tocilizumab) and Kineret (anakinra) has been ineffective, not tolerated or is contraindicated.

OR

D. Periodic fever syndromes

Arcalyst (rilonacept), Ilaris (canakinumab), and Kineret (anakinra) may be considered medically necessary for periodic fever syndromes when there is clinical documentation (including, but not limited to chart notes) that criteria 1 and 2 below are met:

1. **For Arcalyst (rilonacept) and Ilaris (canakinumab) only:** Prior treatment with Kineret (anakinra) was ineffective, unless not tolerated or use is contraindicated.

AND

2. One of the following diagnostic criterion (a through d) below is met AND established by or in consultation with a specialist in rheumatology, immunology, or hematology:

a. A diagnosis of **cryopyrin associated periodic syndromes (CAPS)** and criteria i, ii, and iii below are met:

i. There is laboratory evidence of a genetic mutation in the cold-induced auto-inflammatory syndrome 1 (CIAS1 – sometimes referred to as the NLRP3).

AND

ii. There is clinical documentation of at least one of the following types of CAPS (1, 2, or 3) below:

1. **Neonatal onset multisystem inflammatory disease (NOMID)**.

OR

2. **Familial cold auto-inflammatory syndrome (FCAS)**.

OR

3. **Muckle-Wells syndrome (MWS)**.

AND

iii. **For Arcalyst (rilonacept) and Ilaris (canakinumab) only:** Documented significant functional impairment as a result of CAPS, leading to limitations in activities of daily living (ADLs).

OR

b. A diagnosis of **Familial Mediterranean fever (FMF)** and treatment with colchicine was ineffective, not tolerated, or is contraindicated.

OR

c. A diagnosis of **Tumor necrosis factor receptor-1 associated periodic syndrome (TRAPS)**, as confirmed by genetic testing.

OR

d. A diagnosis of **Hyperimmunoglobulin D syndrome (HIDS)/mevalonate kinase deficiency (MKD)**, as confirmed by elevated immunoglobulin D (IgD) levels and/or genetic testing.

OR

E. **Deficiency of interleukin-1 receptor antagonist (DIRA)**

Arcalyst (rilonacept) and Kineret (anakinra) may be considered medically necessary for DIRA when there is clinical documentation (including, but not limited to chart notes) that criteria 1 and 2 below are met:

1. A diagnosis of DIRA established by or in conjunction with a specialist in rheumatology, or immunology.

AND

2. **For Arcalyst (rilonacept) only:** Prior treatment with Kineret (anakinra) was ineffective, not tolerated, or is contraindicated.

AND

F. **For Ilaris (canakinumab) ONLY:** Site of care administration requirements are met [refer to Pharmacy Services Medication Policy Manual, Site of Care Review, dru408].

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers Arcalyst (rilonacept) and Kineret (anakinra) coverable only under the pharmacy benefit (as self-administered medications).

B. Regence Pharmacy Services considers Ilaris (canakinumab) coverable only under the medical benefit (as a provider-administered medication).

C. When pre-authorization is approved, interleukin-1 antagonists will be authorized in quantities as listed in Table 1:

TABLE 1.

Product	Quantity Limit
Arcalyst (rilonacept)	**1. For periodic fever syndromes and RP:** **a.** Initial: Up to 25 vials containing 220 mg each in the first 24-week period (based on a loading dose of 320 mg once followed by 160 mg weekly). **b.** Continued Authorization: Up to four 220 mg vials per 28 days (based on a dose of 160 mg every week). **2. For DIRA:** Up to 320 mg (2 vials) per week.
Ilaris (canakinumab)	**1. For CAPS:** Up to 1 vial (150 mg) every 8 weeks (i.e., 7 vials in a 12-month period). **2. For FMF, TRAPS, HIDS/MKD:** Up to 2 vials (300 mg) every 4 weeks (i.e., 26 vials in a 12-month period). **3. For SJIA and AOSD:** Up to 2 vials (300 mg) every 4 weeks (i.e., 26 vials in a 12- month period).
Kineret (anakinra)	**1. For RA, RP, SJIA, AOSD, FMF, TRAPS, HIDS/MKD:** Up to 28 doses (twenty-eight 100 mg syringes) every 4 weeks. **2. For CAPS and DIRA:** A quantity sufficient for up to 28 doses every four weeks based on a recommended maximum dose of 8 mg/kg per day.

AOSD: Adult-onset still's disease; CAPS: cryopyrin associated periodic syndromes; DIRA: deficiency of interleukin-1 receptor antagonist; FMF: Familial Mediterranean fever; HIDS: Hyperimmunoglobulin D syndrome; MKD: mevalonate kinase deficiency; RA: rheumatoid arthritis; RP: recurrent pericarditis; SJIA: systemic juvenile idiopathic arthritis; TRAPS: tumor necrosis factor receptor-1 associated periodic syndrome.

C. Authorization Limits:

TABLE 2.

Product	Authorization Limit
Arcalyst (rilonacept)	**1. For Periodic fever syndromes:** **a.** Initial authorization: **Shall** be reviewed at 6 months. **b.** Continued authorization: **Shall** be reviewed at least annually. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, such as disease stability or improvement of associated symptoms. **2. For RP and DIRA:** Authorization **may** be reviewed at least annually to confirm that current medical necessity criteria are met, and that the medication is effective.
Ilaris (canakinumab)	Initial authorization: **Shall** be reviewed at 6 months. Continued authorization: **Shall** be reviewed at least annually. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, such as disease stability or improvement of associated symptoms.
Kineret (anakinra)	Authorization **may** be reviewed at least annually to confirm that current medical necessity criteria are met, and that the medication is effective.

RP: recurrent pericarditis; DIRA: deficiency of interleukin-1 receptor antagonist.

IV. Interleukin-1 antagonists are considered investigational when used for all other conditions including, but not limited to:

A. Atherosclerotic coronary artery disease (ASCAD).

B. Bursitis.

C. Chronic Kidney Disease (CKD).

D. Diabetes Mellitus Type 1 (DM).

E. Gout.

Position Statement

Summary

- Arcalyst (rilonacept), Ilaris (canakinumab), and Kineret (anakinra) are interleukin-1 antagonists) used in the treatment of several inflammatory conditions.
- The intent of this policy is to cover interleukin-1 (IL-1) antagonists for the indications and dose for which they have been shown to be safe and effective in the available evidence, as detailed in the coverage criteria.
- Other than rheumatoid arthritis (RA), there is limited overall evidence for the use of IL-1 antagonists given the rarity of most of the conditions for which IL-1 antagonists are used. Much of the evidence is of very low quality.
- The general approach to conditions covered in this policy is use of stepwise treatment with various anti-inflammatories, such as nonsteroidal anti-inflammatory drugs (NSAIDs) and colchicine (diagnosis-dependent), as well as use of preferred treatment options. IL-1 antagonists are generally reserved for patients not responding to standard of care.
- There are no head-to-head trials comparing any of the IL-1 antagonists to each other or any other medication in the management of any condition. In several of the covered conditions, lowest-cost Kineret (anakinra) is a treatment option based on years of clinical experience as the first-available IL-1 antagonist.
- For this health plan, Kineret (anakinra) provides the best value among IL-1 antagonists for many of the covered conditions. Therefore, higher-cost IL-1 antagonists [Arcalyst (rilonacept) and Ilaris (canakinumab)] are coverable only when lower-cost Kineret (anakinra) therapy is ineffective or not a treatment option, as detailed in the coverage criteria.
- For patients established on higher-cost IL-1 antagonists [Arcalyst (rilonacept) and Ilaris (canakinumab)] prior to membership with this health plan, continuation of therapy (COT) criteria must be met, including prior use of lower-cost Kineret (anakinra) therapy, unless there is specific documentation that the patient is not a candidate for treatment with Kineret (anakinra).

Clinical Efficacy

Recurrent Pericarditis (RP)

- *Disease background*: [1] RP is characterized by chest pain associated often with peculiar electrocardiographic changes and may be accompanied by pericardial effusion. Pericarditis is considered recurrent (RP) when there has been a recurrence at least 4-6 weeks after the first episode. NSAIDs and colchicine are first-line options to treat pericarditis and prevent recurrences. Guidelines recommend colchicine be continued for at least 6 months. Arcalyst (rilonacept) and Kineret (anakinra) are considered third-line options in patients who have had recurrences despite treatment with colchicine.
- Efficacy of Arcalyst (rilonacept) in recurrent pericarditis (RP) is based on one phase 3 randomized withdrawal study (RHAPSODY). [2 3]
    * Patients with RP were initially assigned to receive Arcalyst (rilonacept) for 16 weeks. Patients who had a response during the initial period were then randomized to continue Arcalyst (rilonacept) (n=30) or switch to placebo (n=31).

    * The primary endpoint was time to first pericarditis recurrence. This was an event driven study, and the study was stopped when 22 events occurred.
    * Results showed that, rilonacept significantly reduced the recurrence of pericarditis compared to patients who were randomized to placebo.
- Efficacy of Kineret (anakinra) is based on one phase 2 randomized-withdrawal trial (AIRTRIP). [4]
    * Kineret (anakinra) was administered at 2 mg/kg per day (up to 100 mg), for 2 months to patients with an episode of pericarditis. Patients who responded to treatment were then randomized to continue Kineret (anakinra) (n = 11) or switch to placebo (n = 10) for 6 months or until an episode of RP occurred.
    * RP occurred in 9 of 10 patients assigned to placebo and 2 of 11 patients assigned to Kineret (anakinra), a significant difference.
    * While the evidence is of lower quality due to the small nature of the study, Kineret (anakinra) does appear to be an effective option for the management of RP.
- 2020 American College of Cardiology Foundation (ACCF) Guidelines for RP list IL-1 blockers as a treatment option for RP; however, no product preference is given. [5]
- 2015 European Society of Cardiology (ESC) Guidelines for pericarditis recommend that aspirin or NSAIDs in combination with colchicine are used as the initial treatment for recurrent pericarditis. Each treatment is then maintained for weeks to months. [1]
    * Low-dose corticosteroids are recommended as second-line agent in patients who cannot tolerate or have a contraindication to colchicine.
    * IVIG, Kineret (anakinra), or azathioprine may be considered in cases of proven-infection negative, corticosteroid-dependent RP not responsive to colchicine. Guidelines have not been updated to include Arcalyst (rilonacept) (2015).
    * After obtaining a complete response, tapering should be done with a single class of drug at a time before colchicine is gradually discontinued.

Rheumatoid Arthritis (RA)

- Several targeted DMARDs, including Kineret (anakinra), have been shown to be effective in the treatment of RA. [6]
- The efficacy of these targeted DMARDs in the treatment of RA is similar. Refer to Drugs for Chronic Inflammatory Diseases, Medication Policy Manual, Policy No. dru444.
- Because of similar efficacy among the studied targeted DMARDs, non-preferred/non-formulary options are coverable when preferred/formulary options are ineffective, as detailed in the coverage criteria.

Systemic Juvenile Idiopathic Arthritis (SJIA; Stills Disease) and Adult- Onset Still's Disease (AOSD):

- *Disease Background:* Systemic JIA is a subtype of juvenile idiopathic arthritis that is associated with systemic inflammation, [7] such as erythematous rash, lymphadenopathy, hepatomegaly or splenomegaly, and serositis.
- IL-6 inhibitor Actemra (tocilizumab) and IL-1 antagonists [Ilaris (canakinumab) and Kineret (anakinra) only] are shown to improve signs and symptoms of SJIA, as

measured by the adapted JIA American College of Rheumatology (ACR) 30 response. Specifically, the evidence is as follows:

* The efficacy of Ilaris (canakinumab) for SJIA was based on two randomized placebo-controlled trials. [8] The primary endpoints included JIA ACR 30 response in Study 1 (n=84) and time to disease flare in Study 2 (n=177, 71 of whom were responders rolled over from Study 1). The majority of patients included in clinical trials of Ilaris (canakinumab) for SJIA were receiving methotrexate and prednisone at the time of study enrollment, and > 50% of patients had prior treatment with a biologic [e.g., Actemra (tocilizumab), Kineret (anakinra), anti-TNF agents or other biologics].
* The efficacy of Actemra (tocilizumab) and Kineret (anakinra) in SJIA was based on one RCT for each, with an improvement in ACR30, with an odds ratio favoring the biologic therapy over placebo. [9]
* At this time, the use of Arcalyst (rilonacept) for SJIA is considered investigational. Arcalyst (rilonacept) was studied in 24 systemic juvenile idiopathic arthritis (SJIA) patients in a double-blind, 4-week trial followed by an open-label phase for 23 months in 23 of these patients. Patients received 2.2 mg/kg or 4.4 mg/kg of Arcalyst (rilonacept). Improvements in clinical and laboratory measures of articular and systemic manifestations of SJIA were achieved in > 50% of Arcalyst (rilonacept)-treated patients over two years. Larger, well-designed trials are needed to establish the efficacy of Arcalyst (rilonacept) in SJIA. [10]

- Consensus guidelines from the Childhood Arthritis Rheumatology and Research Alliance (2012) endorse the use of a step-up treatment of SJIA and include use of Actemra (tocilizumab) and Kineret (anakinra) when biologics are indicated. [11] Updated ACR guidelines (2013) include use of Ilaris (canakinumab) as a biologic option. However, use of Arcalyst (rilonacept) is not recommended. [7]
- The efficacy of the coverable targeted DMARDs (as listed above) in the treatment of SJIA is generally similar. [9 12-14] However, none have been directly compared to each other in a clinical trial and there is a significant difference in the cost between these treatment options. Therefore, the costlier treatment options are coverable only when the less costly options are ineffective. For this health plan, Actemra (tocilizumab) and Kineret (anakinra) provide the best value among biologic medications used to treat SJIA.

Periodic Fever Syndromes - *including CAPS (NOMID, MWS, FCAS), FMF, TRAPS, and HIDS/MKD*

Cryopyrin-associated periodic syndromes (CAPS) – NOMID, MWS, FCAS

- *Disease Background: [15 16]*
  * CAPS are a group of rare genetic diseases affecting approximately 200 to 300 people in the United States, attributed to a specific genetic mutation.
  * Three types of CAPS affect the majority of patients:
    - Familial Cold Auto-Inflammatory Syndrome (FCAS)
    - Muckle-Wells Syndrome (MWS)

    - Neonatal-Onset Multisystem Inflammatory Disease (NOMID)
  * FCAS symptoms include recurrent intermittent episodes of fever and rash that primarily followed natural, artificial (e.g., air conditioning), or both types of generalized cold exposure.
  * MWS symptoms include a syndrome of chronic fever and rash that may wax and wane in intensity and is sometimes exacerbated by generalized cold exposure. This syndrome may be associated with deafness or amyloidosis.
  * NOMID symptoms include urticaria-like rash, CNS involvement [papilledema, cerebrospinal fluid (CSF) pleocytosis, or sensorineural hearing loss], elevated C-reactive protein (CRP), or epiphyseal and/or patellar overgrowth on radiographs.
- Medications that affect interleukin-1 (IL-1) may be helpful in controlling the symptoms of CAPS (NOMID, MWS, FCAS), including Arcalyst (rilonacept), Ilaris (canakinumab), and Kineret (anakinra). However, due to the rarity of these conditions, it has been difficult to conduct high quality scientific studies.
- There is currently insufficient evidence that IL-1 antagonists are efficacious in patients with CAPS (NOMID, MWS, FCAS) who do not exhibit the NLRP3 (CIAS1) genetic mutation.
- There have been no head-to-head trials comparing the efficacy of IL-1 antagonists against each other or any other medication in the management of CAPS (NOMID, MWS, FCAS).
- Kineret (anakinra) is FDA-approved only for NOMID. Arcalyst (rilonacept) and Ilaris (canakinumab) have FDA marketing approval for CAPS, "including MWS and FCAS." However, many patients in the pivotal trials for the FDA approval for Arcalyst (rilonacept) and Ilaris (canakinumab) were previously treated with Kineret (anakinra) for MWS or FCAS, there is years of experience with Kineret (anakinra) based on lower level evidence and use of Kineret (anakinra) is recognized in guidelines, such that Kineret (anakinra) is a potential lower-cost treatment option for patients needing IL-1 antagonists.
- *Evidence for CAPS (MWS or FCAS):*
  * Kineret (anakinra): The evidence for efficacy of Kineret (anakinra) for CAPS (FCAS or MWS) is based on retrospective and observational case series and years of experience. A 2020 comprehensive systematic review of the available evidence for the use of IL-1 antagonists in CAPS reported frequent use of Kineret (anakinra) for CAPS (both MWS and FCAS).[17] In addition, the review noted a number of trials of Ilaris (canakinumab) were in patients with CAPS (MWS, FCAS) previously on Kineret (anakinra). The most common rationale for switching IL-1 antagonist therapy were patient/parent convenience and/or injection site reaction, as well as efficacy. Guidelines recommend Kineret (anakinra) as one of the IL-1 antagonist treatment options for MWS and FCAS.[18]
  * Arcalyst (rilonacept): The evidence for efficacy of Arcalyst (rilonacept) for CAPS (FCAS or MWS) is based on one randomized, crossover study in 47 patients, all positive for the CIAS1 mutation. Patients receiving Arcalyst (rilonacept)

experienced greater clinically meaningful reductions in mean composite symptom scores (about 2 points on a 10-point scale) and maintained improvements compared to placebo after treatment for 24 weeks. [12 19 20]

- Patients initially received 6 weeks of treatment with either Arcalyst (rilonacept) or placebo then were crossed over to the other treatment in a blinded manner.
- At 6 weeks, the symptom scores of patients assigned to Arcalyst (rilonacept) had improved by 2.3 points (on a 10-point scale) relative to patients receiving placebo.
- This modest benefit was sustained for up to 24 weeks of treatment during the clinical trial. A similar benefit (compared to baseline) was seen when patients continued treatment through an open-label extension up to 48 weeks.
- Subjects withdrawn from Arcalyst (rilonacept) following Part A of the trial had a return of symptoms, while those continuing on Arcalyst (rilonacept) maintained their response to treatment.
- Improvement in laboratory test results for inflammatory markers of disease (serum amyloid A and C-reactive protein) were supportive of clinical improvement seen with Arcalyst (rilonacept). These inflammatory markers are not specific to CAPS (i.e., not diagnostic), but might be useful in monitoring clinical response to treatment.

* Ilaris (canakinumab): The evidence for efficacy of Ilaris (canakinumab) for CAPS (FCAS or MWS) is based on one trial (n=35). [21]
  - In phase 1, all patients received a single dose of Ilaris (canakinumab). Those who remained relapse-free after 8 weeks and elected to continue (n=31) were then randomized to receive Ilaris (canakinumab) 150 mg SC every 8 weeks (n=15) or placebo (n=16) for up to 24 weeks.
  - Any patient who relapsed or completed 24 weeks of therapy was then enrolled in an open-label, follow-on trial for at least two doses and up to 52 weeks of therapy.
  - Of the 35 patients initially enrolled, 34 remained relapse-free for 8 weeks.
  - During the double-blinded, randomized phase, all subjects in the Ilaris (canakinumab) group remained relapse-free versus 29% of subjects in placebo group at 24 weeks (100% vs 29%, $p < 0.001$, NNT = 2).
  - Changes in laboratory markers of inflammatory disease (CRP and SAA) were supportive of clinical findings.

- *Evidence for CAPS -neonatal-Onset Multisystem Inflammatory Disease (NOMID):*

* Kineret (anakinra): The efficacy of Kineret (anakinra) for NOMID was based on a prospective, long-term, open-label and uncontrolled study inpatients(n=43) with NOMID aged 0.7 to 46 years who were treated for up to 60 months. [6]
  - Treatment with Kineret (anakinra) resulted in improvements in all individual disease symptoms measured by a disease-specific Diary Symptom Sum Score (DSSS), as well as in the serum markers of inflammation.

- For 11 patients who went through a withdrawal phase, disease symptoms and serum markers of inflammation worsened after withdrawal and promptly responded to reinstitution of Kineret (anakinra) therapy.

* Arcalyst (rilonacept): There is no data for the use of Arcalyst (rilonacept) for NOMID. [17]

* Ilaris (canakinumab): Although trials of Ilaris (canakinumab) for CAPS included patients with NOMID, subsequent data suggests that Ilaris (canakinumab) may be less effective for NOMID as compared to Kineret (anakinra) based on CNS penetration. [22] In addition, a small trial investigated withdrawal of anakinra in patients stable on therapy for NOMID (n=6). After washout, patients were then changed to Ilaris (canakinumab). However, Ilaris (canakinumab) failed to produce a similar response to Kineret (anakinra) and dose escalation was needed.[23] Therefore, Ilaris (canakinumab) is not more effective that Kineret (anakinra), and is significantly more costly. Therefore, Ilaris (canakinumab) is coverable for NOMID only when Kineret (anakinra) is ineffective or not tolerated.

Other Periodic Fever Syndromes: FMF, TRAPS, HIDS/MKD

- *Disease Background: [16 24-26]*

* **Familial Mediterranean Fever (FMF)**
  - The most common periodic syndrome is FMF, which mainly affects people of Eastern Mediterranean ancestry. FMF affects 1 in 250 to 1 in 1,000 individuals in these populations.
  - FMF is characterized by episodic attacks of fever lasting one to three days and accompanied, in most cases, by abdominal pain, pleurisy, and arthralgias/arthritis.
  - Initial treatment of FMF is with colchicine. Colchicine is primarily effective as a prophylactic treatment for FMF attacks.

* **Tumor necrosis factor receptor-1 associated periodic syndrome (TRAPS)**
  - TRAPS is characterized by recurrent fevers over months or years. Other clinical features include focal myalgias, conjunctivitis, and rash. Fever and associated symptoms commonly last at least five days and often continue for more than two weeks.
  - Fever may respond to use of NSAIDs, and glucocorticoids are required to resolve other clinical manifestations of an attack. Off-label treatment with Enbrel (etanercept) for patients with frequent and/or severe recurrences has been reported.
  - The diagnosis of TRAPS is confirmed by genetic testing for disease-associated pathogenic variants in the tumor necrosis factor receptor-1 (TNFR1) gene (TNFRSF1A).

* **Hyperimmunoglobulin D syndrome (HIDS)/mevalonate kinase deficiency (MKD)**
  - HIDS/MKD is characterized by episodic attacks of fever lasting three to

seven days accompanied, in most cases, by chills, cervical lymphadenopathy, abdominal pain, vomiting, and/or diarrhea.

- NSAIDs and glucocorticoids are used to treat the fever and accompanying symptoms. Case reports of treatment with Actemra (tocilizumab), Enbrel (etanercept) and Kineret (anakinra) have been reported in the literature.
- The diagnosis of HIDS/MKD is confirmed by elevated immunoglobulin D (IgD) levels and/or genetic testing.

- Medications that affect interleukin-1 (IL-1) may be helpful in controlling the symptoms of other periodic fevers (FMF, TRAPS, HIDS/MKD) including Arcalyst (rilonacept), Ilaris (canakinumab), and Kineret (anakinra). However, due to the rarity of these conditions, it has been difficult to conduct high quality scientific studies.
- There have been no head-to-head trials comparing the efficacy of IL-1 antagonists against each other or any other medication in the management of other periodic fevers (FMF, TRAPS, HIDS/MKD).
- Only Ilaris (canakinumab) is FDA approved for other periodic fevers (FMF, TRAPS, HIDS/MKD). However, there is years of experience with Kineret (anakinra) based on lower level evidence, and use of Kineret (anakinra) is recognized in guidelines, such that Kineret (anakinra) is a potential lower-cost treatment option for patients needing IL-1 antagonists.
- *Evidence of Efficacy for FMF*
  * Kineret (anakinra): The evidence for efficacy of Kineret (anakinra) for FMF is based on 22 case series and years of experience. [27] In addition, the review noted a number of cases of use of Ilaris (canakinumab) in patients previously on Kineret (anakinra). IL-1 antagonist therapy was switched due to intolerance as well as efficacy.
  * Arcalyst (rilonacept): The evidence for efficacy of Arcalyst (rilonacept) for FMF is based on one small RCT (n=14). However, the complete response rate was low relative to that seen with Ilaris (canakinumab) or Kineret (anakinra). [27 28]
  * Ilaris (canakinumab): The efficacy of Ilaris (canakinumab) for the treatment of FMF, TRAPS, HIDS/MKD was demonstrated in a 4-part study consisting of three separate disease cohorts (FMF, TRAPS, HIDS/MKD). [29] (see "*TRAPS, HIDS/MKD"* below)
- *Evidence of Efficacy for TRAPS, HIDS/MKD:* Due to the rarity of these other periodic fever conditions, available trial evidence is limited.
  * Kineret (anakinra):
    - The evidence for efficacy of Kineret (anakinra) for TRAPS and HIDS/MKD is based on retrospective and observational case series and years of experience. A 2020 comprehensive systematic review of the available evidence for the use of IL-1 antagonists in CAPS reported frequent use of Kineret (anakinra) for TRAPS and HIDS/MKD. [17] In addition, the review noted a number of studies of Ilaris (canakinumab) were in patients with HIDA/MKD previously on Kineret (anakinra). The most common rationale for switching IL-1 antagonist therapy were

patient/parent convenience and/or injection site reaction, as well as efficacy. Guidelines recognize Kineret (anakinra) as one of the IL-1 antagonist treatment options for TRAPS and HIDS/MKD. [18]

* Arcalyst (rilonacept): There is no evidence for the use of Arcalyst (rilonacept) for TRAPS and/or HIDS/MKD. [17]
* Ilaris (canakinumab): The efficacy of Ilaris (canakinumab) for the treatment of FMF, TRAPS, HIDS/MKD was demonstrated in a 4-part study consisting of three separate disease cohorts (FMF, TRAPS, HIDS/MKD). [29]
    - Patients in each cohort entered a 12-week screening period (part 1) during which they were evaluated for the onset of disease flare. Patients aged 2 to 76 years were then randomized at flare onset into a 16-week double-blind, placebo-controlled treatment period (part 2) where they received either 150 mg Ilaris (canakinumab) (2 mg/kg for patients weighing less than or equal to 40 kg) subcutaneously or placebo every 4 weeks.
    - Additional doses of Ilaris (canakinumab) were permitted for patients whose disease flare did not resolve, or who had persistent disease activity. Part 3 and part 4 of the study are ongoing.
    - For the primary efficacy endpoint, Ilaris (canakinumab) was more effective than placebo in the proportion of patients with FMF, TRAPS, and HIDS/MKD who resolved their disease flare at day 15 and had no new flare over the 16 weeks of treatment from the time of resolution of the index flare.

- Guidelines recognize both Ilaris (canakinumab) and Kineret (anakinra) as IL-1 antagonist treatment options for TRAPS and HIDS/MKD. [18] Guidelines for FMF mention use of IL-1 antagonists for colchicine-resistant disease but did not include specific recommendations. [30]
- For this health plan, Kineret (anakinra) provides the best value among IL-1 antagonists used to treat FMF, TRAPS, and HIDS/MKD. Ilaris (canakinumab) was studied in patients previously on Kineret (anakinra) but is not known to be a superior treatment option.

Deficiency of Interleukin-1 Receptor Antagonist (DIRA)

- *Disease Background: [16 31]*
    * DIRA is a rare autoinflammatory disease, caused by loss of function mutations in the IL1RN gene. Prevalence is not known due to the rarity of the condition.
    * It presents with life-threatening systemic inflammation and osteomyelitis with periostitis and pustulosis. Mortality during early infancy is approximately 30%.
    * NSAIDs, conventional immunosuppressants, and steroids are considered only partially effective. Arcalyst (rilonacept) and Kineret (anakinra) are both IL-1 antagonist treatment options.
- *Evidence of Efficacy:* Due to the rarity of the condition, studies are limited to small, single-arm, open-label studies.

* Kineret (anakinra): Efficacy of Kineret (anakinra) for DIRA was based on a single long-term natural history study (n=9) for up to 10 years. After dose adjustment to control active inflammation, all nine patients were able to achieve inflammatory remission.[6 16]
* Arcalyst (rilonacept): Efficacy of Arcalyst (rilonacept) for DIRA was based on a two-year, open-label pilot study in 6 patients with DIRA and responding to Kineret (anakinra) therapy. After switching to Arcalyst (rilonacept), all six patients remained in inflammatory remission for the duration of the 2-year study.[12 31]

- For this health plan, Kineret (anakinra) provides the best value among IL-1 antagonists used to treat DIRA. Arcalyst (rilonacept) was studied in patients previously on Kineret (anakinra) but is not known to be a superior treatment option.

Other Uses

- Gout and gouty arthritis: There is insufficient evidence that use of any IL-1 antagonist is superior to less costly alternatives for gout and/or gouty arthritis, based on preliminary data.
  * A Cochrane systematic review evaluated interleukin-1 antagonists for the treatment of acute gout and concluded that there is low-quality evidence indicated that compared with maximum doses of indomethacin (50 mg three times a day), 320 mg of Arcalyst (rilonacept) may provide less pain relief with a similar rate of adverse events. [32] There is moderate-quality evidence that Ilaris (canakinumab) 150 mg may provide marginal symptomatic relief in people with an acute gout flare compared to a sub-optimal dose of intramuscular triamcinolone.[32 33] However, there is no evidence of that Ilaris (canakinumab) provides any disease modification and a small likelihood that Ilaris (canakinumab) is associated with an increased risk of adverse events. In one clinical trial, Ilaris (canakinumab) was associated with double the rate of overall and serious adverse events relative to triamcinolone.[33] In patients taking Ilaris (canakinumab), after 3 days, the pain level was reduced from 74 to 25 (on a standard rating scale from 0 to 100), whereas in patients taking triamcinolone, the pain level was reduced from 74 to 35. Serious adverse events were 1.4% for Ilaris (canakinumab) versus 0% for triamcinolone. In addition, increased uric acid levels were observed for patients taking Ilaris (canakinumab) versus triamcinolone (44% v 40%, respectively).
  * A phase 2 trial compared Kineret (anakinra) for five days to a single injection of triamcinolone in patients with gout (n=165). Both treatments were similar for gouty flares and associated pain. [34] Clinical guidelines have noted that triamcinolone is considered a weak comparator and there are numerous other treatments available. [35]
  * Arcalyst (rilonacept) was studied in a 16-week, randomized, placebo-controlled study of 241 adult patients with chronic active gouty arthritis who were initiating uric acid-lowering therapy with allopurinol. In addition to allopurinol daily, patients received 16 once-weekly injections of Arcalyst (rilonacept) (80 mg or 160 mg) or placebo. There was a reported improvement in the number of gout

flares per patient through week 16 (primary endpoint) with Arcalyst (rilonacept) vs placebo ($P < 0.001$). [36] However, this data is not helpful to determine the benefit of Arcalyst (rilonacept) relative to less costly alternatives for management of gouty flares, such as NSAIDS or corticosteroids.

- Bursitis: Arcalyst (rilonacept) versus triamcinolone was studied for the treatment of subacromial bursitis in a randomized, non-inferiority, unblinded study. While both treatments improved QuickDASH score, a measure of physical function and pain, triamcinolone offered greater improvement. [37]
- Chronic kidney disease (CKD): Arcalyst (rilonacept) was studied in 39 patients with stage 3 - 4 CKD mineral and bone disorder (CKD-MBD) who completed a randomized trial receiving either the IL-1 trap Arcalyst (rilonacept) (160 mg/week) or placebo for 12 weeks. The following CKD-MBD markers were assessed in serum before and after the intervention: calcium, phosphorus, 25-hydroxyvitamin D, 1,25-dihydroxyvitamin D, 24,25-dihydroxyvitamin D, intact parathyroid hormone (iPTH), and fibroblast growth factor 23 (FGF23). Results of the trial showed that 12 weeks of IL-1 inhibition did not improve markers of CKD-MBD or physical function.[38]
- Myocardial Infarction (MI): Ilaris (canakinumab) has been studied in patients with previous MI and a high blood level of C-reactive protein.
    * In a phase 3, randomized, placebo-controlled trial, treatment with Ilaris (canakinumab) 150 mg and 300 mg reduced the primary composite endpoint of nonfatal myocardial infarction, nonfatal stroke, or cardiovascular death.[39]
    * While promising, additional information is needed to clarify the risk-benefit profile of the drug as the magnitude of benefit is relatively small and Ilaris (canakinumab) had a significantly higher risk of serious infection and sepsis compared to placebo.
- Peripheral artery disease (PAD): One small study evaluated Ilaris (canakinumab) for the treatment of symptomatic peripheral artery disease (PAD). Results showed small improvement in walking distance, however larger, longer-term studies are needed to determine risk-benefit profile and impact on quality of life.[40]
- Other Uses:[41]
    * Ilaris (canakinumab) is also currently being studied in multiple conditions including diabetes mellitus (DM, type 1) and rheumatoid arthritis (RA). Results from these studies are not yet available.
    * Arcalyst (rilonacept) is also currently being studied in multiple other conditions including atherosclerotic coronary artery disease (ASCAD), and diabetes mellitus type 1. Results from these studies are not yet available.

Dosing:

- For FDA labeled uses, the IL-1 antagonists are coverable up to the FDA labeled doses, as studied in the associated clinical trials. [6 12 13]
- For familial Mediterranean fever (FMF), available clinical evidence studied doses of Kineret (anakinra), up to 100 mg per day. [42]
- For other covered uses, studied Kineret (anakinra) dosing was 1-2 mg/kg (up to 5 mg/kg) per day for CAPS (MWS, FCAS), HIDS/MKD and TRAPS. [16 17] Therefore, existing

CAPS (NOMID) Kineret (anakinra) quantity limit of "up to 8 mg/kg/day" is sufficient for treatment of these additional indications.

Revision History

Revision Date	Revision Summary
6/20/2024	Added Ilaris to site of care (SOC) program (effective 10/1/2024).
3/21/2024	• No criteria changes with this annual review. • Ilaris for gout remains investigational despite FDA indication. Background updated to reflect evidence.
3/16/2023	• Clarification of COT criteria (addition of a specific provider rationale). • Clarification of diagnostic criteria for Periodic Fever Syndromes for operational consistency (no change to intent; by a specialist and genetic confirmation for HIDS/MKD and TRAPS). • No change to intent for other indications.
3/18/2022	• Clarification of Continuation of Therapy (COT) criteria, with addition of step therapy with lowest-cost IL-1 antagonist, when possible. • Add step therapy with Kineret (anakinra) for periodic fever syndromes [CAPS (NOMID, MWS, FCAS), FMF, TRAPS, HIDS/MKD] and DIRA, as the lowest-cost IL-1 antagonist, recognized as a treatment option. • Simplification of CAPS criteria for operational purposes. • No change to intent for other indications.
7/16/2021	Effective 10/1/2021: • New combination policy replacing individual policies for Arcalyst, Ilaris, and Kineret (dru159, dru186, and dru444). • For Arcalyst and Kineret, added coverage criteria for recurrent pericarditis and Deficiency of Interleukin-1 Receptor Antagonist (DIRA), newly FDA approved indications. • For Ilaris, and Kineret, added coverage criteria for adult-onset Still's Disease (AOSD), a newly FDA approved indication. • No change to intent for other indications.

Drug names identified in this policy are the trademarks of their respective owners.

Medication Policy Manual | **Policy No:** dru680

Topic: Evkeeza, evinacumab-dgnb | **Date of Origin:** August 15, 2021

Committee Approval Date: March 16, 2023 | **Next Review Date:** 2024

Effective Date: June 1, 2023

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Evkeeza (evinacumab-dgnb) is an angiopeptin-like 3 (ANGPTL3) inhibitor given intravenously (IV) for the treatment of homozygous familial hypercholesterolemia (HoFH).

Policy/Criteria

Most contracts require pre-authorization approval of Evkeeza (evinacumab-dgnb) prior to coverage.

I. Continuation of therapy (COT): Evkeeza (evinacumab-dgnb) may be considered medically necessary for COT when criterion A, B, or C below is met.

A. For diagnoses NOT listed in the coverage criteria below, full policy criteria must be met for coverage.

OR

B. For diagnoses listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

C. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

Please note*: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Evkeeza (evinacumab-dgnb) may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) that criteria A, B, and C below are met.

A. A diagnosis of **homozygous familial hypercholesterolemia** (HoFH).

AND

B. Evkeeza (evinacumab-dgnb) has been prescribed by or in conjunction with a specialist in cardiology or lipid management and there is clinical documentation of at least one of the following:

1. Genetic confirmation of two mutant alleles at the *LDLR, APOB, PCSK9,* or *LDLRAP1* gene locus.

OR

2. An untreated low-density lipoprotein cholesterol (LDL-C) of > 500 mg/dL (or a treated LDL-C of > 300 mg/dL) with either:

a. Cutaneous or tendon xanthoma before age 10 years.

OR

b. Evidence of heterozygous familial hypercholesterolemia in both parents.

AND

C. Treatment with maximally tolerated statin AND PCSK-9 inhibitor (Repatha [evolocumab] or Praluent [alirocumab]) therapy has been ineffective, contraindicated, or not tolerated.

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers Evkeeza (evinacumab-dgnb) coverable only under the medical benefit (as a provider-administered medication).

B. When prior authorization is approved, Evkeeza (evinacumab-dgnb) will be authorized in quantities of up to 15 mg/kg once monthly. For doses exceeding 1200 mg, dose rounding down to the nearest available vial size (within 10% of calculated dose) is required.

C. Initial approval shall be up to 6 months. After initial authorization, Evkeeza (evinacumab-dgnb) shall be reviewed at least annually. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, such as improvement of LDL-C from baseline.

IV. Evkeeza (evinacumab-dgnb) is considered investigational when used for all other indications, including but not limited to:

A. Other causes of hypercholesterolemia, including those with heterozygous familial hypercholesterolemia (HeFH).

B. Prevention of cardiovascular disease (CVD).

Position Statement

Summary

- The intent of this policy is to limit coverage of Evkeeza (evinacumab-dgnb) to patients with a confirmed diagnosis of homozygous familial hypercholesterolemia (HoFH) who have tried and failed lower cost therapies as detailed in the coverage criteria.
- The efficacy and safety of Evkeeza (evinacumab-dgnb) was evaluated in a phase 3, double-blind trial that demonstrated a significant decrease in low density lipoprotein cholesterol (LDL-C) when compared to placebo. Most patients in the study were already established on statin medications prior to study entry. Of note, the effects of Evkeeza (evinacumab-dgnb) on cardiovascular morbidity and mortality have not been determined.
- Treatment guidelines recommend the use of a maximally tolerated high-intensity statin as first-line pharmacotherapy for patients with HoFH, even in patients who are LDL receptor negative, as they have been shown to reduce cardiovascular (CV) and all-cause mortality. [1 2 3] PCSK9 inhibitors are endorsed as add-on therapy for HoFH.[4]

- In addition, statins and PCSK9 inhibitors provide the best value. Evkeeza (evinacumab-dgnb) has not been proven to be safer or more effective than statins or PCSK9 inhibitors but is more costly.
- HoFH may be diagnosed via clinical criteria, such as baseline LDL values, family history, and physical manifestations of FH, or through genetic testing.
- Evkeeza (evinacumab-dgnb) may be covered for up to 15 mg/kg every four weeks, the dose studied in clinical trials. The safety and effectiveness of higher doses have not been established. Dose rounding down to the nearest available vial size may be required within 10% of the calculated dose to reduce product waste without sacrificing efficacy. Dose rounding within 10% of a calculated dose is an accepted industry standard and has been adopted in various clinical care areas.[5]

Background[6 7]

- HoFH is a very rare type of familial hypercholesterolemia (FH), an autosomal dominant lipid disease, that is characterized by abnormally elevated LDL-C levels and an increased propensity for early onset cardiovascular disease.
- Genetic confirmation of two mutant alleles at the *LDLR*, *APOB*, *PCSK9*, or *LDLRAP1* gene locus is confirmative of the presence of HoFH.
- Clinical criteria for FH may be used to guide a clinical diagnosis of HoFH (see *Appendices 1* and *2*).

Clinical Efficacy[8 9 10]

- The efficacy and safety of evinacumab was evaluated in ELIPSE, a phase 3, double-blind, placebo-controlled trial of patients with genetically or clinically confirmed HoFH on stable lipid-lowering therapy.
    * Patients were randomly assigned to an IV infusion of evinacumab 15 mg/kg or placebo every four weeks.
    * 63% of patients were receiving at least three lipid-modifying drugs at baseline; 94% were on a statin and 77% were on a PCSK9 inhibitor.
    * The between group decrease in LDL-C from baseline to week 24 was 49% (absolute change of -132 mg/dL), in favor of Evkeeza (evinacumab-dgnb).
    * The effects of Evkeeza (evinacumab-dgnb) on cardiovascular morbidity and mortality have not been determined.

Investigational Uses

- There are no published clinical trials evaluating the safety or efficacy of Evkeeza (evinacumab-dgnb) for the treatment of other causes of hypercholesterolemia, including those with heterozygous FH (HeFH) and prevention of cardiovascular disease (CVD).

Appendix 1: Dutch Lipid Clinic Network criteria[6]	
Criteria	**Points**
Group 1: family history	
First-degree relative with known premature (less than age 55 for males or 65 for females) coronary heart disease *OR* First-degree relative with known LDL cholesterol above 95th percentile	1
First-degree relative with tendon xanthoma and/or corneal Arcus *OR* Children < 18 years with LDL cholesterol above 95th percentile	2
Group 2: clinical history	
Premature coronary heart disease	2
Subject has cerebral or peripheral vascular disease	1
Group 3: physical examination	
(i) Tendon xanthoma	6
(ii) Corneal arcus in a person before age 45	4
Group 4: biochemical results (LDL-C)	
>8.5 mmol/L (.325 mg/dL)	8
5–8.4 mmol/L (251–325 mg/dL)	5
5.0–6.4 mmol/L (191–250 mg/dL)	3
4.0–4.9 mmol/L (155–190 mg/dL)	1
Group 5: molecular genetic testing (DNA analysis)	
(i) Causative mutation shown in the LDLR, APOB, or PCSK9 genes	8
Scoring	
> 8 points: Definite FH 6-8 points: Probably FH 3-5 points: Possible FH <3 points: Unlikely FH	

Appendix 2: Simon Broome Register Diagnostic Criteria for Definitive FH[7]
Adults: Total cholesterol levels > 290 mg/dL (7.5 mmol/L) or LDL-C > 190 mg/dL (4.9 mmol/L) Children less than 16 years of age: Total cholesterol levels > 260 mg/dL (6.7 mmol/L) or LDL-C > 155 mg/dL (4.0 mmol/L) Plus at least one of the two: **1.** Physical findings: tendon xanthomas or tendon xanthomas in a first or second degree relative. **OR** **2.** DNA-based evidence of an LDL-receptor mutation, familial defective apo B-100, or a PCSK9 mutation.

Medication Policy Manual | **Policy No:** dru682

Topic: Rybrevant, amivantamab-vmjw | **Date of Origin:** November 15, 2021

Committee Approval Date: September 19, 2024 | **Next Review Date:** 2025

Effective Date: December 1, 2024

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Rybrevant (amivantamab-vmjw) is an intravenously administered medication used in the treatment of advanced or metastatic non-small cell lung cancer (NSCLC).

Policy/Criteria

Most contracts require pre-authorization approval of Rybrevant (amivantamab-vmjw) prior to coverage.

I. Continuation of therapy (COT): Rybrevant (amivantamab-vmjw) may be considered medically necessary for COT when criterion A, B, or C below is met.

A. For diagnoses NOT listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND there is documentation that the medication was covered by another health plan. Examples of documentation include the coverage approval letter from the previous health plan or paid claim.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

B. For diagnoses listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

C. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

Please note*: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Rybrevant (amivantamab-vmjw) may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) that criteria A and B below are met.

A. A diagnosis of **locally advanced or metastatic non-small cell lung cancer** (NSCLC).

AND

B. Documentation of epidermal growth factor receptor (EGFR) exon 20 insertion mutation and criteria 1 or 2 below are met.

1. First-line: Rybrevant (amivantamab) will be used as part of a front-line regimen (no prior systemic therapy) when used in combination with pemetrexed and platin- based chemotherapy.

OR

2. Subsequent: Rybrevant (amivantamab) will be used as monotherapy when there is disease progression on or after platinum-containing (e.g., carboplatin, cisplatin) chemotherapy regimen unless contraindicated.

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers Rybrevant (amivantamab-vmjw) coverable only under the medical benefit (as a provider-administered medication).

B. When pre-authorization is approved, Rybrevant (amivantamab-vmjw) may be approved for up to FDA-recommended dose and frequency limits until disease progression.

C. Authorization **may** be reviewed at least annually. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, such as disease stability or improvement.

IV. Rybrevant (amivantamab-vmjw) is considered not medically necessary when used as subsequent therapy for locally advanced or metastatic NSCLC with EGFR exon 19 deletion or exon 21 L858R mutation.

V. Rybrevant (amivantamab-vmjw) is considered investigational when used for all other conditions (including NSCLC without EGFR mutations specified in criteria above) and/or when given concomitantly with any other targeted chemotherapy medication.

Position Statement

Summary

- Rybrevant (amivantamab-vmjw) is an antibody that targets epidermal growth factor receptor (EGFR) and mesenchymal epithelial transition (MET) receptors.
- The intent of this policy is to allow for coverage of Rybrevant (amivantamab-vmjw) for the indication and dose for which it has been shown to be safe and effective, as detailed in the coverage criteria.
- Rybrevant (amivantamab-vmjw) is approved for patients with locally advanced or metastatic non-small cell lung cancer (NSCLC) with EGFR exon 20 insertion mutations, either as front-line therapy in combination with pemetrexed and carboplatin or as subsequent therapy in those whose disease has progressed on or after platinum-based chemotherapy when given as monotherapy.
- The approval of Rybrevant (amivantamab-vmjw) as subsequent therapy in locally advanced or metastatic NSCLC is based on tumor response rates in a cohort of 81 patients whose tumors had exon 20 insertion mutations. Subsequently, Rybrevant (amivantamab) given with chemotherapy was approved in the first-line setting and found to have a longer progression free survival rate than chemotherapy. In both trials, nearly all patients had adenocarcinoma. The effect of Rybrevant (amivantamab) on clinically meaningful outcomes (such as overall survival) is not known.
- Rybrevant (amivantamab) is considered not medically necessary when given with chemotherapy for locally advanced or metastatic NSCLC with EGFR-Ex19del or L858R after progression with osimertinib. Although there was a marginal two-month progression free survival benefit with combination therapy relative to chemotherapy alone, the addition of Rybrevant (amivantamab) adds significant toxicity in the absence of any proven overall survival benefit.
- The National Comprehensive Cancer Network (NCCN) treatment guideline for NSCLC lists Rybrevant (amivantamab-vmjw) as a treatment option when given as first-line with chemotherapy or as subsequent monotherapy for patients with advanced/metastatic NSCLC with an EGFR exon 20 insertion mutation. Rybrevant (amivantamab) is also listed as an option when given with chemotherapy for locally advanced or metastatic NSCLC with EGFR-Ex19del or L858R after progression with Tagrisso (osimertinib).
- Rybrevant (amivantamab-vmjw) has not been shown to be safe and effective in any other condition or when used in combination with targeted chemotherapy medication.
- There is insufficient evidence to establish the safety or efficacy of the use of Rybrevant (amivantamab) in patients with NSCLC with mutations not specified in this policy. Although the results of the CHRYSALIS trial, using Rybrevant (amivantamab) in patients without biomarker selection are promising, the results are based on the exploratory cohort of the Phase 1, open-label trial. Larger, high-quality randomized controlled clinical trials are needed to establish the dose, clinically meaningful outcomes (such as in overall survival), and safety. As such, the use of Rybrevant in NSCLC for mutations not otherwise specified in this policy is considered investigational.

- Rybrevant (amivantamab-vmjw) may be covered for up to the doses studied in clinical trials, until disease progression or unacceptable toxicity. The safety and effectiveness of higher doses has not been studied.

Regence Pharmacy Services performs independent analyses of oncology medication evidence, to establish coverability per the contracts with the health plan.

- Most contracts define coverability based on established clinical benefit in published, peer-reviewed literature, along with consideration of regulatory status.
- FDA approval does not in itself establish medical necessity, as unpublished, low-quality evidence, including exploratory analyses and unvalidated surrogate endpoints, may be used as the basis of approval. Regulatory approval may or may not reflect clinical benefit relative to standard of care and the recommendations of expert clinical advisors such as the Oncologic Drugs Advisory Committee (ODAC). FDA approvals generally do not consider cost compared to established therapies, or value to members.
- Likewise, NCCN clinical practice guidelines assignment of a recommendation (category 1, 2a, or 2b) does not necessarily establish medically necessity. NCCN recommendations are inconsistently supported by published, peer-reviewed literature and do not uniformly consider value of new therapies relative to existing potentially higher-value treatment options, considering effectiveness, safety, and cost.
- Medication coverage criteria are developed based on the 'medical necessity' assessment, as described above.

Regence Pharmacy Services analysis and coverage policy may differ from FDA labeled indication and/or NCCN clinical practice guidelines.

Clinical Efficacy [1-3]

The efficacy of Rybrevant (amivantamab-vmjw) for subsequent therapy is based on a low quality, non-comparative, open-label, phase 1 trial in patients with advanced or metastatic NSCLC with an EGFR exon 20 insertion mutation whose disease progressed on or after platinum-based chemotherapy.

- Patients received a median of two prior lines of therapy and either had a performance status of 0 (32%) or 1 (68%). Patients with untreated brain metastasis were excluded. 99% of patients had adenocarcinoma.
- The study evaluated overall response rate (ORR) as the primary endpoint. Tumor response is not a validated surrogate for any clinically relevant endpoint (such as overall survival) in metastatic NSCLC.
- The overall response rate (ORR) was 40%. Most were partial responses (4% were considered complete responses). The duration of response was 11 months.
- The efficacy of Rybrevant (amivantamab-vmjw) relative to other NSCLC therapies (e.g., chemotherapy) is unknown; its place in therapy has not been adequately defined.

Efficacy for Rybrevant (amivantamab) in the front-line setting was evaluated in PAPILLON, a randomized, open-label trial in patients with locally advanced or metastatic NSCLC with EGFR exon 20 insertion mutation. Patients received Rybrevant (amivantamab) in combination with

chemotherapy (carboplatin and pemetrexed) or chemotherapy alone. 99% of patients had adenocarcinoma.

- The primary endpoint was progression-free survival (PFS) as assessed by blinded independent central review (BICR). Rybrevant (amivantamab) plus chemotherapy demonstrated a significant improvement in PFS versus with chemotherapy. The median PFS was 11.4 months and 6.7 months, respectively.
- Although overall survival is not yet mature, preliminary data favors the use of Rybrevant (amivantamab) in combination with chemotherapy.

Rybrevant (amivantamab) was studied in an open-label trial in patients with locally advanced or metastatic NSCLC with EGFR exon 19 deletion or exon 21 L858R mutation after progression on Tagrisso (osimertinib). Patients received Rybrevant (amivantamab) plus chemotherapy (carboplatin and pemetrexed) or chemotherapy (carboplatin and pemetrexed) alone.

- Rybrevant (amivantamab)-chemotherapy demonstrated a marginal improvement in progression-free survival (PFS) versus chemotherapy alone (6.3 months and 4.2 months in combination vs chemotherapy alone arms; overall survival is immature. PFS is a surrogate endpoint that has not been correlated with clinical outcomes in this setting.
- Although there was a marginal two-month progression free survival benefit with combination therapy relative to chemotherapy alone, the addition of Rybrevant (amivantamab) adds significant toxicity in the absence of any proven overall survival benefit. Therefore, use of Rybrevant (amivantamab) is considered 'not medically necessary' when given with chemotherapy for locally advanced or metastatic NSCLC with EGFR-Ex19del or L858R after progression with osimertinib, given the lack of superior efficacy and the higher cost versus chemotherapy alone.

Guidelines [4]

- The National Comprehensive Cancer Network (NCCN) NSCLC guideline lists Rybrevant (amivantamab-vmjw) monotherapy as a treatment option for advanced or metastatic disease in the first-line setting when given with chemotherapy or in the subsequent-line setting as monotherapy when an EGFR exon 20 insertion mutation is present. Rybrevant (amivantamab) is also listed as an option when given with chemotherapy for locally advanced or metastatic NSCLC with EGFR-Ex19del or L858R after progression with Tagrisso (osimertinib).
- Chemotherapy has been the standard of care for the subsequent-line treatment of patients with metastatic NSCLC, including patients with EGFR exon 20 insertion mutations, exon 19 deletions or exon 21 L858R mutations.

Investigational Uses

- There are no published clinical trials evaluating the safety or efficacy of Rybrevant (amivantamab-vmjw) outside of the settings above, as described in the coverage criteria.
- The safety and efficacy of Rybrevant (amivantamab-vmjw) have not been established when used in doses higher than listed on the package insert/prescribing information.

Safety [1]

- Overall, the known side effects experienced with Rybrevant (amivantamab-vmjw) appear congruent with EGFR and MET inhibitors and appears be acceptable in a population with metastatic NSCLC. However, approximately 11% of patients in the clinical trial stopped taking Rybrevant (amivantamab-vmjw) due to side effects, suggesting there may be some issues with tolerability.
- When given with chemotherapy, safety is consistent with the known profile of the individual therapy components, but toxicity is additive. In the subsequent setting in patients with either EGFR exon 19 deletion or 21 L858R mutation, grade >3 adverse events (AEs) occurred in 67% and 35% of patients in the Rybrevant (amivantamab)-chemotherapy arm versus chemotherapy arm, respectively; mostly hematologic or dermatologic. Treatment-related serious AEs were reported in 23% of the patients in the Rybrevant (amivantamab)–chemotherapy group and in 9% of those in the chemotherapy group. Four AE related deaths (3%) occurred in the Rybrevant (amivantamab)-chemotherapy arm and three (1%) occurred in the chemotherapy alone arm.[2]
- Infusion-related reactions are also possible. Premedication with diphenhydramine is recommended. For more severe reactions, dexamethasone and acetaminophen may be used.

Revision History

Revision Date	Revision Summary
9/19/2024	• Added coverage for front-line NSCLC with exon 20 insertion mutation in combination with chemotherapy. • Coverage for NSCLC with exon 19 deletion or exon 21 L858R mutation in combination with chemotherapy after progression with Tagrisso (osimertinib) considered not medically necessary. • Use of Rybrevant (amivantamab) for NSCLC without EGFR mutations specified in criteria is considered investigational.
9/14/2023	No criteria changes with this annual review.
9/23/2022	Updated continuation of therapy to allow if established with benefit (standard oncology).
10/15/2021	New policy (effective 11/15/2021). Limits coverage to patients with locally advanced/metastatic NSCLC with EGFR exon 20 insertion mutations as subsequent-line, the setting in which it was studied and has a labeled indication.

Drug names identified in this policy are the trademarks of their respective owners.

Medication Policy Manual | **Policy No:** dru688

Topic: Saphnelo, anifrolumab | **Date of Origin:** November 15, 2021

Committee Approval Date: March 21, 2024 | **Next Review Date:** 2025

Effective Date: June 1, 2024

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Saphnelo (anifrolumab) is a type I interferon receptor antagonist used for the treatment of patients with systemic lupus erythematosus who are receiving standard therapy.

Policy/Criteria

Most contracts require pre-authorization approval of Saphnelo (anifrolumab) prior to coverage.

I. Continuation of therapy (COT): Saphnelo (anifrolumab) may be considered medically necessary for COT when criterion A, B, or C below **AND** D is met.

A. For diagnoses NOT listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND there is documentation that the medication was covered by another health plan. Examples of documentation include the coverage approval letter from the previous health plan or paid claim.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

B. For diagnoses listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

C. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

AND

D. Site of care administration requirements are met [refer to Pharmacy Services Medication Policy Manual, Site of Care Review, dru408].

***Please note**: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Saphnelo (anifrolumab) may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) that criteria A, B, and C below are met.

A. A diagnosis of active, **systemic lupus erythematosus** (SLE) established by or in conjunction with a specialist in rheumatology.

AND

B. Previous treatment with at least one of the following has been ineffective: hydroxychloroquine, methotrexate, azathioprine, or mycophenolate mofetil, unless all are contraindicated or not tolerated.

AND

C. Site of care administration requirements are met [refer to Pharmacy Services Medication Policy Manual, Site of Care Review, dru408].

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers Saphnelo (anifrolumab) coverable only under the medical benefit (as a provider-administered medication).

B. When pre-authorization is approved, Saphnelo (anifrolumab) will be authorized in quantities up to 300 mg every 4 weeks.

C. Authorization may be reviewed at least annually. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, including disease stability or improvement must be provided, relative to baseline symptoms.

IV. Saphnelo (anifrolumab) is considered investigational when used for all other conditions, including but not limited to:

A. Central nervous system lupus.

B. Lupus nephritis.

C. Use in combination with Benlysta (belimumab).

Position Statement

Summary

- Saphnelo (anifrolumab) is an intravenously administered type 1 interferon antagonist approved for the treatment of patients with moderate to severe systemic lupus erythematosus (SLE) who are receiving standard therapy. [1]
- The intent of this policy is to limit use of Saphnelo (anifrolumab) to patients with a diagnosis of SLE who have had inadequate response to standard therapies.
- Saphnelo (anifrolumab) was evaluated in two phase 3 studies and one phase 2 study. All were 52-week double-blind placebo-controlled trials. All patients had disease activity despite treatment with standard SLE therapy (either one or any combination of oral corticosteroids, hydroxychloroquine, and/or immunosuppressants). Results from two of the three studies showed that Saphnelo (anifrolumab) increased the rate of clinical response as measured by validated indices of disease severity. [2 3]
- 2023 European League Against Rheumatism (EULAR) Guidelines for SLE recommend that all patients receive hydroxychloroquine. Immunosuppressants such as methotrexate, azathioprine, or mycophenolate should be considered in patients who had an inadequate response to hydroxychloroquine. Glucocorticoids (e.g., prednisone) are recommended for the treatment of flares and to provide symptom relief. The dose of glucocorticoids should be minimized and withdrawn when possible. [4]

    * Benlysta (belimumab) and Saphnelo (anifrolumab) are recommended in patients with inadequate control to hydroxychloroquine with or without immunosuppressants.

- Saphnelo (anifrolumab) is administered as an intravenous (IV) infusion every 4 weeks. The safety and effectiveness of higher doses have not been established. [1]
- The safety and effectiveness of Saphnelo (anifrolumab) in conditions other than SLE have not been established. Therefore, Saphnelo (anifrolumab) is not recommended in lupus nephritis or central nervous system (CNS) lupus. [1]
- Saphnelo (anifrolumab) has not been studied in combination with other biologic therapies, including Benlysta (belimumab). [1]
- New technologies and pharmaceuticals allow therapeutic services, such as infusion therapy, to be administered safely, effectively, and much less costly outside of hospital-based infusion centers (i.e., hospital outpatient settings). Sites of care such as doctor's offices, infusion centers, home infusion, and approved hospital-based infusion centers are well-established, accepted by physicians, and provide the best value to patients to reduce the overall cost of care.

Clinical Efficacy

- Approval for Saphnelo (anifrolumab) was based on two phase 3 trials and one phase 2 trial. [3] [1]
- All studies were 52-weeks in duration included patients with SLE who were receiving standard therapy (HCQ or immunosuppressive therapy) with or without corticosteroids. Patients were maintained on their existing therapies throughout the trial, except for corticosteroids which were tapered off. [1 3]
- Efficacy was evaluated using Systemic Lupus Erythematosus Responder Index (SRI-4) and BILAG-based Composite Lupus Assessment (BICLA). Both are composite indices of treatment response in SLE though their exact components differ.
- Overall, results showed that treatment with Saphnelo (anifrolumab) increased the rate of response compared to standard therapy alone. However, one phase 3 study (TULIP-1) did not meet its primary endpoint of SRI-4 response.

Investigational Uses

- There are no clinical trials to date supporting the safety or efficacy of Saphnelo (anifrolumab) for the treatment of any condition other than systemic lupus erythematosus.
- The prescribing information for Saphnelo (anifrolumab) contains a limitation of use stating that it has not been evaluated for the treatment of lupus nephritis (LN) or CNS lupus. Although Saphnelo (anifrolumab) is currently being studied in trials for LN, more data is needed to establish safety and efficacy. Use of Saphnelo (anifrolumab) is therefore not recommended in these settings. [1,5]
- Combination use of Benlysta (belimumab) and Saphnelo (anifrolumab) is considered investigational. Clinical trials of Saphnelo (anifrolumab) did not allow combination use. The safety and efficacy of combined use has not been established.

Medication Policy Manual | **Policy No:** dru690

Topic: Tivdak, tisotumab vedotin | **Date of Origin:** April 15, 2022

Committee Approval Date: December 7, 2023 | **Next Review Date:** 2024

Effective Date: March 1, 2024

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Tivdak (tisotumab vedotin) is an intravenously administered antibody-drug conjugate that is used for treating specific types of cancer (advanced cervical cancer).

Policy/Criteria

Most contracts require pre-authorization approval of Tivdak (tisotumab vedotin) prior to coverage.

I. Continuation of therapy (COT): Tivdak (tisotumab vedotin) may be considered medically necessary for COT when criterion A, B, or C below is met.

A. For diagnoses NOT listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND there is documentation that the medication was covered by another health plan. Examples of documentation include the coverage approval letter from the previous health plan or paid claim.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

B. For diagnoses listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

C. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

Please note*: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Tivdak (tisotumab vedotin) may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) that criteria A through D below are met.

A. A confirmed diagnosis of **cervical cancer**, recurrent or metastatic.

AND

B. There has been disease progression on or after at least one prior chemotherapy doublet regimen (e.g., cisplatin/paclitaxel, topotecan/paclitaxel).

AND

C. For programmed death-ligand 1 (PD-L1)-expressing tumors with a Combined Positive Score (CPS) $\geq$ 1, there has been disease progression on or after Keytruda (pembrolizumab), unless contraindicated or not tolerated.

AND

D. Tivdak (tisotumab vedotin) will be used as monotherapy.

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers Tivdak (tisotumab vedotin) coverable only under the medical benefit (as a provider-administered medication).

B. When pre-authorization is approved, Tivdak (tisotumab vedotin) will be approved for up to FDA-recommended dose and frequency limits until disease progression.

C. Authorization may be reviewed at least annually. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, such as disease stability or improvement.

IV. Tivdak (tisotumab vedotin) is considered investigational when used in the front-line disease setting for cervical cancer, and for all other conditions.

Position Statement

Summary

- Tivdak (tisotumab vedotin) is an intravenously administered tissue factor (TF)-directed antibody-drug conjugate (ADC) that delivers chemotherapy to TF expressing cancer cells.
- The intent of this policy is to allow coverage of Tivdak (tisotumab vedotin) in the clinical setting described above (in the coverage criteria), where it has been evaluated for efficacy, up to the dose shown to be safe in clinical trials. FDA approval of Tivdak (tisotumab vedotin) was based on low quality data from a single, small, non-comparative, non-blinded study that evaluated an endpoint that has not been proven to predict clinical benefit.
- Tivdak (tisotumab vedotin) was evaluated as a monotherapy in patients with recurrent of metastatic cervical cancer that progressed after one or two lines of prior therapy, at least one of which was doublet chemotherapy, the current front-line standard of care (SOC).
- In the pivotal clinical study, Tivdak (tisotumab vedotin) was found to temporarily slow or stop the growth of tumors in about one-quarter of the patients. Seven patients (7%) were considered to have a complete response. It is not known how temporarily impacting tumor growth ultimately affects clinical outcomes like overall survival or disease-associated symptom control.
- Tivdak (tisotumab vedotin) has only been used in the subsequent-line treatment setting. All patients enrolled in the clinical trial were of good performance status (PS) and were candidates for therapy with doublet chemotherapy regimens, the front-line SOC. Patients who were not fit for doublet chemotherapy (poor PS) were excluded from the trial. Therefore, the safety and efficacy of Tivdak (tisotumab vedotin) in patients with poor PS or those unable to tolerate doublet chemotherapy is unknown.

- It is not known how the efficacy of Tivdak (tisotumab vedotin) compares with other therapies used in the subsequent-line advanced cervical cancer treatment setting.
- Tivdak (tisotumab vedotin) carries a Boxed Warning for ocular toxicity, including severe vision loss and corneal ulceration. In some patients these ocular adverse events may persist or worsen even after treatment is withdrawn.
- Keytruda (pembrolizumab) is approved for use as an add-on to front-line chemotherapy doublet therapy for advanced cervical cancer when tumors express programmed death-ligand 1 [PD-L1; with a Combined Positive Score (CPS) ≥ 1] based on improved overall survival relative to the chemotherapy doublet alone. It is also approved as monotherapy in the subsequent-line setting for PD-L1-expressing tumors where the quality of evidence is similar to that of Tivdak (tisotumab vedotin). Keytruda (pembrolizumab) is more cost effective among these options. Therefore, Tivdak (tisotumab vedotin) is coverable only after use of Keytruda (pembrolizumab) for PD-L1 expressing cervical cancer.
- The National Comprehensive Cancer Network (NCCN) treatment guideline lists Tivdak (tisotumab vedotin) and Keytruda (pembrolizumab) among potential treatment options for advanced cervical cancer when there has been disease progression on or after front-line doublet chemotherapy.
- Tivdak (tisotumab vedotin) may be covered in doses up to 2 mg/kg (max of 200 mg) IV every three weeks until disease progression, the dose studied in the pivotal trial. The safety and effectiveness of higher doses have not been established.
- The safety and effectiveness of Tivdak (tisotumab vedotin) in conditions other than advanced cervical cancer have not been established.

Regence Pharmacy Services performs independent analyses of oncology medication evidence, to establish coverability per the contracts with the health plan.

- Most contracts define coverability based on established clinical benefit in published, peer-reviewed literature, along with consideration of regulatory status.
- FDA approval does not in itself establish medical necessity, as unpublished, low-quality evidence, including exploratory analyses and unvalidated surrogate endpoints, may be used as the basis of approval. Regulatory approval may or may not reflect clinical benefit relative to standard of care and the recommendations of expert clinical advisors such as the Oncologic Drugs Advisory Committee (ODAC). FDA approvals generally do not consider cost compared to established therapies, or value to members.
- Likewise, NCCN clinical practice guidelines assignment of a recommendation (category 1, 2a, or 2b) does not necessarily establish medically necessity. NCCN recommendations are inconsistently supported by published, peer-reviewed literature and do not uniformly consider value of new therapies relative to existing potentially higher-value treatment options, considering effectiveness, safety, and cost.
- Medication coverage criteria are developed based on the 'medical necessity' assessment, as described above.

Regence Pharmacy Services analysis and coverage policy may differ from FDA labeled indication and/or NCCN clinical practice guidelines.

Disease Background [1,2]

- When detected in early stages, cervical cancer is potentially curable. However, once it metastasizes to distant sites it is rarely curable, and treatment is palliative.
- Cisplatin is the most effective agent for metastatic cervical cancer. However, by the time the disease progresses to advanced stages, most patients are no longer sensitive to single-agent cisplatin due to its use as a radiosensitizing agent in earlier stages of the disease. For this reason, multi-agent cisplatin-containing regimens are used in metastatic disease.

Clinical Efficacy [1,3]

- The efficacy of Tivdak (tisotumab vedotin) was evaluated in a small, non-comparative, non-blinded study [innovaTV 204] that evaluated tumor response in patients with recurrent or metastatic cervical cancer that had progressed on or after prior doublet chemotherapy.
    * Nearly all enrolled patients (94%) had extra-pelvic metastatic disease.
    * All patients had good performance status (PS) and prior doublet chemotherapy (either cisplatin plus paclitaxel or topotecan plus paclitaxel) with or without bevacizumab. Patients in the study had at least one, but no more than two prior therapies in the advanced disease setting.
    * Patients with any histology were included in the study; however, those with squamous cell carcinoma made up the majority (68%) of the population.
    * Partial tumor response was observed in 24% of patients, with 7 patients (7%) achieving a complete response. The median duration of response was 8.3 months.
- There is currently no data comparing Tivdak (tisotumab vedotin) with any other therapy used in the management of advanced cervical cancer, and there is no data evaluating clinical outcomes such as survival or symptom control.
- A phase 3 randomized controlled trial (RCT) studying Keytruda (pembrolizumab) as an add-on therapy to front-line doublet chemotherapy in advanced cervical cancer demonstrated improved overall survival with this combination relative to doublet chemotherapy alone. Keytruda (pembrolizumab) has also been studied and is approved as monotherapy for PD-L1-expressing (CPS $\geq$ 1) advanced cervical cancer when used in the subsequent-line treatment setting where the quality of evidence is similar to that of Tivdak (tisotumab vedotin). [4,5]
- The National Comprehensive Cancer Network (NCCN) cervical cancer guideline lists Tivdak (tisotumab vedotin) as a treatment option for recurrent or metastatic cervical cancer after progression on standard of care chemotherapy. Pembrolizumab is listed as preferred option in this population when tumors express PD-L1 (CPS $\geq$ 1). [2]

Investigational Uses [6,7]

- There is no published information evaluating the safety and efficacy of Tivdak (tisotumab vedotin) in disease settings other than as subsequent-line therapy for advanced cervical cancer.
- The NCCN Compendium does not currently recommend Tivdak (tisotumab vedotin) for any uses other than second- or subsequent-line treatment of advanced cervical cancer.

Safety [1 ,5]

- Tivdak (tisotumab vedotin) carries a Boxed Warning for potentially serious ocular toxicity, including severe vision loss and corneal ulceration. Ocular adverse events (AEs) may persist or worsen even after treatment is withdrawn.
- Other serious AEs include peripheral neuropathy, hemorrhage, and pneumonitis.

Revision History

Revision Date	Revision Summary
12/7/2023	No criteria changes with this annual review.
12/9/2022	• Updated standard language in policy. • No changes to coverage criteria with this annual update.
3/18/2022	New policy (effective 4/15/2022). Limits coverage to monotherapy in patients with recurrent or metastatic cervical cancer whose disease has progressed on or after doublet chemotherapy and, for tumors that express PD-L1 (CPS ≥ 1), pembrolizumab unless contraindicated or not tolerated.

Drug names identified in this policy are the trademarks of their respective owners.

Medication Policy Manual | **Policy No:** dru696

Topic: Neonatal Fc Receptor (FcRn) Antagonists:

- Rystiggo, rozanolixizumab
- Vyvgart, efgartigimod alfa-fcab
- Vyvgart Hytrulo, efgartigimod alfa and hyaluronidase-qvfc

Date of Origin: April 15, 2022

Committee Approval Date: December 12, 2024 | **Next Review Date:** 2025

Effective Date: January 15, 2025

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Neonatal Fc receptor (FcRn) antagonists are medications used in specific types of generalized myasthenia gravis (gMG) and chronic inflammatory demyelinating polyneuropathy (CIDP). FcRn antagonists target the immune response in patients with gMG and CIDP [bind to the neonatal Fc receptor, resulting in the reduction of circulating immune globulin G (IgG)].

Policy/Criteria

Most contracts require pre-authorization approval of efgartigimod-containing products prior to coverage.

I. Continuation of therapy (COT): Neonatal Fc Receptor (FcRn) antagonists (as listed in Table 1) may be considered medically necessary for COT when criteria A, B, and C are met.

A. One of the following (1, 2, or 3):

1. For diagnoses NOT listed in the coverage criteria below, criteria a and b must be met:

a. The patient was established on therapy prior to current health plan membership AND there is documentation that the medication was covered by another health plan. Examples of documentation include the coverage approval letter from the previous health plan or paid claim.

AND

b. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

2. For diagnoses listed in the coverage criteria below, criteria a and b must be met:

a. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

b. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

3. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

AND

B. Site of care administration requirements are met [refer to Pharmacy Services Medication Policy Manual, Site of Care Review, dru408].

AND

C. "Administration, Quantity Limitations, and Authorization Period" below applies, as well as "Investigational Uses" for combination therapy.

Please note: *Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Neonatal Fc receptor (FcRn) antagonists (as listed in Table 1) may be considered medically necessary when clinical documentation (including, but not limited to chart notes) confirming that criteria A and B below are met:

A. Site of care administration requirements are met [refer to Pharmacy Services Medication Policy Manual, Site of Care Review, dru408].

AND

B. One of the following diagnostic criteria 1 or 2 below is met:

1. A diagnosis **generalized myasthenia gravis** (gMG) when criteria a through d below are met:

a. The diagnosis has been established by or in consultation with a neurologist who is a sub-specialist in neuromuscular disorders.

AND

b. One of the following specific antibody criteria (i or ii) below is met:

i. A positive serologic test for anti-acetylcholine receptor (anti-AChR) antibodies.

OR

ii. ***For Rystiggo (rozanolixizumab) only***: A positive serologic test for anti-muscle specific tyrosine kinase (MuSK) antibodies.

AND

c. Prior to starting neonatal Fc receptor (FcRn) antagonists, documentation of a total myasthenia gravis activities of daily living (MG-ADL) score of ≥ 5 OR a non-ocular MG-ADL score of ≥ 3.

AND

d. Standard MG treatment is documented as ineffective (lack of MG symptom control as verified by a MG scoring tool), unless all options listed below are documented as medically contraindicated or not tolerated. Standard MG therapy is defined as both criteria i and ii below.

i. At least two non-steroidal immunomodulating therapies including non-steroidal immunosuppressive therapies given continuously over the last 12 months: azathioprine, cyclosporine, mycophenolate, tacrolimus, methotrexate, or cyclophosphamide; chronic intravenous immune globulin (IVIG) given at least monthly over at least the past six months; plasmapheresis/plasma exchange (PLEX) given at least four times in the past 12 months; or rituximab given for at least 3 months.

PLEASE NOTE: Worsening of MG symptoms during IST dose taper is not considered documentation of "ineffective." Use of short-term IVIG as needed for myasthenic crisis will not satisfy this criterion.

AND

ii. If anti-acetylcholine receptor (anti-AChR) antibody positive, the patient has had a thymectomy.

OR

2. ***For Vyvgart Hytrulo (efgartigimod alfa and hyaluronidase-qvfc) only:*** A diagnosis of **chronic inflammatory demyelinating polyneuropathy (CIDP)** when criteria a through d below are met:

a. The diagnosis has been established by or in consultation with a neurologist.

AND

b. All of the following diagnostic criteria are met (i through v):

i. Progressive or relapsing proximal (upper arms, shoulders, hips and upper legs) **and** distal (hands, feet, lower arms and lower legs) muscle weakness of at least two limbs.

AND

ii. The muscle weakness is defined as developing over at least 8 weeks.

AND

iii. Reduced or absent tendon reflexes (areflexia) in at least two limbs.

AND

iv. Documented significant functional disability.

AND

v. Documentation of slowed nerve conduction velocity on electromyogram (EMG)/nerve conduction study (NCS) involving at least two nerves (median, ulnar, peroneal or tibial).

AND

c. Documentation of baseline symptoms with a standardized CIDP disability or impairment scale score, including, but not limited to, the Inflammatory Neuropathy Cause and Treatment (INCAT) scale, the Inflammatory Rasch-built Overall Disability Scale (I-RODS), or grip strength score using handheld dynamometry.

AND

d. Standard CIDP treatment is documented as ineffective (lack of CIDP symptom control as verified by a CIDP scoring tool **and** a lack of improvement in relapse frequency), unless all options

listed below are documented as medically contraindicated or not tolerated. Standard CIDP treatment is defined as use of at least TWO options listed below (i, ii, iii):

i. Immune globulin replacement (IVIG/SCIG), given at least monthly over at least 6 months.

ii. Corticosteroids, daily or pulsed, given at least weekly over at least 6 months.

iii. Plasmapheresis (plasma exchange/PLEX), given at least four times over 12 months.

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers neonatal Fc receptor (FcRn) antagonists (as listed in Table 1) coverable only under the medical benefit (as a provider-administered medication).

B. When pre-authorization is approved, neonatal Fc receptor (FcRn) antagonists (as listed in Table 1) will be covered in quantities as follows:

Table 1. Neonatal Fc receptor (FcRn) antagonists

Drug	Initial authorization	Reauthorization
Rystiggo (rozanolixizumab)	<100 kg: up to thirty-six 280 mg vials in a 6-month period	<100 kg: up to seventy-two 280 mg vials in a 12-month period
	≥100 kg: up to fifty-four 280mg vials in a 6-month period	≥100 kg: up to one-hundred eight 280mg vials in a 12-month period
Vyvgart (efgartigimod)	Up to sixteen doses in a 6-month period, up to 10 mg/kg/dose, not to exceed 1,200 mg/dose	Up to thirty-two doses in a 12-month period, up to 10 mg/kg/dose, not to exceed 1,200 mg/dose
Vyvgart Hytrulo (efgartigimod hyaluronidase)	**gMG:** Up to sixteen doses in a 6-month period, up to 1,008 mg per dose **CIDP:** Up to twenty-six doses in a 6-month period, up to 1,008mg per dose.	**gMG:** Up to thirty-two doses in a 12-month period, up to 1,008 mg per dose **CIDP:** Up to fifty-two doses in a 12-month period, up to 1,008mg per dose.

C. Authorization **shall** be reviewed initially at 6 months then at least every 12 months to confirm that current medical necessity criteria are met, and that the medication is effective. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that the medication is providing clinical benefit, including disease stability or improvement must be provided, relative to

baseline symptoms. A standard disease-specific scoring tool must be included.

Specifically:

1. For gMG: the total myasthenia gravis activities of daily living (MG-ADL) score, total quantitative myasthenia gravis (QMG) score, and/or myasthenia gravis composite (MGC) scale.

2. For CIDP: the Inflammatory Neuropathy Cause and Treatment (INCAT) score, the Inflammatory Rasch-built Overall Disability score (I-RODS) and/or a grip strength score using a hand-held grip dynamometer or vigorimeter.

IV. Neonatal Fc receptor (FcRn) antagonists (as listed in Table 1) are considered investigational when used for all other conditions, including but not limited to:

A. Vyvgart, Vyvgart Hytrulo (efgartigimod): Myasthenia gravis with MUSK antibodies or antibodies other than anti-AChR.

B. Use in combination with other targeted therapies for myasthenia gravis or CIDP (such as intravenous or subcutaneous immunoglobulin, other FcRn antagonists or complement inhibitors [Soliris (eculizumab), Ultomiris (ravulizumab)])

C. Dosing of efgartigimod-containing products for gMG sooner than 50 days from the start of the previous cycle.

D. Dosing of Rystiggo (rozanolixizumab) sooner than 63 days from the start of the previous cycle.

E. Vyvgart Hytrulo (efgartigimod hyaluronidase): Guillain-Barré syndrome (GBS), auto-immune nodopathies, monoclonal gammopathies (amyloidosis, multiple myeloma etc.), diabetic neuropathy, neuropathies other than CIDP etc.

Position Statement

Summary

- The intent of the policy is to allow for coverage of neonatal Fc receptor (FcRn) antagonists for generalized myasthenia gravis (gMG) and chronic inflammatory demyelinating polyneuropathy (CIDP) when managed by a specialist, limit to more severe disease, and encourage the use of lower cost therapies (when appropriate), and limit coverage to doses studied and shown to be safe and effective in clinical trials.
- Myasthenia gravis (MG) is a rare autoimmune disease arising from T cell-dependent immunologic attack of AChR, muscle-specific tyrosine kinase (MuSK), and/or other receptors found on the postsynaptic neuromuscular junction, resulting in striated muscle weakness.
- Approximately 10-15% of all MG cases are refractory despite corticosteroids or steroid-sparing immunosuppressive agents. Neonatal Fc receptor (FcRn) antagonists are coverable for the treatment of gMG when front-line therapies are not effective.
- Chronic inflammatory demyelinating polyneuropathy (CIDP) is an acquired, immune-mediated neuropathy that affects peripheral nerves, characterized by a progressive (more common) or relapsing-remitting course of proximal and distal muscle weakness.
    * The presentation of CIDP is usually over the course of several months or longer. The diagnosis is dependent on progression or relapse over a course of 8 weeks or more.[1]
    * The diagnosis of CIDP is based on a combination of clinical symptoms (proximal and distal muscle weakness of upper and lower limbs, sensory involvement in at least two limbs, and absent or reduced tendon reflexes in all limbs), nerve conduction study findings, and other supportive criteria (laboratory findings, imagine, nerve biopsy, cerebral spinal fluid examination etc.).[1]
    * Nerve conduction studies are the most important diagnostic tool to support the clinical diagnosis of CIDP; nerve conduction study diagnostic criteria involve assessments for demyelination in at least 2 nerves (median, ulnar, peroneal, or tibial). [1]
    * There is a lack of *consistent* diagnostic criteria used in clinical practice for the diagnosis of CIDP. Therefore, coverage of Vyvgart Hytrulo (efgartigimod hyaluronidase) for CIDP is limited to CIDP, as defined by the diagnostic inclusion criteria from the pivotal trial. Use of Vyvgart Hytrulo (efgartigimod hyaluronidase) in patients with CIDP defined from other diagnostic criteria has not been studied and the use of Vyvgart Hytrulo (efgartigimod hyaluronidase) in these patients is considered investigational.
    * There are other treatment alternatives for CIDP, such as corticosteroids or immunoglobulin replacement therapy, with years of clinical experience, endorsed by guidelines and significantly less costly as compared to Vyvgart Hytrulo (efgartigimod hyaluronidase).
- Neonatal Fc receptor (FcRn) antagonists provide new treatment options for refractory gMG and CIDP. While the clinical data is promising, there are several limitations in the body of evidence. Use should be limited to patients who have failed other standard

treatment options, as detailed in the coverage criteria. Standard therapies recommended by treatment guidelines for management of MG include acetylcholinesterase (ACh) inhibitors (pyridostigmine), corticosteroids, various non-steroidal immunosuppressant therapy (NIST), intravenous immunoglobulin (IVIG), plasmapheresis/plasma exchange (PLEX), and thymectomy, unless contraindicated. [2-6]

- Standard therapies recommended by treatment guidelines for management of CIDP include corticosteroids, intravenous or subcutaneous immunoglobulin, and plasmapheresis/plasma exchange (PLEX). [1]
- Disease specific scoring tools are used for baseline assessment and monitoring of disease progression, as well as response to therapy(s).
    * MG-ADL is a scoring tool used in clinical practice, along with MG composite score, for monitoring progression of MG and response to therapies.[7]
    * Despite not being used regularly in clinical practice, the INCAT score, is a commonly used, reliable and validated measure used in clinical trials for CIDP.
    * The INCAT, I-RODS and grip strength scores are in guidelines as recommended *objective* measures for monitoring response to treatment, when compared to their baseline values.[1]
- Efgartigimod-containing products have not been studied and shown to be safe or effective in patients other than specified in the coverage criteria, including:
    * Patients with MG and other antibodies, including MuSK antibodies, antibodies to the agrin receptor low-density lipoprotein receptor–related protein 4 (LRP4), or any other antibodies. Efgartigimod has been studied in both AChR antibody positive and MuSK antibody positive populations.
    * Patients with less severe MG (without generalized MG symptoms) or those in myasthenic crisis (MGFA Class V).
    * Patients with any other type of neuropathy, or conditions including, but not limited to, Guillain-Barré syndrome (GBS), auto-immune nodopathies, monoclonal gammopathies (amyloidosis, multiple myeloma etc.), diabetic neuropathy etc.
- The safety and efficacy of neonatal Fc receptor (FcRn) antagonists in combination with other targeted MG therapies, such as Soliris (eculizumab) or Ultomiris (ravulizumab), have not been established. In addition, there is insufficient evidence to support the use of chronic maintenance IVIG in combination with FcRn antagonists and/or compliment inhibitors for either MG or CIDP.
- Neonatal Fc receptor (FcRn) antagonists may be covered for refractory MG at the doses proven to be safe and effective in clinical trials, as detailed in the coverage criteria. Efgartigimod-containing products when used to treat gMG have not been studied when given more frequently than every 50 days per cycle. Rystiggo (rozanolixizumab) when used to treat gMG has not been studied when given more frequently than every 63 days per cycle.

Disease Background

Generalized Myasthenia Gravis (gMG) [2-6]

- Myasthenia gravis (MG) is a rare autoimmune disease arising from T cell-dependent immunologic attack of AChR, muscle-specific tyrosine kinase (MuSK), and/or other receptors found on the postsynaptic neuromuscular junction, resulting in striated muscle weakness.
    * MG presents with painless, fluctuating, fatigable weakness of specific muscle groups. Initially, patients most frequently present with ocular MG of the eyelids and extraocular muscles, presenting with asymmetric ptosis and diplopia. As weakness extends beyond ocular muscles, the disease progresses into gMG.
    * Approximately 10-15% of all MG cases consist of refractory gMG that presents with severe debilitating muscle weakness despite substantial use of long-term corticosteroids or multiple steroid-sparing immunosuppressive agents, resulting in substantial negative effects on activities of daily living and quality of life. Neonatal Fc receptor (FcRn) antagonists are coverable for the treatment of gMG when front-line therapies are not effective.
- Standard therapies recommended by treatment guidelines for management of MG include acetylcholinesterase (ACh) inhibitors (pyridostigmine), corticosteroids, various non-steroidal immunosuppressant therapy (NIST), intravenous immunoglobulin (IVIG), plasmapheresis/plasma exchange (PLEX), and thymectomy.
    * Acetylcholinesterase inhibitors are used for temporary symptomatic relief of MG symptoms, by slowing the breakdown of acetylcholine at the neuromuscular junction. However, their use is limited as an adjunct therapy to immunotherapy in those with residual or refractory MG or for treatment of ocular and mild gMG in those who cannot receive immune suppression.
    * Corticosteroids are the most widely used immune modulator for MG. Corticosteroids are effective in ocular MG and in patients with gMG with unsatisfactory responses to acetylcholinesterase inhibitors; however, they are associated with significant dose-dependent adverse events and should not be used for extended durations.
    * Azathioprine, cyclosporine, and mycophenolate mofetil are standard non-steroidal immunosuppressant therapy (NIST) and act as steroid-sparing agents. Other options include cyclophosphamide, methotrexate, and tacrolimus.
        ▪ Onset of effect is slow (up to 9-12 months). Once goals are met, steroids may be slowly tapered; however, many patients require long-term low-dose steroids for symptom control.
        ▪ Guidelines recommend dose adjustments no more frequently than every 3 to 6 months.
        ▪ Once treatment effective is achieved and doses are maintained for six months to two years of therapy, NIST doses should be tapered to the lowest effect dose
    * Plasma exchange/plasmapheresis (PLEX) and IVIG provide short-term symptomatic relief during exacerbations for surgical preparation or in patients

with septicemia through downregulating autoantibodies and/or inducing anti-idiopathic antibodies. IVIG may be a maintenance treatment option for patients intolerant to or not responding to an adequate course of non-steroidal immunosuppressive therapy (NIST).[2]

* Patients with thymoma should undergo thymectomy. In non-thymomatous patients, thymectomy is a treatment option to minimize need for immunotherapy (either avoid, dose minimize, or use for refractory MG symptoms). However, thymectomy may not be indicated in the following types of patients:
    - Unstable MG patients (medically not possible).
    - Patients with antibodies other than AChR, including MuSK, low-density lipoprotein receptor–related protein 4 (LRP4). (thymectomy is not indicated, based on lack of efficacy in the currently available evidence).[3 8]
    - Of note, other targeted therapy for AChR antibody positive MG includes complement inhibitors, such as Soliris (eculizumab) or Ultomiris (ravulizumab).

Chronic Inflammatory Demyelinating Polyneuropathy (CIDP) [1 9 10]

- Chronic inflammatory demyelinating polyneuropathy (CIDP) is an acquired, immune-mediated neuropathy that affects peripheral nerves.
    * CIDP is characterized by a progressive (more common) or relapsing-remitting course of proximal and distal muscle weakness.
    * The presentation of CIDP is usually over the course of several months or longer. The diagnosis is dependent on progression or relapse over a course of 8 weeks or more.
    * It typically follows a progressive course; however, it can also be remitting and relapsing.
- Common clinical features include proximal muscle weakness (climbing/descending stairs, rising from a seated position, difficulty walking and frequent falls), distal muscle weakness (scuffing or tripping over the feet), difficulty with fine motor tasks, diminished or absent reflexes (areflexia) and tremor.
- The exact cause of CIDP and its variants is unknown; current evidence supports involvement of both cellular (activation of T cells, cytokines, tumor necrosis factor, interferons, and interleukins) and humoral (immunoglobulin G) components of the adaptive immune system.
- The diagnosis of CIDP is based on electrodiagnostic criteria (conduction abnormalities), pathologic features of nerve demyelination and responsiveness to immunomodulatory treatments. The diagnosis of probable or definite CIDP in the pivotal trial was based on criteria from the 2010 European Federation of Neurological Societies/Peripheral Nerve Society (EFNS/PNS) guidelines, which recommend a combination of clinical, electrodiagnostic and laboratory features with exclusions to eliminate other disorders that may appear as CIDP.

CIDP Guidelines[1]

- Early administration of treatment in CIDP is important to minimize long-term disability and to improve symptoms and function. Most patients are significantly impaired and require treatment, often with multiple medication trials to optimize response and reduce relapse occurrence.
- The first-line treatments for CIDP include corticosteroids, plasmapheresis (plasma exchange), and immunoglobulin G administration [intravenous (IVIG) or subcutaneous (SCIG)].
- The 2021 guidelines from the European Academy of Neurology and Peripheral Nerve Society (EAN/PNS) consider the above treatments as first line for the treatment of CIDP:
    * IVIG or corticosteroids are strongly recommended as initial (induction) treatment.
    * Plasma exchange is strongly recommended if IVIG and corticosteroids are ineffective.
    * For maintenance treatment, IVIG, SCIG, or corticosteroids are recommended.
- Per this guideline, there is insufficient evidence to demonstrate greater efficacy of one product over another for the treatment of CIDP.
- Guidelines have not been updated since the FDA approval of efgartigimod alfa and hyaluronidase-qvfc for CIDP.

Clinical Efficacy

Generalized Myasthenia Gravis (gMG)[7 11 12]

- The evidence for efgartigimod-containing products in gMG is limited. Efgartigimod was approved for the treatment of gMG based on one 26-week, phase 3, ADAPT study, comparing efgartigimod to placebo in patients who had a gMG with a MG-ADL score $\geq$ 5 and who were on stable doses of $\geq$ 1 treatment for gMG. The trial included both AChR antibody positive and negative patients but only a small portion (23%) of patients were AChR antibody negative. The response rate in AChR antibody negative patients was similar to that of placebo but the evidence is limited due to the small sample size.
    * In ADAPT, the primary endpoint of proportion of AChR-ab+ patients who were MG-ADL responders (≥2-point MG-ADL improvement sustained for ≥4 weeks) in the first treatment cycle (8 weeks) was higher in the efgartigimod arm versus the placebo arm.
    * Most patients (~70%) in the ADAPT study had at least one prior non-steroidal immunosuppressant agent; ~70% had prior thymectomy.
    * Although patients were permitted a 7-week cycle duration between cycles (time from first infusion of one cycle to the first infusion of the next cycle), the median duration between cycles was 10 weeks.
    * The ADAPT study was a 26-week study period thus it may be insufficient to comprehensively assess the efficacy of a drug therapy in a chronic disease, including the durability of treatment effect.

- The evidence for rozanolixizumab is limited to one double-blind, placebo-controlled, phase 3 study (MycarinG) , in which patients who are either AChR+ or MuSK+ with refractory moderate to severe gMG were randomly assigned to receive subcutaneous infusions of 7 mg/kg rozanolixizumab, 10 mg/kg rozanolixizumab, or placebo once a week for 6 weeks followed by 8 weeks of observation.[13]
    * Patients were required to have a Myasthenia Gravis Activities of Daily Living (MG-ADL) score of at least 3 (with at least 3 points from non-ocular symptoms) at baseline. The median baseline total MG-ADL score was 8.
    * The primary efficacy endpoint was the comparison of the change from baseline between treatment groups in the MG-ADL total score at day 43. A statistically clinically significant difference favoring rozanolixizumab was observed in the MG-ADL total score change from baseline [-3.4 points in rozanolixizumab-treated groups vs -0.8 points in the placebo-treated group ($p<0.001$)].
    * More patients in the rozanolixizumab arms had a clinically significant increase in MG-ADL score versus placebo.
    * Due to the short study duration, the long-term safety and efficacy of rozanolixizumab is unknown at this time.
- None of the trials of FcRn antagonists allowed the use of these therapies in combination with either IVIG and/or complement inhibitors.

Chronic Inflammatory Demyelinating Polyneuropathy (CIDP) [9 14]

- The FDA-approval of efgartigimod hyaluronidase for the treatment of CIDP was based on one unpublished placebo-controlled trial (ADHERE, N=322). The trial included an open-label period (stage A) to identify patients who had evidence of improvement (responders) with the use of efgartigimod hyaluronidase, who then entered a randomized-double-blind, placebo-controlled withdrawal period (stage B).
    * All enrolled subjects:
        - Had a diagnosis of progressing or relapsing, probable or definite CIDP, according to criteria from the 2010 criteria from the European Federation of Neurological Societies/Peripheral Nerve Society (EFNS/PNS).
        - Had a baseline INCAT score ≥ 2 from the leg disability score or ≥ 3 without specifics to leg or arm scores.
        - Were currently receiving either standard of care therapy (intravenous or subcutaneous immunoglobulin replacement or corticosteroids) or no previous treatment. All current treatments were discontinued prior to the open label stage A.
    * Concomitant treatment with any other biologic agent, FcRn antagonist, or immunoglobulin (IVIG/SCIG) was not allowed.
    * All enrolled subjects received weekly efgartigimod hyaluronidase SC for 12 weeks (Stage A; n=322). Responders from stage A were randomized to efgartigimod hyaluronidase SC or placebo for 48 weeks (stage B efficacy phase; n=221). Non-responders (31% of enrolled patients from Stage A) did not continue to Stage B.

* The primary efficacy endpoint was the time to clinical deterioration (relapse), defined as a 1-point increase in the adjusted Inflammatory Neuropathy Cause and Treatment (aINCAT) score.
* The FDA approval of efgartigimod hyaluronidase SC for CIDP was based on unpublished trial evidence, that has not been peer-reviewed. At this time, there are significant unknowns to the trial to define who is most likely to respond, including the percent of patients who were previously treated with standard of care (corticosteroids and/or immunoglobulins) and in whom standard of care was ineffective or not tolerated.
    - Based on the abstract presentation, a 61% reduction in the relapse risk was demonstrated in subjects who received active treatment (HR=0.39; p=0.000039), compared to placebo. Subjects who received efgartigimod hyaluronidase experienced a longer time to clinical deterioration (relapse) compared to those who received placebo.
    - However, at this time, the primary endpoint results [time to clinical deterioration (relapse)] are not available, and the true clinical efficacy of efgartigimod hyaluronidase cannot be evaluated.
    - Despite the reported relapse risk reduction of 61%, it is important to remember that any outcome analysis is based only on responders from the open-label phase. Use of an open-label trial design favors the active treatment arm. Therefore, the expected clinical response rate in all-comers, as well as patients in clinical practice, is unknown.
* The aINCAT score is a validated, commonly used and reliable measure of symptomatic disability of patients with CIDP, that takes into account upper and lower limb function. A decrease in the score of ≥ 1 point is considered clinically significant for symptom improvement (minimal clinically important difference, MCID).

Investigational Uses[12 15]

- Neonatal Fc receptor (FcRn) antagonists are being studied for a variety of other indications. However, at this time, there is insufficient evidence to establish the safety and efficacy of neonatal Fc receptor (FcRn) antagonist sin any other indications (other than detailed in the coverage criteria).
- There are no published clinical trials evaluating the safety or efficacy of neonatal Fc receptor (FcRn) antagonists given in combination with one another, with a complement inhibitor such as Soliris (eculizumab) or Ultomiris (ravulizumab), or in combination with IVIG or SCIG.
- Evidence for the use of efgartigimod-containing products in MUSK-antibody positive or AChR-Ab negative population is limited. Although the ADAPT study included AChR-Ab negative patients, the number of patients was low (n=38), and results of this subgroup analysis were underpowered (68% response rate in the efgartigimod arm versus 63% in the placebo arm). Only six patients in the ADAPT trial were MUSK-antibody positive.

- The safety of initiating subsequent cycles of efgartigimod-containing products sooner than 50 days or Rystiggo (rozanolixizumab) sooner than 63 days from the start of the previous treatment cycle has not been established.

Safety [11 12 15]

- Although neonatal Fc receptor (FcRn) antagonists do not have a boxed warning for life-threatening and fatal meningococcal infections, long-term safety data is lacking and there are concerns for infections associated with prolonged lowering of IgG. In the ADAPT and MycarinG trials, 23-46% of patients had an adverse event related to infections, most of which were mild to moderate severity.
- A post-observation period is required to monitor for hypersensitivity reactions.

Dosing [11 12 15]

- In the ADAPT trial, patients on efgartigimod were given 10 mg/kg IV (1200 mg for those weighing 120 kg or more) once weekly x 4 weeks. The interval was variable but no sooner than 50 days after initiation of the previous cycle. Patients were re-dosed only when they no longer had a clinically meaningful improvement on the MG-ADL.
- In an extension study of rozanolixizumab, the minimum time for initiating subsequent treatment cycles, was 63 days from the start of the previous treatment cycle. On average, patients initiated 4 cycles of rozanolixizumab in one year (range 1 to 7 cycles).
- In the ADHERE trial, the dose of efgartigimod hyaluronidase for CIDP was limited to once weekly, subcutaneous injections of 1,008 mg of efgartigimod and 11,200 units of hyaluronidase.

HCPCS	J9332	Injection, efgartigimod alfa-fcab (Vyvgart), 2mg
HCPCS	J9334	Injection, efgartigimod alfa 2mg and hyaluronidase-qvfc 11,200 units, (Vyvgart Hytrulo)
HCPCS	J9333	Injection, rozanolixizumab-noli (Rystiggo), 1 mg

Appendix 1: Medications that may unmask or worsen myasthenia gravis *
Aminoglycosides
Amantadine
Antiarrhythmics (procainamide, propafenone, quinidine)
Antiepileptics (various, carbamazepine, gabapentin, phenytoin, etc.)
Cancer immunotherapies, including but not limited to: Anti-programmed death receptor-1 monoclonal antibodies (PD1s, PDL-1s; Opdivo [nivolumab], Keytruda [pembrolizumab], etc.) Yervoy (ipilimumab) Provenge (sipuleucel-T)
Antihistamines (diphenhydramine)
Beta-blockers
Calcium channel blockers (felodipine, verapamil)
Colchicine
Erythromycins (azithromycin, clarithromycin, clindamycin)
Plaquenil (hydroxychloroquine)
Interferons (various)
Lithium
Magnesium
Neuromuscular blockers (succinylcholine, etc.)
Opioids
Phenothiazines (haloperidol)
Proton pump inhibitors (lansoprazole, omeprazole)
Quinine
Quinolones (ciprofloxacin, levofloxacin, etc.)
Statins (pravastatin, etc.)

*Including, but not limited to this list. Medication lists will be reviewed in full versus compendium (such as DrugDex).

Revision History

Revision Date	Revision Summary
12/12/2024	Effective 1/15/25: • No change to policy intent. Clarified authorization durations (initial authorization is for 6 months, followed by 12 months for reauthorizations). • Corrected v.3 criteria II.B.1.c. clerical error of missing MG-ADL parameter (reason for expedited effective date).
9/19/2024	Added coverage criteria for Vyvgart Hytrulo (efgartigimod hyaluronidase) for the treatment of chronic inflammatory demyelinating polyneuropathy (CIDP).
12/7/2023	• Renamed policy to "FcRn Antagonists." • Added Rystiggo (rozanolixizumab) to policy. • Criteria modified to include coverage for MuSK+ (for rozanolixizumab [Rystiggo]) • Added non-ocular MG-ADL score > or = 3 or total score of > or = 5. • Criteria simplified to require two prior non-steroidal immunomodulating therapies. • Use with other targeted therapies or IVIG is investigational. • Initial authorization duration extended to 6 months, reauthorization 12 months.
9/14/2023	• Renamed policy to "Efgartigimod-containing medications". • Added of Vyvgart Hytrulo (efgartigimod hyaluronidase-qvfc) to policy.
3/18/2022	New policy (effective 4/15/2022). Limits use of Vyvgart (efgartigimod) for generalized myasthenia gravis (gMG) when managed by a specialist, limit to more severe disease and encourage the use of lower cost therapies (when appropriate), and limit coverage to doses studied and shown to be safe and effective in clinical trials.

Medication Policy Manual

Policy No: dru697

Topic: PCSK9 Inhibitors

- Leqvio, inclisiran
- Praluent, alirocumab
- Repatha, evolocumab

Date of Origin: June 1, 2022

Committee Approval Date: March 16, 2023

Next Review Date: 2024

Effective Date: June 1, 2023

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of medication policy is to provide a guide to coverage. Medical Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Proprotein convertase subtilisin/kexin type 9 (PCSK9) inhibitors are used in the treatment of atherosclerotic cardiovascular disease (ASCVD) and familial hypercholesteremia.

Policy/Criteria

Most contracts require pre-authorization approval of PCSK9 inhibitors prior to coverage.

I. Continuation of therapy (COT): PCSK9 inhibitors may be considered medically necessary for COT when criteria A, B, or C **AND** D below is met.

A. For diagnoses NOT listed in the coverage criteria below, full policy criteria must be met for coverage.

OR

B. For diagnoses listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

C. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

AND

D. **For Leqvio (inclisiran) only:** Site of care administration requirements are met [refer to Pharmacy Services Medication Policy Manual, Site of Care Review, dru408].

***Please note**: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): PCSK9 inhibitors may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) that criteria A and B below are met.

A. **Leqvio (inclisiran) only:** Site of care administration requirements are met [refer to Pharmacy Services Medication Policy Manual, Site of Care Review, dru408].

AND

B. At least one of the following diagnostic criterion 1, 2 or 3 below is met.

1. **Leqvio (inclisiran), Praluent (alirocumab), Repatha (evolocumab): Heterozygous familial hypercholesterolemia** (HeFH) when both criteria a and b are met.

a. The requested PCSK9 inhibitor has been prescribed by or in conjunction with a specialist in cardiology or lipid management and there is clinical documentation of at least one of the following (i, ii, or iii):

i. A definitive diagnosis of FH using Simon Broome diagnostic criteria or Dutch Lipid Clinic Network criteria (see *Appendices 1 and 2*).

OR

ii. An untreated low-density lipoprotein cholesterol (LDL-C) of ≥ 190 mg/dL (or ≥ 160 mg/dL in patients less than 20 years of age) with at least one of the following:

1. Physical signs of FH, such as presence of tendon xanthomas, premature corneal arcus, tuberous xanthomas, or xanthelasma.

OR

2. Family History of FH.

OR

iii. Presence of a causal mutation for FH by DNA testing (e.g., a mutation in the *LDLR, APOB, PCSK9,* or *LDLRAP1* genes).

AND

b. Treatment with maximally tolerated lipid lowering therapy has failed to achieve an LDL-C of less than or equal to 100 mg/dL after at least 12 weeks of therapy. The treatment regimen must include all the following (i, ii, and iii), unless contraindicated or not tolerated:

i. A high-intensity statin (atorvastatin or rosuvastatin). If one high-intensity statin has not been tolerated due to statin-associated side effects, then at least one other statin must have been tried at a lower dose.

AND

ii. Ezetimibe.

AND

iii. **For Leqvio (inclisiran) only:** Praluent (alirocumab) or Repatha (evolocumab).

OR

2. **Praluent (alirocumab) or Repatha (evolocumab) only: homozygous familial hypercholesterolemia** (HoFH) when criteria a and b below are met:

a. The requested PCSK9 inhibitor has been prescribed by or in conjunction with a specialist in cardiology or lipid management and there is clinical documentation of at least one of the following (i or ii):

i. Genetic confirmation of two mutant alleles at the *LDLR, APOB, PCSK9,* or *LDLRAP1* gene locus.

OR

ii. An untreated low-density lipoprotein cholesterol (LDL-C) of > 500 mg/dL (or a treated LDL-C of > 300 mg/dL) with either (1 or 2):

1. Cutaneous or tendon xanthoma before age 10 years.

OR

2. Evidence of heterozygous familial hypercholesterolemia in both parents.

AND

b. Treatment with maximally tolerated statin therapy has been ineffective, contraindicated, or not tolerated.

OR

3. Leqvio (inclisiran), Praluent (alirocumab), Repatha (evolocumab): clinical atherosclerotic cardiovascular disease (ASCVD) when criteria a, b, and c below are met (see *Appendix 6* for definitions of ASCVD).

a. The requested PCSK9 inhibitor has been prescribed by or in conjunction with a specialist in cardiology or lipid management.

AND

b. The member is at very high risk for ASCVD events (see *Appendix 8*).

AND

c. Treatment with maximally tolerated lipid lowering therapy has failed to achieve an LDL-C of less than or equal to 70 mg/dL after at least 12 weeks of therapy. The treatment regimen must include <u>all the following</u> (i, ii, and iii), unless contraindicated or not tolerated.

i. A high-intensity statin (atorvastatin or rosuvastatin). If one high-intensity statin has not been tolerated due to statin-associated side effects, then at least one other statin must have been tried at a lower dose.

AND

ii. Ezetimibe.

AND

iii. **For Leqvio (inclisiran) only:** Praluent (alirocumab) or Repatha (evolocumab).

III. Administration, Quantity Limitations, Authorization Period

A. Regence Pharmacy Services considers Praluent (alirocumab) and Repatha (evolocumab) to be coverable only under the pharmacy benefit (as self-administered medications).

B. Regence Pharmacy Services considers Leqvio (inclisiran) to be coverable only

under the medical benefit (as a provider-administered medication).

C. When pre-authorization is approved, PCSK9 inhibitors will be authorized in the following quantities:

Medication	Authorization Limit
Praluent (alirocumab)	Up to 150 mg every 2 weeks or 300 mg every 4 weeks.
Repatha (evolocumab)	Up to 140 mg every other week or 420 mg once monthly.
Leqvio (inclisiran)	Loading Dose: Up to 284 mg initially followed by 284 mg in 3 months. Maintenance Dose: Up to 284 mg every 6 months.

D. Authorization may be reviewed at least annually. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, such as disease stability or improvement.

IV. PCSK9 inhibitors are considered not medically necessary when used for:

A. Non-familial hyperlipidemia/hypercholesterolemia.

B. Primary prevention of atherosclerotic cardiovascular disease (ASCVD).

C. Primary prevention of ASCVD in patients who are statin-intolerant.

V. PCSK9 inhibitors are considered investigational when used for all other conditions, including but not limited to:

A. In combination with other PCSK9 inhibitors or Juxtapid (lomitapide).

Position Statement

Summary

- Proprotein convertase subtilisin/kexin type 9 (PCSK9) inhibitors are subcutaneous medications indicated:
  * to reduce the risk of myocardial infarction, stroke, and coronary revascularization in adults with established cardiovascular disease.
  * as an adjunct to diet, alone or in combination with other lipid-lowering therapies (e.g., statins, ezetimibe), for treatment of adults with primary hyperlipidemia (including heterozygous familial hypercholesterolemia, HeFH) to reduce low-density lipoprotein cholesterol (LDL-C).
  * as an adjunct to diet and other LDL-lowering therapies (e.g., statins, ezetimibe, LDL apheresis) in patients with homozygous familial hypercholesterolemia (HoFH) who require additional lowering of LDL-C.
- American College of Cardiology (ACC)/American Heart Association (AHA) Guidelines define clinical ASCVD as acute coronary syndromes, a history of MI, stable or unstable angina, coronary or other arterial revascularization, stroke, TIA, or peripheral arterial disease presumed to be of atherosclerotic origin.
- The intent of this policy is to limit coverage of PCSK9 inhibitors to patients with a confirmed diagnosis of HoFH, HeFH, or clinical ASCVD, who have tried and failed lower cost therapies (as detailed in the coverage criteria).
- 2018 AHA/ACC Guidelines on the Management of blood cholesterol recommend high-intensity statins for high-risk patients, such as those with clinical ASCVD or with HeFH. On average, high-intensity statins lower LDL-C by approximately ≥50%. Statins have been proven to reduce cardiovascular (CV) events and mortality; thus, they are the preferred treatment to reduce the risk ASCVD and recommended as the first-line treatment by multiple guidelines.
- AHA/ACC Guidelines recommend ezetimibe before PCSK9 inhibitors in patients with ASCVD. Although there is limited evidence supporting the strategy of ezetimibe before PCSK9 inhibitors, guidelines state that ezetimibe is widely available as a generic and has proven safety and tolerability along with CV outcomes data. [1]
- Based on results from the IMPROVE-IT study, ezetimibe has also been shown to modestly improve cardiovascular outcomes. Although, it was studied in a very narrow, high-risk population it is a treatment option in patients with clinical ASCVD or HeFH.
- The addition of ezetimibe to statin therapy typically reduces LDL-C by 15% to 30% in patients with hyperlipidemia.
- AHA/ACC Guidelines state that PCSK9 inhibitors are reasonable in patients with very high risk ASCVD who cannot achieve an LDL or < 70 mg/dL while on a high-intensity statin and ezetimibe.
- PCSK9 inhibitors have been studied in multiple placebo- or active-controlled phase 3 studies which included a variety of patients including those with HeFH and/or clinical ASCVD.

- Treatment with either Praluent (alirocumab) or Repatha (evolocumab) in combination with a statin improved CV outcomes. However, the magnitude of benefit was modest.
- CV outcomes data for Leqvio (inclisiran) is not yet available. The use of medications with proven CV benefits is required prior to coverage of Leqvio (inclisiran), as outlined in the coverage criteria, as the CV benefits of Leqvio (inclisiran) are unknown at this time.
- HeFH and HoFH may be diagnosed via clinical criteria, such as baseline LDL values, family history, and physical manifestations of FH, or through genetic testing. Commonly used diagnostic criteria include Simon Broome Diagnostic Criteria and Dutch Lipid Clinic Network Criteria for Heterozygous FH Diagnosis.
- Statins are also recommended as initial therapy for the treatment of HeFH. Non-statins may be considered in patients who are unable to reach target LDL-levels or who are statin intolerant. Although ACA/AHA guidelines do provide treatment recommendations for patients with HeFH, guidelines specifically for HeFH have been produced by the National Lipid Association (NLA) and European Atherosclerosis Society (EAS).
- NLA treatment guidelines for HeFH recommend targeting a 50% reduction in LDL-C from baseline; however higher risk patients may require a more aggressive treatment goal of less than 100 mg/dL. Patients will generally require treatment with multiple agents to achieve LDL-C goals.
- Statin-intolerance is not well defined. In a clinical trial of Praluent (alirocumab) in statin intolerant patients (defined as the inability to tolerate due to muscle symptoms at least two statins with at least one at the lower FDA-approved starting dose), over 70% of patients who were randomized to receive blinded atorvastatin 20 mg were able to complete the study. Although, this trial was conducted in a "statin intolerant" population, most of these patients were able to tolerate statin therapy, thus requiring trials of multiple statins prior to coverage of a PCSK9 inhibitor is warranted.
- 2018 AHA/ACC Guidelines state that in patients with statin-associated side effects that are not severe, it is recommended to reassess and to re-challenge to achieve a maximal LDL-C lowering by modified dosing regimen, an alternate statin or in combination with non-statin therapy.
- PCSK9 inhibitors have not been studied in combination with any other PCSK9 inhibitor or Juxtapid (lomitapide).
- PCSK9 inhibitors appear to be well-tolerated. However, additional long-term studies and clinical experience is needed with Leqvio (inclisiran).
- In late 2018, the manufacturer of Repatha (evolocumab) introduced new NDC's (beginning with 72511) at a significant discount. The previous (legacy) NDC's (beginning with 55513) have been discontinued as of December 31, 2019.

Clinical Efficacy

Praluent (alirocumab)

- The ODYSSEY OUTCOMES study evaluated the impact of Praluent (alirocumab) on cardiovascular outcomes in patients with a history of acute coronary syndrome (ACS) in the past 1 to 12 months. The primary endpoint was the composite of cardiovascular death, MI, stroke, and hospitalization for unstable angina. Patients were randomized to

either Praluent (alirocumab) 75 mg every two weeks or placebo. All patients were on background high-intensity statins or their maximally-tolerated dose of atorvastatin or rosuvastatin.

  * After a median follow-up of 2.8 years, Praluent (alirocumab) reduced the risk of the primary endpoint compared to placebo (9.5% vs. 11.1%, respectively; hazard ratio, 0.85; 95% CI, 0.78 to 0.93; P<0.001). The secondary endpoint of the composite of death from any cause, non-fatal MI, and non-fatal stroke also favored alirocumab compared to placebo (10.3% vs. 11.9%, respectively; hazard ratio 0.86; 95% CI 0.79 to 0.93; P<0.001).

- The body of evidence supports that Praluent (alirocumab) produces substantial reductions in LDL-C. [2 3]
  * The primary endpoint in the majority of Praluent (alirocumab) phase 3 studies was percent change in LDL-C.
  * Among ten placebo- and active controlled phase 3 studies, Praluent (alirocumab) reduced LDL-C by approximately 43 to 61 percent from baseline. The studies included a several populations, including those with HeFH and/or clinical ASCVD. Studies ranged in duration from 12 to 78 weeks. Results were statistically significant versus placebo and versus ezetimibe.
  * In patients with HoFH the mean LDL-C reduction was approximately 36%.[4]

Repatha (evolocumab)

- The FOURIER study evaluated the impact of evolocumab on cardiovascular outcomes in patients with clinical ASCVD. The primary endpoint was the composite of cardiovascular death, MI, stroke, hospitalization for unstable angina, or coronary revascularization. Patients were randomized to either Repatha (evolocumab) or placebo and all patients were on background high or moderate intensity statin therapy. [5]
  * After a median follow-up of 26 months, evolocumab modestly reduced the risk of the primary endpoint compared to placebo (9.8% vs. 11.3%, respectively; hazard ratio, 0.85; 95% CI, 0.79 to 0.92; P<0.001).
  * Evolocumab also significantly reduced the risk of the key secondary composite of CV death, MI, or stroke compared to placebo (5.9% vs. 7.4%, respectively; hazard ratio, 0.80; 95% CI, 0.73 to 0.88; P<0.001). However, results for cardiovascular mortality alone were not statistically significant.
- The body of evidence supports that Repatha (evolocumab) produces substantial reductions in LDL-C. [6]
  * The primary endpoint in the majority of Repatha (evolocumab) phase 3 studies was percent change in LDL-C. Reductions in LDL-C ranged from 54% to 71% in patients with clinical ASCVD or HeFH. [6]
  * In patients with HoFH the mean LDL-C reduction was approximately 31%. [7]

Leqvio (inclisiran)

- The body of evidence supports that Leqvio (inclisiran) produces substantial reductions in LDL-C. [8 9]

    * The primary endpoint in the majority of Leqvio (inclisiran) phase 3 studies was percent change in LDL-C.
    * Reductions in LDL-C ranged from 40% to 51% in patients with clinical ASCVD or HEFH.
- Although the data continues to evolve, CV outcomes data for Leqvio (inclisiran) is not yet available. Of note, Praluent (alirocumab) or Repatha (evolocumab) in combination with a statin resulted in a modest improvement in CV outcomes in trials.
- Several outcomes trials have demonstrated that statins reduce the risks of cardiovascular and cerebrovascular events. [1]
    * Reduction in cardiovascular and cerebrovascular risk is not unique to any specific statin and has been demonstrated with many of the available statins in a variety of patient populations, such as in patients with coronary heart disease, high cholesterol levels, normal cholesterol levels, hypertension, diabetes, and previous stroke.
    * Several primary and secondary prevention trials with simvastatin, pravastatin, lovastatin, and atorvastatin consistently demonstrate that reductions in cardiovascular events correlate with LDL-C reduction.[10-12]

Guidelines

ASCVD

- The 2018 American College of Cardiology and American Heart Association (ACC/AHA) treatment guidelines state that PCSK9 inhibitors are reasonable for patients with very high risk ASCVD who cannot achieve an LDL or < 70 mg/dL while on a high-intensity statin and ezetimibe.
    * Very high risk is defined as a history of multiple major ASCVD events or one major ASCVD event and multiple high-risk condition (see *Appendix 8*).
- For patients with ASCVD the first goal is to achieve a 50% or more reduction in LDL-C, but if LDL-C levels remain 70 mg/dL or great additional treatment with ezetimibe is considered reasonable.
- Guidelines acknowledge that the evidence supporting the use of ezetimibe before PCSK9 inhibitors is limited. Although, patients in both PCSK9 inhibitor outcomes studies were permitted to use ezetimibe, very few did. The recommendation placing ezetimibe ahead of PCSK9 inhibitors is primarily due to wide availability as a generic and proven safety and tolerability.
- PCSK9 inhibitors may also be considered in patients with severe primary hypercholesterolemia (e.g., HeFH) with an LDL-C of 100 mg/dL or greater despite maximally tolerated statin and ezetimibe therapy.

HeFH

- National Lipid Association (NLA) treatment guidelines for HeFH recommend targeting a 50% reduction in LDL-C from baseline; however higher risk patients may require a more aggressive treatment goal of less than 100 mg/dL. High risk HeFH patients included those with clinically evident CHD or other atherosclerotic cardiovascular disease, diabetes, a family history of very early CHD (in men < 45 years of age and women < 55

years of age), current smoking, two or more CHD risk factors, or high lipoprotein (a) ≥ 50 mg/dL. Intensification of therapy may also be considered in patients without any of the listed previously factors, if LDL-C remains ≥ 160 mg/dL (or non-HDL cholesterol ≥ 190 mg/dL), or if an initial 50% decrease is LDL-C is not achieved. [13]

- Although treatment targets are recommended by clinical guidelines, they are based primarily on surrogate endpoints, expert opinion, and studies in patients without familial hypercholesterolemia. [13-15]
- NLA guidelines recommend statins as the initial treatment for all patients with FH. Ezetimibe, niacin, and bile acid sequestrants are considered reasonable treatment options for intensification of therapy, or for those intolerant of statins. EAS guidelines for HeFH provide generally similar treatment recommendations but recommend different target LDL levels. [13]

HoFH

- HoFH is a rare, genetic disease characterized by abnormally elevated LDL cholesterol levels and an increased risk for early onset coronary heart disease. LDL levels can range from 300 to over 1000 mg/dL. If not treated, affected patients often die in early adulthood. [16]
- Treatment options include Repatha (evolocumab), Praluent (alirocumab), Juxtapid (lomitapide), traditional lipid-lowering medications, and LDL-apheresis.[16] Kynamro (mipomersen), oligonucleotide inhibitor of apolipoprotein B-100 synthesis indicated for HoFH, was discontinued by its manufacturer in 2018.

Statin intolerance

- ODYSSEY ALTERNATIVE was a 24-week study of Praluent (alirocumab) in patients who were considered to be statin intolerant, which was defined as inability to tolerate at least two statins due to muscle symptoms, with one at the lowest FDA-approved dose. [16]
    * Muscle related symptoms must have begun or increased during statin therapy and stopped when statin therapy was discontinued.
    * The trial included a 4-week, single-blind placebo run-in period, patients who experienced muscle symptoms during the placebo run-in period were excluded. After completion of the run-in period patients were randomized to Praluent (alirocumab), ezetimibe, or atorvastatin.
    * In total, 314 of 361 patients completed the placebo run-in period. Of the 47 placebo run-in failures, 23 (48.9%) reported at least one skeletal muscle-related adverse event.
    * Approximately 70% of patients randomized to atorvastatin completed 24 weeks of the double-blind treatment period. The intent of this arm was to rechallenge patients with a statin.
    * Fewer patients experienced skeletal muscle-related TEAEs in the alirocumab group than the atorvastatin (HR: 0.61; 95% CI: 0.38 to 0.99) or ezetimibe (HR: 0.70; 95% CI: 0.47 to 1.06) groups. Fewer patients in the Praluent (alirocumab) group discontinued the study due to musculoskeletal AEs compared to the atorvastatin group (15.9% versus 22.2%, respectively).

    * Although, this trial was conducted in a "statin intolerant" population, the majority of these patients were able to tolerate statin therapy, thus requiring multiple statin-rechallenges prior to use of a PCSK9 inhibitor is warranted.

- Other studies have also concluded that most patients can tolerate a statin after being re-challenged.
    * In a retrospective analysis of 1,605 statin-intolerant patients conducted by researchers at the Cleveland Clinic, 72.5% of patients were able to tolerate a statin after re-challenge. [17]
    * Authors of a separate retrospective analysis conducted at two academic medical centers concluded that most patients who are rechallenged can tolerate statins long-term. In this study, 92.2% of patients who were re-challenged with a statin were able to continue taking statins after 12-months.
- 2018 AHA/ACC Guidelines state that in patients with statin-associated side effects that are not severe, it is recommended to reassess and to re-challenge to achieve a maximal LDL-C lowering by modified dosing regimen, an alternate statin or in combination with non-statin therapy. Guidelines authors noted that a large majority of patients can tolerate statin re-challenge with an alternative statin or alternative regimen, such as reduced dose or in combination with non-statins.
- The ACC has developed an online application to help providers assess, treat, and manage patients with possible statin intolerance. The tool is available at: http://tools.acc.org/StatinIntolerance/

Dosing considerations

- The recommended starting dose for Praluent (alirocumab) is 75 mg administered subcutaneously once every 2 weeks. If the LDL-C response is inadequate, the dose may be increased to the maximum dose of 150 mg administered every 2 weeks. An alternative starting dose of 300 mg every 4 weeks may also be considered.[3]
- The recommended starting dose of Repatha (evolocumab) for patients with HeFH or clinical ASCVD is 140 mg once every 2 weeks or 420 mg once monthly, administered subcutaneously. The recommended starting dose for patients with HoFH is 420 mg once monthly.[6]
- The recommended dose of Leqvio (inclisiran) is 284 mg given subcutaneously as a single injection, repeated at 3 months, then every 6 months thereafter.[18]

Appendix 1: Dutch Lipid Clinic Network criteria [12]	
Criteria	**Points**
Group 1: family history	
First-degree relative with known premature (less than age 55 for males or 65 for females) coronary heart disease *OR* First-degree relative with known LDL cholesterol above 95th percentile	1
First-degree relative with tendon xanthoma and/or corneal Arcus *OR* Children < 18 years with LDL cholesterol above 95th percentile	2
Group 2: clinical history	
Premature coronary heart disease	2
Subject has cerebral or peripheral vascular disease	1
Group 3: physical examination	
(i) Tendon xanthoma	6
(ii) Corneal arcus in a person before age 45	4
Group 4: biochemical results (LDL-C)	
>8.5 mmol/L (>325 mg/dL)	8
5–8.4 mmol/L (251–325 mg/dL)	5
5.0–6.4 mmol/L (191–250 mg/dL)	3
4.0–4.9 mmol/L (155–190 mg/dL)	1
Group 5: molecular genetic testing (DNA analysis)	
(i) Causative mutation shown in the LDLR, APOB, or PCSK9 genes	8
Scoring	
> 8 points: Definite FH 6-8 points: Probably FH 3-5 points: Possible FH <3 points: Unlikely FH	

Appendix 2: Simon Broome Register Diagnostic Criteria for Definitive FH [19]
Adults: Total cholesterol levels > 290 mg/dL (7.5 mmol/L) or LDL-C > 190 mg/dL (4.9 mmol/L). Children less than 16 years of age: Total cholesterol levels > 260 mg/dL (6.7 mmol/L) or LDL-C > 155 mg/dL (4.0 mmol/L). Plus at least one of the two: **1.** Physical findings: tendon xanthomas or tendon xanthomas in a first or second degree relative. **OR** **2.** DNA-based evidence of an LDL-receptor mutation, familial defective apo B-100, or a PCSK9 mutation.

Appendix 3: Risk Factors for Statin-Associated Muscle Symptoms [1 20]
Hypothyroidism
Multiple or serious co-morbidities, including reduced renal or hepatic function
Rheumatologic disorders such as polymyalgia rheumatica
Steroid myopathy
Vitamin D deficiency
Primary muscle diseases
Acute infection
Organ transplant recipients
Severe trauma
HIV
Diabetes mellitus
Major Surgery
History of creatinine kinase elevation
History of pre-existing/unexplained muscle/joint/tendon pain
Genetic factors such as polymorphisms in genes encoding cytochrome P450 isoenzymes or drug transporter
High level of physical activity
Dietary effects (excessive grapefruit or cranberry juice)
Excess alcohol
Drug abuse (cocaine, amphetamines, heroin)

Appendix 4: Examples of Drug-drug interactions that may increase the risk of skeletal muscle effects with High-Intensity Statins
Strong inhibitors of CYP 3A4 (e.g., clarithromycin, itraconazole, protease inhibitors)
Grapefruit Juice
Cyclosporine
Gemfibrozil and other fibrates
Niacin
Colchicine

Appendix 5: Contraindications to Statin Therapy [10 21]
Active liver disease, which may include unexplained persistent elevations in hepatic transaminase levels
History of rhabdomyolysis
Hypersensitivity
Nursing Mothers
Pregnancy

Appendix 6: Clinical Atherosclerotic Cardiovascular Disease (ASCVD) [1]
Acute coronary syndromes
History of coronary or other arterial revascularization
History of myocardial infarction
History of stable or unstable angina
History of stroke or transient ischemic attack (TIA)
Peripheral arterial disease presumed to be of atherosclerotic origin

Appendix 7: Statin Comparison Chart [1]		
% LDL- C Lowering	**Statin Name**	**Strength**
Low-intensity: < 30%	Fluvastatin	20 mg, 40 mg
	Lovastatin	10 mg, 20 mg
	Lovastatin ER (Altoprev)	20 mg
	Pitavastatin (Livalo)	1 mg
	Pravastatin	10 mg, 20 mg
	Simvastatin	5 mg, 10 mg
Moderate-intensity: 31% - 49%	Atorvastatin	10 mg, 20 mg
	Fluvastatin ER (Lescol XL)	80 mg
	Lovastatin	40 mg
	Lovastatin ER (Altoprev)	40 mg, 60 mg
	Pitavastatin (Livalo)	2 mg, 4 mg
	Pravastatin	40 mg, 80 mg
	Rosuvastatin	5 mg, 10 mg
	Simvastatin	20 mg, 40 mg
High-intensity: ≥ 50%	Atorvastatin	40 mg, 80 mg
	Rosuvastatin	20 mg, 40 mg

Appendix 8: AHA/ACC Definition of Very-High Risk ASCVD [1]	
Very high risk includes a history of multiple major ASCVD events or one major ASCVD event and multiple high-risk conditions.	
Major ASCVD Events	**High-Risk Conditions**
Recent ACS (in past 12 months)	Age ≥ 65 years
History of MI (other than recent ACS event)	HeFH
History of ischemic stroke	History of prior coronary artery bypass surgery or percutaneous coronary intervention outside of the major ASCVD event
Symptomatic Peripheral arterial disease (History of claudication with ABI< 0.85, or previous revascularization or amputation)	Diabetes mellitus
	Hypertension
	Chronic Kidney Disease
	Current Smoking
	Persistently elevated LDL-C (≥ 100 mg/dL) despite maximally tolerated statin therapy and ezetimibe
	History of congestive heart failure

Revision History

Revision Date	Revision Summary
3/16/2023	No changes to policy criteria with this annual update.
3/18/2022	New policy (effective 6/1/2022). Replaces individual coverage policies for Praluent (alirocumab), dru406 and Repatha (evolocumab), dru407 and includes Leqvio (inclisiran). No change to intent of coverage from previous criteria: limits coverage to confirmed labeled indications with step therapy with low-cost generics. Inclisiran has an additional clinical step with other PCSK9 inhibitors.

Drug names identified in this policy are the trademarks of their respective owners.

Medication Policy Manual

Policy No: dru698

Topic: Gene therapies for beta thalassemia

- Casgevy (exagamglogene autotemcel)
- Zynteglo, betibeglogene autotemcel

Date of Origin: April 15, 2022

Committee Approval Date: June 20, 2024

Next Review Date: 2025

Effective Date: September 1, 2024

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of medication policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Gene therapies in this policy are intravenous (IV) therapies used to treat a rare, genetic blood condition (transfusion dependent beta thalassemia).

PLEASE NOTE:

This policy does not apply to Casgevy (exagamglogene autotemcel) for use in sickle cell disease (SCD). Please refer to policy dru766 gene therapies for sickle cell disease for coverage details.

Policy/Criteria

Most contracts require pre-authorization of gene therapies for beta thalassemia prior to coverage.

I. Gene therapies for beta thalassemia are considered investigational, except for those situations specifically addressed in the policy criteria below.

PLEASE NOTE: Under this criterion, any products not specifically addressed in this policy will be considered investigational.

II. Continuation of therapy (COT): Gene therapies for beta thalassemia may be considered medically necessary for COT when full policy criteria below are met, including quantity limit. However, gene therapies for beta thalassemia are not coverable for repeated doses and are not coverable if a patient has previously received prior gene therapy for SCD.

***Please note**: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment naïve): Gene therapies for beta thalassemia may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) that criteria A and B below are met.

A. A diagnosis of **transfusion-dependent beta-thalassemia** (TDT) when there is clinical documentation that all criteria (1 through 6) below are met:

1. The diagnosis of beta thalassemia is genetically confirmed.

AND

2. No prior hematopoietic stem cell transplantation (HSCT).

AND

3. Documented transfusion-dependence, defined as transfusion of at least 8 red blood cell transfusions (RBCTs) in the prior 12-month period.

AND

4. Standard transfusion therapy (RBCTs) **and** iron chelation therapy (ICT) have been ineffective, not tolerated, or use is contraindicated (as defined in A*ppendix 2*).

AND

5. ***For Casgevy (exagamglogene autotemcel) only:*** The patient is 12 years of age or older at the time of infusion.

AND

6. ***For Zynteglo (betibeglogene autotemcel) only:*** The patient is 4 years of age or older at the time of infusion.

AND

B. The patient is a suitable candidate for gene therapies for beta thalassemia and meets all of the following criteria (1, 2, and 3) below:

1. No prior use of gene therapy (see *Appendix 1*).

AND

2. Patient is fit for therapy, as defined by meeting all the criteria (a, b, and c) below.

a. The patient has a Karnofsky or Lansky performance status (KPS) of at least 80 [or ECOG performance status of 0 or 1; the patient is ambulatory and able to carry out work of a light or sedentary nature].

AND

b. The patient has adequate and stable kidney, liver, and cardiac function (provider attestation).

AND

c. The patient has no active systemic infections (including, but not limited to HCV, HBV, and HIV infection) (provider attestation).

AND

3. Treatment with HSCT is contraindicated (including, but not limited to lack of a matched donor, comorbidities, and age).

PLEASE NOTE: Suitability for gene therapy must be documented in recent clinical documentation (such as in chart notes, laboratory reports), which MUST include evaluation for HSCT [bone marrow transplant (BMT)].

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers gene therapies for beta thalassemia coverable only under the medical benefit (as provider-administered medications).

B. When pre-authorization is approved, gene therapies for beta thalassemia may be authorized in quantities of one treatment course per lifetime.

C. Additional infusions of gene therapies for beta thalassemia will not be authorized.

IV. Gene therapies for beta thalassemia are considered investigational when used for all other conditions, including, but not limited to:

A. Alpha thalassemia

B. N**on**-transfusion dependent beta thalassemia

C. ***Zynteglo (betibeglogene autotemcel) only:*** Sickle cell disease (SCD).

Position Statement

Summary

- Gene therapies for beta thalassemia are ex-vivo therapies given as a one-time IV infusion.
- FDA approved products include the following:
  - Casgevy (exagamglogene autotemcel), a novel clustered regularly interspaced short palindromic repeats **(**CRISPR) and Cas9 gene-editing cell therapy that targets BCL11A gene to increase production of fetal Hb.
  - Zynteglo (betibeglogene autotemcel) uses a lentiviral vector to encode a functional copy of a modified ß-globin gene into hematopoietic stem cells.
- Gene therapies for beta thalassemia are complex, high-cost treatments that require several phases of administration, extended hospitalization, and extensive supportive care, similar to a hematopoietic stem cell transplantation (HSCT).
- The intent of this policy is to allow for coverage of gene therapies for beta thalassemia for the indication and dose for which it has been shown to be safe and effective in clinical trials. This includes for treatment of genetically confirmed transfusion-dependent beta-thalassemia (TDT). Aside from transfusion-dependence, patients must be clinically suitable to receive gene therapies for beta thalassemia.
- Current available evidence for gene therapies for beta thalassemia is limited to small, single-arm, non-randomized trials that evaluated transfusion independence as the primary endpoint.
  - Based on most recent data analyses of the pivotal trials for Casgevy and Zynteglo, the majority of patients were transfusion free for a year or more.
  - However, the long-term impact of these gene therapies for beta thalassemia on other clinically relevant outcomes, such as overall survival (OS), is currently unknown.
- Standard of care therapies, including transfusions along with iron chelation therapy (ICT) and HSCT, have proven survival benefit in patients with TDT. However, not all patients with TDT are able to tolerate iron overload-associated adverse events, despite hematologic response from transfusions. In addition, many patients with TDT do not have an HLA-matched donor for HSCT or are not suitable candidates for HSCT. For these specific populations, the potential benefit of these gene therapies for beta thalassemia may outweigh the risks.
- Currently, there is insufficient evidence to establish the safety and efficacy in other settings, including non-transfusion dependent beta thalassemia or alpha thalassemia.
- Gene therapies for beta thalassemia may be covered for up to one dose per lifetime. There is no data on the safety or efficacy of repeated doses.

Disease Background [1]

- Beta thalassemia is a rare, recessive genetic blood disease caused by a mutation in the ß-globulin gene. It is characterized by an absence or reduced production of ß-globin, an integral component of hemoglobin (Hgb).

    - Hemoglobin A (HgbA), the most common form of adult hemoglobin, consists of a tetramer containing alpha (α) and beta (ß)-globin subunits.
    - Under normal physiologic conditions, the α/ß-globin chain ratio is tightly regulated. However, the absence or reduction in ß-globin chains that occurs in beta thalassemia leads to an imbalance in this ratio. This leads to an increase in unbound non-soluble α-globin chains, which causes cellular damage.
- Ineffective erythropoiesis is a hallmark of beta-thalassemia, which leads to anemia and a number of subsequent pathophysiologic complications: hemolysis, hypercoagulability, iron overload, extramedullary hematopoiesis, heart disease, and hepatic cirrhosis.
- Symptoms of beta thalassemia include fatigue, weakness, poor appetite, pallor, jaundice, growth retardation, delayed puberty, abdominal swelling, and bone problems (especially facial bone deformities).

Clinical Efficacy

Zynteglo (betibeglogene autotemcel) in Transfusion Dependent Beta Thalassemia (TDT)

- The safety and efficacy of Zynteglo (betibeglogene autotemcel) was established primarily on four small, single-arm, non-randomized trials in patients with TDT. All four trials evaluated transfusion independence (TI). [2 3]
    - All patients had genetically confirmed TDT and transfusion-dependence, defined as required ≥ 8 RBCTs per year. In addition, all were ≤ 50 years of age and fit for Zynteglo (betibeglogene autotemcel) therapy (Karnofsky or Lansky performance status ≥ 80, adequate organ function, and no active infections, clinically stable and eligible for a HSCT but without an HLA-matched donor). Patients with severe liver dysfunction or significant cardiac abnormalities (with myocardial iron stores of T2 < 10 msecs) were excluded from trial enrollment.
    - TI, the primary endpoint, was defined as a weighted average Hgb ≥ 9 g/dl without any RBCTs for a continuous period of at least12 months.
    - The initial trials (Northstar and HGB-205) enrolled both non-ß^0/ß^0 TDT (n= 13) and ß^0/ß^0 TDT (n=9) patients.
        - The majority of patients with non-ß^0/ß^0 TDT achieved TI [92% (12/13)], whereas only one-third of the patients with ß^0/ß^0 TDT achieved TI [33% (3/9)].
        - Given the low response in patients with ß^0/ß^0 TDT, the subsequent trial (Northstar-2) of Zynteglo (betibeglogene autotemcel) only investigated use for non-ß^0/ß^0 TDT.
        - In addition, after this trial, the Zynteglo (betibeglogene autotemcel) was reformulated with a modified manufacturing process to improve the levels of gene therapy derived HgbA (increased viral vector copy number).
    - The subsequent Northstar-2 trial enrolled patients with non-ß0/ß0 TDT (n=23).
        - At the time of the data cut, 92% of patients achieved TI, over the average follow up time of approximately two years.

- Of note, this trial used the updated formulation of Zynteglo (betibeglogene autotemcel).
- Additional follow up data is pending (expected after February 2024), to evaluate the durability and long-term safety of Zynteglo (betibeglogene autotemcel).

* Most recently, the Northstar-3 trial enrolled patients with TDT that had both ß0/ß0 TDT and non-ß0/ß0 TDT (n=18). The trial reported similar results to the prior trials, with efficacy across both genotypes.[4]
  - At the completion of the trial, 88.9% of patients achieved TI, over the average follow up time of two years.
  - Of note, 12 of the 18 patients (66%) were ß0/ß0 TDT, while only 6 (33%) were non-ß0/ß0 TDT.
* Similar to a HSCT, patients undergo myeloablative chemotherapy prior to Zynteglo (betibeglogene autotemcel) infusion, requiring on average ≥ 30 days of inpatient hospitalization post infusion of Zynteglo (betibeglogene autotemcel)

<u>Casgevy (exagamglogene autotemcel) in TDT</u>

- The safety and efficacy of Casgevy (exagamglogene autotemcel) was established primarily from the ongoing CLIMB THAL-111 study (n=52), a small phase 2/3, non-randomized, open-label, single arm trial in patients with genetically confirmed TDT (ß0/ß0 TDT and non-ß0/ß0 TDT). The trial evaluated transfusion independence (TI). [5-8]
  * Patients were aged 12 to 35, with genetically confirmed beta thalassemia that was transfusion-dependent (defined as either 10 units or RBCTs per year or 100 ml/kg/year of RBCTs in the previous two years), with the average patient enrolled receiving 35 units of RBCTs per year.
  * All patients were fit for Casgevy (exagamglogene autotemcel) therapy, defined as having a Karnofsky or Lansky performance status ≥ 80, adequate organ function, no active infections, clinically stable, and eligible for a HSCT but without an HLA-matched donor. Patients with severe liver, renal, or cardiac dysfunction and those with a prior HSCT were excluded from trial enrollment.
  * The trial enrolled of both ß0/ß0 and non-ß0/ß0 genotypes, with 31 patients (60%) having ß0/ß0 genotype and 21 patients (40%) having non-ß0/ß0 genotypes.
  * The primary endpoint was the number of patients achieving TI for 12 consecutive months while maintaining a Hgb ≥ 9 g/dl.
  * At the most recent available data cut-off (Jan 2023), 32 of the 35 eligible patients for the primary endpoint achieved TI for 12 consecutive months (91.4%, P<0.0001), with the mean duration of effect of 21 months. Efficacy was seen across both genotypes.
  * Patients undergo myeloablative conditioning prior to Casgevy (exagamglogene autotemcel) infusion, with patients requiring on average ≥ 30 days of inpatient hospitalization from conditioning to discharge.
  * Additional follow up data is pending (expected after February 2024), further evaluating the durability and safety of Casgevy (exagamglogene autotemcel) in TDT.

Clinical Guidelines/Standard of Care Treatment [1 9]

- The treatment of patients with transfusion-dependent beta-thalassemia requires a multidisciplinary approach due to the number of complications associated with the disease.
- Current treatment approaches for patients with beta-thalassemia mainly address the anemia-related symptoms of the disease. The key components of symptomatic care are RBCTs and HSCT (for patients with an HLA-matched donor that are clinically eligible).
- Currently, HSCT is the only proven cure for beta-thalassemia, with greatest benefit seen in young patients. However, use of HSCT is limited by availability of HLA-matched donors for the stem cell donation and the clinical stability of the patient being treated (e.g., adequate organ function, comorbidities, age).
- Patients with transfusion-dependent beta-thalassemia require regular transfusions (every 2 to 5 weeks) to maintain an acceptable Hgb. Recommended pre-transfusion Hgb target is 9.0 to 10.5 g/dl to promote normal growth, allow normal physical activities, and suppress bone marrow activity. A higher pre-transfusion Hgb target of 11 to 12 g/dl is recommended for some patients who develop disease complications (e.g., cardiac disease).
- Disease management with RBCTs and HSCT has greatly improved survival in patients with severe forms of beta-thalassemia, However, iron overload-related comorbidities can arise due to frequent RBCTs. This mainly affects the heart, liver, and endocrine organ systems.
    * Without an effective iron chelation therapy (ICT) regimen, uncontrolled iron overload increases the risks of heart failure, endocrine damage, liver cirrhosis, and hepatocellular carcinoma.
    * Cardiac complications cause the majority (~70%) of deaths in patients with TDT.
- Iron overload is managed with life-long ICT. ICT with deferoxamine, deferasirox, or deferiprone is titrated to iron levels, in the liver, heart, and blood, as follows:
    * Liver iron concentration (LIC) 2-5mg/g of dry weight
    * Myocardial iron: T2 >20 msecs
    * Serum ferritin < 1000 ng/ml

Safety [2 3]

- The most common grade ≥ 3 treatment-emergent adverse events (AEs) seen during pivotal trials were thrombocytopenia, neutropenia, anemia, leukopenia, febrile neutropenia, epistaxis, pyrexia, decreased appetite, and hepatic veno-occlusive disease.
- Of note, the AEs noted above are consistent with those typically seen with the conditioning regimen used prior to infusion with gene therapies for beta thalassemia.
- Long-term safety data is limited as these trials are of a small sample size and short duration for a chronic disease.
- Additional safety data is needed to establish potential long-term toxicities that may be associated with these gene therapies for beta thalassemia, including the risk for malignancies or off target mutations.

Appendix 1:

Gene Therapies [a]
- Casgevy (exagamglogene autotemcel) - Lyfgenia (lovotibeglogene autotemcel) - Zynteglo (betibeglogene autotemcel) - Chimeric Antigen Receptor (CAR) T-cell Therapies (see dru523) - Roctavian (valoctocogene roxaparvovec) - Hemgenix (etranacogene dezaparvovec)

[a] Including, but not limited to these gene therapies

Appendix 2:

Definition of Ineffective/Not tolerated/contraindications to Standard TDT Therapy [transfusion and/or iron chelation therapy (ICT)] [1]

- Patient is unable to maintain pre-transfusional Hgb goal.
- Transfusion-related iron overload, despite compliant use of ICT. [a]
- Patient intolerant of ICT or has a documented contraindication to all ICT options.
- Patient intolerant of RBCTs, such as:
  * Transfusion reactions (allergic, hemolytic, alloimmunization), despite management by a Transfusion Medicine specialist.
  * Excessive volume overload, such that RBCTs are not an option.
  * Other: Transfusion-related lung injury (TRALI), transfusion-related GVHD.
- Clinical or laboratory documentation of persistent ineffective erythropoiesis, despite RBCTs. Clinical signs include facial bone changes (frontal bossing and maxillary hyperplasia), poor growth, symptomatic extramedullary hematopoiesis, fatigue and reduced physical functioning.

[a] Liver iron concentration (LIC) > 5mg/g, myocardial iron (T2) >20 msecs, serum ferritin ≥ 1000 ng/ml

Revision History

Revision Date	Revision Summary
6/20/2024	Updated cross references, no criteria changes with this annual review
3/21/2024	• Renamed policy 'Gene therapies for beta thalassemia'. • Added Casgevy (exagamglogene autotemcel). • Updated criteria as follows: - Added age criteria for each product. - Updated diagnostic criteria to include both beta thalassemia genotypes (β^0/β^0 TDT and non-β^0/β^0 TDT). - Reworded HSCT evaluation criteria to specify no contraindications.
6/15/2023	No criteria changes with this annual update.
9/23/2022	Updated policy to show new brand name of Zynteglo (betibeglogene autotemcel).
3/18/2022	New policy (effective 6/1/2022). Limits use to TDT patients with non-β^0/β^0 genotype that have failed standard transfusion/iron chelation therapy, for whom a hematopoietic stem cell transplantation (HSCT) is appropriate, but a matched donor is not available.

Drug names identified in this policy are the trademarks of their respective owners.

Medication Policy Manual	**Policy No:** dru700
Topic: Fyarro, nab-sirolimus, protein-bound sirolimus	**Date of Origin:** July 15, 2022
Committee Approval Date: September 19, 2024	**Next Review Date:** 2025
Effective Date: December 1, 2024	

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Fyarro (nab-sirolimus, protein-bound sirolimus) is an intravenously administered formulation of sirolimus approved for use in patients with a specific type of tumor [malignant perivascular epithelioid cell tumors (PEComas)].

Policy/Criteria

Most contracts require pre-authorization approval of Fyarro (nab-sirolimus) prior to coverage.

I. Continuation of therapy (COT): Fyarro (nab-sirolimus) may be considered medically necessary for COT when full policy criteria below are met, including quantity limits.

***Please note**: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan*

II. New starts (treatment-naïve patients): Fyarro (nab-sirolimus) is considered not medically necessary for malignant **perivascular epithelioid cell tumor** (PEComa).

III. Fyarro (nab-sirolimus) is considered investigational when used for all other conditions.

IV. Administration, Quantity Limitations, and Authorization Period

- **A.** Regence Pharmacy Services considers Fyarro (nab-sirolimus) coverable only under the medical benefit (as a provider-administered medication).
- **B.** Although the use of Fyarro (nab-sirolimus) is considered "not medically necessary," if pre-authorization is approved, Fyarro (nab-sirolimus) will be authorized in quantities of up to two, 100mg/m^2 infusions every 21 days until disease progression.
- **C.** Authorization **shall** be reviewed at least annually. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, such as disease stability or improvement.

Position Statement

Summary

- Fyarro (nab-sirolimus), a mechanistic target of rapamycin (mTOR) inhibitor, is considered 'not medically necessary' for locally advanced or metastatic malignant perivascular epithelioid cell tumor (PEComa) as it has no proven benefit over much less costly mTOR inhibitor alternatives.
- Fyarro (nab-sirolimus) is a new formulation of sirolimus in which a sirolimus molecule is bound to albumin, a protein found in the blood stream. This alters the pharmacokinetics of sirolimus in the body; however, the clinical relevance of this has not been determined.
- Sirolimus has been available for many years. It is available as an oral tablet and as an injectable prodrug, temsirolimus, which is converted to sirolimus once infused into the body. Both of these products are available as significantly less-costly generics.
- Fyarro (nab-sirolimus) was approved for malignant PEComa based on a small, uncontrolled (it was not directly compared to any other therapy), observational study that looked at the change in tumor size on x-ray as a surrogate endpoint (low quality evidence). The study found that tumors slowed in growth or decreased in size in some patients who received Fyarro (nab-sirolimus). However, this tumor response has not been shown to predict improved survival or improve symptom control, clinically important outcomes in patients with malignant PEComa.
- Other mTOR inhibitors have been used 'off-label' to manage malignant PEComa including oral sirolimus, intravenous temsirolimus, and oral everolimus. The available evidence for these drugs in malignant PEComa is also of low quality. It is based on case studies which also evaluated change in tumor size on x-ray as a surrogate endpoint. As was observed with Fyarro (nab-sirolimus) some patients receiving these medications had slowed growth or decrease in size of their tumors.
- The side effects experienced with Fyarro (nab-sirolimus) are similar to those experienced with other mTOR inhibitors. Because Fyarro (nab-sirolimus) has not been directly compared with other mTOR inhibitors, marketing claims that it may be safer or more effective than other sirolimus formulations cannot be substantiated.
- The National Comprehensive Cancer Network (NCCN) soft tissue sarcoma (STS) guideline lists Fyarro (nab-sirolimus), oral sirolimus, temsirolimus, and everolimus as potential therapies for malignant PEComa.
- Fyarro (nab-paclitaxel) is administered intravenously on days 1 and 8 of each 21-day cycle in a dose of 100 mg/m^2. It is administered until disease progression or unacceptable toxicity.
- The safety and effectiveness of Fyarro (nab-paclitaxel) for conditions other than malignant PEComa has not been studied.

Regence Pharmacy Services performs independent analyses of oncology medication evidence, to establish coverability per the contracts with the health plan.

- Most contracts define coverability based on established clinical benefit in published, peer-reviewed literature, along with consideration of regulatory status.
- FDA approval does not in itself establish medical necessity, as unpublished, low-quality evidence, including exploratory analyses and unvalidated surrogate endpoints, may be used as the basis of approval. Regulatory approval may or may not reflect clinical benefit relative to standard of care and the recommendations of expert clinical advisors such as the Oncologic Drugs Advisory Committee (ODAC). FDA approvals generally do not consider cost compared to established therapies, or value to members.
- Likewise, NCCN clinical practice guidelines assignment of a recommendation (category 1, 2a, or 2b) does not necessarily establish medically necessity. NCCN recommendations are inconsistently supported by published, peer-reviewed literature and do not uniformly consider value of new therapies relative to existing potentially higher-value treatment options, considering effectiveness, safety, and cost.
- Medication coverage criteria are developed based on the 'medical necessity' assessment, as described above.

Regence Pharmacy Services analysis and coverage policy may differ from FDA labeled indication and/or NCCN clinical practice guidelines.

Product Description [1]

- Fyarro (nab-sirolimus) is a new formulation of sirolimus, an mTOR inhibitor, in which a sirolimus molecule is attached to albumin. This alters the pharmacokinetics of sirolimus in the body; however, the clinical relevance of this has not been determined.
- Sirolimus is also available as an oral tablet, and as an injectable prodrug of sirolimus, temsirolimus. Both of these products have been around for many years and are currently available as significantly less-costly generics.

Clinical Efficacy

- Fyarro (nab-sirolimus) was evaluated in a small, non-comparative, observational trial (low quality evidence) in patients with malignant peri-vascular epithelioid cell tumor (PEComa). [2]
    * Patients in the trial had locally advanced (ineligible for surgical resection) or metastatic malignant PEComa.
    * Patients with lymphangioleiomyomatosis (LAM), a specific subtype of PEComa, were excluded from the trial.
    * Patients who received prior therapy with an mTOR inhibitor were also excluded from the trial because resistance to this class of drugs may occur over time.
    * The study evaluated tumor response, a radiographic measure of the size of a tumor, as a surrogate endpoint. Some patients in the study had stabilization or reduction in the size of their tumors while on Fyarro (nab-sirolimus). However, tumor response has not been shown to accurately predict benefit with regard to any clinically relevant outcome such as improved survival or symptom control.

- Other sirolimus formulations (oral sirolimus, intravenous temsirolimus), as well as everolimus (another mTOR inhibitor), have been used 'off-label' for treating malignant PEComa. Tumor responses have also been observed with these drugs. Like the evidence for Fyarro (nab-sirolimus) this is also considered to be low quality evidence. [3-6]
- None of the mTOR inhibitors have been directly compared with one another so it is not known if there are any differences in safety or effectiveness among the various products. Furthermore, the generic mTOR products are less costly so provide better value. For this reason, Fyarro (nab-sirolimus) is considered not medically necessary.

Guidelines [6]

- The National Comprehensive Cancer Network (NCCN) soft tissue sarcoma (STS) guideline lists Fyarro (nab-sirolimus), oral sirolimus, temsirolimus, and everolimus as potential therapies for malignant PEComa.

Investigational Uses *[7,8]*

- Fyarro (nab-sirolimus) has not been studied in any condition other than malignant PEComa.
- The NCCN compendium does not list any additional uses for the Fyarro formulation of sirolimus (nab-sirolimus).

Safety *[1,9,10]*

- Common adverse effects (AEs) observed with administration of mTOR inhibitors include stomatitis, rash, gastrointestinal symptoms, infection, and edema.
- There are no studies directly comparing the safety of different mTOR inhibitors with one another, so it is not known whether any one product is better tolerated than another.

Dosing *[1]*

- Fyarro (nab-paclitaxel) is administered intravenously on days 1 and 8 of each 21-day cycle in a dose of 100 mg/m^2. It is administered until disease progression or unacceptable toxicity.
- Dose modifications are made for certain AEs including stomatitis, anemia, thrombocytopenia, neutropenia, infections, hypokalemia, hyperglycemia, interstitial lung disease, and hemorrhage.

Medication Policy Manual | **Policy No:** dru701

Topic: Kimmtrak, tebentafusp-tebn | **Date of Origin:** July 15, 2022

Committee Approval Date: June 20, 2024 | **Next Review Date:** 2025

Effective Date: September 1, 2024

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Kimmtrak (tebentafusp-tebn) is an intravenously administered immunotherapy approved for use in patients with a specific type of cancer (HLA-A*02:01-positive, advanced uveal melanoma).

Policy/Criteria

Most contracts require pre-authorization approval of Kimmtrak (tebentafusp-tebn) prior to coverage.

I. Continuation of therapy (COT): Kimmtrak (tebentafusp-tebn) may be considered medically necessary for COT when criterion A, B, or C below is met.

A. For diagnoses NOT listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND there is documentation that the medication was covered by another health plan. Examples of documentation include the coverage approval letter from the previous health plan or paid claim.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

B. For diagnoses listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

C. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

Please note*: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan*

II. New starts (treatment-naïve patients): Kimmtrak (tebentafusp-tebn) may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) that criteria A, B, and C below are met:

A. A diagnosis of **uveal melanoma**, unresectable or metastatic.

AND

B. The patient is Human Leukocyte Antigen (HLA)-A*02:01-positive.

AND

C. Kimmtrak (tebentafusp-tebn) will be used as monotherapy.

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers Kimmtrak (tebentafusp-tebn) coverable only under the medical benefit (as a provider-administered medication).

B. When pre-authorization is approved, Kimmtrak (tebentafusp-tebn) may be approved for up to four, 68 mcg infusions per month until disease progression.

C. Authorization **may** be reviewed at least annually. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, including disease stability or improvement relative to baseline symptoms.

IV. Kimmtrak (tebentafusp-tebn) is considered investigational when used for all other conditions, including but not limited to cutaneous melanoma.

Position Statement

Summary

- Kimmtrak (tebentafusp-tebn) is an intravenously administered immunotherapy. It binds to the human leukocyte antigen (HLA)-A*02:01/gp100 complex on the surface of uveal melanoma tumor cells. This helps the bodies T cells recognize, attack, and kill the tumor cells.
- The intent of this policy is to allow coverage of Kimmtrak (tebentafusp-tebn) in the clinical setting described in the coverage criteria above, where it has been evaluated for efficacy, up to the dose shown to be safe in clinical trials.
- The FDA approval of Kimmtrak (tebentafusp-tebn) was based on one trial in HLA-A*02:01-positive adult patients with metastatic uveal melanoma. Patients enrolled in the trial had no prior systemic therapy or liver-directed therapy for their metastatic disease. Kimmtrak (tebentafusp-tebn), administered as monotherapy, was found to improve overall survival (OS) relative to physician's choice of guideline-recommended therapies. OS is a meaningful clinical outcome in metastatic uveal melanoma which has no cure and is associated with high morbidity and mortality.
- In general, therapies used to treat cutaneous melanoma do not work very well in uveal melanoma due to differences in molecular markers and biology.
- The National Comprehensive Cancer Network (NCCN) uveal melanoma guideline lists Kimmtrak (tebentafusp-tebn) as an option for patients with distant metastatic disease who are HLA A*02:01-postive. For metastases confined to the liver, the guideline recommends considering front-line use of liver-directed palliation for symptomatic patients.
- Kimmtrak (tebentafusp-tebn) may be covered in doses of up to 68 mcg each week, the dose studied in the pivotal trial, until disease progression. The safety and effectiveness of higher doses have not been established.
- The safety and effectiveness of Kimmtrak (tebentafusp-tebn) in other conditions have not been established. This includes metastatic cutaneous melanoma where Kimmtrak (tebentafusp-tebn) has not been formally evaluated.

Regence Pharmacy Services performs independent analyses of oncology medication evidence, to establish coverability per the contracts with the health plan.

- Most contracts define coverability based on established clinical benefit in published, peer-reviewed literature, along with consideration of regulatory status.
- FDA approval does not in itself establish medical necessity, as unpublished, low-quality evidence, including exploratory analyses and unvalidated surrogate endpoints, may be used as the basis of approval. Regulatory approval may or may not reflect clinical benefit relative to standard of care and the recommendations of expert clinical advisors such as the Oncologic Drugs Advisory Committee (ODAC). FDA approvals generally do not consider cost compared to established therapies, or value to members.
- Likewise, NCCN clinical practice guidelines assignment of a recommendation (category 1, 2a, or 2b) does not necessarily establish medically necessity. NCCN recommendations are inconsistently supported by published, peer-reviewed literature and do not uniformly consider value of new therapies relative to existing potentially higher-value treatment options, considering effectiveness, safety, and cost.
- Medication coverage criteria are developed based on the 'medical necessity' assessment, as described above.

Regence Pharmacy Services analysis and coverage policy may differ from FDA labeled indication and/or NCCN clinical practice guidelines.

Clinical Efficacy

- The efficacy of Kimmtrak (tebentafusp-tebn) was studied in a fair quality, open-label, randomized controlled trial in HLA-A*02:01-positive patients with metastatic uveal melanoma. The trial evaluated overall survival (OS) in patients receiving Kimmtrak (tebentafusp-tebn) relative to those receiving Physician's choice of therapy. [1,2]
    * The patients in the trial had no previous systemic or liver-directed therapy for their metastatic disease; however, prior neoadjuvant or adjuvant therapy for early-stage disease was allowed.
    * Patients received either single-agent Kimmtrak (tebentafusp-tebn) or Physician's choice of one of the following three therapies: pembrolizumab (Keytruda), ipilimumab (Yervoy), or dacarbazine. Most patients (82%) received pembrolizumab (Keytruda) in the Physician's choice treatment arm. *(Note: Each of the three therapies included in the comparator arm is included in the current NCCN guideline as a potential therapy for metastatic uveal melanoma)*
    * Treatment was continued until radiographic disease progression. Subsequent therapy was determined at the investigator's discretion.
- The median OS was 21.7 months and 16.0 months in the Kimmtrak (tebentafusp-tebn) and Physician's choice treatment arms, respectively. [1,2] This difference is both statistically and clinically relevant. OS is a clinical outcome of importance in patients with metastatic uveal melanoma, an incurable disease with high morbidity and mortality.
- Note: The pivotal trial excluded patients who had prior liver-directed therapy so it would be unknown if the survival benefit associated with Kimmtrak (tebentafusp-tebn) would extend to this population.

Guideline recommendations [3]

- The current National Comprehensive Cancer Network (NCCN) uveal melanoma guideline lists a clinical trial as the preferred recommendation for patients with metastatic uveal melanoma indicating the lack of a well-defined standard of care in this disease.
- For patients with distant metastatic disease who are HLA A*02:01-postive, Kimmtrak (tebentafusp-tebn) is listed as a treatment option. If metastases are confined to the liver, the guideline recommends considering front-line use of liver-directed palliation for patients who are symptomatic.
- Other recommended therapies for uveal melanoma include medications typically used in the treatment of cutaneous melanoma (e.g., immune checkpoint inhibitors, and cytotoxic chemotherapy). However, the efficacy of these therapies in uveal melanoma is poor due to the differences in molecular markers and biology of these two types of tumors.

Investigational Uses [4]

- There is interest in using Kimmtrak (tebentafusp-tebn) in metastatic cutaneous melanoma in combination with other immunotherapies; however, there are currently no well-controlled, published trials supporting its safety and efficacy in this population.
- There is no evidence to support the use of Kimmtrak (tebentafusp-tebn) in combination with any other therapy in uveal melanoma, or any other condition.
- No studies (enrolling or ongoing) were identified for Kimmtrak (tebentafusp-tebn) outside of the melanoma setting.

Safety [2,5]

- There is a Boxed Warning for Kimmtrak (tebentafusp-tebn) describing the potential for cytokine release syndrome (CRS) when initiating therapy.
- Approximately one in three to four patients who received Kimmtrak (tebentafusp-tebn) in the pivotal trial experienced a dose reduction, interruption, or permanent discontinuation.

Dosing [5]

- Kimmtrak (tebentafusp-tebn) is intravenously administered each week until disease progression.
- The dose of Kimmtrak (tebentafusp-tebn) is slowly increased to minimize the risks of hypotension during/after infusion. The initial three doses should be administered in an appropriate setting where the patient can be monitored for at least 16 hours following infusion. Once it is established that the patient is tolerating the medication, subsequent doses can be given in an appropriate ambulatory care setting.

Medication Policy Manual | **Policy No:** dru702

Topic: Xipere, triamcinolone acetonide injectable suspension for suprachoroidal use | **Date of Origin:** April 15, 2022

Committee Approval Date: March 21, 2024 | **Next Review Date:** 2025

Effective Date: June 1, 2024

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Xipere (triamcinolone acetonide injectable suspension for suprachoroidal use) is a steroid that is injected directly into the eye (suprachoroidal) to help improve swelling associated with specific eye conditions (as detailed below in the coverage criteria).

PLEASE NOTE: Triesence (triamcinolone acetonide injectable suspension for periocular/ intravitreal use) is available without pre-authorization.

Policy/Criteria

Most contracts require pre-authorization approval of Xipere (triamcinolone acetonide injectable suspension for suprachoroidal use) prior to coverage.

I. Continuation of therapy (COT): Xipere (triamcinolone acetonide injectable suspension for suprachoroidal use) may be considered medically necessary for COT when full policy criteria below are met.

Please note: *Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Xipere (triamcinolone acetonide injectable suspension for suprachoroidal use) may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) confirming that treatment with topical, oral, AND injectable (periocular or intravitreal) corticosteroids (as listed in *Table 1*) has been:

A. Ineffective after two weeks of therapy.

OR

B. Not tolerated.

OR

C. Use to all forms is documented as medically contraindicated.

TABLE 1.

Lower-Cost Corticosteroid Step Therapy
Topical ophthalmic corticosteroids (variable dose, based on formulation)
Oral corticosteroids (such prednisone ≥ 20 mg/day or equivalent for at least 2-4 weeks)
Triesence (triamcinolone acetonide injectable), intravitreal OR Periocular (such as subconjunctival, subtenon, suprachoroidal, or peribulbar)

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers Xipere (triamcinolone acetonide injectable suspension for suprachoroidal use) coverable only under the medical benefit (as a provider-administered medication).

B. When pre-authorization is approved, Xipere (triamcinolone acetonide injectable suspension for suprachoroidal use) will be authorized in quantities up to two of the 40 mg/1mL vials in 24 weeks (based on a dose of 4 mg/0.1 mL every 12 weeks).

C. Authorization shall be reviewed at least every 24 weeks (six months). Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, including disease stability or improvement relative to baseline symptoms.

IV. Xipere (triamcinolone acetonide injectable suspension for suprachoroidal use) is considered investigational when:

A. Used for any route of administration other than suprachoroidal.

B. Used concomitantly with any other long-acting ophthalmic corticosteroid formulations, such as Ozurdex (dexamethasone implant) or fluocinonide (Retisert, Iluvien, Yutiq) (see *Appendix 1*).

Position Statement

Summary

- Xipere (triamcinolone acetonide injectable suspension for suprachoroidal use) ["Xipere (triamcinolone acetonide suprachoroidal)"] is a corticosteroid injected directly into the suprachoroidal space of the eye that has been studied and approved to reduce the macular edema associated with uveitis.
- The intent of the policy is to allow for coverage of Xipere (triamcinolone acetonide suprachoroidal) when all the best value steroids, including topical ophthalmics, oral, and periocularly/intravitreally injectables, are not an option.
- There is no evidence that Xipere (triamcinolone acetonide suprachoroidal) is safer or more effective than lower-cost steroids, including Triesence (triamcinolone acetonide injectable suspension for periocular/intravitreal use).
- However, Xipere (triamcinolone acetonide suprachoroidal) is significantly more costly than various lower-cost steroids, including triamcinolone acetonide periocular/ intravitreal (Triesence). Therefore, the use of Xipere (triamcinolone acetonide suprachoroidal) is considered necessary only when all lower cost steroid treatment options are ineffective, not tolerated, or documented as medically contraindicated.
- As a class, corticosteroids are associated with several adverse events (AEs). Ocular AEs include elevation in intraocular pressure (IOP), glaucoma, and formation of cataracts.
- Xipere (triamcinolone acetonide suprachoroidal) may be covered for up to a 4 mg dose, the dose studied in clinical trials. The safety and effectiveness of higher doses have not been established. The dose may be repeated, if clinically indicated, after 12 weeks.

Background

- There are many formulations of corticosteroids for treatment of uveitis, including but not limited to: [1]
  * Topical ophthalmic: dexamethasone, prednisolone, available as solutions, suspensions, gels, and/or ointments.

    * Oral steroids: prednisone, dexamethasone, methylprednisolone, prednisolone
    * Periocular/intravitreal injection: triamcinolone acetonide (Triesence; Kenalog periocular only)
    * Ocular steroid implants: Ozurdex (dexamethasone implant), fluocinonide (Retisert, Iluvien, Yutiq)

- The use of steroids for ocular inflammatory diseases, including non-infectious uveitis, is considered a mainstay of therapy. Ocular inflammation is managed with a stepwise approach.[2-4]
    * Topical steroids +/- a topical non-steroidal anti-inflammatory (NSAID) as usual initial therapy. Patients with posterior uveitis, including panuveitis, are less likely to respond to topical steroids.
    * If additional acute inflammation control is needed, systemic steroids (such as oral prednisone) may be added. Guidelines recommend a high dose course (prednisone 1 mg/kg/day or up to 60-80 mg per day) for up to one month.
    * Regional administration of steroids (such as triamcinolone injection) may be used to maximize local ocular benefit and minimize systemic steroid exposure and associated adverse events. Steroids are injected periocularly (subconjunctival, subtenon, suprachoroidal, orbital floor, or peribulbar) or intravitreally, dependent on the type and location of the inflammation.
    * A systemic immunomodulator (csDMARD, such as mycophenolate mofetil, azathioprine, methotrexate, cyclosporine, or tacrolimus) may be used if there is no response, or worsening, after two to four weeks of oral steroids (e.g., prednisone ≥ 30mg/day or 0.5 mg/kg/day). Initiation of therapy is dependent on several factors, including underlying etiology and severity of the inflammation.
- There are existing formulations of triamcinolone acetonide injection for ocular inflammatory conditions, given inside the eye (intraocular, intravitreal) or around the eye (periorbital, periocular). [3,5,6]
    * Triesence (triamcinolone acetonide injection) has many years of experience to establish the safety and efficacy for intravitreal use.
    * Triamcinolone acetonide injection (Kenalog) is also used in clinical practice in ocular inflammatory conditions, but not specifically labeled for periocular use. Because triamcinolone acetonide injection (Kenalog) contains benzyl alcohol, it cannot be used intravitreally. [5]
    * Methylprednisolone (Depot Medrol) is also used for periocular injections (but not intraocular/intravitreal injection). [3]
    * However, Triesence (triamcinolone acetonide injection) is the only commercially available injectable steroid for intravitreal use. Other intravitreal steroid formulations include implants.
    * Xipere (triamcinolone acetonide suprachoroidal) is injected suprachoroidally, a newer route of administration without significant clinical experience. [6]

Clinical Efficacy

- The efficacy of Xipere (triamcinolone acetonide suprachoroidal) was assessed in a 6-month, randomized, multicenter, double-masked, sham-controlled trial in patients with macular edema (ME) associated with non-infectious uveitis (PEACHTREE; n=160). [7,8]
    * The trial evaluated patients with non-infectious uveitis: anterior-, intermediate-, posterior-, or pan-uveitis.
    * Use of systemic corticosteroids (prednisone ≤ 20 mg/day or equivalent) and/or stable doses of systemic immunomodulatory therapies were allowed during the trial. Concomitant use with other corticosteroids, including topical ocular, intraocular and periocular injection, and intraocular implants, was not allowed at randomization; however, rescue therapy was allowed beginning at week 4.
    * Patients were randomized to Xipere (triamcinolone acetonide suprachoroidal) 4 mg or sham-control, administered at baseline and week 12.
    * The primary efficacy endpoint was the proportion of patients with best corrected visual acuity (BCVA) improved ≥15 letters from baseline after 24 weeks.
    * Xipere (triamcinolone acetonide suprachoroidal) was superior to placebo (sham) for improvement of vision (BCVA) at 24 weeks (47% vs. 16%, respectively). However, several flaws limit utility of the data for use of Xipere (triamcinolone acetonide suprachoroidal) in clinical practice:
        ▪ Patients in the trial were allowed to use other baseline anti-inflammatories, such the true effect of Xipere (triamcinolone acetonide suprachoroidal) is unclear.
        ▪ Given the lack of active comparator, the benefit of Xipere (triamcinolone acetonide suprachoroidal) relative to standard of care oral, topical, or intravitreal corticosteroids and systemic immunomodulatory therapies remains unknown.
        ▪ The trial was of short duration for a chronic condition; durability of response is currently unknown. In addition, any benefit from suprachoroidal steroid administration, such as reduction in cataracts or exacerbation of glaucoma, remains unproven with the available evidence.
- Xipere (triamcinolone acetonide suprachoroidal) has not been compared to any of the other available steroid formulations. Systematic reviews consider the use of existing triamcinolone acetonide formulations (such as Triesence) safe and effective for periocular and intravitreal use. [9,10]
- Xipere (triamcinolone acetonide suprachoroidal) has not been studied in a well-designed RCT in any other causes of ME, such as diabetic ME (DME), retinal vein occlusion (central or branch; CRVO, BRVO), or age-related (wet) macular degeneration (wAMD). The approach to treatment of these non-uveitis causes of macular edema do not use topical and oral steroids as standard treatments.

Investigational Uses

- There are no published clinical trials evaluating the safety or efficacy of Xipere (triamcinolone acetonide suprachoroidal) in any other route of administration aside from suprachoroidally.

Safety [1, 8, 9]

- There is no evidence that Xipere (triamcinolone acetonide suprachoroidal) is safer than other corticosteroid options, including periocular/intravitreal triamcinolone acetonide (Triesence).
- Elevations in intraocular pressure (IOP), exacerbation of glaucoma, and cataract development or progression are known adverse events (AEs) with use of intravitreal corticosteroids, resulting from corticosteroid exposure to the anterior segment and the lens. However, the available trial data for Xipere (triamcinolone acetonide suprachoroidal) is insufficient to conclude lower rates of these intraocular complications with the use of suprachoroidal administration.
- At this time, the overall, AE rates with Xipere (triamcinolone acetonide suprachoroidal) appear generally comparable to periocular/intraocular (intravitreal) administered corticosteroids, such as triamcinolone acetonide periocular/intravitreal (Triesence). However, given the absence of a direct comparative trial, any conclusion of superior safety of triamcinolone acetonide suprachoroidal (Xipere) is not possible.

Appendix 1: Duration of action of long-acting ophthalmic corticosteroids

Formulation	Duration of Action
Iluvien (fluocinonide implant)	36 months
Ozurdex (dexamethasone implant)	6 months
Retisert (fluocinonide implant)	36 months
Yutiq (fluocinonide implant)	30 months

Codes	Number	Description
HCPCS	J3299	Injection, triamcinolone acetonide (Xipere), 1 mg

Medication Policy Manual **Policy No:** dru705

Topic: Medications for T-Cell Lymphoma **Date of Origin:** June 1, 2022

- Beleodaq, belinostat
- Lymphir, denileukin diftitox-cxdl
- pralatrexate (generic, Folotyn)
- romidepsin (generic, Istodax)

Committee Approval Date: March 6, 2025 **Next Review Date:** 2026

Effective Date: May 1, 2025

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Medications in this policy are cancer medications used in the treatment of certain types of T-cell lymphomas. They are administered via intravenous infusion.

Policy/Criteria

Most contracts require pre-authorization approval of Medications for T-cell lymphoma (as listed in Table 1) prior to coverage.

I. Continuation of therapy (COT): Medications for T-cell lymphoma may be considered medically necessary for COT when criterion A, B, or C below is met.

A. For diagnoses NOT listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND there is documentation that the medication was covered by another health plan. Examples of documentation include the coverage approval letter from the previous health plan or paid claim.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

B. For diagnoses listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

C. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

Please note: *Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Medications for T-cell lymphoma (as listed in *Table 1*) may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) that the applicable diagnosis-based criteria and step therapy below are met:

Table 1:

Diagnosis	Coverable Medication(s)	ALL of the following diagnostic criteria are met:
Peripheral T-cell Lymphoma (PTCL)	- Beleodaq (belinostat) - pralatrexate (generic, Folotyn) - romidepsin (generic, Istodax)	**1.** A confirmed diagnosis of PTCL. **2.** At least two prior systemic therapy regimens for PTCL were ineffective or not tolerated (see *Appendix 1*). **3.** Will be used as monotherapy.
Cutaneous T-cell Lymphoma (CTCL)	- Lymphir (denileukin diftitox-cxdl) - romidepsin (generic, Istodax)	**1.** A confirmed diagnosis of CTCL [e.g., Mycosis Fungoides (MF) and Sézary Syndrome]. **2.** At least two prior systemic therapy regimens have been ineffective or not tolerated (see *Appendix 2*). **3.** Will be used as monotherapy.

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers Medications for T-cell lymphoma (as listed in *Table 1*) coverable only under the medical benefit (as provider-administered medications).

B. When pre-authorization is approved, Medications for T-cell lymphoma will be authorized up to the limits in *Table 2* below, until disease progression.

Table 2:

Medication	Quantity Limit
Beleodaq (belinostat)	Up to five infusions every three weeks.
Lymphir (denileukin diftitox)	Up to five infusions every three weeks.
pralatrexate (generic, Folotyn)	Up to four infusions every four weeks.
romidepsin (generic, Istodax)	Up to three infusions every four weeks.

C. Authorization **may** be reviewed at least annually. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, such as disease stability or improvement.

IV. Investigational Uses:

A. Unless otherwise specified in the coverage criteria above, medications included in this policy are considered investigational when used for all other conditions, due to lack of published data, lack of high-quality data, or lack of positive data.

B. Sequential use of HDAC inhibitors [Beleodaq (belinostat) or romidepsin (generic, Istodax)] after disease progression (and/or disease non-response) on prior HDAC inhibitor therapy.

C. HDAC inhibitors [Beleodaq (belinostat), romidepsin (generic, Istodax), or pralatrexate (generic, Folotyn)]: when used in combination with other chemotherapy medications.

Position Statement

Summary

- "Medications for T-cell lymphoma" are intravenously (IV) administered medications approved for the treatment of several specific T-cell cancers.
- The intent of this policy is to cover medications for T-cell lymphoma in the clinical settings where they have been shown to be safe and effective, as detailed in the coverage criteria, with consideration for other available treatment options.
    * Where there is lack of proven additional benefit and/or lack of demonstrated health outcomes (such as overall survival or improved quality of life) relative to alternative therapies, use of "Medications for T-cell lymphoma" is not coverable ("not medically necessary" or "investigational").
- "Medications for T-cell lymphoma" include the following:
    * Pralatrexate (generic, Folotyn), a methotrexate analog, is used in the treatment of peripheral T-cell lymphoma (PTCL), including the various subtypes of PTCL (*see Appendix 1*).
    * Beleodaq (belinostat), a histone deacetylase (HDAC) inhibitor, is also used for the treatment of relapsed or refractory PTCL.
    * Romidepsin (generic, Istodax), another HDAC inhibitor, is among several systemic medications (see *Appendix 2*) that may be used to treat cutaneous T-cell lymphoma (CTCL) [e.g., Mycosis Fungoides (MF), Sézary Syndrome (SS)]. It was previously FDA approved for use in relapsed/refractory PTCL after one prior therapy; however, because a confirmatory trial in first-line treatment failed to meet the primary endpoint, the FDA indication for PTCL was withdrawn. However, given that the evidence for romidepsin (generic, Istodax) in the salvage setting has not changed, the policy stance for coverage of romidepsin (generic, Istodax) for PTCL after two prior therapies remains unchanged.
    * Lymphir (denileukin diftitox-cxdl), an interleukin-2 (IL2)-receptor-directed cytotoxin, is used in the treatment of relapsed or refractory CTCL (e.g., MF or SS). *[Note: Lymphir is a new purified formulation of denileukin diftitox. It replaces Ontak, an older formulation, which was withdrawn from the market in 2014 due to production purity issues]*
- The effectiveness of "Medications for T-cell lymphoma" is based on low-quality, uncontrolled studies that evaluated surrogate endpoints (tumor response and duration of response). The effect of these therapies on overall survival has not been evaluated. Additional studies are necessary to describe and verify a clinical benefit, as these surrogate endpoints have not been shown to correlate with clinically meaningful outcomes.
- "Medications for T-cell lymphoma" were studied in patients who had prior systemic therapy for their PTCL or CTCL. However, prior treatment with other HDAC inhibitors was not allowed in the trials of HDAC inhibitors Beleodaq (belinostat) and romidepsin (generic, Istodax).
- None of the "Medications for T-cell lymphoma" have been compared to any other therapy options. Therefore, no one treatment option is known to be superior to another.

- National Comprehensive Cancer Network (NCCN) guidelines list many options for the treatment of PTCL and CTCL, including the medications in this policy.
- "Medications for T-cell lymphoma" are administered intravenously (IV) and given until disease progression or unacceptable toxicity.
- "Medications for T-cell lymphoma" are being studied in a variety of other cancers; however, there is insufficient evidence supporting safety and efficacy in these other conditions at this time.

Regence Pharmacy Services performs independent analyses of oncology medication evidence, to establish coverability per the contracts with the health plan.

- Most contracts define coverability based on established clinical benefit in published, peer-reviewed literature, along with consideration of regulatory status.
- FDA approval does not in itself establish medical necessity, as unpublished, low-quality evidence, including exploratory analyses and unvalidated surrogate endpoints, may be used as the basis of approval. Regulatory approval may or may not reflect clinical benefit relative to standard of care and the recommendations of expert clinical advisors such as the Oncologic Drugs Advisory Committee (ODAC). FDA approvals generally do not consider cost compared to established therapies, or value to members.
- Likewise, NCCN clinical practice guidelines assignment of a recommendation (category 1, 2a, or 2b) does not necessarily establish medically necessity. NCCN recommendations are inconsistently supported by published, peer-reviewed literature and do not uniformly consider value of new therapies relative to existing potentially higher-value treatment options, considering effectiveness, safety, and cost.
- Medication coverage criteria are developed based on the 'medical necessity' assessment, as described above.

Regence Pharmacy Services analysis and coverage policy may differ from FDA labeled indication and/or NCCN clinical practice guidelines.

Clinical Efficacy

PERIPHERAL T-CELL LYMPHOMA (PTCL)

- *Beleodaq (belinostat):* The efficacy of Beleodaq (belinostat) is based on a single, uncontrolled study in patients with relapsed or refractory PTCL (n=129), with surrogate endpoints, tumor response and duration of response, not tied to clinically relevant outcomes. [1]
    - Patients in the trial had a median of two prior therapies for PTCL (range of 1 to 8) and a life expectancy of at least 3 months. Prior therapy with a histone deacetylase (HDAC) inhibitor [e.g., Istodax (romidepsin)] was not allowed.
    - The overall response rate among the 120 evaluable patients was 25.8%, with a median duration of response of 8.4 months.
- *Pralatrexate (generic, Folotyn):* The efficacy of pralatrexate (generic, Folotyn) is based on a single, uncontrolled study in patients with relapsed or refractory PTCL (n=111) that used response criteria as its primary outcome. [2]
    - The median number of prior systemic therapies was 3 (range 1 to 12).

    * Overall response rate was defined as the sum of the complete response rate, unconfirmed complete response rate, and partial response rate.
- Tumor response rates and duration of response are surrogate endpoints, not proven to correlate with clinically relevant outcomes for patients with PTCL.
- There is currently no evidence that Beleodaq (belinostat) or pralatrexate (generic, Folotyn) improve clinical outcomes such as progression-free survival or overall survival in PTCL.
- It is not known how Beleodaq (belinostat) or pralatrexate (generic, Folotyn) compare with other PTCL therapies; neither have not been directly compared with placebo or any other therapy.
- *Romidepsin (generic, Istodax):* was FDA approved based on 25% improvement in overall response rate in an uncontrolled trial in patients with previously treated PTCL (n=130) who had failed at least one prior therapy. [3] A second trial in a mixed group of patients with PTCL or CTCL was used as supportive information. [4] Most recently, the follow-up phase 3 confirmatory trial failed to meet the primary endpoint of progression-free survival (PFS) as a first-line therapy for PTCL. [5] In mid-2021, the FDA indication for Istodax (romidepsin) was withdrawn for PTCL after ten years on the market. However, the available evidence for use of Istodax (romidepsin) in relapsed/refractory PTCL remains unchanged.
- The NCCN T-cell lymphoma guideline lists several potential options for the subsequent treatment of PTCL (see *Appendix 1*), including Beleodaq (belinostat), pralatrexate (generic, Folotyn), and romidepsin (generic, Istodax), meaning the quality of evidence is low, but there was consensus among oncologists on the panel for inclusion on the guideline. [6]

CUTANEOUS T-CELL LYMPHOMA (CTCL)

- *Istodax (romidepsin):* The effectiveness of romidepsin (generic, Istodax) has been evaluated in 167 subjects with cutaneous T-cell lymphoma (CTCL) in two, uncontrolled clinical trials with poor quality evidence. [7 8]
    * There was no comparator in either of the studies.
    * The studies evaluated a subgroup of subjects with CTCL for overall response (partial response plus complete response) to therapy.
    * Approximately 34% of subjects had either a partial response (28%) or a complete response (6%).
    * All subjects evaluated in the studies had been on one or more prior systemic therapies.
    * There is currently no evidence that romidepsin (generic, Istodax) improves clinical outcomes (e.g., overall survival, quality of life) in patients with CTCL.
- *Lymphir (denileukin diftitox):* The efficacy of Lymphir (denileukin diftitox) in relapsed or refractory CTCL is based on a single-arm, open-label, low-quality study [Study 302] in 69 subjects with stage I to III mycoses fungoides (MF) or Sézary syndrome (SS). [9 10]
    * The proportion of patients with MF and SS was not identified.

    * The median number of prior therapies received was four (includes both systemic and skin-directed therapies).
    * Prior therapies included: Systemic retinoids (49%), methotrexate/pralatrexate (49%), a histone deacetylase inhibitor (35%), Adcetris (brentuximab vedotin) (26%), and Poteligeo (mogamulizumab) (12%).
    * The objective response rate (ORR) was 36% with 6 (9%) complete responses.
- The NCCN T-cell Lymphomas and Primary Cutaneous Lymphomas guideline lists: [11]
    * Romidepsin (generic, Istodax) among several recommended systemic treatment options for the treatment of CTCL [refer to *Appendix 2*].
    * Lymphir (denileukin diftitox) among its recommendations for MF; however, it is not listed a recommendation for SS.

OTHER CANCERS:

- To date, the activity of Beleodaq (belinostat) in the following cancers has not been promising: [12-17] mesothelioma, carcinoma of unknown primary site (CUP), and myelodysplastic syndromes. There are several small, published, preliminary trials that studied Beleodaq (belinostat) in other types of cancer including thymic cancers, ovarian cancer, and hepatocellular carcinoma. Larger, comparative studies are needed to establish clinical benefit in these conditions. There is limited evidence for efficacy (i.e., response rates) in this setting. [18] Larger, well-controlled studies are needed to confirm preliminary findings.
- Pralatrexate (generic, Folotyn) is being studied in the treatment of several additional conditions including other types of non-Hodgkin's lymphomas, non-small cell lung cancer (NSCLC) and mesothelioma. There is also interest in using pralatrexate (generic, Folotyn) as a front-line therapy for patients with PTCL.
    * Results from most of the non-Hodgkin's lymphoma studies (other than PTCL) have not been reported in peer-reviewed literature. [10]
    * In a small, published trial Folotyn (pralatrexate) demonstrated some activity in patients with NSCLC based on objective response rates. [19] A second, published trial comparing pralatrexate (generic, Folotyn) and erlotinib used overall survival as a primary endpoint. No statistical difference was reported; however, the trial was not adequately powered to detect a difference between interventions, so results are not meaningful. [20] Larger, well-controlled studies are needed to establish the safety and efficacy of pralatrexate (generic, Folotyn) in NSCLC.
    * A single small trial failed to demonstrate any benefit from single-agent pralatrexate (generic, Folotyn) in patients with malignant pleural mesothelioma. [21]
    * When used as a front-line therapy for PTCL, the addition of pralatrexate (generic, Folotyn) to conventional chemotherapy (i.e., cyclophosphamide, doxorubicin, vincristine, prednisone), did not improve outcomes compared to historical data using chemotherapy alone. [22]

    - Small, preliminary studies evaluated tumor response in patients (N = 49) who were given carboplatin plus pralatrexate (generic, Folotyn) for recurrent, platinum-sensitive ovarian, fallopian tube, or primary peritoneal cancer. Controlled trials are needed to establish clinical benefit in this population. [23]
- Istodax (romidepsin) is being evaluated for use in several other conditions:
    - Preliminary studies failed to demonstrate a benefit in advanced colorectal cancer, metastatic renal cell carcinoma, prostate cancer, and lung cancer. [24-28]
    - A phase 2 study evaluated the combination of romidepsin (generic, Istodax) and gemcitabine in patients with relapsed or refractory PTCL. There was no additional benefit shown over the use of romidepsin (generic, Istodax) alone. [29]
    - In small number of patients with relapsed multiple myeloma, poor response rates were achieved. [30]
    - No results are available for studies in several other conditions including squamous cell cancer of the head and neck (SCCHN), breast cancer, solid tumors, and acute myelogenous leukemia. [10]
- Lymphir has not been studied in other T-cell lymphomas to date. *[Note: Lymphir is a new purified formulation of denileukin diftitox. It replaces Ontak, an older formulation, which was withdrawn from the market in 2014 due to production purity issues]*

Dosing [31]

- Beleodaq (belinostat) is given intravenously (IV) on days 1 through 5 of a 21-day cycle.
- Pralatrexate (generic, Folotyn) is given IV push once weekly for 6 weeks in 7-week cycles.
- Romidepsin (generic Istodax) is given IV on days 1, 8, and 15 of every 28-day cycle.
- Lymphir (denileukin diftitox) is given IV on days 1 through 5 of each 21-day cycle.
- Administration of each of these therapies is continued until disease progression or unacceptable toxicity.

Appendix 1: Systemic Treatment Options for PTCL [11] [a,b,c]	
First-line Therapy	
• Adcetris (brentuximab vedotin) + CHP (cyclophosphamide, doxorubicin, prednisone) for CD30+ histologies [a] • CHOEP (cyclophosphamide, doxorubicin, vincristine, etoposide, prednisone) • CHOP (cyclophosphamide, doxorubicin, vincristine, prednisone) • CHOP followed by IVE (ifosfamide, etoposide, epirubicin) alternating with methotrexate • Dose-adjusted EPOCH (etoposide, prednisone, vincristine, cyclophosphamide, doxorubicin)	
Second-line Therapy	
Transplant candidates	*Non-transplant candidates*
• *Preferred single agents:* o Adcetris (brentuximab vedotin) for CD30+ PTCL o Beleodaq (belinostat) o Pralatrexate (generic, Folotyn) o Romidepsin (generic, Istodax) o Duvelisib (Copiktra) • *Preferred combination regimens:* o DHA (dexamethasone, cisplatin, cytarabine) o ESHAP (etoposide, methylprednisolone, cytarabine, cisplatin) o GDP (gemcitabine, dexamethasone, cisplatin) o GemOx (gemcitabine, oxaliplatin) o ICE (ifosfamide, carboplatin, etoposide) • *Other recommended single agents/regimens:* o Bendamustine o Gemcitabine o GVD [gemcitabine, vinorelbine, liposomal doxorubicin (generic, Doxil)] o lenalidomide (generic, Revlimid)	• *Preferred single agents/regimens:* o Adcetris (brentuximab vedotin) for CD30+ PTCL o Beleodaq (belinostat) o Pralatrexate (generic, Folotyn) o Romidepsin (generic, Istodax) o Duvelisib (Copiktra) • *Other recommended single agents:* o Alemtuzumab o Bendamustine o Campath (alemtuzumab) o Cyclophosphamide and/or etoposide (IV or PO) o Gemcitabine o Radiation therapy o lenalidomide (generic, Revlimid)
[a] PTCL subtypes included: PTCL not otherwise specified (NOS), angioimmunoblastic T-cell lymphoma (AITL), anaplastic large cell lymphoma (ALCL), enteropathy-associated T-cell lymphoma (EATL), monomorphic epitheliotropic intestinal T-cell lymphoma (MEITL) [b] All therapies listed above are NCCN category 2A recommendations (lower quality evidence but uniform consensus among panel) unless otherwise indicated. [c] AITL and ALCL have slight variations in the regimens used in the second line and subsequent therapy setting	

Appendix 2: Systemic Treatment Options for CTCL (i.e. Mycosis Fungoides (MF)/Sezary Syndrome) [a] [6]	
Actimmune (interferon gamma)	Leukeran (chlorambucil)
Adcetris (brentuximab vedotin)	Lymphir (denileukin diftitox-cxdl)
Campath (alemtuzumab)	methotrexate
liposomal doxorubicin (generic, Doxil)	Poteligeo (mogamulizumab)
pralatrexate (generic, Folotyn)	acitretin (generic, Soriatane)
gemcitabine	bexarotene (generic, Targretin)
Intron A (interferon alfa)	temozolomide (CNS involvement)
isotretinoin	Vesanoid (all-trans retinoic acid)
romidepsin (generic, Istodax)	Zolinza (vorinostat)
Keytruda (pembrolizumab) [category 2B]	
[a] All therapies listed above are NCCN category 2A recommendations (lower quality evidence but uniform consensus among panel), unless otherwise noted.

Revision History

Revision Date	Revision Summary
3/6/2025	No changes to coverage criteria with this annual review.
12/12/2024	Added coverage for Lymphir, a new and purer formulation of denileukin diftitox, for CTCL after two prior systemic therapies. All other uses are considered investigational.
6/20/2024	No criteria changes with this annual review.
12/7/2023	No criteria changes with this annual review.
3/16/2023	No changes to coverage criteria with this annual update.
12/9/2022	• Updated standard language in policy. • No changes to coverage criteria with this annual update.
3/18/2022	New combination policy, effective 6/1/2022: Combined the following medication policies: dru362 Beleodaq, belinostat, dru198 Istodax, romidepsin, and dru197 Folotyn, pralatrexate. No change to the intent of pre-existing criteria with the following exceptions: - Removal of Istodax (romidepsin) step therapy for coverage of medications for PTCL, as the FDA indication for PTCL was withdrawn by the manufacturer based on a failed trial of Istodax (romidepsin) in the front-line setting. - Clarification of intent of monotherapy and sequential HDAC therapy.

Drug names identified in this policy are the trademarks of their respective owners.

Medication Policy Manual | **Policy No:** dru711

Topic: Skysona, elivaldogene autotemcel | **Date of Origin:** July 15, 2023

Committee Approval Date: March 21, 2024 | **Next Review Date:** 2025

Effective Date: June 1, 2024

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Skysona (elivaldogene autotemcel) is an intravenous (IV) medication that is used to treat a rare, genetic condition (cerebral adrenoleukodystrophy).

Policy/Criteria

Most contracts require pre-authorization approval of Skysona (elivaldogene autotemcel) prior to coverage.

I. Continuation of therapy (COT): Skysona (elivaldogene autotemcel) may be considered medically necessary for COT when full policy criteria below are met, including quantity limit.

Please note: *Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Skysona (elivaldogene autotemcel) may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) that criteria A and B below are met.

A. The patient is a suitable candidate for Skysona (elivaldogene autotemcel) and meets all of the following criteria (1 and 2) below:

1. No prior use of gene therapy

AND

2. Patient is fit for therapy, as defined by meeting all the criteria below:

a. The patient is clinically stable and eligible for an Allo-HSCT but does NOT have an available HLA-matched donor (provider attestation).

AND

b. The patient has adequate and stable kidney, liver, and cardiac function (provider attestation).

AND

c. The patient has no active systemic infections (including, but not limited to HCV, HBV, and HIV infection) (provider attestation).

PLEASE NOTE: Suitability for therapy must be documented in recent clinical documentation (such as in chart notes, laboratory reports), which MUST include evaluation for HSCT [bone marrow transplant BMT)].

AND

B. A diagnosis of **early, active cerebral adrenoleukodystrophy** (CALD) when there is clinical documentation that all criteria 1 through 7 below are met:

1. The diagnosis is genetically confirmed (adenosine triphosphate binding cassette, sub family D member 1 [ABCD1] gene).

AND

2. No prior allogeneic hematopoietic stem cell transplantation (allo-HSCT).

AND

3. Neurologic function score (NFS) less than or equal to 1.

AND

4. Gadolinium enhancement (GdE+) on brain magnetic resonance imaging (MRI).

AND

5. Loes score between 0.5 and 9.

AND

6. Elevated very long chain fatty acids (VLCFA) values per reference range of the laboratory performing the test.

AND

7. Patient does not have isolated pyramidal tract disease.

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers Skysona (elivaldogene autotemcel) coverable under the medical benefit (as a provider administered medication).

B. When pre-authorization is approved, Skysona (elivaldogene autotemcel) will be authorized in quantities of one treatment course per lifetime.

C. Additional infusions of Skysona (elivaldogene autotemcel) will not be authorized.

IV. Skysona (elivaldogene autotemcel) is considered investigational when used for all other conditions.

Position Statement

Summary

- Skysona (elivaldogene autotemcel) is an ex-vivo gene therapy. It adds functional copies of the adenosine triphosphate binding cassette, subfamily D, member 1 (ABCD1) gene into hematopoietic stem cells using a replication-deficient, self-inactivating lentiviral vector (LVV).
- Skysona (elivaldogene autotemcel) is a one-time IV infusion. However, it is a very complex, high-cost therapy and requires several phases of administration, extended hospitalization, and extensive supportive care, similar to a hematopoietic stem cell transplantation (HSCT).
- The intent of this policy is to allow for coverage of Skysona (elivaldogene autotemcel) for the indication and dose for which it has been shown to be safe and effective in clinical trials. This includes genetically confirmed early, active CALD in patients that are clinically stable and eligible for an allo-HSCT, but do not have an available HLA-matched donor (related or unrelated) and the patient does not have isolated pyramidal tract disease.
- Current evidence for Skysona (elivaldogene autotemcel) is limited to small, single-arm, non-randomized trials that evaluated the proportion of patients who were alive and had none of the predefined Major Functional Disabilities (MFD) at Month 24. MFD-free

survival was achieved in the majority of genetically confirmed early, active CALD patients; however, the generalizability of the results and the long-term impact of Skysona (elivaldogene autotemcel) on other clinically relevant outcomes, such as overall survival (OS), is unknown at this time.

- For those with early, active disease, the standard of care is an allo-HSCT. It is the only known treatment that has demonstrated the ability to stabilize or slow the progression of disease. However, many patients with early, active CALD do not have a HLA-matched donor for HSCT. For these specific populations, the potential benefit of Skysona (elivaldogene autotemcel) may outweigh the risks.
- Significant safety issues are directly associated with the use of Skysona (elivaldogene autotemcel). In particular, the risk of hematologic malignancies is especially notable, given the high frequency of LVV integrations into proto-oncogenes.
- At this time, there is not enough data available to determine that the benefit of Skysona (elivaldogene autotemcel) use would outweigh the risks or provide any meaningful benefit long-term in those transplant-eligible patients with an available HLA-matched donor (both related and unrelated). However, in patients without an HLA-matched donor, the benefits may outweigh the risks due to the unmet need in this population.

Clinical Efficacy

- Skysona (elivaldogene autotemcel) was granted accelerated approval by the FDA based on post-hoc exploratory endpoints from a small subset of patients enrolled in two open-label trials. Patients in both trials had early, active CALD, were between 4 to 17 years of age, a Neurologic Function Score (NFS) ≤ 1, and were without an HLA-matched sibling donor.
- The first trial, ALD-102, is an ongoing multicenter, single arm, phase 2/3 trial in which all subjects (n=32) received a single infusion of Skysona (elivaldogene autotemcel) at a dose of ≥5 x 10^6 $CD34^+$ cells/kg after completion of conditioning regimens.
    * The primary endpoint for this trial was the proportion of patients who were alive and had none of the predefined Major Functional Disabilities (MFD) at Month 24, also known as MFD-free survival.
        - The defined MFDs are clinically relevant to the CALD population, and included the following: loss of communication, cortical blindness, tube feeding, total incontinence, wheelchair dependence, and complete loss of voluntary movement.
- The second trial, ALD-104, is an ongoing multicenter, single arm, phase 3 trial (n=35) and was similar in design to ALD-102. At the time of the data cut, the median follow-up was 6.3 months. As such, the primary efficacy endpoint could not be assessed at this time.
- Given the single arm nature of ALD-102 and ALD-104, and the heterogenous nature of CALD, the FDA utilized external control data derived from a retrospective natural history study, ALD-101, which consisted of untreated CALD patients, as a basis for evaluating the efficacy of Skysona (elivaldogene autotemcel).
    * Despite a high MFD-free response rate, the FDA could not rely on the primary endpoint from the ALD-102 trial to support approval due to the following reasons:

    - Lack of comparability between Skysona (elivaldogene autotemcel) treated subjects and the natural history populations.
    - Insufficient length of study to ensure that the clinical results (lack of MFDs) were not simply due to early disease identification.
    - Overestimation of the number of failure events in the allo-HSCT-treated early, active disease subpopulation.
- Therefore, the basis for approval was primarily due to a post-hoc time to event analysis (time to progression to MFD or death from first disease symptom (NFS ≥ 1)), in a small symptomatic subset of Skysona (elivaldogene autotemcel) treated subjects which demonstrated a slowed progression of neurologic dysfunction compared to the expected natural history.
    * MFD-free survival KM estimates at the 24-month time point were 43%, 69%, and 72% for the untreated (n=7), allo-HSCT treated (n=16) and elivaldogene autotemcel (n=11) symptomatic subpopulations, respectively.
- Patients with isolated pyramidal tract disease often have slower progressing disease that does not appear until adulthood. In ALD-102, participants with isolated pyramidal tract disease had a worse response to Skysona (elivaldogene autotemcel) than other cohorts. As a result, the following was included in the FDA package insert:
    * Given the risk of hematologic malignancy with elivaldogene autotemcel , and unclear long-term durability of Skysona (elivaldogene autotemcel), and human adrenoleukodystrophy protein (ALDP) expression, careful consideration should be given to the timing of treatment for each boy and treatment of boys with isolated pyramidal tract disease as clinical manifestations do not usually occur until adulthood.

Clinical Guidelines/Standard of Care Treatment

- The treatment of patients with CALD requires a multidisciplinary approach due to the number of complications associated with the disease.
- Currently, for those with early, active disease (Loes score 0.5-9, Gadolinium enhancement on MRI, and NFS ≤1), allo-HSCT is the only known treatment that has demonstrated the ability to stabilize or slow the progression of disease. However, use of allo-HSCT is limited by availability of HLA-matched donors for the stem cell donation.
    * Although effective, allo-HSCT is associated with known risks, including graft rejection, graft versus host disease, and infection. This risk is increased in those without an HLA-matched donor.
- For those with more advanced disease (Loes score >9), allo-HSCT is no longer recommended, as it may increase the rapidity of disease progression. Treatment in this population is predominantly supportive in nature.

Investigational Uses

- Skysona (elivaldogene autotemcel) is considered investigational when used for all other conditions.

Safety

- Skysona (elivaldogene autotemcel) is associated with a serious risk of hematologic malignancy, which is noted in the FDA label.
    * Insertional oncogenesis is a serious adverse event directly associated with LVV therapies, including Skysona (elivaldogene autotemcel).
    * There were 3 patients treated with elivaldogene autotemcel that developed a hematologic malignancy (myelodysplastic syndrome) as a direct result of the treatment. Additional hematologic malignancies are expected to arise.
- The most common side effects (>20% incidence) experienced during the ALD-102 trial were consistent with expected AEs from use of a conditioning regimen.
- Additional long-term follow-up is necessary to further define the safety profile of elivaldogene autotemcel in CALD patients. This includes the long-term risk of oncogenesis.

Medication Policy Manual

Policy No: dru716

Topic: Enjaymo, sutimlimab-jome

Date of Origin: July 15, 2022

Committee Approval: June 20, 2024

Next Review Date: 2025

Effective Date: July 15, 2024

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of medication policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Enjaymo (sutimlimab-jome) is an intravenously administered medication used to treat a rare condition, cold agglutinin disease (CAD).

Policy/Criteria

Most contracts require pre-authorization approval of Enjaymo (sutimlimab-jome) prior to coverage.

I. Continuation of therapy (COT): Enjaymo (sutimlimab-jome) may be considered medically necessary for COT when full policy criteria below are met, including quantity limit.

Please note: *Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Enjaymo (sutimlimab-jome) may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) that criteria A through G below are met.

A. Site of care administration requirements are met [refer to Pharmacy Services Medication Policy Manual, Site of Care Review, dru408].

AND

B. A diagnosis of **cold agglutinin disease** (CAD), established by or in consultation with a hematologist.

AND

C. Presence of symptomatic anemia related to CAD.

AND

D. At least one documented red blood cell transfusion (RBCT) within the past 6 months.

AND

E. Rituximab-containing regimen used for the treatment of CAD has been ineffective, not tolerated, or use is contraindicated.

AND

F. Hemoglobin (Hgb) level ≤10.0 g/dL

AND

G. Total bilirubin level is above the normal reference range.

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers Enjaymo (sutimlimab-jome) coverable only under the medical benefit (as a provider-administered medication).

B. When pre-authorization is approved, Enjaymo (sutimlimab-jome) will be authorized be authorized up to the following weight-based dosing:

1. For patients weighing less than 75 kg: 6,500 mg IV weekly for two weeks, then 6,500 mg IV every two weeks thereafter.

2. For patients weighing 75 kg or more: 7,500 mg IV weekly for two weeks, then 7,500 mg IV every two weeks thereafter.

C. Initial authorization up to 6 months. Reauthorization **shall** be reviewed every 12 months. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, such as disease symptom improvement or positive hematologic response (Hgb level increase or reduction in RBC transfusions).

IV. Enjaymo (sutimlimab-jome) is considered not medically necessary when used for CAD without a recent red blood cell transfusion (RBCT) (within the past 6 months).

V. Enjaymo (sutimlimab-jome) is considered investigational when used for all other conditions, including, but not limited to cold agglutinin syndrome (CAS).

Position Statement

Summary

- Enjaymo (sutimlimab-jome) is new complement inhibitor that may result in a decrease in hemolysis and need for RBC transfusions in patients with symptomatic cold agglutinin disease (CAD). Unlike B-cell targeted therapies (e.g., rituximab), Enjaymo (sutimlimab-jome) does not target the underlying cause of cold agglutinin disease and it does not improve the cold-induced ischemic symptoms of CAD.
- The intent of the policy is to allow coverage of Enjaymo (sutimlimab-jome) for patients with symptomatic CAD with a recent history of red blood cells (RBC) transfusions, after failure of rituximab-containing regimens, up to the dose shown to be safe and effective in clinical trials.
- CAD is a type of autoimmune hemolytic anemia (AIHA), which is triggered by cold temperatures.
- CAD is a heterogenous disease, with a range in severity and symptoms. Some CAD patients are asymptomatic with no treatment required, while others present with severe anemia and other cold-induced symptoms. Patients with symptomatic disease and a dependence on RBC transfusions may see benefit with Enjaymo (sutimlimab-jome), based on a reduction in hemolysis markers. However, Enjaymo (sutimlimab-jome) does not affect production of cold agglutinins or reduce resulting cold-ischemic symptoms of CAD.
- In symptomatic patients, CAD results in both hemolytic anemia (caused by complement pathway activation) and cold-induced ischemic symptoms (due to RBC agglutination).
- In patients with a history of recent transfusion, Enjaymo (sutimlimab-jome) use resulted in a clinical response in 54.2% of CAD patients.
- Enjaymo (sutimlimab-jome) was initially studied in symptomatic CAD patients with a history of RBC transfusions in the past 6 months and clinical laboratory markers of hemolytic anemia (Hgb ≤10.0 g/dL, total bilirubin ≥ ULN etc.).
- Subsequently, Enjaymo (sutimlimab-jome) was studied in asymptomatic CAD patients (withOUT a history of recent RBC transfusions). However, the use of Enjaymo (sutimlimab-jome) for CAD without a transfusion requirement is considered not

medically necessary, given the lack of clinically meaningful endpoints demonstrated during the trial.

- Rituximab-based regimens are considered first-line therapy, as they address all aspects of the disease pathophysiology (hemolysis and cold-induced ischemic symptoms), by reduction in the production of cold agglutinins by targeting the B-cells.
- In contrast, Enjaymo (sutimlimab-jome) only addresses hemolysis-related symptoms and must be taken indefinitely. Rituximab can be used for a short period of time, provides long-term benefits, and is a significantly less costly treatment option.
- Additional controlled trials are needed to assess the long-term safety and efficacy of Enjaymo (sutimlimab-jome), including improvement in quality of life (QOL), overall survival, impact on long-term complications, or benefit over existing treatment options.
- Enjaymo (sutimlimab-jome) may be covered in doses up to 6500 mg or 7,500 mg IV every 2 weeks, depending on weight. These are the doses at which it has been shown to be safe and effective.

Disease Background

- CAD accounts for ~15% of total AIHA cases and is the result of an indolent, clonal B-cell lymphoproliferative disorder that leads to an overproduction of cold agglutinins, which are IgM autoantibodies that target erythrocytes.
- When exposed to cold temperatures and internal temperatures drop below 37º C, cold agglutinins bind to the "I" antigen on RBCs. This triggers agglutination and activates the classic complement pathway when the IgM-antigen complex binds to the C1 complement complex.
- Secondary cold agglutinin syndrome (CAS) occurs when cold agglutinins arise due to an underlying condition. This syndrome is managed differently than CAD and Enjaymo (sutimlimab-jome) would not be used in this population.

Clinical Efficacy[1 2]

The safety and efficacy of sutimlimab in CAD in patients with recent transfusion was established based on one phase 3, multi-center, open-label, single-arm trial (CARDINAL) in patients with symptomatic CAD (n=24). Although sutimlimab improved hemolysis markers in half of treated patients with symptomatic CAD, sutimlimab does not reduce production of cold agglutinins, the cause of the hemolysis, nor reduce associated cold-ischemic symptoms of CAD.

- All patients had symptomatic CAD, laboratory findings consistent with hemolysis, and a history of RBC transfusions in the last six months.
    * Symptoms for enrollment included one of the following within the last 3 months: symptomatic anemia, acrocyanosis, Raynaud's syndrome, hemoglobinuria, disabling circulatory symptoms, or a major adverse vascular event.
    * Subjects were required to have a Hgb level ≤10 g/dL and bilirubin above the normal reference range.
- A majority of enrolled patients (62%; n=15) had been treated with rituximab in the past 5 years [monotherapy (n=12), rituximab/bendamustine (n=4), and rituximab/fludarabine (n=2)].

- The primary endpoint was treatment response at 26 weeks, based on a composite endpoint of hemolysis markers, defined as meeting all of the following:
    * No blood transfusions from Week 5 through Week 26.
    * No additional treatments started for CAD management.
    * Hgb level ≥12 g/dL (mean value from Weeks 23, 25, and 26) or Hgb increased ≥ 2 g/dL from baseline.
- Treatment response rate was 54.2%. Although sutimlimab reduced symptomatic CAD, based on hemolysis markers, sutimlimab does not reduce cold agglutinin production, the underlying cause of the hemolysis.
- Due to the short duration of the trial (26 eeks), it is unknown if sutimlimab will result in a clinically meaningful improvement in long-term QOL, overall survival, or a reduction in chronic complications.

Subsequently, sutimlimab was FDA approved in CAD in patients without a recent transfusion based a phase 3, double-blind, placebo-controlled, CADENZA trial. Although sutimlimab was studied compared to placebo in CAD patients without recent transfusion, evidence is insufficient that sutimlimab is safer or more effective than standard of care.

- The primary endpoint was treatment response at 26 weeks, based on a composite endpoint of hemolysis markers, defined as meeting all of the following:
    * No blood transfusions from Week 5 through Week 26.
    * No additional treatments started for CAD management.
    * Hgb level increased ≥ 1.5 g/dL from baseline.
- The response rate difference between sutimlimab and placebo was ~59% but appeared to be driven by increases in Hgb. There was as there was little to no difference in transfusions and use of prohibited medications for CAD.
- It is unknown how sutimlimab compares with standard of care for the management of CAD.

Standard of Care Treatment [3-6]

Management of CAD includes a variety of therapies and modalities to manage and prevent disease-related symptoms.

- Preventative: Cold temperature avoidance is effective at reducing cold-induced symptoms and hemolysis.
- Anemia management:
    * RBC transfusions are a valuable tool to manage symptomatic anemia.
    * Plasmapheresis can be used for acute critical hemolysis, to immediately remove cold agglutinins from the body.
- Reduction of cold agglutinins:
    * Short-term use of B-cell targeted therapies, such as rituximab-containing regimens) are considered first-line treatment to reduce the production of cold agglutinins by targeting the B-cells responsible for their production
    * Rituximab +/- bendamustine or fludarabine has the most evidence for efficacy and is most commonly used.

- Bind complement:
    * Anti-complement therapies target the classic complement pathway that leads to hemolysis. This can reduce the hemolysis markers and transfusion requirements and symptoms of anemia.
    * Of note, targeting this pathway does not impact the cells producing the cold agglutinins. Therefore, anti-complement therapies must be taken indefinitely and are not expected to improve cold-induced symptoms, such as acrocyanosis.

Safety [7]

- During clinical trials of sutimlimab, the most frequent adverse events (>10% incidence) were respiratory tract infection, viral infection, diarrhea, dyspepsia, cough, arthralgia, and peripheral edema.

Dosing [7]

- Sutimlimab is administered at a dose of 6,500 mg IV weekly for two weeks, then every two weeks thereafter for patients weighing less than 75 kg. The dose is increased to 7,500mg, at the same dosing frequency, for those weighing over 75kg.
- Efficacy and safety of dosing of sutimlimab in CAD patients in doses higher than mentioned above has not been established.

Medication Policy Manual	**Policy No:** dru718
Topic: Opdualag, nivolumab-relatlimab-rmbw	**Date of Origin:** July 15, 2022
Committee Approval Date: September 19, 2024	**Next Review Date:** 2025
Effective Date: January 1, 2025	

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Opdualag (nivolumab-relatlimab-rmbw) is an intravenously administered immunotherapy approved for use in patients with advanced melanoma.

Policy/Criteria

Most contracts require pre-authorization approval of Opdualag (nivolumab-relatlimab-rmbw) prior to coverage.

I. Continuation of therapy (COT): Opdualag (nivolumab-relatlimab-rmbw) may be considered medically necessary for COT when criterion A, B, or C below is met.

A. For diagnoses NOT listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND there is documentation that the medication was covered by another health plan. Examples of documentation include the coverage approval letter from the previous health plan or paid claim.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

B. For diagnoses listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

C. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

Please note*: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan*

II. New starts (treatment-naïve patients): Opdualag (nivolumab-relatlimab-rmbw) may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) that criteria A, B, and C below are met:

A. A diagnosis of **melanoma**, unresectable or metastatic.

AND

B. No prior systemic therapy (including but not limited to prior use of PD-1 inhibitors or PD-L1 inhibitors) in the advanced disease setting (see *Appendix 1*).

AND

C. Opdualag (nivolumab-relatlimab-rmbw) will be used as monotherapy.

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers Opdualag (nivolumab-relatlimab-rmbw) coverable only under the medical benefit (as a provider-administered medication).

B. When pre-authorization is approved, Opdualag (nivolumab-relatlimab-rmbw) may be approved for 24 weeks for up to one, 480 mg/160 mg infusion per month until disease progression.

C. Reauthorization: Authorization **shall** be reviewed at least every 24 weeks for documented benefit. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met. Specifically, documentation that the medication is providing clinical benefit, including disease stability or improvement, and lack of disease progression, based on an assessment of change in tumor burden. If there is documentation of potential disease progression, a shortened authorization (up to three months) may be approved to allow time for clarification of response to Opdualag (nivolumab-relatlimab-rmbw), including clinical re-evaluation of the patient and reimaging.

PLEASE NOTE: Additional doses of Opdualag (nivolumab-relatlimab-rmbw) will not be authorized without a documented recent assessment by the treating provider (such as oncologist) with objective evidence of response to therapy, such as by re-imaging and use of iRECIST criteria.

.

IV. Opdualag (nivolumab-relatlimab-rmbw) is considered investigational when used for all other conditions, including but not limited to:

A. Subsequent therapy for previously-treated advanced melanoma: Use for disease progression/recurrence on/after use of systemic therapy in the advanced setting, including but not limited to, PD-1 inhibitors or PD-L1 inhibitors in the advanced setting (see *Appendix 1*).

B. Sequential use of PD-1 inhibitors or PD-L1 inhibitors (see *Appendix 1*)

Position Statement

Summary

- Opdualag (nivolumab-relatlimab-rmbw) is an intravenously administered immunotherapy. It is a combination of nivolumab, a programmed death receptor-1 (PD-1) blocking antibody and relatlimab, a lymphocyte activation gene-3 (LAG-3) blocking antibody. Blocking these pathways inhibits tumor growth and promotes tumor regression.
- The intent of this policy is to allow coverage of Opdualag (nivolumab-relatlimab-rmbw) in the clinical setting described in the coverage criteria above, where it has been evaluated for efficacy, up to the dose shown to be safe in clinical trials.
- The FDA approval of Opdualag (nivolumab-relatlimab-rmbw) was based on a fair quality randomized controlled trial [RELATIVITY-047] in patients with unresectable or metastatic melanoma who had no prior systemic therapy for their advanced disease. Opdualag (nivolumab-relatlimab-rmbw), when administered as monotherapy, was found to improve progression-free survival (PFS) relative to Opdivo (nivolumab).
    * PFS has not been proven to be an accurate predictor of OS or any other clinically relevant endpoint in advanced melanoma. Improved overall survival (OS) is the clinical outcome of interest in this disease setting. There is currently no information to determine if Opdualag (nivolumab-relatlimab-rmbw) improves OS relative to Opdivo (nivolumab) or any other melanoma therapy.
    * Seventy-five percent of patients enrolled in the pivotal trial had tumors with LAG-3 expression $\geq$ 1%. Both an early-stage trial and a subgroup analysis from the phase 2/3 pivotal trial suggest that LAG-3 expression $\geq$ 1% is associated with improved tumor response to Opdualag (nivolumab-relatlimab-rmbw) as compared with LAG-3 expression < 1%. Whether this has any application in the clinical setting is not yet known.
    * The use of Opdualag (nivolumab-relatlimab-rmbw) after disease progression/recurrence on/after chemotherapy and/or immunotherapy for advanced melanoma is not coverable at this time. A small percent of patients enrolled in the RELATIVITY-047 trial received prior immunotherapy in the non-advanced adjuvant setting for resectable melanoma. Patients with prior use of systemic therapy for advanced melanoma were excluded from the trial. Therefore, the use of Opdualag (nivolumab-relatlimab-rmbw) is coverable only when there is no prior systemic therapy in the advanced setting.
- The National Comprehensive Cancer Network (NCCN) cutaneous melanoma guideline lists Opdualag (nivolumab-relatlimab-rmbw) among its recommendations for front-line treatment of unresectable or metastatic melanoma when no BRAF V600 mutation is present.
- Opdualag (nivolumab-relatlimab-rmbw) may be covered in doses up to 480 mg/160 mg each month, the dose studied in the pivotal trial, until disease progression. This dose was established based on a weight of 40 kg or more. A dose for patients less than 40 kg has not been established. The safety and effectiveness of higher doses have not been established.

- The safety and effectiveness of Opdualag (nivolumab-relatlimab-rmbw) in conditions other than unresectable or metastatic melanoma have not been established.
- *Reauthorization Criteria*: When coverage criteria are met, Opdualag (nivolumab-relatlimab-rmbw) is authorized for six months (24 weeks) of therapy, after which time documentation must be provided to establish that the medication is effective. Specifically, there must be documentation of clinical benefit, including disease stability or improvement and there is a lack of disease progression, based on an assessment of change in tumor burden. Documentation of benefit must include an assessment of the most recent imaging ("restaging scans") and/or re-biopsy by the treating oncologist.

Regence Pharmacy Services performs independent analyses of oncology medication evidence, to establish coverability per the contracts with the health plan.

- Most contracts define coverability based on established clinical benefit in published, peer-reviewed literature, along with consideration of regulatory status.
- FDA approval does not in itself establish medical necessity, as unpublished, low-quality evidence, including exploratory analyses and unvalidated surrogate endpoints, may be used as the basis of approval. Regulatory approval may or may not reflect clinical benefit relative to standard of care and the recommendations of expert clinical advisors such as the Oncologic Drugs Advisory Committee (ODAC). FDA approvals generally do not consider cost compared to established therapies, or value to members.
- Likewise, NCCN clinical practice guidelines assignment of a recommendation (category 1, 2a, or 2b) does not necessarily establish medically necessity. NCCN recommendations are inconsistently supported by published, peer-reviewed literature and do not uniformly consider value of new therapies relative to existing potentially higher-value treatment options, considering effectiveness, safety, and cost.
- Medication coverage criteria are developed based on the 'medical necessity' assessment, as described above.

Regence Pharmacy Services analysis and coverage policy may differ from FDA labeled indication and/or NCCN clinical practice guidelines.

Clinical Efficacy

- The efficacy of Opdualag (nivolumab-relatlimab-rmbw) was studied in a fair quality randomized controlled trial [RELATIVITY-047] in patients with previously untreated, unresectable metastatic melanoma. The trial compared Opdualag (nivolumab-relatlimab-rmbw) with Opdivo (nivolumab) and evaluated progression-free survival (PFS) as the primary endpoint. [1]
    * Patients in the trial had no prior systemic therapy for their advanced disease. Approximately 8% of the population had prior adjuvant therapy which may have included immunotherapy or BRAF/MEK inhibitors; however, adjuvant therapy must have been completed at least 6 months prior to the current recurrence.
    * Approximately 90% of patients had metastatic disease and all had good performance status.

    * All patients were required to have a tumor tissue sample available for biomarker analysis. Randomization was stratified by PD-L1 expression, LAG-3 expression, BRAF status, and tumor stage.
    * Seventy-five percent of tumors had LAG-3 expression of at least 1%. In an earlier phase 1 study, a greater than 3-fold increase in tumor response to Opdualag (nivolumab-relatlimab-rmbw) was observed when LAG-3 expression was ≥ 1% versus < 1%.
- Median PFS was improved with Opdualag (nivolumab-relatlimab-rmbw) relative to Opdivo (nivolumab); however, there is no mature overall survival (OS) data available. OS is the clinical outcome of interest in this population. PFS has not been proven to be an accurate predictor of OS benefit. More information is needed before a better estimate of net health benefit can be made. [1]
- Additionally, similar to what was observed in an earlier phase 1 trial (Study CA224020), a subgroup analysis appears to show that tumors with a LAG-3 expression ≥ 1% show a better response to Opdualag (nivolumab-relatlimab-rmbw) than those with LAG-3 expression < 1%. [1] Whether this has any application in a clinical setting is yet to be determined.
- There is interest in the use of Opdualag (nivolumab-relatlimab-rmbw) as a subsequent therapy for metastatic melanoma, based on the Phase 1/2 RELATIVITY-020 trial, a single-arm, open-label trial in deeply pre-treated melanoma.[2] Given the lack of controls in the trial, overall low response rate compared to serious treatment-related adverse reaction rate, it is not known if patients are likely to benefit from sequential therapy. Additional trials are ongoing.
-

Guideline recommendations [3]

- The current National Comprehensive Cancer Network (NCCN) cutaneous melanoma guideline lists Opdualag (nivolumab-relatlimab-rmbw) among front-line options for unresectable or metastatic melanoma.
- Other therapies with higher levels of evidence include Opdivo (nivolumab), with or without concomitant Yervoy (ipilimumab), and Keytruda (pembrolizumab).
- Opdualag (nivolumab-relatlimab-rmbw) is not listed among the recommendation for:
    * Uveal melanoma (the pivotal trial excluded patients with uveal melanoma)
- Opdualag (nivolumab-relatlimab-rmbw) is now also listed as an option for subsequent-line therapy of advanced melanoma. NCCN guidelines recommend that, following progression or poor response, subsequent lines of therapy should use different mechanisms of action. At this time, there is no robust comparative clinical trial evidence to support the use of Opdualag after progression on previous therapy, and as such this use is considered investigational per this policy.

Reauthorization Criteria:

- When coverage criteria are met, Opdualag (nivolumab-relatlimab-rmbw) is authorized for six months (24 weeks) of therapy, after which time documentation must be provided to establish that the medication is effective. Specifically, there must be documentation of clinical benefit, including disease stability or improvement and there is a lack of disease progression, based on an assessment of change in tumor burden.
    * The standard of care for evaluation of response to cancer immunotherapy, such as Opdualag (nivolumab-relatlimab-rmbw) is use of the iRECIST criteria for assessment of tumor burden. [4]
    * The iRECIST criteria include use of quantitative and qualitative criteria for assessment of change in tumor burden for target lesions and non-target lesions. [5]
        - Quantitative measurements for target lesions (tumor size and % change)
        - Qualitative evaluation for non-target lesions (present/disappeared/ unequivocal progression)
    * Documentation of benefit must include an assessment of the most recent imaging ("restaging scans") by the treating oncologist. Given the complexity of the evaluation, including use of the iRECIST criteria, Opdualag (nivolumab-relatlimab-rmbw) will not be reauthorized without an assessment of response to therapy, such a partial response (iPR), complete response (iCR), or stable disease (iSD).
    * Use of immunotherapy may result in pseudoprogression, due to immune and T-cell activation, which can appear similar to tumor flare. If there is documentation of potential disease progression ["unconfirmed progressive disease (iUPD)"], a shortened authorization (up to three months) may be approved to allow time for clarification of response to Opdualag (nivolumab-relatlimab-rmbw), including clinical re-evaluation of the patient and reimaging. Guidelines recommend reimaging for iUPD after 4-8 weeks.
    * If a patient has confirmed, unequivocal new lesions (progression of disease, iPD), additional Opdualag (nivolumab-relatlimab-rmbw) is not coverable. If a new lesion is equivocal, iUPD reassessment by the treating oncologist with repeat imaging would apply (as noted above).

Investigational Uses [6]

- There is interest in using Opdualag (nivolumab-relatlimab-rmbw) in other tumors that express LAG-3; however, there are currently no well-controlled, published trials supporting its safety and efficacy in other cancers at this time.
- There is no evidence to support the use of Opdualag (nivolumab-relatlimab-rmbw) in combination with any other melanoma therapy.

Safety [7 8]

- Qualitatively, the adverse effects reported in the Opdualag (nivolumab-relatlimab-rmbw) clinical trial were similar to those reported with Opdivo (nivolumab). However, as relatlimab is a new entity and safety experience is limited, it cannot be ruled out that additional harms may become known in the future.

- Approximately one in two to three patients receiving Opdualag (nivolumab-relatlimab-rmbw) in the pivotal trial experienced a dose interruption, or permanent discontinuation due to AEs.

Dosing [7]

- Opdualag (nivolumab-relatlimab-rmbw) is intravenously administered every four weeks until disease progression.
- Opdualag is available in a fixed combination of nivolumab 240 mg and relatlimab 80 mg per 20 ml. The dose for patients with a weight of at least 40 kg is 480 mg/160 mg IV every 4 weeks until disease progression. No dose has been established for patients weighing less than 40 kg.

Revision History

Revision Date	Revision Summary
9/19/2024	**Effective 1/1/2025:** Changed reauthorization from 'may' to 'shall.' Operationally, all approvals will be for 24 weeks (6 months). Ongoing therapy (beyond 24 weeks) will be subject to reauthorization review every 24 weeks, for documentation of disease stability or improvement and lack of disease progression.
9/19/2024	**Effective 12/1/2024:** • Clarification of coverage criterion "no prior systemic therapy in the advanced setting" to include "including but not limited to prior use of PD-1 inhibitors or PD-L1 inhibitors." • Addition of Investigational Uses, to include use as subsequent therapy in the advanced setting, as well as sequential PD1/PD-L1 therapy in the advanced setting.
9/14/2023	No criteria changes with this annual review.
12/9/2022	No changes to coverage criteria with this annual update.
06/17/2022	New Policy (effective 7/15/2022). • Limits coverage to patients with unresectable or metastatic melanoma when Opdualag (nivolumab-relatlimab-rmbw) is given as monotherapy and there has been no prior systemic therapy in the advanced disease setting. • Opdualag (nivolumab-relatlimab-rmbw) may be covered in doses up to 480 mg/160mg monthly, the dose studied in the pivotal trial and the maximum dose listed in the FDA label.

Medication Policy Manual

Policy No: dru722

Topic: Pluvicto, lutetium Lu 177 vipivotide tetraxetan

Date of Origin: October 15, 2022

Committee Approval Date: June 20, 2024

Next Review Date: 2025

Effective Date: September 1, 2024

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Pluvicto (lutetium Lu 177 vipivotide tetraxetan) is an intravenously administered radiopharmaceutical approved for use in patients with a specific type of prostate cancer (prostate-specific membrane antigen [PSMA]-positive, metastatic castration-resistant prostate cancer [mCRPC]).

Policy/Criteria

Most contracts require pre-authorization approval of Pluvicto (lutetium Lu 177 vipivotide tetraxetan) prior to coverage.

I. Continuation of therapy (COT): Pluvicto (lutetium Lu 177 vipivotide tetraxetan) may be considered medically necessary for COT when criterion A, B, or C below is met.

A. For diagnoses NOT listed in the coverage criteria below, full policy criteria must be met for coverage.

OR

B. For diagnoses listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

C. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

***Please note**: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Pluvicto (lutetium Lu 177 vipivotide tetraxetan) may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) that criteria A through D below are met:

A. A diagnosis of **metastatic castration-resistant prostate cancer** (mCRPC).

AND

B. Attestation that the metastatic lesions are predominantly prostate-specific membrane antigen (PSMA)-positive (no dominant PSMA-negative metastatic lesions).

AND

C. There has been disease progression on or after treatment with both of the following (1 and 2):

1. At least one androgen receptor pathway inhibitor (see *Appendix A*).

AND

2. At least one taxane-based chemotherapy regimen (see *Appendix B*).

AND

D. Testosterone levels are at castrate levels (< 50 ng/dL).

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers Pluvicto (lutetium Lu 177 vipivotide tetraxetan) coverable only under the medical benefit (as a provider-administered medication).

B. When pre-authorization is approved, Pluvicto (lutetium Lu 177 vipivotide tetraxetan) will be approved for up to a total of six of the 7.4 GBq infusions.

C. Authorization **may** be reviewed at least annually. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, including disease stability or improvement relative to baseline symptoms.

IV. Pluvicto (lutetium Lu 177 vipivotide tetraxetan) is considered investigational when used for all other conditions.

Position Statement

Summary

- Pluvicto (lutetium Lu 177 vipivotide tetraxetan) is an intravenously administered radioligand that delivers radiation to prostate cancer cells that are positive for prostate-specific membrane antigen (PSMA).
- The intent of this policy is to allow coverage of Pluvicto (lutetium Lu 177 vipivotide tetraxetan) in the clinical setting described in the coverage criteria above, where it has been evaluated for efficacy, up to the dose shown to be safe in clinical trials.
- The FDA approval of Pluvicto (lutetium Lu 177 vipivotide tetraxetan) was based on a fair quality, randomized, controlled trial in patients with metastatic castration-resistant prostate cancer (mCRPC) with at least one PSMA-positive metastatic lesion (and no PSMA-negative lesions). Patients in the trial had progression of their disease on at least one prior androgen receptor pathway inhibitor and at least one prior taxane (docetaxel, cabazitaxel).
- As per standard of care, castrate levels of testosterone (< 50 ng/dL) were maintained throughout the study.
- In the pivotal study, Pluvicto (lutetium Lu 177 vipivotide tetraxetan) was found to improve median survival relative to best supportive care/standard of care.
- The current National Comprehensive Cancer Network (NCCN) prostate cancer guideline lists Pluvicto (lutetium Lu 177 vipivotide tetraxetan) among the recommendations for mCRPC when there is at least one PSMA-positive metastatic lesion and/or the disease is predominantly PSMA-positive and with no dominant PSMA-negative metastatic lesions, and there has been prior treatment with androgen receptor-directed therapy and a taxane-based chemotherapy regimen.

- Pluvicto (lutetium Lu 177 vipivotide tetraxetan) may be in doses of up to 7.4 GBq per infusion given every six weeks for a maximum of six infusions. The safety and efficacy of higher or more frequent doses have not been established.
- The safety and effectiveness of Pluvicto (lutetium Lu 177 vipivotide tetraxetan) in other conditions or in other prostate cancer settings have not been established.

Regence Pharmacy Services performs independent analyses of oncology medication evidence, to establish coverability per the contracts with the health plan.

- Most contracts define coverability based on established clinical benefit in published, peer-reviewed literature, along with consideration of regulatory status.
- FDA approval does not in itself establish medical necessity, as unpublished, low-quality evidence, including exploratory analyses and unvalidated surrogate endpoints, may be used as the basis of approval. Regulatory approval may or may not reflect clinical benefit relative to standard of care and the recommendations of expert clinical advisors such as the Oncologic Drugs Advisory Committee (ODAC). FDA approvals generally do not consider cost compared to established therapies, or value to members.
- Likewise, NCCN clinical practice guidelines assignment of a recommendation (category 1, 2a, or 2b) does not necessarily establish medically necessity. NCCN recommendations are inconsistently supported by published, peer-reviewed literature and do not uniformly consider value of new therapies relative to existing potentially higher-value treatment options, considering effectiveness, safety, and cost.
- Medication coverage criteria are developed based on the 'medical necessity' assessment, as described above.

Regence Pharmacy Services analysis and coverage policy may differ from FDA labeled indication and/or NCCN clinical practice guidelines.

Clinical Efficacy

- The efficacy of Pluvicto (lutetium Lu 177 vipivotide tetraxetan) was studied in a fair quality, open-label, randomized controlled trial in prostate-specific membrane antigen (PSMA)-positive, metastatic castrate-resistant prostate cancer (mCRPC) which compared it with best supportive care (BSC)/standard of care. [1,2]
    * Tumor histology in the enrolled population consisted of 91% with adenocarcinoma, and 1% with 'other' histology. Status was unknown in the remaining 8% of subjects.
    * All subjects had at least one PSMA-positive metastatic lesion, and no PSMA-negative metastatic lesions.
    * All subjects had at least one prior androgen receptor inhibitor (e.g., abiraterone, enzalutamide) and at least one prior taxane-based therapy (e.g., docetaxel, cabazitaxel).
    * Castrate levels of testosterone (< 50 ng/dL) were maintained throughout the study. Concomitant androgen blocking therapies included enzalutamide, abiraterone, and gonadotropin-releasing hormone (GNRH) analogues.

* Treatment was continued for up to 6 doses of Pluvicto (lutetium Lu 177 vipivotide tetraxetan) unless imaging-documented progression was detected prior to completion.

- The median OS was 15.3 months and 11.3 months in the Pluvicto (lutetium Lu 177 vipivotide tetraxetan) and BSC treatment arms, respectively. [2] There is some uncertainty in the results due to the very high rate of attrition in the BSC treatment arm; however, a relevant improvement in OS in favor or Pluvicto (lutetium Lu 177 vipivotide tetraxetan) appears to have been maintained based on follow up with missing subjects and several confirmatory sensitivity analyses. Accurate point estimates of expected survival benefit are difficult to determine because of this potential performance bias. [1]

Guideline recommendations [3]

- The current National Comprehensive Cancer Network (NCCN) prostate cancer guideline lists Pluvicto (lutetium Lu 177 vipivotide tetraxetan) as a category 1 recommendation for mCRPC when there is at least one PSMA-positive metastatic lesion and/or the disease is predominantly PSMA-positive and with no dominant PSMA-negative metastatic lesions, and there has been prior treatment with androgen receptor-directed therapy and a taxane-based chemotherapy regimen.
- The guideline recommends continuation of androgen deprivation therapy in the mCRPC population to keep testosterone at castrate levels (< 50 ng/dL).

Investigational Uses [4]

- There were no additional studies for Pluvicto (lutetium Lu 177 vipivotide tetraxetan) identified in clinicaltrials.gov.
- There is a small risk that Pluvicto (lutetium Lu 177 vipivotide tetraxetan) might be used in patients that do not have “predominantly PSMA-positive metastatic lesions” depending on the location of the given metastases.

Safety [1,5]

- Pancytopenia, fatigue, urinary tract infection, and kidney injury are the primary adverse effects experienced with Pluvicto (lutetium Lu 177 vipivotide tetraxetan).
- Renal function should be carefully monitored in patients receiving Pluvicto (lutetium Lu 177 vipivotide tetraxetan). Patients should remain adequately hydrated while receiving therapy.

Dosing [5]

- Pluvicto (lutetium Lu 177 vipivotide tetraxetan) should be administered at a facility that is licensed to handle radiopharmaceuticals.
- The recommended dose of Pluvicto (lutetium Lu 177 vipivotide tetraxetan) is 7.4 GBq (200 mCi) intravenously every six weeks for up to six total infusions, or until disease progresses, whichever comes first.

Appendix A: Androgen Receptor Pathway Inhibitors Approved for Use in Castration-Resistant Prostate Cancer (CRPC)

Medication Policy Manual **Policy No:** dru733

Topic: Medications for transthyretin-mediated amyloidosis

Date of Origin: January 15, 2023

- Amvuttra, vutrisiran
- Onpattro, patisiran
- Tegsedi, inotersen
- Vyndamax, tafamidis
- Vyndaqel, tafamidis meglumine
- Wainua, eplontersen

Committee Approval Date: June 20, 2024 **Next Review Date:** 2025

Effective Date: September 1, 2024

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Medications included in this policy are used for the treatment of transthyretin mediated (ATTR) amyloidosis, which is a rare, progressive disease that can affect the nervous system, heart, and other major organs.

Policy/Criteria

Most contracts require pre-authorization approval of medications for ATTR amyloidosis prior to coverage.

I. Continuation of therapy (COT): Medications for ATTR amyloidosis may be considered medically necessary for COT when criterion A **AND** B below are met.

A. One of the following (1, 2, or 3)

1. For diagnoses NOT listed in the coverage criteria below, full policy criteria must be met for coverage.

OR

2. For diagnoses listed in the coverage criteria below, criteria a. and b. must be met:

a. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

b. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

3. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission

AND

B. **For Amvuttra and Onpattro only (effective 10/1/2024)**: Site of care administration requirements are met [refer to Medication Policy Manual, Site of Care Review, dru408].

Please note: *Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Medications for ATTR amyloidosis may be considered medically necessary when criterion A **AND** B below are met.

A. One of the following diagnostic criteria are met (1 or 2)

1. **Hereditary transthyretin (hATTR) amyloidosis with polyneuropathy: Amvuttra (vutrisiran), Onpattro (patisiran), Tegsedi (inotersen), or Wainua (eplontersen)** may be considered medically necessary for hATTR with polyneuropathy when there is clinical documentation (including, but not limited to chart notes) that criteria a through e below are met.

a. A diagnosis of **hereditary transthyretin (hATTR) amyloidosis with polyneuropathy** established by a specialist in neurology, cardiology, amyloidosis, or genetics.

AND

b. The diagnosis has been confirmed by genetic testing, with documentation of a mutation in the transthyretin (TTR) gene.

AND

c. The patient has impairment due to neuropathy with a **Polyneuropathy Disability** (PND) score between I-IIIb or are in **Familial Amyloid Polyneuropathy** (FAP) Stage 1 or Stage 2 (as defined in *Appendix 1*).

AND

d. The patient has symptoms consistent with polyneuropathy (see *Appendix 2*).

AND

e. **For Tegsedi (inotersen) and Wainua (eplontersen) only:** The patient has not had a prior liver transplant.

OR

2. **Cardiomyopathy of transthyretin-related amyloidosis (ATTR-CM): Vyndamax (tafamidis) or Vyndaqel (tafamidis meglumine)** may be considered medically necessary for ATTR-CM when there is clinical documentation (including, but not limited to chart notes) that criteria a through d below are met.

a. A diagnosis of wild-type or hereditary **cardiomyopathy of transthyretin-related amyloidosis** (ATTR-CM) was established in consultation with a specialist in cardiology.

AND

b. The diagnosis has been confirmed by biopsy, immunohistochemical analysis, scintigraphy, or mass spectrometry.

AND

c. Documented New York Heart Association (NYHA) functional class I, II, or III.

AND

d. The patient has not had a liver and/or heart transplant.

AND

B. **For Amvuttra and Onpattro only (effective 10/1/2024)**: Site of care administration requirements are met [refer to Medication Policy Manual, Site of Care Review, dru408].

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers Amvuttra (vutrisiran) and Onpattro (patisiran) coverable only under the medical benefit (as provider-administered medications).

B. Regence Pharmacy Services considers Tegsedi (inotersen), Vyndamax (tafamidis), Vyndaqel (tafamidis meglumine), and Wainua (eplontersen) coverable only under the pharmacy benefit (as self-administered medications).

C. When pre-authorization is approved, medications for ATTR amyloidosis will be authorized in the following quantities and for the following authorization periods outlined in *Table 1* below.

Table 1 Medications for ATTR amyloidosis

Authorization Limits
Polyneuropathy of hATTR amyloidosis: - Amvuttra (vutrisiran): Up to 4 injections of a 25 mg prefilled syringe in a one-year period. - Onpattro (patisiran): Patients < 100kg: Up to 18 infusions in a one-year period based on dose of 0.3 mg/kg every 3 weeks. Patients ≥ 100kg: Up to 18 infusions in a one-year period based on a dose of 30 mg every 3 weeks. - Tegsedi (inotersen): Up to 4 prefilled syringes per 28 days. - Wainua (eplontersen): Up to one autoinjector per 28 days. Authorization **shall** be reviewed at least every twelve months. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met as and that the medication is providing clinical benefit, including stability or improvement in symptoms consistent with polyneuropathy.
Cardiomyopathy of transthyretin-related amyloidosis (ATTR-CM): - Vyndamax (tafamidis): Up to 30 of the 61 mg tablets per 30 days. - Vyndaqel (tafamidis meglumine): Up to 120 of the 20 mg tablets per 30 days. Authorization **shall** be reviewed at least annually. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, such as disease stability, improvement in heart failure symptoms, or improvement of NYHA functional class.

IV. Medications for ATTR amyloidosis are considered investigational when used for all other conditions, including but not limited to:

A. In combination with another medication for ATTR amyloidosis (as listed in this policy).

B. Other forms of amyloidosis not specified above.

Position Statement

Summary

- Medications for transthyretin-mediated (ATTR) amyloidosis may be covered for specific diagnoses where there is demonstrated safety and efficacy from randomized, controlled trials to support their use, including treatment of polyneuropathy hereditary transthyretin-mediated amyloidosis (hATTR) and treatment of cardiomyopathy of wild-type or hereditary transthyretin-mediated amyloidosis.
    - Small interfering RNA (siRNA) medications including Amvuttra (vutrisiran) and Onpattro (patisiran) silence the transthyretin (TTR) gene resulting in a reduction of serum and tissue TTR concentrations.
    - Tegsedi (inotersen) and Wainua (eplontersen) are RNA oligonucleotides that work by silencing the TTR gene resulting in a reduction of serum and tissue TTR concentrations.
    - Tafamidis is a transthyretin (TTR) stabilizer that selectively binds to specific sites of the TTR tetramer to prevent destabilization and amyloid fibril formation.

- Medications for ATTR amyloidosis may be covered at the doses proven to be safe and effective in the clinical trials (as outlined in *Table 1* of the coverage criteria above). The safety and effectiveness of higher doses has not been established. Use of medications for ATTR amyloidosis in clinical settings other than described in the coverage criteria is considered investigational.
- The safety and efficacy of medications for ATTR amyloidosis being used in combination with each other has not been established and is considered investigational.

Polyneuropathy of hATTR Amyloidosis

- Medications for polyneuropathy of hATTR amyloidosis are intravenous (IV) or subcutaneously administered medications and include the following: Onpattro (patisiran), Amvuttra (vutrisiran), Wainua (eplontersen), and Tegsedi (inotersen).
- The intent of the policy is to allow coverage of medications for polyneuropathy of hATTR amyloidosis in patients with a confirmed diagnosis of hATTR (by genetic testing), when there is documented symptomatic impairment due to polyneuropathy, similarly to how it was studied, as detailed in the coverage criteria.
- The effectiveness of the medications for polyneuropathy of hATTR amyloidosis were demonstrated in phase 3 randomized, controlled trials, in patients with genetically confirmed hATTR amyloidosis and symptomatic polyneuropathy, familial amyloidosis polyneuropathy (FAP) Stage 1 or 2.
- All medications for polyneuropathy of hATTR amyloidosis slowed the progression of neurologic worsening and decline in quality of life compared to placebo. In addition, Onpattro (patisiran), Amvuttra (vutrisiran), and Wainua (eplontersen) improved neurologic function and quality of life compared to placebo.
- Genetic testing is required to confirm the diagnosis of hATTR amyloidosis.
- Patients with a history of liver transplant were excluded from pivotal trials; however, a more recent study of Onpattro (patisiran) did show similar efficacy in patients with previous liver transplant.
- There is insufficient evidence that any one medication for the treatment of polyneuropathy in hATTR is superior to another as there are currently no comparative trials.
- Tegsedi (inotersen) is associated with severe, potentially fatal adverse effects (thrombocytopenia, glomerulonephritis, hepatotoxicity, and neurologic reactions) and has a REMS program.

Cardiomyopathy of transthyretin-related amyloidosis (ATTR-CM)

- The intent of this policy is to limit coverage of medications for ATTR-CM hATTR amyloidosis in patients with a confirmed diagnosis of ATTR-CM and to ensure use similarly to how they were studied, as detailed in the coverage criteria.
- The efficacy of tafamidis was established based on one clinical trial in adults with ATTR-CM (wild-type or hereditary). Tafamidis improved all-cause mortality and reduced cardiovascular (CV)-related hospitalizations at 30 months as compared to placebo.
- A biopsy is the gold standard for confirming a diagnosis of ATTR-CM. Other less invasive methods include immunohistochemical analysis, scintigraphy, or mass spectrometry.

- Subjects with a liver and/or heart transplant were excluded from clinical trial. It is unclear if patients with a prior liver and/or heart transplant who use tafamidis-containing medications will receive clinical benefit.
- Patients with NYHA class IV functional status who were unlikely to benefit from the medication were excluded from the study.
- Vyndaqel (tafamidis meglumine) 80 mg and Vyndamax (tafamidis) 61 mg are bioequivalent.

Clinical Efficacy

Polyneuropathy of hATTR Amyloidosis

Background [1-7]

- hATTR amyloidosis is a rare, rapidly progressing condition, caused by an autosomal-dominant inherited mutation in the TTR gene resulting in misfolded protein accumulating as amyloid fibrils in nerves, heart, gastrointestinal tract, or other tissues, leading to progressive disability and loss of function in major organs presenting as neurological, cardiac, or mixed phenotype.
- Neurologic phenotype, also known as familial amyloid polyneuropathy (FAP), manifests as sensorimotor polyneuropathy with a high variability in symptoms impacting quality of life such as pain, numbness, muscle weakness, weight loss/wasting, focal nerve lesions, and autonomic dysfunction, while patients with a cardiac phenotype experience cardiomyopathy leading to heart failure.
- Symptom onset can occur anywhere between the ages of 20-70, is often misdiagnosed without family history of disease, and can only be confirmed with biopsy and genetic confirmation of the TTR mutation.
- Life expectancy once diagnosed is between 5-12 years, though often shorter in patients with cardiomyopathy, with death attributed to cardiac dysfunction, infection, and cachexia.
- There are no consensus U.S. treatment guidelines. However, the 2022 Canadian Neurological Sciences Foundation guidelines now recommend Onpattro (patisiran) and Tegsedi (inotersen) as first line agents. Guidelines have not been updated since the approval of the newer TTR lowering medications (Amvuttra and Wainua).
- Liver transplant was the previous standard of care in early disease but does not prevent progression as the wild type TTR may continue to expand amyloid deposits and is no longer recommended as first line treatment.
- Vyndamax/Vyndaqel (tafamidis) and diflunisal stabilize TTR protein and are sometimes used in this indication; however, they have not been FDA approved. Tafamidis failed to receive approval from FDA for this indication due to not meeting statistical significance and diflunisal does not reverse course of disease and has limitations due to long term risks of adverse effects.
- Endpoints in trials included modified Neuropathy Impairment Score +7 (mNIS+7) and in the Norfolk Quality of Life-Diabetic Neuropathy (Norfolk QOL-DN). [8 9]
    * The mNIS+7 is an exam-based assessment of neuropathy which includes measures of nerve fiber conduction, sensory testing, and autonomic measures (postural blood pressure). Higher scores indicate worse neurologic function.

* The Norfolk QOL-DN evaluates patients' perception of impairment with respect to physical functioning/large fiber neuropathy, activities of daily living, neuropathy symptoms, small fiber neuropathy, and autonomic dysfunction. Higher scores indicate poorer quality of life.

Tegsedi (inotersen)[10]

- Efficacy of Tegsedi (inotersen) was demonstrated the NEURO-TTR study, a 15-month, phase 3 randomized, placebo-controlled trial. [10] Patients were required to meet the following requirements for enrollment:
  * FAP stage 1 (ambulatory) or stage 2 (ambulatory with assistance).
  * A diagnosis of hATTR confirmed by genetic testing and biopsy.
  * Symptoms of neuropathy measured using the Neuropathy Impairment Score (NIS). The NIS is a tool used to measure motor, sensory, and reflex function.
  * Patients with a history of liver transplant were excluded.
- The primary endpoints in modified Neuropathy Impairment Score +7 (mNIS+7) and in the Norfolk Quality of Life-Diabetic Neuropathy (Norfolk QOL-DN).
- Results showed that Tegsedi (inotersen) slowed the progression of neurologic symptoms and decline in quality of life compared to placebo. There is limited data on cardiovascular outcomes or mortality.
- Trials for Tegsedi (inotersen) excluded patients:
  * with prior liver transplant. At this time, it is unclear if patients who have received a liver transplant would experience benefit from these medications.
  * that were on TTR stabilizers such as Vyndamax/Vyndaqel (tafamidis) or diflunisal. At this time, it is unclear if patients receiving concomitant use of medications for hATTR with polyneuropathy and TTR stabilizers above is safe or effective.
  * Use of Tegsedi (inotersen) is investigational in these patient populations.

Onpattro (patisiran) [1 11-13]

- Efficacy of Onpattro (patisiran) was demonstrated the APOLLO study, an 18-month, phase 3 randomized, placebo-controlled trial. Patients were required to meet the following requirements for enrollment:
  * FAP stage 1 (mild ambulatory impairment) or stage 2 (ambulatory with assistance).
  * A diagnosis of hATTR confirmed by genetic testing and biopsy.
  * Symptoms of neuropathy measured using the Neuropathy Impairment Score (NIS). The NIS is a tool used to measure motor, sensory, and reflex function.
  * Patients with a history of liver transplant were excluded.
- The primary endpoint was change in modified Neuropathy Impairment Score +7 (mNIS+7) from baseline. Change in Norfolk Quality of Life-Diabetic Neuropathy (Norfolk QOL-DN) score was a secondary endpoint.
- Results showed that Onpattro (patisiran) improved neurologic symptoms and improved quality of life compared to placebo. There is limited data on effect of Onpattro (patisiran) on other end organ dysfunction associated with amyloidosis, such as cardiovascular outcomes or mortality.

- A recent phase 3b open-label, single arm trial (n=23) demonstrated efficacy of Onpattro (patisiran) in patients post liver transplant.
    * Patients had received a liver transplant 12 months prior to study, and had experienced polyneuropathy progression post-transplant, defined as an increase of PND.
    * PND scores of IV were excluded from the trial, as well as past use of Onpattro (patisiran) or Tegsedi (inotersen).
- The primary endpoint of serum TTR reduction showed statistically significant reduction with the median percent reduction from baseline at 12 months of 91%. Secondary endpoints of mean improvements from baseline of neurological impairment score (NIS) of -3.7 and Norfolk QOL-DN of -6.5, support the primary endpoints and are in line with the results from the primary APOLLO trial for which Onpattro (patisiran) previously was approved.
- Trials for Onpattro (patisiran) excluded patients that were on TTR stabilizers such as Vyndamax/Vyndaqel (tafamidis) or diflunisal. At this time, it is unclear if patients receiving concomitant use of medications for hATTR with polyneuropathy and TTR stabilizers above is safe or effective. Use of Onpattro (patisiran) is investigational in these patient populations.

Amvuttra (vutrisiran) [4 14 15]

- Efficacy of Amvuttra (vutrisiran) was demonstrated the HELIOS-A study, an 18-month, phase 3 randomized, externally placebo-controlled trial.
    * Patients were required to meet the following requirements for enrollment:
        - A diagnosis of hATTR confirmed by presence of a TTR gene mutation.
        - Polyneuropathy disability (PND) score between I-IIIb, which equates to being FAP stage 1 (mild ambulatory impairment) or stage 2 (ambulatory with assistance).
        - Symptoms of neuropathy measured using the Neuropathy Impairment Score (NIS) scoring between 5-130. The NIS is a tool used to measure motor, sensory, and reflex function.
        - Patients with a history of liver transplant were excluded.
        - Patients treated with TTR stabilizers (tafamidis or diflunisal) must have been off therapy for 14 days prior to enrollment to be included.
    * Patients were randomized 3:1 to be treated with Amvuttra (vutrisiran) 25 mg every 3 months or a reference comparator Onpattro 0.3 mg/kg every 3 weeks, respectively for 18 months.
    * Efficacy data was determined by comparing the Amvuttra (vutrisiran) population (n=122) of the HELIOS-A trial to the external placebo group (n=77) from the APOLLO trial above, (for which Onpattro [patisiran] received FDA approval when compared to the same placebo group).
    * The inclusion/exclusion criteria and endpoints from the external placebo group in the APOLLO trial were the same in the HELIOS-A trial.
    * Baseline characteristics were similar between groups, however in the APOLLO trial, patients appeared to have more severe disease compared to the HELIOS-A trial with a baseline mNIS+7 of 74.6 vs 60.6, and Norfolk QOL-DN total score 55.5 vs 47.1, respectively.
    * The primary endpoint was the mean change in modified Neuropathy Impairment

Score +7 (mNIS+7) from baseline at 9 months. Mean change in Norfolk Quality of Life-Diabetic Neuropathy (Norfolk QOL-DN) score and the 10-meter walk test (10-MWT) were secondary endpoints at 9 and 18 months (mNIS+7 was also a secondary endpoint at 18 months).

  * Results showed that Amvuttra (vutrisiran) improved neurologic symptoms (mNIS+7 change from baseline was -2.2 in Amvuttra (vutrisiran) arm vs 14.76 in placebo at 9 months; -0.46 vs 28.09 at 18 months), quality of life (change from baseline in Norfolk QOL-DN was a -3.3 vs 12.9 compared to placebo at 9 months; -1.2 vs 19.8 at 18 months), and gait speed (change from baseline in 10-MWT was -.133 vs 0 compared to placebo at 9 months; -.264 vs -.02 at 18 months).

- There is currently no data on effect of Amvuttra (vutrisiran) on other end organ dysfunction associated with amyloidosis, such as cardiovascular outcomes or mortality.
- Use of an external placebo vs active comparator and the external placebo having more severe baseline disease are of a concern, however patients in the Amvuttra (vutrisiran) arm showed large statistical significance across all endpoints at 9 and 18 months compared to placebo, results were seen across all subgroups, and the disease did not follow the normal course of progression.
- Amvuttra (vutrisiran) also showed non-inferiority when looking at exploratory endpoints comparing the serum concentrations of TTR protein to the active comparator group of Onpattro (patisiran) patients at 18 months.
- Trials for Amvuttra (vutrisiran) excluded patients:
  * That were on TTR stabilizers such as Vyndamax/Vyndaqel (tafamidis) or diflunisal. At this time, it is unclear if patients receiving concomitant use of medications for hATTR with polyneuropathy and TTR stabilizers above is safe or effective.
  * Use of Amvuttra (vutrisiran) is investigational in these patient populations.

Wainua (eplontersen)[16-18]

- Efficacy of Wainua (eplontersen) was demonstrated the NEUROTTRansform study, a 66-week, phase 3 randomized, externally placebo-controlled trial.
  * Patients were required to meet the following requirements for enrollment:
    - A diagnosis of hATTR confirmed by presence of a TTR gene mutation.
    - Polyneuropathy disability (PND) score between I-IIIb, which equates to being FAP stage 1 (mild ambulatory impairment) or stage 2 (ambulatory with assistance).
    - Symptoms of neuropathy measured using the Neuropathy Impairment Score (NIS) scoring between 10-130. The NIS is a tool used to measure motor, sensory, and reflex function.
    - Patients with a history of liver transplant were excluded.
    - Patients treated with TTR stabilizers (tafamidis or diflunisal) must have been off therapy for 14 days prior to enrollment to be included.
  * Patients were randomized 6:1 to be treated with Wainua (eplontersen) 45 mg every month or a reference comparator Tegsedi (inotersen) 300 mg weekly, respectively for 35 weeks, with all patients transferred over to Wainua (eplontersen) from week 36 on.
  * Efficacy data was determined by comparing the Wainua (eplontersen) population (n=140) of the NEUROTTRansform trial to the external placebo group (n=59)

from the NEUROTTR trial above, (for which Tegsedi [inotersen] received FDA approval when compared to the same placebo group).
    * The inclusion/exclusion criteria and endpoints from the external placebo group in the NEUROTTR trial were the same in the NEUROTTRansform trial.
    * Baseline characteristics were similar between groups, however in the NEUROTTR trial, patients appeared to have less severe disease compared to the NEUROTTRansform trial with a baseline mNIS+7 of 74.8 vs 81.3, respectively.
    * The primary efficacy endpoints were the mean change in modified Neuropathy Impairment Score +7 (mNIS+7) from baseline at 35 and 66 weeks. Mean change in Norfolk Quality of Life-Diabetic Neuropathy (Norfolk QOL-DN) score was the pivotal secondary endpoint at 35 and 66 weeks.
    * Results showed that Wainua (eplontersen) improved neurologic symptoms (mNIS+7 change from baseline was 0.2 in Wainua (eplontersen) arm vs 9.2 in placebo at 35 weeks; 0.3 vs 25.1 at 66 weeks), quality of life (change from baseline in Norfolk QOL-DN was -3.1 vs 8.7 compared to placebo at 35 weeks:-5.5 vs 14.2 at 66 weeks).
    * Use of an external placebo vs active comparator confounds interpretation of the results; however, patients in the Wainua (eplontersen) arm showed large statistical significance across all endpoints at 35 and 66 weeks compared to placebo, results were seen across all subgroups, and the disease did not follow the normal course of progression.
- The trial for Wainua (eplontersen) excluded patients:
    * That were on TTR stabilizers such as Vyndamax/Vyndaqel (tafamidis) or diflunisal. At this time, it is unclear if patients receiving concomitant use of medications for hATTR with polyneuropathy and TTR stabilizers above is safe or effective.
- Use of Wainua (eplontersen) is investigational in these patient populations. There is currently no data on effect of Wainua (eplontersen) on other end organ dysfunction associated with amyloidosis, such as cardiovascular outcomes or mortality.

Cardiomyopathy of transthyretin-related amyloidosis (ATTR-CM)

Background [19 20]

- ATTR-CM is a rare, late-onset, life-threatening disease associated with restrictive cardiomyopathy and progressive heart failure. It is caused by the deposition of misfolded transthyretin (TTR) protein in the heart tissues that leads to the formation amyloid fibrils. Formation of amyloid fibrils leads to organ damage and dysfunction.
- ATTR-CM typically manifests as heart failure, characterized by dyspnea, edema, syncope, sudden cardiac death, pericardial disease, thromboembolism, stroke, and peripheral neuropathy.
- The diagnosis of cardiac amyloidosis is confirmed by a cardiac biopsy. Other non-invasive methods include nuclear scintigraphy and cardiac MRI.
- The prevalence is estimated to be 45 in 100,000. The number of newly diagnosed cases is expected to increase in the next five years due increased disease awareness and diagnosis. ATTR-CM can be hereditary or non-hereditary. The age of onset for hereditary (mutant) ATTR-CM is typically between 50 and 60, while wild-type typically occurs between ages 60 and 70.

- Median survival without treatment is reported to be 2.5 to 3.5 years after diagnosis. However, the evidence for the natural history of ATTR-CM is limited to small trials.
- Treatment is divided into management of heart failure symptoms (e.g. edema, dyspnea, risk of thromboembolism) and treatment of the underlying disease, with a liver transplant and tafamidis being the only treatments for underlying disease.
- A liver transplant is only indicated in hereditary ATTR-CM and was the previous standard of care but does not prevent progression as the wild type TTR may continue to expand amyloid deposits. A combined liver and heart transplant may be indicated for some patients with advanced heart disease.

Vyndaqel (tafamidis meglumine) and Vyndamax (tafamidis) [19 20]

- The efficacy of Vyndaqel (tafamidis meglumine) was established in a single 30-month phase 3, placebo-controlled, randomized-controlled trial (ATTR-ACT).
    * In the primary analysis, Vyndaqel (tafamidis meglumine) demonstrated an improvement in survival rates and reduction in CV-related hospitalizations in patients with ATTR-CM as compared to placebo.
    * Subjects were included in the study if they had a diagnosis of wild-type or hereditary ATTR-CM and a history of heart failure which required additional treatment (e.g. hospitalization, diuretics).
    * Subjects with NYHA class IV functional class had a previous liver and/or heart transplant, or had an implanted cardiac device were excluded from the trial. It is unclear if these patients will receive clinical benefit from Vyndaqel (tafamidis meglumine).
- In a bioequivalence study, Vyndaqel (tafamidis meglumine) 80 mg and Vyndamax (tafamidis) 61 mg demonstrated no clinically significant pharmacokinetic differences.
- Trials of Vyndaqel (tafamidis meglumine) excluded patients with prior liver and/or heart transplant. There are no published clinical trials evaluating the safety or efficacy of tafamidis-containing medications for the treatment of ATTR-CM in patient with prior liver and/or heart transplant.

Safety [2]

- Tegsedi (inotersen) is associated with severe, potentially fatal adverse effects. It contains boxed warning for thrombocytopenia and glomerulonephritis. Due to these serious safety concerns enrollment in the TEGSEDI REMS program is required prior to initiating treatment.

Appendix 1: Staging of hATTR amyloidosis with polyneuropathy [5 6]		
FAP Stage	Symptoms	Modified Polyneuropathy Disability (PND) Score

0	Asymptomatic	N/A
I	Mild, ambulatory, symptoms at lower limbs limited	I. Sensory disturbances in extremities but preserved walking capacity II. Difficulties in walking but without the need for a walking stick
II	Moderate, further neuropathic deterioration, ambulatory but requires assistance	IIIa. One stick or one crutch required for walking IIIb. Two sticks or two crutches required for walking
III	Severe, bedridden/wheelchair bound with generalized weakness	IV. Patient confined to a wheelchair or bed

Appendix 2: Symptoms of Polyneuropathy [4]	
Peripheral sensorimotor polyneuropathy Symptoms	**Autonomic neuropathy symptoms**
Tingling or increased pain in the hands, feet, hands and/or arms,	Orthostasis
Loss of feeling in the hands and/or feet, numbness or tingling in the wrists,	Abnormal sweating
Loss of ability to sense temperature,	Sexual dysfunction
Difficulty with fine motor skills	Recurrent urinary tract infections
Seizures	Dysautonomia (constipation and/or diarrhea, nausea, vomiting, anorexia, early satiety)

Revision History

Revision Date	Revision Summary
6/20/2024	▪ Added newly FDA-approved drug Wainua (eplontersen) for polyneuropathy of hATTR amyloidosis in patients with a confirmed diagnosis of hATTR (by genetic testing), when there is documented symptomatic impairment due to polyneuropathy, similarly to how it was studied, as detailed in the coverage criteria (effective 9/1/2024). ▪ Added Amvuttra and Onpattro to site of care (SOC) program (effective 10/1/2024).
3/21/2024	No criteria changes with this annual review.
12/7/2023	No criteria changes with this annual review.
12/9/2022	New combination policy (effective 1/15/2023): ▪ Combined the following medication policies: dru577 Onpattro, patisiran, dru579 Tegsedi, inotersen, and dru595 tafamidis-containing medication; no change to intent of pre-existing criteria. ▪ Added newly FDA-approved drug Amvuttra (vutrisiran), for polyneuropathy of hATTR amyloidosis in patients with a confirmed diagnosis of hATTR (by genetic testing), when there is documented symptomatic impairment due to polyneuropathy, similarly to how it was studied, as detailed in the coverage criteria ▪ Removed requirement for "no prior liver transplant" for Onpattro (patisiran). ▪ For polyneuropathy criteria: - Clarified intent of "functional impairment" criterion to "symptomatic impairment" based on trial data and staging of polyneuropathy. - Removed Onpattro (patisiran) from "no previous liver transplant" criterion.

Medication Policy Manual **Policy No:** dru735

Topic: Gene therapies for hemophilia B **Date of Origin:** January 15, 2023

- Hemgenix, etranacogene dezaparvovec-drlb
- Beqvez, fidanacogene elaparvovec-dzkt

Committee Approval Date: June 20, 2024 **Next Review Date:** 2025

Effective Date: July 15, 2024

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Medications in this policy are intravenous (IV) gene therapies used for the treatment of patients with hemophilia B.

Policy/Criteria

Most contracts require pre-authorization approval of gene therapies for hemophilia B prior to coverage.

I. Gene therapies for hemophilia B are considered investigational, except for those situations specifically addressed in the policy criteria below.

PLEASE NOTE: Under this criterion, any gene therapies for hemophilia B not specifically addressed in this policy will be considered investigational.

II. Continuation of therapy (COT): Gene therapies for hemophilia B may be considered medically necessary when full policy criteria below are met, including quantity limit. However, gene therapies for hemophilia B are not coverable for repeated doses and are not coverable if a patient has previously received prior gene therapy for hemophilia B.

Please note*: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

III. New starts (treatment-naïve patients): Gene therapies for hemophilia B may be considered medically necessary for the treatment of patients with severe hemophilia B when there is clinical documentation (including, but not limited to chart notes) that all criteria (A through J) below are met:

A. A diagnosis of **hemophilia B (congenital FIX deficiency),** established by or in consultation with a hematologist with experience treating hemophilia B.

AND

B. Confirmation of severe or moderate-severe phenotype (factor IX activity ≤ 2% of normal.)

AND

C. Laboratory confirmation showing that the patient does not have factor IX inhibitors (less than 0.6 Bethesda Units).

AND

D. The patient has been appropriately evaluated for and does not have any comorbidity which presents a significant safety risk (See *Appendix 1*).

AND

E. The patient does not have any medical contraindications to corticosteroids **(physician attestation).**

AND

F. The patient is ≥ 18 years of age.

AND

G. Patient has not received prior treatment with a gene therapy for hemophilia B.

AND

H. Routine prophylaxis with fully optimized dosing of exogenous factor IX has been ineffective, defined as having one of the following while taking optimized exogenous factor IX prophylaxis (1 or 2):

1. Repeated bleeding episodes requiring acute treatment with additional doses of exogenous blood factor (factor IX) while taking optimized prophylaxis.

OR

2. Documentation of progressive disability including, but not limited to, disability from arthropathy due to bleeding.

AND

I. ***For Hemgenix (etranacogene dezaparvovec-drlb) only***: Laboratory confirmation showing that the patient is negative for antibodies to AAV5 (anti-AAV5 antibodies) or having anti-AAV5 titers ≤ 679.

AND

J. ***For Beqvez (fidanacogene elaparvovec-dzkt) only:*** Laboratory confirmation showing that the patient is negative for antibodies to AAVRh74 var (anti-AAVRh74 antibodies).

IV. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers gene therapies for hemophilia B coverable only under the medical benefit (as a provider-administered medication).

B. When pre-authorization is approved, gene therapies for hemophilia B may be authorized in quantities of one treatment course per lifetime.

C. Additional infusions of gene therapies for hemophilia B will not be authorized.

V. Use of gene therapies for hemophilia B in patients who are successfully managed with prophylactic exogenous factor IX replacement therapy is considered "not medically necessary".

VI. Investigational Uses

A. Repeated doses gene therapies for hemophilia B, including for gene therapies for hemophilia B previously given as part of a clinical trial.

B. Unless otherwise specified in the coverage criteria above, gene therapies for hemophilia B are considered investigational when used for all other conditions.

Position Statement

Summary

- Hemophilia B is a rare X-linked congenital bleeding disorder caused by a deficiency of coagulation factor IX (FIX), part of the intrinsic coagulation pathway. A deficiency in circulating FIX leads to impaired clotting and bleeding episodes.
- Gene therapies for hemophilia B are FDA approved adeno-associated viral (AAV) vector-based intravenous (IV) medications, that replace the defective FIX gene and include:
    * Hemgenix (etranacogene dezaparvovec-drlb), which uses a AAV5 vector.
    * Beqvez (fidanacogene elaparvovec-dzkt), which uses a AAVRh74 vector.
- The intent of this policy is to allow for coverage of gene therapies for hemophilia B in patients with severe hemophilia, that are clinically fit for gene therapy treatment, for whom routine optimized prophylactic exogenous factor IX therapy has been ineffective, as described in the above coverage criteria.
- Evidence for gene therapies for hemophilia B is limited to ongoing, small, single -arm, non-randomized, phase 3 trials in patients ≥ 18 years of age, with hemophilia B, having a FIX activity ≤2% of normal, that evaluated the annual bleed rate (ABR) for all bleeds compared to a 6-month run in phase on prophylactic exogenous FIX replacement therapy as their primary endpoint.
    * At the most recent data analysis, both Hemgenix (etranacogene dezaparvovec-drlb) and Beqvez (fidanacogene elaparvovec-dzkt) have reported non-inferiority to the 6-month run of prophylactic exogenous FIX replacement therapy.
- However, the long-term safety, efficacy, and benefit relative to the existing FIX alternatives remains unclear as:
    * The trials were without an active comparator.
    * The trials did not optimize prophylaxis with exogenous factor IX products during the run-in period.
    * There is significant intra-patient variability in terms of FIX therapy response.
    * Due to a limited trial size and short duration, the durability of gene therapies for hemophilia B is unknown.
- Although the phase 3 trial for Beqvez (fidanacogene elaparvovec-dzkt) excluded all patients with anti-AAVRh74 antibodies, Hemgenix (etranacogene dezaparvovec-drlb) was studied in patients with anti-AAV5 antibodies, with no significant difference in efficacy with anti-AAV5 antibody titers up to 679. However, the efficacy in patients with anti-AAV5 titers above 679 is unknown.
- Gene therapies for hemophilia B have not been studied in subjects with a history of FIX inhibitors or in patients less than 18 years of age, therefore use in these settings is considered investigational.
- Current standard of care for long-term management of hemophilia B is routine prophylactic exogenous FIX replacement therapy, with decades of clinical safety and efficacy experience for reduction of bleeding and improvement in quality of life (QOL). Treatment is highly individualized and differs by region and provider preference. The optimal treatment regimen is not known at this time. However, exogenous FIX

replacement therapies have a high clinical burden due to life-long use.

- Additional evidence is needed to assess the long-term safety and efficacy of gene therapies for hemophilia B, including impact on long-term complications, durability, and benefit over existing options in patients that are currently stable on prophylactic exogenous factor IX therapy. Therefore, the use of Hemgenix (etranacogene dezaparvovec-drlb) is considered 'not medically necessary' for the treatment of hemophilia B in patients that are stable on their current prophylactic exogenous factor IX therapy regimen.
- Gene therapies for hemophilia B may be covered for up to one dose per lifetime. There is no data on the safety or efficacy of repeated doses.

Clinical Efficacy [1-3]

Hemgenix (etranacogene dezaparvovec-drlb) for hemophilia B.

- The available evidence for Hemgenix (etranacogene dezaparvovec-drlb) is limited to two ongoing, open-label trials (AMT-061 and HOPE-B) in patients with moderately severe or severe hemophilia B (baseline FIX level ≤2 IU/dL).
    * All patients were at least 18 years of age, on prophylactic exogenous FIX therapy, no history of FIX inhibitors, and no existing liver issues.
    * All patients received a single infusion of Hemgenix (etranacogene dezaparvovec-drlb) at a dose of $2x10^{13}$ vc/kg.
    * The first trial, HOPE-B is an ongoing, multicenter, single arm, phase 3 trial (n=54).
        - All patients were required to participate in a 6-month run-in phase prior to gene therapy administration during which they received prophylactic factor IX. No data is available at this time regarding this run-in period (including impacts on adherence and dosing), which provided a baseline annualized bleeding rate (ABR) for the enrolled subjects.
        - The primary endpoint was ABR at 52 weeks after Hemgenix (etranacogene dezaparvovec-drlb) infusion. The mean ABR at week 52 was 1.51, compared to 4.19 during the run-in phase.
        - A relevant secondary endpoint included the change in FIX activity. At 6-, 12-, and 18-months post-Hemgenix (etranacogene dezaparvovec-drlb) infusion, the FIX activity levels were 39.0 IU/dL, 41.5 IU/dL, and 36.9 IU/dL, respectively.
        - By month 18 post-Hemgenix (etranacogene dezaparvovec-drlb) infusion, 52 patients (96.3%) had discontinued prophylactic factor IX therapy.
    * The second trial, AMT-061, is an unpublished, single arm, phase 2 trial (n=3).
        - The primary endpoint of this trial was FIX activity level.
        - At 12-, 24-, 30-, and 36-months post-Hemgenix (etranacogene dezaparvovec-drlb) infusion, the FIX activity levels were 40.8 IU/dL, 44.2 IU/dL, 50 IU/dL, and 36.9 IU/dL, respectively.

* Despite the reported efficacy in the phase 3 and phase 2 trials above, there are significant limitations in the data which impact the confidence in the data.
    - Small trial size and short duration limit the estimation of clinical effect and the ability to assess the impact on long-term complications as well as long term benefit (durability).
    - Clinical trials did not have an active comparator; therefore, the magnitude of benefit compared to FIX replacement therapies is unknown. Exogenous FIX products have decades of clinical data backing up their safety and efficacy in this population.
    - Significant inter-patient variability in FIX expression was seen during clinical trials. At this time, due to the small sample size of patients treated with Hemgenix (etranacogene dezaparvovec-drlb), no specific variable has been identified that can be used to predict FIX response. Therefore, it is unknown how to determine if a patient will respond to treatment with Hemgenix (etranacogene dezaparvovec-drlb).
    - Subjects with Anti-AAV5 antibodies were studied. No significant difference in FIX expression was observed in subjects with anti-AAV5 antibody titers up to 679. One subject with an anti-AAV5 titer > 3000 did not respond to therapy. There is insufficient data showing that treatment with Hemgenix (etranacogene dezaparvovec-drlb) is effective in patients with anti-AAV5 titers above 679.
    - Hemgenix (etranacogene dezaparvovec-drlb) was not studied in subjects with a history of FIX inhibitors.

<u>Beqvez (fidanacogene elaparvovec-dzkt) for hemophilia B[4-6]</u>

- The safety and efficacy of Beqvez (fidanacogene elaparvovec-dzkt) was established primarily from the ongoing BEGENE-2 trial (n=45), a small, multicenter, single arm open-label, non-inferiority study in patients with moderately severe or severe hemophilia B (baseline FIX level ≤2 IU/dL).
    * Patients were at least 18 years of age, on prophylactic exogenous FIX therapy, with no history of FIX inhibitors, chronic infections, or existing liver disease.
    * Prior to receiving treatment with Beqvez (fidanacogene elaparvovec-dzkt), all patients were in a 6-month run-in phase in which they received prophylactic factor IX therapy. Limited data is available at this time regarding this run-in period (including impacts on adherence and dosing), which provided a baseline annualized bleeding rate (ABR) for the enrolled subjects.
    * After the 6-month run in period, all patients received a single infusion of Beqvez (fidanacogene elaparvovec-dzkt) at a dose of $5x10^{11}$ vg/kg.
    * The primary endpoint was change from baseline in ABR for total bleeds at the end of the efficacy evaluation period (EEP), which was defined as week 12 post Beqvez (fidanacogene elaparvovec-dzkt) infusion up to the most recent data cut off. (median of 1.8 years).

    * The average ABR at the EEP was 2.5, compared to 4.5 during the run-in phase, which met non-inferiority to prophylactic exogenous FIX therapy.
    * Relevant secondary endpoints included FIX activity compared to the run-in period (25% vs ≤2%), and the total number of patients with no bleeds (60% vs 29%).
    * Post-Beqvez (fidanacogene elaparvovec-dzkt) infusion, 38 patients (84%) had discontinued prophylactic factor IX therapy during the EEP.
- Despite the reported efficacy in the phase 3 trial above, there are significant limitations in the data which impact the confidence in the data.
    * Small trial size and short duration limit the estimation of clinical effect, the ability to assess the impact on long-term complications as well as long term benefit (durability).
    * Clinical trials did not have an active comparator; therefore, the magnitude of benefit compared to FIX replacement therapies is unknown. Exogenous FIX products have decades of clinical data backing up their safety and efficacy in this population.
    * Lack of optimization of exogenous FIX prophylactic therapy during the 6-month run in period before treatment with Beqvez (fidanacogene elaparvovec-dzkt) leads to uncertainty.
    * Significant inter-patient variability in FIX expression was seen during the clinical trial. At this time, due to the small sample size of patients treated with Beqvez (fidanacogene elaparvovec-dzkt), no specific variable has been identified that can be used to predict FIX response. Therefore, it is unknown how to determine if a patient will respond to treatment.
    * Beqvez (fidanacogene elaparvovec-dzkt) was not studied in subjects with a history of FIX inhibitors, those <18 years of age, or in patients with anti-AAVRh74 antibodies. Therefore, use in this population is considered investigational.

Guidelines [7]

- Clinical guidelines recommend routine prophylaxis with exogenous FIX replacement therapy as the optimal treatment modality for individuals with severe hemophilia B (FIX <1 IU/dL), with the goal to maintain FIX trough levels above 1 IU/dL. Due to the peaks and troughs seen with exogenous FIX administration, this goal does not apply to gene therapy.
- In 2020, the WFH gene therapy workgroup agreed that the ideal range of FIX expression post-gene therapy should be over 50 IU/dL; however, there was no consensus on the minimum acceptable FIX level. A minimal acceptable level of 10-15% was proposed, but the main concern centered on the 10% minimum factor expression, as this level does not prevent arthropathies.
- Prophylaxis does not reverse established joint damage; however, it reduces ABR, and may slow the progression of joint damage and improve quality of life.
- FIX replacement therapy dosage and dose frequency varies greatly between patients. Dosage is dependent upon the level of severity, the presence of an inhibitor, prescribed

regimen (on-demand, prophylaxis, perioperative), the number of bleeding episodes, individual pharmacokinetics, the products utilized, and the level of physical activity.

Investigational Uses

- Use in pediatrics, patients with inhibitors, or liver dysfunction: At this time, there are no proposed or ongoing trials that will look at the safety or efficacy of gene therapies for hemophilia B in patients less than 18 years of age, with inhibitors to FIX, or liver dysfunction. [8]
- Repeated doses: There is no evidence to establish the safety or efficacy of repeat doses of gene therapies for hemophilia B. If medical necessity criteria are met, only a single dose of gene therapies for hemophilia B will be covered per lifetime. Use of more than one dose is considered 'investigational' and not coverable.

Safety [1 3 4]

- The most common side effects (>10% incidence) experienced during the clinical trials included ALT/AST elevations, headache, influenza-like illness, and infusion related reactions.
- One patient developed hepatocellular carcinoma after treatment with Hemgenix (etranacogene dezaparvovec-drlb). Safety analyses have found that it was not likely linked to therapy based on genetic analysis of the tumor. Off-target insertions in regions not known to be oncogenic were observed. The available data is insufficient to characterize any potential change in cancer risk.
- Due to the small number of patients treated with gene therapies for hemophilia B during clinical trials, additional data is necessary to further define the safety profile.

Appendix 1: Comorbidities which present a significant safety risk
The patient has been appropriately evaluated and ruled out for all of the following: A. Any active infection B. Significant liver dysfunction, defined as any of the following greater than two times the upper limit of normal (ULN): alanine aminotransferase (ALT), aspartate aminotransferase (AST), gamma glutamyl transferase (GGT), total bilirubin (T bili), and/or alkaline phosphatase (alk phos). C. Advanced liver fibrosis (defined as a Meta-analysis of Histological Data in Viral Hepatitis Stage 3 disease, FibroScan score of ≥9 kPa, or equivalent) D. Documentation of any chronic or active hepatitis B and/or active hepatitis C E. Any active malignancy (except non-melanoma skin cancer)

Codes	Number	Description
HCPCS	J1411	Injection, etranacogene dezaparvovec-drlb (Hemgenix), per therapeutic dose
HCPCS	J3490	Injection, fidanacogene elaparvovec-dzkt (Beqvez), per therapeutic dose

Revision History

Revision Date	Revision Summary
6/20/2024	• Renamed policy to "Gene therapies for hemophilia B." • Added coverage criteria for use in patients with hemophilia B and significant bleeding sequelae despite use of optimized exogenous factor IX prophylaxis. Hemgenix (etranacogene dezaparvovec-drlb) was previously considered not medically necessary. • Added newly FDA-approved Beqvez (fidanacogene elaparvovec-dzkt) with same intent as above for hemophilia B.
6/15/2023	No changes to criteria with this annual update.
12/9/2022	New policy (effective 1/15/2023). Coverage of Hemgenix (etranacogene dezaparvovec-drlb) is considered not medically necessary for the treatment of adult hemophilia B.

Drug names identified in this policy are the trademarks of their respective owners.

Medication Policy Manual | **Policy No:** dru736

Topic: Pedmark, sodium thiosulfate | **Date of Origin:** April 15, 2023

Committee Approval Date: March 6, 2025 | **Next Review Date:** 2026

Effective Date: May 1, 2025

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Pedmark (sodium thiosulfate) is an intravenously administered medication that is given to reduce the risk of cisplatin-associated ototoxicity in children who are receiving cisplatin for non-metastatic solid tumors.

PLEASE NOTE: Pedmark (sodium thiosulfate) should not be substituted with other sodium thiosulfate products.

Policy/Criteria

Most contracts require pre-authorization approval of Pedmark (sodium thiosulfate) prior to coverage.

I. Continuation of therapy (COT): Pedmark (sodium thiosulfate) may be considered medically necessary for COT when criterion A, B, or C below is met.

A. For diagnoses NOT listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND there is documentation that the medication was covered by another health plan. Examples of documentation include the coverage approval letter from the previous health plan or paid claim.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

B. For diagnoses listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

C. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

***Please note**: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Pedmark (sodium thiosulfate) may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) that criteria A through E below are met:

A. A diagnosis of a **localized solid tumor**.

AND

B. The disease is not metastatic.

AND

C. Cisplatin will be administered as a treatment.

AND

D. The patient is less than 18 years of age.

AND

E. Pedmark (sodium thiosulfate) will be used to prevent ototoxicity.

III. Pedmark (sodium thiosulfate) is considered investigational when used in adults, and for all other uses and conditions.

IV. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers Pedmark (sodium thiosulfate) coverable only under the medical benefit (as a provider-administered medication).

B. When pre-authorization is approved, Pedmark (sodium thiosulfate) will be authorized in doses up to 20 gm/m^2 in quantities equal to the number of doses of cisplatin that the patient will receive for their treatment course.

C. Authorization may be reviewed at least annually. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, such as disease stability or improvement.

Position Statement

Summary

- Pedmark (sodium thiosulfate) is an intravenously administered medication that is indicated to prevent cisplatin-associated toxicity in pediatric patients who are receiving cisplatin to treat localized, non-metastatic solid tumors.
- The intent of this policy is to allow for coverage of Pedmark (sodium thiosulfate) for pediatric patients with non-metastatic solid tumors who are receiving cisplatin as a treatment in the clinical setting described above, where it has been evaluated for efficacy up to the dose shown to be safe in clinical trials. FDA approval of Pedmark (sodium thiosulfate) was based on two, small, low-quality studies that evaluated hearing loss as an endpoint.
- There is a generic sodium thiosulfate product on the market that received FDA approval as a treatment for cyanide poisoning when used in combination with sodium nitrite. However, this product should not be used in place of Pedmark as the formulations differ. Pedmark (sodium thiosulfate) is the only product that has been studied in pediatric patients to decrease the risk of hearing loss associated with cisplatin.
- The effects of cisplatin-associated ototoxicity are greatest in children as they can lead to impairment in speech and language acquisition, psychosocial and cognitive development, and educational and vocational achievement. Risk factors for developing cisplatin-induced ototoxicity include age < 5 years, cumulative cisplatin dose > 200 mg/m^2 to 400 mg/m^2, extended duration of therapy, and cranial irradiation involving the cochlea.
- Pedmark (sodium thiosulfate) is considered investigational when used in adult patients, and in other clinical settings (e.g., to prevent other cisplatin-associated toxicities) where its safety and effectiveness have not been adequately evaluated.

Pedmark (sodium thiosulfate) is the only guideline-recommended treatment for prevention of cisplatin-based ototoxicity in children. Other therapies have been used off-label for this purpose in the past; however, they are not part of current recommendations.

- Pedmark (sodium thiosulfate) is given six hours after each cisplatin infusion. Because it works via inactivation of platinum compounds in the body, timing of doses is crucial. Dosing should be completed within 10 hours of the next scheduled dose of cisplatin.

Regence Pharmacy Services performs independent analyses of oncology medication evidence, to establish coverability per the contracts with the health plan.

- Most contracts define coverability based on established clinical benefit in published, peer-reviewed literature, along with consideration of regulatory status.
- FDA approval does not in itself establish medical necessity, as unpublished, low-quality evidence, including exploratory analyses and unvalidated surrogate endpoints, may be used as the basis of approval. Regulatory approval may or may not reflect clinical benefit relative to standard of care and the recommendations of expert clinical advisors such as the Oncologic Drugs Advisory Committee (ODAC). FDA approvals generally do not consider cost compared to established therapies, or value to members.
- Likewise, NCCN clinical practice guidelines assignment of a recommendation (category 1, 2a, or 2b) does not necessarily establish medically necessity. NCCN recommendations are inconsistently supported by published, peer-reviewed literature and do not uniformly consider value of new therapies relative to existing potentially higher-value treatment options, considering effectiveness, safety, and cost.
- Medication coverage criteria are developed based on the 'medical necessity' assessment, as described above.

Regence Pharmacy Services analysis and coverage policy may differ from FDA labeled indication and/or NCCN clinical practice guidelines.

Background [1,2]

- Ototoxicity due to cisplatin exposure is common and results from the death of cochlear outer hair cells. It occurs in 60% to 80% of children treated with cisplatin and is generally permanent and progressive.
- The effects of cisplatin-associated ototoxicity are greatest in children as they can lead to impairment in speech and language acquisition, psychosocial and cognitive development, and educational and vocational achievement.
- Risk factors for developing cisplatin-induced ototoxicity include age < 5 years, cumulative cisplatin dose > 200 mg/m^2 to 400 mg/m^2, extended duration of therapy, and cranial irradiation involving the cochlea.

Clinical Efficacy [2,3]

- The efficacy of Pedmark (sodium thiosulfate) was evaluated in two randomized controlled, open-label studies in pediatric patients with localized solid tumors who were receiving cisplatin as a treatment.

    * One study evaluated children with hepatoblastoma while the other included children with other types of solid tumors.
    * Only children with non-metastatic disease were allowed to participate in the studies.
    * The studies compared the children who received Pedmark (sodium thiosulfate) in conjunction with cisplatin therapy with those who did not.
    * The proportion of patients with hearing loss (per audiometry) was measured as the primary endpoint. Overall survival was measured as a secondary endpoint because Pedmark (sodium thiosulfate) has the potential to interfere with the efficacy of cisplatin. (Investigators wanted to demonstrate there was a potential benefit but that it was not compromising the efficacy of the chemotherapy).
    * There was a statistically significant decrease in the number of children experiencing hearing loss at the end of therapy in the Pedmark (sodium thiosulfate) treatment arm relative to the control arm in both studies.
    * One study also evaluated hearing loss one year after completion of Pedmark (sodium thiosulfate) as an exploratory endpoint. Statistically fewer children in the Pedmark (sodium thiosulfate) treatment arm experienced hearing loss at one year relative to the control arm.
    * No statistically significant differences in overall survival were noted between the Pedmark (sodium thiosulfate) and control groups; however, it cannot be ruled out that the ability to detect a difference may have been impaired by the small numbers of children enrolled in each study.
- Current evidence for Pedmark (sodium thiosulfate) as a therapy to prevent cisplatin-associated hearing loss is based on studies of a relatively short duration. Studies of longer duration are needed to confirm whether this therapy contributes to long-term outcomes.

Guidelines [1]

- The Lancet Health Clinical Practice Guideline on Prevention of Cisplatin-Induced Ototoxicity in Children and Adolescents with Cancer recommends Pedmark (sodium thiosulfate) to prevent cisplatin-induced ototoxicity in patients with non-metastatic hepatoblastoma (strong recommendation) and in other non-metastatic cancers (weak recommendation). No other treatments are recommended for this use.

Investigational Uses [4]

- Sodium thiosulfate is used in combination with sodium nitrate as part of a protocol to treat cyanide poisoning. There is a specific formulation of sodium thiosulfate (generic) specifically approved for this use. The use of the Pedmark formulation for the treatment of cyanide poisoning is considered investigational.
- Based its mechanism of action, there is interest in using Pedmark (sodium thiosulfate) to prevent other cisplatin-associated toxicities (e.g., prevent renal toxicity). The safety and effectiveness of Pedmark (sodium thiosulfate) in these other settings have not been established. Use other than prevention of cisplatin-associated ototoxicity in pediatric patients is considered investigational.

Safety [5]

- Electrolyte disturbances are the most common adverse effects associated with Pedmark (sodium thiosulfate).
- Gastrointestinal effects were also observed in patients who received Pedmark (sodium thiosulfate); however, they are also common with the background cisplatin-based regimens that were given during the studies.

Dosing [5]

- Pedmark (sodium thiosulfate) is administered intravenously over 15 minutes.
- The timing of Pedmark (sodium thiosulfate) dosing is critical. The infusion must be given 6 hours after the completion of the cisplatin infusion but at least 10 hours prior to the next cisplatin infusion.
- Dosing is based on patient weight. Consult package labelling for appropriate dosing.

Medication Policy Manual **Policy No:** dru740

Topic: Monoclonal antibodies for Alzheimer's disease **Date of Origin:** April 15, 2023

- Aduhelm, aducanumab
- Kisunla (donanemab)
- Leqembi, lecanemab

Committee Approval Date: September 19, 2024 **Next Review Date:** 2025

Effective Date: December 1, 2024

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Medications included in this policy are monoclonal antibodies used for Alzheimer's disease (AD). A clinical benefit, such as slowing of disease progression, of these monoclonal antibodies for Alzheimer's disease has yet to be established.

Policy/Criteria

Most contracts require pre-authorization approval of monoclonal antibodies for Alzheimer's disease (as listed in Table 1) prior to coverage.

I. Continuation of therapy (COT): Monoclonal antibodies for Alzheimer's disease (as listed in Table 1) may be considered medically necessary for COT when full policy criteria below are met, including quantity limit.

Please note: *Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Monoclonal antibodies for Alzheimer's disease (as listed in *Table 1*) are considered investigational for all conditions, including Alzheimer's disease.

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers monoclonal antibodies for Alzheimer's disease (as listed in *Table 1*) coverable under the medical benefit (as a provider-administered medication).

B. Although the use of monoclonal antibodies for Alzheimer's disease (as listed in *Table 1*) is considered "investigational," if pre-authorization is approved, monoclonal antibodies for Alzheimer's disease (as listed in *Table 1*) will be authorized as follows:

TABLE 1.

Product	Quantity Limit
Aduhelm (aducanumab)	Doses up to 10 mg/kg every 4 weeks.
Kisunla (donanemab)	Doses up to 1400 mg every 4 weeks.
Leqembi (lecanemab)	Doses up to 10 mg per kg every 2 weeks.

C. Authorization **shall** be reviewed at least every six months for documented benefit. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met. Specifically, documentation that the medication is providing clinical benefit, including disease stability or improvement, and lack of disease progression.

Position Statement

Summary

- Monoclonal antibodies for Alzheimer's disease (AD), Aduhelm (aducanumab), Kisunla (donanemab) and Leqembi (lecanemab), are intravenous therapies indicated for the treatment of AD.

- A clinical benefit (e.g. prolongation of independence, improved quality of life, prevention of disease progression and disability) with monoclonal antibodies for AD has not been established. [1 2]
    * The results of two nearly identical unpublished studies (EMERGE and ENGAGE) [1 3] of Aduhelm (aducanumab) had inconsistent clinical benefit after 18 months of treatment. Of the two trials, one demonstrated cognitive and functional improvements based on clinical scores in a subgroup who received high dose aducanumab while no endpoint was met in a second study regardless of dose.
    * In the TRAILBLAZER-ALZ2 trial, treatment with Kisunla (donanemab) resulted in cognitive and functional improvements after 18 months of treatment. However, the clinical meaningfulness of the improvement is unclear as the changes did not meet the defined minimal clinically important difference. [4]
    * Both studies (Study 201 and CLARITY AD) of Leqembi (lecanemab) demonstrated cognitive and functional improvements based on clinical scores, however in Study 201 those scores did not meet the threshold of prespecified success and in CLARITY AD the clinical relevance of the improvement is unclear and did not meet the defined minimal clinically important difference. [2 5-7]
    * Aduhelm (aducanumab), Kisunla (donanemab) and Leqembi (lecanemab) demonstrated improvements in amyloid beta imaging; however, the reduction of beta-amyloid plaque is a surrogate endpoint whose causal link to clinical benefit for patients with AD has yet to be established. [2]
    * Given the lack of overall clinical benefit and potential for harms, the use of monoclonal antibodies for AD is considered investigational.
- Of note: The manufacturer announced discontinuation of Aduhelm (aducanumab) in late 2024.
- Treatment of AD is largely supportive and may include the avoidance of poly-pharmacy as well as treatment of comorbid conditions. Currently available pharmacological therapy focuses on symptom management but does not modify disease course. [8]

Clinical Efficacy

Aduhelm (aducanumab) for Alzheimer's disease

- The results of two nearly identical studies did not have consistent clinical benefit after 18 months of treatment. The FDA standard is typically two demonstrative clinical trials with positive data on patient reported outcomes/symptoms.
- The evidence regarding the effect of Aduhelm (aducanumab) is based on the change from baseline on the CDR-Sum of Boxes is inconclusive. The (CDR-SB) is an extensive cognitive and functional assessment tool used primarily in clinical trials. Higher scores suggest greater disease severity; a minimal clinically significant difference (MCID) is estimated to be 1-2 points. [9]

- Patients in the pivotal trials had prodromal or mild AD along with confirmed amyloid pathology [positive amyloid positron emission tomography (PET) scan]. All patients in the trials had either mild cognitive impairment associated with AD or mild AD; patients with more severe disease were not studied.
    * EMERGE: A statistically significant improvement in CDR-SB was observed in the high-dose aducanumab arm (difference vs. placebo -0.39 [95% CI -0.69 to -0.09]) but not the low-dose arm. Although the results were statistically significant in the high-dose arm, the change in CDR-SB was less than the 1-2 point change that has been suggested as the MCID.
    * ENGAGE: Neither low dose or high dose had any statistically significant improvement vs placebo in CDR-SB or any secondary efficacy endpoints.
- Both studies demonstrated significant improvements in amyloid plaques based on PET imaging; however, the effect of amyloid beta on clinical outcomes has not yet been established. There have been 16 trials of other drugs in which the treatment arm did worse than placebo despite reduction of amyloid, albeit typically in a population with more severe disease. [2]
- Although the existing evidence is promising, an additional confirmatory trial is needed to establish the safety and efficacy of Aduhelm (aducanumab) in AD. Aduhelm (aducanumab) has not yet proven to improve clinically relevant outcomes such as quality of life, prolongation of independent functioning, or prevention of disease progression and disability, or mortality.
- The FDA advisory committee as well as the Institute for Clinical and Economic Review (ICER) openly advised against approval of Aduhelm (aducanumab). [10 11] Prior to approval, the American Academy of Neurology (AAN) advised against a broad label approval and that further characterization of patients who would benefit most is warranted. [8]
- At this time, there is not enough data available to determine that the benefits of Aduhelm (aducanumab) use would outweigh the risks or provide any meaningful benefit in the AD population. Aduhelm (aducanumab) has uncertain benefit in the face of known harms.

Kisunla (donanemab) for Alzheimer's disease

- The efficacy of Kisunla (donanemab) was evaluated in a single phase 3, double-blind, placebo-controlled trial (TRAILBLAZER-ALZ2, N=1736) in patients with AD with mild cognitive impairment or mild dementia. [4]
    * Results of the trial showed that patients treated with Kisunla (donanemab) achieved greater improvements compared to placebo based on the integrated Alzheimer's Disease Rating Scale (iADRS).
    * The iADRS is a cognitive and functional assessment scale that combines components of two other AD scales commonly used in clinical trials. Scores in the iADRS can range from 0 to 144 with lower scores indicating greater disease severity.

    * The minimal clinically important difference (MCID) for a score is 5 points in AD with mild cognitive impairment and 9 points in AD with mild dementia. After 18 months of treatment, the difference in the iADRS scores between Kisunla (donanemab) and placebo was 2.9, which did not reach the threshold for clinically meaningful change for cognition or function.[4]

- Although the existing evidence is promising, additional confirmatory trials are needed to establish the safety and efficacy of Kisunla (donanemab) in AD. Based on the results of the TRAILBLAZER trial, there is not enough evidence that any potential benefit of treatment with Kisunla (donanemab) outweighs the harms associated with treatment. Kisunla (donanemab has not yet proven to improve clinically relevant outcomes such as prolongation of independent functioning nor has it proven prevention of disease progression and disability, or mortality.

Leqembi (lecanemab) for Alzheimer's disease

- The FDA accelerated approval of Leqembi (lecanemab) was based on a single phase 2b, double-blind, placebo-controlled, dose finding trial (Study 201, N=856). The FDA standard is typically two demonstrative clinical trials with positive data on patient reported outcomes/symptoms. [5 7 12] A phase 3, global, multicenter, randomized, double-blind placebo-controlled confirmatory trial (CLARITY AD, N=1795) has since been published, submitted to FDA, and received full approval. [6]
- The evidence regarding the effect of Leqembi (lecanemab) based on the change from baseline on the CDR-Sum of Boxes is inconclusive. The (CDR-SB) is an extensive cognitive and functional assessment tool used primarily in clinical trials. Higher scores suggest greater disease severity; MCID is estimated to be 1-2 points. The clinical relevance of the effect that Leqembi (lecanemab) showed (slowing of CRD-SB by 0.45 compared to placebo at 18 months) is unclear at this time as it falls below the MCID. [2]
- Patients in both pivotal trials had either mild cognitive impairment associated with AD or mild dementia due to AD. Patients with more severe disease were not studied. Confirmation of amyloid pathology [positive amyloid positron emission tomography (PET) scan or via cerebrospinal fluid (CSF)] was also required. [6 12]
    * Study 201: An improvement in the primary endpoint of the change in baseline on a weighted composite score from Clinical Dementia Rating Scale-Sum of Boxes (CDR-SB), the Mini-Mental State Examination (MMSE) and the AD assessment scale-Cognitive 14 Subscale (ADAS-Cog 14) was shown at week 53 (64% likelihood of a 25% or greater slowing of progression) with Leqembi (lecanemab) when compared to placebo. However, the results did NOT meet prespecified success criterion of 80%. [5]
    * CLARITY AD: A statistically significant improvement in the primary endpoint of the change from baseline of CDR-SB at month 18 was observed in the Leqembi (lecanemab) arm (difference vs. placebo -0.45 [95% CI -0.67 to -0.23, p-value of 0.00005], which represents a 27% reduction in progression). Although the results were statistically significant, the change in CDR-SB was less than the 1–2-point change that has been suggested as the minimal clinically important difference (MCID). [6]

- Both studies demonstrated significant improvements in amyloid plaques based on PET imaging; however, the effect of amyloid beta on clinical outcomes has not yet been established. There have been at least previous 16 trials of other drugs in which the treatment arm did worse than placebo despite reduction of amyloid, albeit typically in a population with more severe disease. [2]
- Although the existing evidence is promising, additional confirmatory trials are needed to establish the safety and efficacy of Leqembi (lecanemab) in AD. Lecanemab (lecanemab) has not yet proven to improve clinically relevant outcomes such as prolongation of independent functioning nor has it proven prevention of disease progression and disability, or mortality. [13]
- At this time, even with the recent phase 3 trial outcomes noted above resulting in full FDA approval, there is not enough data available to determine that the benefits of Leqembi (lecanemab) use would outweigh the risks or provide any meaningful benefit in the AD population. Leqembi (lecanemab) has uncertain benefit in the face of known harms.

Safety

- 40% of patients on the high-dose Aduhelm (aducanumab) had amyloid related imaging abnormalities (ARIA) which may be linked to brain bleeds/swelling. [1]
- 36.8% of patients treated with Kisunla (donanemab) experienced ARIA reactions compared to 14.9% of patients treated with placebo. [14]
- 21.5% of patients on Leqembi (lecanemab) had ARIA reactions compared to only 9.5% in placebo. [7]
- Labeling for monoclonal antibodies for AD carry warnings for ARIA as well as require periodic brain magnetic resonance imaging (MRI) to monitor for ARIA.

Revision History

Revision Date	Revision Summary
9/19/2024	Added newly FDA-approved Kisunla (donanemab) to policy.
12/7/2023	No criteria changes with this annual review.
9/14/2023	Updated position statement to reflect recent Leqembi (lecanemab) full FDA approval. Leqembi (lecanemab) has now received full approval based upon the results of the CLARITY AD trial. No change to criteria.
3/16/2023	New combination policy (effective 4/15/2023) Combined newly FDA-approved drug Leqembi (lecanemab) with previously medication policy: dru670 Aduhelm (aducanumab), into a new policy, monoclonal antibodies for Alzheimer's disease with no change to intent.

Drug names identified in this policy are the trademarks of their respective owners.

Medication Policy Manual | **Policy No:** dru743

Topic: Adstiladrin, nadofaragene firadenovec-vncg | **Date of Origin:** July 15, 2023

Committee Approval Date: December 7, 2023 | **Next Review Date:** 2024

Effective Date: March 1, 2024

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Adstiladrin (nadofaragene firadenovec-vncg) is instilled into the bladder (intravesical administration) as a treatment for high-risk, non-muscle invasive bladder cancer (NMIBC) that is unresponsive to Bacillus Calmette-Guérin (BCG). It is administered by a trained healthcare provider.

Policy/Criteria

Most contracts require pre-authorization approval of Adstiladrin (nadofaragene firadenovec-vncg) prior to coverage.

I. Continuation of therapy (COT): Adstiladrin (nadofaragene firadenovec-vncg) may be considered medically necessary for COT when criterion A, B, or C below is met.

A. For diagnoses NOT listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND there is documentation that the medication was covered by another health plan. Examples of documentation include the coverage approval letter from the previous health plan or paid claim.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

B. For diagnoses listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

C. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

Please note*: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Adstiladrin (nadofaragene firadenovec-vncg) may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) that criteria A through E below are met:

A. A diagnosis of **non-muscle invasive bladder cancer (NMIBC)** with carcinoma *in situ* (CIS) either with or without papillary tumors.

AND

B. The tumor is Bacillus Calmette-Guérin (BCG)-unresponsive as defined by the following (1 or 2):

1. Persistent or recurrent CIS alone after adequate BCG therapy (refer to *Appendix 1*).

OR

2. Recurrent Ta/T1 disease within 12 months of BCG therapy.

AND

C. The patient is ineligible for or has elected not to undergo cystectomy (removal of the bladder).

AND

D. Treatment with Keytruda (pembrolizumab) was not tolerated or is contraindicated.

AND

E. Adstiladrin (nadofaragene firadenovec-vncg) will be used as monotherapy.

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy services considers Adstiladrin (nadofaragene firadenovec-vncg) coverable only under the medical benefit (as a provider-administered medication).

B. When pre-authorization is approved, Adstiladrin (nadofaragene firadenovec-vncg) will be authorized in a dose of 75 ml for up to two instillations per six months.

C. Authorization **shall** be reviewed at least every six months for documented benefit. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, such as disease stability or improvement.

IV. Adstiladrin (nadofaragene firadenovec-vncg) is considered investigational when used for all other conditions.

Position Statement

Summary

- Adstiladrin (nadofaragene firadenovec-vncg) is a gene therapy designed to introduce a human interferon alfa-2b gene into bladder cancer cells. Once inserted, this gene causes the cancer cells to produce interferon which results in the cancer cells' destruction.
- Adstiladrin (nadofaragene firadenovec-vncg) is given via intravesical administration (instilled into the bladder). It is indicated as a monotherapy for the treatment of adult patients with high-risk Bacillus Calmette-Guérin (BCG)-unresponsive non-muscle invasive bladder cancer (NMIBC) with carcinoma in situ (CIS) with or without papillary tumors.
- The intent of this policy is to allow for coverage of Adstiladrin (nadofaragene firadenovec-vncg) where it has been shown to be effective, up to the dose shown to be safe and effective in clinical trials, as detailed in the coverage criteria.
- Adstiladrin (nadofaragene firadenovec-vncg) received FDA approval based on a low-quality, single-arm study in patients with high-risk BCG-unresponsive NMIBC with CIS with or without papillary tumors. The study evaluated complete response as the primary endpoint.

- Tumor response, a surrogate endpoint, has not been shown to accurately predict improvement in any clinically relevant outcome. It is not known if responses will be durable or will translate into improved overall survival (OS), the clinical outcome of interest.
- Keytruda (pembrolizumab) has also been evaluated in a similar population of patients. The study design, quality, size, and results were generally similar to the Adstiladrin (nadofaragene firadenovec-vncg) study. Keytruda (pembrolizumab) currently provides a better value over Adstiladrin (nadofaragene firadenovec-vncg).
- Adstiladrin (nadofaragene firadenovec-vncg) is relatively well tolerated. There may be instillation site discharge, bladder spasm, urination urgency, and dysuria associated with the intravesical administration. Other side effects may include fatigue, fever, and chills.
- The National Comprehensive Cancer Network (NCCN) guideline lists cystectomy (bladder removal), Keytruda (pembrolizumab), Adstiladrin (nadofaragene firadenovec-vncg), and intravesical chemotherapy as potential therapies for high-grade, BCG-unresponsive NMIBC.
- Adstiladrin (nadofaragene firadenovec-vncg) is administered via intravesical instillation by a trained healthcare provider every three months. The solution must be retained in the bladder for an hour after instillation. Because it contains a viral vector, voided urine should be disinfected with a virucidal agent for 30 minutes before disposal.
- The safety and effectiveness of Adstiladrin (nadofaragene firadenovec-vncg) have not been adequately studied in other disease settings. Therefore, use in settings other than that which is described above are considered investigational.

Regence Pharmacy Services performs independent analyses of oncology medication evidence, to establish coverability per the contracts with the health plan.

- Most contracts define coverability based on established clinical benefit in published, peer-reviewed literature, along with consideration of regulatory status.
- FDA approval does not in itself establish medical necessity, as unpublished, low-quality evidence, including exploratory analyses and unvalidated surrogate endpoints, may be used as the basis of approval. Regulatory approval may or may not reflect clinical benefit relative to standard of care and the recommendations of expert clinical advisors such as the Oncologic Drugs Advisory Committee (ODAC). FDA approvals generally do not consider cost compared to established therapies, or value to members.
- Likewise, NCCN clinical practice guidelines assignment of a recommendation (category 1, 2a, or 2b) does not necessarily establish medically necessity. NCCN recommendations are inconsistently supported by published, peer-reviewed literature and do not uniformly consider value of new therapies relative to existing potentially higher-value treatment options, considering effectiveness, safety, and cost.
- Medication coverage criteria are developed based on the 'medical necessity' assessment, as described above.

Regence Pharmacy Services analysis and coverage policy may differ from FDA labeled indication and/or NCCN clinical practice guidelines.

Background *[1,2]*

- Non-muscle invasive bladder cancer (NMIBC) may affect the bladder urothelium, or the bladder epithelium and subepithelial connective tissue immediately underlying the urothelium but has not yet invaded the muscle layer of the bladder.
- Management of NMIBC is directed at reducing disease recurrence and preventing disease from progressing to more advanced stages.
- Bacillus Calmette-Guérin (BCG) is the main therapy used in the management of NMIBC. It is an immunotherapy that works by stimulating the immune system within the bladder which leads to the destruction of cancer cells. It is typically given after transurethral resection of the bladder (TURBT).

Clinical Efficacy

- The efficacy of intravesical Adstiladrin (nadofaragene firadenovec-vncg) monotherapy was evaluated in a small (N=98), low quality, single-arm, open-label study in adults with NMIBC who had become unresponsive to treatment with BCG. Tumor response was evaluated as the primary surrogate endpoint. [1,3]
    * Seventy-six percent of the population had carcinoma *in situ* (CIS) only, 19% had CIS with Ta tumors, and 5% had CIS with T1 tumors. (Refer to *Appendix 2* for staging definitions.)
    * Fifty-three percent were refractory to BCG therapy and 47% had relapsed disease after adequate BCG therapy.
    * Patients with upper tract urothelial carcinoma (UC) or UC within the prostatic urethra were excluded from participating in the study.
    * Complete response was reported in 51% of the study population with a median duration of response of 9.7 months. There is no comparative or outcomes data. It is also not known if this therapy limits future metastasis of bladder cancer.
- Keytruda (pembrolizumab) was evaluated in a small (N=96), low quality, single-arm, open-label study (KEYNOTE-057) in a similar population. Complete response was reported in 41% of subjects with a median duration of response of 16.2 months. [4,5]

Guidelines *[2]*

- The National Comprehensive Cancer Network (NCCN) urothelial carcinoma guideline recommends the following for high-grade NMIBC that is not responsive to or recurs after BCG: Cystectomy (removal of the bladder), Keytruda (pembrolizumab), Adstiladrin (nadofaragene firadenovec-vncg), or intravesical chemotherapy.
- The guideline notes that both Keytruda (pembrolizumab) and Adstiladrin (nadofaragene firadenovec-vncg) are appropriate for CIS with or without papillary tumors.

Investigational Uses *[6]*

- There is an ongoing study of intrapleural Adstiladrin (nadofaragene firadenovec-vncg) in malignant pleural mesothelioma when given in combination with chemotherapy. There are currently no results available from this trial.
- There are no published clinical studies evaluating Adstiladrin (nadofaragene firadenovec-vncg) in conditions other than NMIBC.

Safety [7]

- Adstiladrin (nadofaragene firadenovec-vncg) was generally well tolerated in clinical trials.
- Because Adstiladrin (nadofaragene firadenovec-vncg) uses a viral vector, spills should be treated with a virucidal agent for 30 minutes. Additionally, voided urine should be disinfected for 30 minutes with an equal volume of virucidal agent before flushing of the toilet.

Dosing [7]

- Adstiladrin (nadofaragene firadenovec-vncg) is given via intravesical instillation once every three months by a trained provider (most likely a urologist). The suspension must be maintained in the bladder for one hour after instillation.
- Refer to the Adstiladrin (nadofaragene firadenovec-vncg) prescribing information for specific information regarding dose, premedication, dosing interval, and administration.

Appendix 1: Standard Definition of BCG Failure [1]
BCG-unresponsive CIS: Persistent or recurrent CIS alone or with recurrent Ta/T1 disease within 12 months of adequate BCG therapy. Adequate BCG therapy is defined as at least five of six doses of an initial induction course plus at least two or three doses of maintenance BCG, or at least five of six doses of initial induction course plus at least two of six doses of a second induction course.

Appendix 2: AJCC Staging of NMIBC [2] (refer to Figure 1 below)
T = Primary tumor
Ta = Noninvasive papillary tumor
Tis = Urothelial carcinoma *in situ* (CIS; 'flat tumor')
T1 = Tumor invades lamina propria (subepithelial connective tissue)

AJCC = American Joint Committee on Cancer

Figure 1: Bladder Cancer Classification [8]

Medication Policy Manual | **Policy No:** dru745

Topic: Lunsumio, mosunetuzumab-axgb | **Date of Origin:** July 15, 2023

Committee Approval Date: March 21, 2024 | **Next Review Date:** 2025

Effective Date: June 1, 2024

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Lunsumio (mosunetuzumab-axgb) is an intravenously administered immunotherapy used in the management of follicular lymphoma (FL). It helps T-cells recognize and destroy lymphoma cells that express the CD20 antigen.

Policy/Criteria

Most contracts require pre-authorization approval of Lunsumio (mosunetuzumab-axgb) prior to coverage.

I. Continuation of therapy (COT): Lunsumio (mosunetuzumab-axgb) may be considered medically necessary for COT when criterion A, B, or C below is met.

A. For diagnoses NOT listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND there is documentation that the medication was covered by another health plan. Examples of documentation include the coverage approval letter from the previous health plan or paid claim.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

B. For diagnoses listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

C. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

Please note*: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Lunsumio (mosunetuzumab-axgb) may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) that criteria A, B, C, and D below are met:

A. A diagnosis of **follicular lymphoma (FL)**, relapsed or refractory.

AND

B. The FL is Grade 1-2, or 3a.

AND

C. The FL relapsed after or was refractory to at least two prior systemic therapies which must have included each of the following (1 and 2):

1. An alkylating agent (see *Appendix A*).

AND

2. An anti-CD20-directed monoclonal antibody (see *Appendix B*).

AND

D. Lunsumio (mosunetuzumab-axgb) will be given as monotherapy.

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy services considers Lunsumio (mosunetuzumab-axgb) coverable only under the medical benefit (as a provider-administered medication).

B. ***Initial authorization:*** When pre-authorization is approved, Lunsumio (mosunetuzumab-axgb) will be authorized for up to eight, 21-day cycles (a quantity of ten infusions including the two initial test doses administered in the first cycle).

C. ***Additional authorization:***

1. *For complete response:* If a complete response is achieved after the initial eight cycles of Lunsumio (mosunetuzumab-axgb), no additional cycles will be authorized.

2. *For partial response or stable disease:* If a partial response or stable disease is achieved after the initial eight cycles of Lunsumio (mosunetuzumab-axgb), up to nine additional 21-day cycles may be authorized. No additional Lunsumio (mosunetuzumab-axgb) will be authorized (17 cycles in total).

IV. Lunsumio (mosunetuzumab-axgb) is considered investigational when used for Grade 3b FL, and for all other conditions.

Position Statement

Summary

- Lunsumio (mosunetuzumab-axgb) is an intravenously administered bispecific T-cell engager that binds to the CD3 receptor on T-cells and the CD20 antigen expressed on the surface of lymphoma cells thus initiating an immune response. It is indicated as a monotherapy for the treatment of adult patients with relapsed or refractory follicular lymphoma (FL) after two or more lines of systemic therapy.
- The intent of this policy is to allow for coverage of Lunsumio (mosunetuzumab-axgb) as a monotherapy for relapsed or refractory FL after at least two prior lines of systemic therapy, including an alkylating agent and an anti-CD20-directed monoclonal antibody.
- Lunsumio (mosunetuzumab-axgb) received FDA *accelerated* approval based on a single-arm study in patients with Grades 1 to 3a FL who had relapse after or failed to respond to at least two prior systemic therapies. All patients had prior therapy with an alkylating agent and an anti-CD20-directed monoclonal antibody. The study evaluated tumor response as the primary endpoint.
- Tumor response, a surrogate endpoint, has not been shown to accurately predict improvement in any clinically relevant outcome. Though tumor responses in the study were quite high, it is not yet known if they will be durable and will translate into improved overall survival, the clinical outcome of interest.
- As observed with chimeric antigen receptor T-cell therapies, the strong T-cell response initiated with Lunsumio (mosunetuzumab-axgb) can lead to serious harms including cytokine release syndrome (CRS) and neurological toxicity. It should only be administered by qualified healthcare professionals with experience and appropriate medical support to manage these toxicities.
- The National Comprehensive Cancer Network (NCCN) guideline includes Lunsumio (mosunetuzumab-axgb) among its recommendations for Grade 1-2 FL. The guideline notes that the treatment of Grade 3a FL is individualized, and that Grade 3b FL (transformed FL) should be treated as diffuse large B-cell lymphoma (DLBCL).
- Lunsumio (mosunetuzumab-axgb) is administered intravenously every 21 days over 2 hours; however, it must be initiated with small test doses administered over 4 hours to minimize the risk of severe CRS. Lunsumio (mosunetuzumab-axgb) is given for an initial 8 cycles after which response is evaluated. For patients who do not achieve a complete response with the initial 8 cycles (partial response or stable disease) an additional 9 cycles may be administered (up to 17 cycles total).
- The safety and effectiveness of Lunsumio (mosunetuzumab-axgb) have not been adequately studied in other disease settings. Therefore, use in settings other than that which is described above are considered investigational.

Regence Pharmacy Services performs independent analyses of oncology medication evidence, to establish coverability per the contracts with the health plan.

- Most contracts define coverability based on established clinical benefit in published, peer-reviewed literature, along with consideration of regulatory status.
- FDA approval does not in itself establish medical necessity, as unpublished, low-quality evidence, including exploratory analyses and unvalidated surrogate endpoints, may be used as the basis of approval. Regulatory approval may or may not reflect clinical benefit relative to standard of care and the recommendations of expert clinical advisors such as the Oncologic Drugs Advisory Committee (ODAC). FDA approvals generally do not consider cost compared to established therapies, or value to members.
- Likewise, NCCN clinical practice guidelines assignment of a recommendation (category 1, 2a, or 2b) does not necessarily establish medically necessity. NCCN recommendations are inconsistently supported by published, peer-reviewed literature and do not uniformly consider value of new therapies relative to existing potentially higher-value treatment options, considering effectiveness, safety, and cost.
- Medication coverage criteria are developed based on the 'medical necessity' assessment, as described above.

Regence Pharmacy Services analysis and coverage policy may differ from FDA labeled indication and/or NCCN clinical practice guidelines.

Background [1]

- Follicular lymphoma (FL) is the second most common non-Hodgkin lymphoma (NHL).
- The World Health Organization (WHO) classifies FL using several Grades (FL1-2, FL3A, FL3B) based on the number of centroblasts that are present to stratify patients based on expected outcomes. Grade 3B FL is also known as 'transformed FL' and is generally treated using therapy pathways for diffuse large B-cell lymphoma (DLBCL).

Clinical Efficacy [2,3]

- The efficacy of Lunsumio (mosunetuzumab-axgb) was evaluated in a single-arm, open-label study in adults with Grade 1 to 3A, relapsed or refractory FL that evaluated tumor response as the primary endpoint.
    * Patients in the study relapsed after or failed to respond to at least two prior systemic therapies (median of 3). All patients had a prior alkylating agent and a prior anti-CD20-directed monoclonal antibody. Three percent of patients had a prior chimeric antigen receptor (CAR) T-cell therapy for their FL.
    * Patients with prior allogeneic stem cell transplant (SCT) were excluded from participating in the study due to the high likelihood of severe immune reactions; however, 21% of the population had a prior autologous SCT.
    * The objective response rate (ORR) was 80% with 60% being complete responses. The median duration of response was 22.8 months.
- Though the reported ORRs were very high in this study, it is not yet known how durable the responses will be, or whether Lunsumio (mosunetuzumab-axgb) will ultimately

improve overall survival, the clinical outcome of interest. Lunsumio (mosunetuzumab-axgb) has not been directly compared with any other therapy, including CAR T-cell therapies which also are associated with high ORRs.

Guidelines [1]

- The National Comprehensive Cancer Network (NCCN) B-cell lymphomas guideline lists Lunsumio (mosunetuzumab-axgb) among potential systemic therapy options for relapsed or refractory FL (Grade 1-2) in the third- and subsequent-line treatment setting.
- The NCCN guideline notes that Grade 3B FL should be treated using the DLBCL pathway.

Investigational Uses [4]

- Lunsumio (mosunetuzumab-axgb) is only indicated as a monotherapy. Future studies are planned which combine it with other medications such as lenalidomide; however, the safety and efficacy of these combinations is not yet established.
- Based on its mechanism of action there may be interest in using Lunsumio (mosunetuzumab-axgb) in other B-cell malignancies; however, the safety and efficacy in diseases other than relapsed or refractory FL have not been established.

Safety [5]

- There is a boxed warning for Lunsumio (mosunetuzumab-axgb) indicating that it has the potential to cause severe and life-threatening cytokine release syndrome (CRS). It may also cause severe neurologic toxicity. Like CAR T-cell therapies it should only be administered by qualified healthcare professionals with experience and appropriate medical support to manage these toxicities.
- In the clinical study Lunsumio (mosunetuzumab-axgb) was also associated with cytopenias, infections, fatigue, and electrolyte disturbances.

Dosing [5]

- Lunsumio (mosunetuzumab-axgb) is given on Day 1 of each 21-day cycle. However, in the first cycle, two small test doses are given on Days 1 and 8 to make sure the patient tolerates the medication before proceeding to the full regimen.
- Lunsumio (mosunetuzumab-axgb) is given for an initial 8 cycles at which point response to therapy is assessed. If the patient has a complete response to therapy, no additional medication is given. If there is a partial response or stable disease, up to nine additional cycles of Lunsumio (mosunetuzumab-axgb) may be administered (total of 17 cycles).
- Refer to the Lunsumio (mosunetuzumab-axgb) prescribing information for the specific information regarding dose, dosing intervals, and infusion times.

Medication Policy Manual | **Policy No:** dru751

Topic: Zynyz, retifanlimab-dlwr | **Date of Origin:** July 15, 2023

Committee Approval Date: September 19, 2024 | **Next Review Date:** 2025

Effective Date: January 1, 2025

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Zynyz (retifanlimab-dlwr) is an intravenously administered immunotherapy used in the management of a specific type of skin cancer. It belongs to a class of medications called programmed death receptor-1 (PD-1) blocking antibodies.

Policy/Criteria

Most contracts require pre-authorization approval of Zynyz (retifanlimab-dlwr) prior to coverage.

I. Continuation of therapy (COT): Zynyz (retifanlimab-dlwr) may be considered medically necessary for COT when criterion A, B, or C below is met.

A. For diagnoses NOT listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND there is documentation that the medication was covered by another health plan. Examples of documentation include the coverage approval letter from the previous health plan or paid claim.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

B. For diagnoses listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

C. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

Please note*: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Zynyz (retifanlimab-dlwr) may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) that criteria A, B, C, and D below are met:

A. A diagnosis of **Merkel cell carcinoma** (MCC), recurrent locally advanced or metastatic.

AND

B. No prior systemic therapy (chemotherapy or immunotherapy) was used in the advanced disease setting.

AND

C. Zynyz (retifanlimab-dlwr) will be used as monotherapy.

AND

D. No prior programmed death receptor-1 (PD-1) blocking antibody (PD-1 inhibitor) or programmed death-ligand 1 (PD-L1) blocking antibody (PD-L1 inhibitor) therapy (see *Appendix 1*).

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy services considers Zynyz (retifanlimab-dlwr) coverable only under the medical benefit (as a provider-administered medication).

B. When pre-authorization is approved, Zynyz (retifanlimab-dlwr) will be authorized for 24 weeks in quantities up to 500 mg every four weeks, until disease progression, or for up to 24 months.

C. Reauthorization: Authorization **shall** be reviewed at least every 24 weeks for documented benefit. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met. Specifically, documentation that the medication is providing clinical benefit, including disease stability or improvement, and lack of disease progression, based on an assessment of change in tumor burden. If there is documentation of potential disease progression, a shortened authorization (up to three months) may be approved to allow time for clarification of response to Zynyz (retifanlimab-dlwr), including clinical re-evaluation of the patient and reimaging.

PLEASE NOTE: Additional doses of Zynyz (retifanlimab-dlwr) will not be authorized without a documented recent assessment by the treating provider (such as oncologist) with objective evidence of response to therapy, such as by re-imaging and use of iRECIST criteria.

IV. Zynyz (retifanlimab-dlwr) is considered investigational when used for all other conditions.

Position Statement

Summary

- Zynyz (retifanlimab-dlwr) is an intravenously administered programmed death receptor-1 (PD-1) blocking antibody. It is indicated for the treatment of adult patients with metastatic or recurrent locally advanced Merkel cell carcinoma (MCC), an aggressive form of skin cancer.
- The intent of this policy is to allow for coverage of Zynyz (retifanlimab-dlwr) as a front-line therapy for patients with MCC that is not amenable to curable surgery or radiation.
- Zynyz (retifanlimab-dlwr) received FDA *accelerated* approval based on a small, single-arm study in patients with advanced MCC who had not received prior systemic therapy for their disease. The study evaluated tumor response as the primary endpoint. Tumor response has not been shown to accurately predict improvement in any important clinical outcome such as overall survival. Additional controlled studies are needed to confirm whether Zynyz (retifanlimab-dlwr) provides a clinical benefit in patients with MCC.
- Bavencio (avelumab) and Keytruda (pembrolizumab) were also approved for use in advanced MCC via the FDA *accelerated* pathway based on a similar, low-quality evidence.
- As with other PD-1/PD-L1 inhibitors, the primary adverse effects of concern with Zynyz (retifanlimab-dlwr) are immune-mediated toxicities (e.g., endocrinopathies, colitis, hepatitis).
- The National Comprehensive Cancer Network (NCCN) guideline includes Zynyz (retifanlimab-dlwr) among its recommendations for front-line treatment of advanced MCC that is not amenable to curable surgery or curable radiotherapy.
- Zynyz (retifanlimab-dlwr) was studied and FDA-approved in a dose of 500 mg given intravenously every four weeks until disease progression, or for up to 24 months.
- The safety and effectiveness of Zynyz (retifanlimab-dlwr) have not been adequately studied in other disease settings. Therefore, use in settings other than that which is described above are considered investigational.
- *Reauthorization Criteria*: When coverage criteria are met, Zynyz (retifanlimab-dlwr) is authorized for six months (24 weeks) of therapy, after which time documentation must be provided to establish that the medication is effective. Specifically, there must be documentation of clinical benefit, including disease stability or improvement and there is a lack of disease progression, based on an assessment of change in tumor burden.
  * The standard of care for evaluation of response to cancer immunotherapy, such as Zynyz (retifanlimab-dlwr), is use of the iRECIST criteria for assessment of tumor burden. [1]
  * The iRECIST criteria include use of quantitative and qualitative criteria for assessment of change in tumor burden for target lesions and non-target lesions. [2]
    - Quantitative measurements for target lesions (tumor size and % change)
    - Qualitative evaluation for non-target lesions (present/disappeared/ unequivocal progression)
  * Documentation of benefit must include an assessment of the most recent imaging ("restaging scans") by the treating oncologist. Given the complexity of the evaluation, including use of the iRECIST criteria, Zynyz (retifanlimab-dlwr) will

not be reauthorized without an assessment of response to therapy, such a partial response (iPR), complete response (iCR), or stable disease (iSD).

* Use of immunotherapy may result in pseudoprogression, due to immune and T-cell activation, which can appear similar to tumor flare. If there is documentation of potential disease progression ["unconfirmed progressive disease (iUPD)"], a shortened authorization (up to three months) may be approved to allow time for clarification of response to Zynyz (retifanlimab-dlwr), including clinical re-evaluation of the patient and reimaging. Guidelines recommend reimaging for iUPD after 4-8 weeks.
* If a patient has confirmed, unequivocal new lesions (progression of disease, iPD), additional Zynyz (retifanlimab-dlwr) is not coverable. If a new lesion is equivocal, iUPD reassessment by the treating oncologist with repeat imaging would apply (as noted above).

Regence Pharmacy Services performs independent analyses of oncology medication evidence, to establish coverability per the contracts with the health plan.

- Most contracts define coverability based on established clinical benefit in published, peer-reviewed literature, along with consideration of regulatory status.
- FDA approval does not in itself establish medical necessity, as unpublished, low-quality evidence, including exploratory analyses and unvalidated surrogate endpoints, may be used as the basis of approval. Regulatory approval may or may not reflect clinical benefit relative to standard of care and the recommendations of expert clinical advisors such as the Oncologic Drugs Advisory Committee (ODAC). FDA approvals generally do not consider cost compared to established therapies, or value to members.
- Likewise, NCCN clinical practice guidelines assignment of a recommendation (category 1, 2a, or 2b) does not necessarily establish medically necessity. NCCN recommendations are inconsistently supported by published, peer-reviewed literature and do not uniformly consider value of new therapies relative to existing potentially higher-value treatment options, considering effectiveness, safety, and cost.
- Medication coverage criteria are developed based on the 'medical necessity' assessment, as described above.

Regence Pharmacy Services analysis and coverage policy may differ from FDA labeled indication and/or NCCN clinical practice guidelines.

Background [3 4]

- Merkel cell carcinoma (MCC) is a rare, aggressive neuroendocrine carcinoma of the skin. It predominantly affects older adults (mean age of 75 years) with light skin types.
- Localized disease can generally be cured with surgical excision and radiotherapy. For patients with locally advanced or metastatic disease that is not amenable to curative surgery or radiation, systemic therapy may be used.

Clinical Efficacy [5-7]

- The efficacy of Zynyz (retifanlimab-dlwr) was evaluated in a single-arm, open-label study in adults with recurrent locally advanced or metastatic MCC. The study evaluated tumor response as a primary surrogate endpoint.
    * The MCC was not amenable to curable surgical resection or radiotherapy.
    * No prior systemic therapies, including prior programmed death receptor-1 (PD-1) blocking antibodies, were allowed in the study population.
    * Zynyz (retifanlimab-dlwr) was used as monotherapy.
    * The reported objective response rate (ORR) was 52% with 18% complete responses.
    * The duration of response was 6 months or longer in 76% of patients and 12 months or longer in 62% of patients.
- The evidence for Bavencio (avelumab) and Keytruda (pembrolizumab) in advanced MCC is also based on small, single-arm studies that evaluated ORR as a surrogate endpoint. There is no outcomes evidence for any of the PD-1 inhibitors approved for use in MCC.

Guidelines [4]

- The National Comprehensive Cancer Network (NCCN) Merkel cell carcinoma guideline lists Zynyz (retifanlimab-dlwr) among potential systemic therapeutic options that can be used for locally advanced and metastatic MCC. Bavencio (avelumab) and Keytruda (pembrolizumab) are also potential treatment options.

Investigational Uses [8]

- Zynyz (retifanlimab-dlwr) is currently being studied in several other types of cancer including anal carcinoma and gastroesophageal adenocarcinoma. However, to date, Zynyz (retifanlimab-dlwr) has not been shown to be an effective therapy for any other type of cancer.

Safety [5]

- The primary adverse effects (AEs) of interest for Zynyz (retifanlimab-dlwr) include immune-mediated reactions and infusion reactions. Immune-related AEs can affect any organ system or tissue (e.g., colitis, endocrinopathies, hepatitis, nephritis with renal dysfunction, dermatologic reactions, pneumonitis).
- Overall, the safety of Zynyz (retifanlimab-dlwr) is similar to other PD-1 and PD-L1 inhibitors.

Dosing [5]

- Zynyz (retifanlimab-dlwr) is approved at a dose of 500 mg administered intravenously (IV) every 28 days.
- In the clinical trial, Zynyz (retifanlimab-dlwr) was given until disease progression or for up to a maximum of 24 months.

Revision History

Revision Date	Revision Summary
9/19/2024	• **Effective 1/1/2025:** Changed reauthorization from 'may' to 'shall.' Operationally, all approvals will be for 24 weeks (6 months). Ongoing therapy (beyond 24 weeks) will be subject to reauthorization review every 24 weeks, for documentation of disease stability or improvement and lack of disease progression.
12/7/2023	No criteria changes with this annual review.
6/15/2023	New policy (effective 7/15/2023) limits coverage of Zynyz (retifanlimab-dlwr) to patients with locally advanced or metastatic Merkel cell carcinoma (MCC) as a front-line therapy (no prior chemotherapy or immunotherapy).

Drug names identified in this policy are the trademarks of their respective owner.

- Rebif, interferon beta-1a
- Tascenso ODT, fingolimod
- Tecfidera, dimethyl fumarate
- Vumerity, diroximel fumarate
- Zeposia, ozanimod

Committee Approval Date: October 10, 2024

Next Review Date: 2024

Effective Date: December 1, 2024

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of medication policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Medications in this policy are used primarily in the treatment of multiple sclerosis (MS). They help to slow the progression of disability and reduce the number of clinical relapses associated with this condition. Zeposia (ozanimod) can also be used for ulcerative colitis, and natalizumab (Tysabri/Tyruko) for Crohn's disease.

PLEASE NOTE:

This policy does NOT apply to Campath (alemtuzumab), which is used primarily in the treatment of cancer (leukemia).

Policy/Criteria

Most contracts require pre-authorization approval of medications for multiple sclerosis (MS) prior to coverage.

I. Continuation of therapy (COT): Medications for MS may be considered medically necessary for COT when criterion A **and** B below are met.

A. One of the following (1, 2, or 3) are met:

1. For diagnoses NOT listed in the coverage criteria below, full policy criteria must be met for coverage.

OR

2. For diagnoses listed in the coverage criteria below, criteria a, b, and c must be met:

a. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

b. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

AND

c. For **use of branded Aubagio, Copaxone, Gilenya, Tascenso ODT, or Tecfidera:** There is clinical documentation (including, but not limited to chart notes) of an intolerance or contraindication to an inactive ingredient in the generic equivalent medication (teriflunomide, fingolimod, glatiramer acetate/Glatopa, or dimethyl fumarate).

OR

3. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission. **For use of branded Aubagio, Copaxone, Gilenya, Tascenso ODT, or Tecfidera:** There is clinical documentation (including, but not limited to chart notes) of an intolerance or contraindication to an inactive ingredient in the generic equivalent medication (teriflunomide, glatiramer acetate/Glatopa, fingolimod or dimethyl fumarate).

AND

B. For provider-administered medications **Briumvi (ublituximab-xiiy) and Ocrevus (ocrelizumab) only:** Site of care administration requirements are met [refer to Medication Policy Manual, Site of Care Review, dru408]. PLEASE NOTE: Not all provider-administered medications in this policy are part of the site of care program. Verify with the posted site of care review policy, dru408.

Please note*: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Medications for MS may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) that one of the following criterion A through E below are met.

A. A diagnosis of a **relapsing form of MS** (see *Appendix B*) that has been established by a specialist in neurology or MS and the following criteria 1 through 4 below are met.

1. Treatment with **at least one** low-cost disease modifying therapy (DMT) for MS (as listed in Table 1) was ineffective, contraindicated or not tolerated. Ineffectiveness is defined as meeting **at least one** of the following criteria during treatment with one of these medications:

a. The patient continues to have clinical relapses (at least one relapse within the past 12 months).

b. The patient continues to have CNS lesion progression as measured by MRI.

c. The patient continues to have worsening disability. Examples of worsening disability include, but are not limited to, decreased mobility, decreased ability to perform activities of daily living due to **disease progression, or an increase in EDSS score**.

Table 1. Low-Cost Disease Modifying Therapies (DMTs) for MS*

Teriflunomide (generic for Aubagio)
Dimethyl fumarate (generic for Tecfidera)
Fingolimod (generic for Gilenya)
Glatiramer acetate (generic for Copaxone) or Glatopa

* DMTs in this table are available without a prior authorization (PA).

AND

2. ***For non-preferred brand medications for MS only:*** Treatment with **at least one** preferred higher-cost DMT for MS (as listed in Table 2 below) has been ineffective, contraindicated, or not tolerated. Ineffectiveness is defined as meeting **at least one** of the following criteria during treatment with one of these medications:

a. The patient continues to have clinical relapses (at least one relapse within the past 12 months).

b. The patient continues to have CNS lesion progression as measured by MRI.

c. The patient continues to have worsening disability. Examples of worsening disability include, but are not limited to, decreased mobility, decreased ability to perform activities of daily living due to **disease progression, or an increase in EDSS score.**

Table 2. Preferred Higher-Cost Disease Modifying Therapies (DMTs) for MS

Briumvi (ublituximab-xiiy)
Interferon beta-1a (Avonex, Rebif)
Kesimpta (ofatumumab)
Ocrevus (ocrelizumab)
Rituximab
Natalizumab (Tysabri/Tyruko)
Zeposia (ozanimod)

For Bafiertam, Extavia, Mayzent, Ponvory, and Vumerity only: There are adjudicated and paid claims in the member's prescription history of the step therapy medications listed in *Appendix C*.

AND

3. ***For use of branded Aubagio (teriflunomide), Copaxone (glatiramer acetate), Gilenya or Tascenso ODT (fingolimod), and Tecfidera (dimethyl fumarate) only*:** There is clinical documentation (including, but not limited to chart notes) of an intolerance or contraindication to an inactive ingredient in the generic equivalent medication (teriflunomide, fingolimod, glatiramer acetate/Glatopa, or dimethyl fumarate).

AND

4. ***Briumvi (ublituximab-xiiy) and Ocrevus (ocrelizumab) only*:** Site of care administration requirements are met [refer to Medication Policy Manual, Site of Care Review, dru408].

OR

B. ***Natalizumab (Tysabri/Tyruko), Ocrevus (ocrelizumab), Briumvi (ublituximab), or Kesimpta (ofatumumab) only:*** A diagnosis of a **particularly aggressive relapsing form of MS** when established by a specialist in neurology or MS when criteria **1 AND 2** below are met.

1. The patient has had a particularly aggressive initial disease course, as defined by meeting at least one of the following:

a. An EDSS score of ≥ 4 within 5 years of onset.

OR

b. Multiple (two or more) relapses with incomplete resolution in the past year.

OR

c. At least two MRI studies showing new or enlarging T2 lesions or gadolinium-enhancing lesions despite treatment over 6 months.

OR

d. The presence of spinal or brainstem lesions on MRI.

AND

2. ***For Briumvi (ublituximab) and Ocrevus (ocrelizumab) only:*** The Site of Care administration requirements are met [refer to Medication Policy Manual, Site of Care Review, dru408].

OR

C. ***Ocrevus (ocrelizumab) only:*** A diagnosis of a **primary progressive MS** when criteria 1 and 2 below are met.

1. A diagnosis of **primary progressive MS** (see *Appendix B*) when established by a specialist in neurology or MS.

AND

2. The Site of Care administration requirements are met [refer to Medication Policy Manual, Site of Care Review, dru408].

OR

D. ***Zeposia (ozanimod) only:*** A diagnosis of **ulcerative colitis** (UC) when following criteria 1 through 3 below are met.

1. A diagnosis of **ulcerative colitis** (UC) when established by or in consultation with a specialist in gastroenterology.

AND

2. Severity Criteria: At least one of the following criterion a, b, or c below, are met.

a. Treatment with an adequate course of corticosteroids (for example, prednisone 40 to 60 mg/day, oral budesonide 9 mg/day, or budesonide rectal for 7 to 14 days) was ineffective or is contraindicated.

OR

b. The patient has been unable to taper an adequate course of corticosteroids without experiencing worsening of disease.

OR

c. The patient is experiencing breakthrough disease (for example, active disease flares) while stabilized on a conventional immunomodulators, for at least two months. Conventional immunomodulators for UC include azathioprine, balsalazide, cyclosporine, mercaptopurine, mesalamine, and sulfasalazine.

AND

3. Treatment with two of the following preferred products listed in Table 3 below was not effective after at least a 12-week treatment course unless not tolerated or contraindicated:

Table 3. Ulcerative Colitis (UC) – Preferred Products

Adalimumab (Humira, or biosimilars)

Skyrizi (risankizumab)
Stelara (ustekinumab)
Tremfya (guselkumab)
Tofacitinib (Xeljanz/Xeljanz XR)
Rinvoq (upadacitinib)

OR

E. ***Natalizumab (Tysabri/Tyruko) only:*** A diagnosis of **Crohn's disease** when following criteria 1 through 3 are met.

1. Natalizumab (Tysabri/Tyruko) is prescribed by, or in consultation with, a specialist in gastroenterology for the indication of Crohn's disease.

AND

2. Adalimumab (Humira or biosimilars) is not effective after at least an initial 3-dose induction period, except if not tolerated due to documented clinical side effects.

AND

3. Infliximab is not effective after at least an initial induction period (5 mg/kg on weeks 0, 2 and 6), except if not tolerated due to documented clinical side effects.

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers oral and subcutaneous (SC) self-injectable medications [as listed in Table 4] for multiple sclerosis coverable only under the pharmacy benefit (as self-administered medications).

B. Regence Pharmacy Services considers intravenous (IV) infused medications [as listed in Table 4] for multiple sclerosis coverable only under the medical benefit (as a provider-administered medication).

C. When pre-authorization is approved, each drug will be covered in the following quantities and for the following authorization periods outlined in Table 4 below:

Table 4: Medications for MS Quantity Limits, Authorization Period, and Route of Administration

Product	Quantity Limit and Authorization Period	Route/Benefit
Aubagio (teriflunomide)	- Up to 28 tablets per 28 days. - Authorization **shall** be reviewed at least annually. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that all of the following criteria (a, b, and c) below are met: **a.** Current medical necessity criteria are met. **AND** **b.** For brand Aubagio (teriflunomide): There is an intolerance or	Oral; pharmacy benefit

Product	Quantity Limit and Authorization Period	Route/Benefit
	contraindication to an <u>inactive</u> ingredient in generic teriflunomide. **AND** **c.** Ongoing clinical benefit, such as disease stability or improvement.	
Avonex (interferon beta-1a)	- Up to 4 syringes per 28 days. - Authorization may be reviewed at least annually. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, such as disease stability or improvement.	SC; pharmacy benefit
Bafiertam (monomethyl fumarate)	- Up to 120 capsules per 30 days. - Authorization may be reviewed at least annually. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, such as disease stability or improvement.	Oral; pharmacy benefit
Betaseron (interferon beta-1b)	- Up to 15 syringes every 30 days. - Authorization may be reviewed at least annually. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, such as disease stability or improvement.	SC; pharmacy benefit
Briumvi (ublituximab-xiiy)	- <u>Initial authorization (first 12 months)</u>: Up to 1500 mg (10 vials) for the first 12 months (one IV infusion of 150 mg on day 1 followed by a second infusion of 450 mg on day 15 with subsequent doses of 450 mg infusions given at 24 weeks intervals from the first infusion). - <u>Additional 12-month authorization:</u> Up to quantities of 900 mg (6 vials) every 12 months. (450 mg infusions every 24 weeks). - Authorization may be reviewed at least annually. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, such as disease stability or improvement.	IV; medical benefit (**SOC program applies)**
Copaxone, (glatiramer acetate)	- <u>Copaxone 20 mg/mL</u>: Up to 30 syringes per 30 days. - <u>Copaxone 40 mg/mL</u>: Up to 12 syringes per 28 days. - Authorization **shall** be reviewed at least annually. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that all of the following (a, b, and c) are met: **a.** Current medical necessity criteria are met. **AND** **b.** For brand Copaxone: There is an intolerance or contraindication to an <u>inactive</u> ingredient in generic glatiramer acetate. **AND** **c.** Ongoing clinical benefit, such as disease stability or improvement	SC; pharmacy benefit

Product	Quantity Limit and Authorization Period	Route/Benefit
Extavia (interferon beta-1b)	- Up to 15 pre-filled syringes per 28 days. - Authorization may be reviewed at least annually. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, such as disease stability or improvement.	SC; pharmacy benefit
Fingolimod (Gilenya or Tascenso ODT)	- Up to 30 capsules or oral disintegrating tablets per 30 days. - Authorization **shall** be reviewed at least annually. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that all of the following (a, b, and c) are met: **a.** Current medical necessity criteria are met. **AND** **b.** For brand fingolimod (Gilenya or Tascenso ODT): There is an intolerance or contraindication to an inactive ingredient in generic fingolimod. **AND** **c.** Ongoing clinical benefit, such as disease stability or improvement.	Oral; pharmacy benefit
Kesimpta (ofatumumab)	- Initial year: Up to 15 pen injectors per year. - Subsequent years: Up to 13 pen injectors per year. - Authorization may be reviewed at least annually. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, such as disease stability or improvement	SC; pharmacy benefit
Lemtrada (alemtuzumab)	- Initial authorization (first treatment course; 5 doses): Up to 12 mg/day IV infusion on five consecutive days in a 12-month period. - Second authorization (second treatment course; 3 doses): Following the first treatment course (of five doses), a second treatment course of up to 12 mg/day on three consecutive days in a 12-month period. - Additional Authorizations [additional treatment course(s); 3 doses]: Following the second treatment course (of three doses), subsequent treatment courses of 12 mg/day on three consecutive days may be administered in a 12-month period. - All subsequent courses must be administered at least 12 months after the last dose of the prior treatment course. - Authorization **shall** be reviewed after each treatment course. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, such as disease stability or improvement.	IV; medical benefit
Mavenclad (cladribine)	- Up to 20 tablets per year for up to a maximum of 2 years only. - Use of Mavenclad (cladribine) beyond the 2-year course is considered investigational.	Oral; pharmacy benefit

Product	Quantity Limit and Authorization Period	Route/Benefit
	- Authorization **shall** be reviewed at least annually. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, such as disease stability or improvement	
Mayzent (siponimod)	- For initial 5-day dose titration: Up to one Starter pack. - Maintenance dosing: Up to 120 of the 0.25 mg tablets, or 30 of the 1mg or 2 mg tablets per 30 days, based on a recommended maintenance dose of 1 to 2 mg per day depending on CYP2C9 genotype. - Authorization may be reviewed at least annually. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, such as disease stability or improvement.	Oral; pharmacy benefit
Ocrevus (ocrelizumab)	- Initial authorization (first 12 months): Up to 1200 mg (4 vials) for the first 12 months (one IV infusion of 300 mg on day 1 followed by a second 300 mg infusion on day 15 with subsequent doses of 600 mg infusions every 6 months thereafter). - Additional 12-month authorization: Up to quantities of 1200 mg (4 vials) every 12 months (600 mg infusions (2 vials) every 6 months). - Authorization may be reviewed at least annually. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, such as disease stability or improvement	IV; medical benefit (**SOC program applies)**
Plegridy (peginterferon beta-1a)	- Up to 2 syringes per 28 days. - Authorization may be reviewed at least annually. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, such as disease stability or improvement	SC; pharmacy benefit
Ponvory (ponesimod)	- For initial 14-day dose titration: Up to one Starter pack. - Maintenance dosing: Up to thirty 20 mg tablets per 30 days, based on a recommended maintenance dose of 20 mg once daily. - Authorization may be reviewed at least annually. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, such as disease stability or improvement.	Oral; pharmacy benefit
Rebif (interferon beta-1a)	- Up to 12 syringes per 28 days. - Authorization may be reviewed at least annually. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, such as disease stability or improvement	SC; pharmacy benefit

Product	Quantity Limit and Authorization Period	Route/Benefit
Tecfidera (dimethyl fumarate)	- Up to 60 capsules per 30 days. - Authorization **shall** be reviewed at least annually. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that all of the following (a, b, and c) are met: **a.** Current medical necessity criteria are met. **AND** **b.** For brand Tecfidera (dimethyl fumarate): There is an intolerance or contraindication to an inactive ingredient in generic dimethyl fumarate. **AND** **c.** Ongoing clinical benefit, such as disease stability or improvement.	Oral; pharmacy benefit
Natalizumab (Tysabri/Tyruko)	- Up to one 300-mg IV infusion every 4 weeks. - **Multiple sclerosis:** Authorization may be reviewed at least annually. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, such as disease stability or improvement. - **Crohn's disease:** Initial authorization **shall** be reviewed at 12 weeks. Continued authorization shall be reviewed at least every six months. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, such as disease stability or improvement.	IV; medical benefit
Vumerity (diroximel fumarate)	- Up to 120 capsules per 30 days. - Authorization may be reviewed at least annually. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, such as disease stability or improvement.	Oral; pharmacy benefit
Zeposia (ozanimod)	- Up to 30 capsules per 30 days. - Authorization may be reviewed at least annually. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, such as disease stability or improvement.	Oral; pharmacy benefit

IV. Medications for MS are considered not medically necessary when used in the follow settings:

A. ***For natalizumab (Tysabri/Tyruko) only*** when used in the following settings:

1. For the treatment of Crohn's disease when used concomitantly with any of the following:

a. Adalimumab.
b. Infliximab.
c. Cimzia (certolizumab pegol).

2. For the treatment of ulcerative colitis.

V. Medications for MS are considered investigational when used for all other conditions, including but not limited to:

A. Concomitantly with any other DMTs for MS (see *Appendix A*).

B. For non-relapsing forms of MS, such as SPMS without active relapses OR primary progressive MS (PPMS), unless specifically noted in the coverage criteria above, such as for Ocrevus, ocrelizumab.

C. Any cancer indication, including, but not limited to B-cell chronic lymphocytic leukemia.

D. **For Lemtrada (alemtuzumab):** Post-transplant antibody induction therapy.

E. **For Ocrevus (ocrelizumab):** Neuromyelitis Optica Spectrum Disorders (NMOSD).

F. **For Ocrevus (ocrelizumab) and natalizumab (Tysabri/Tyruko):** Rheumatoid arthritis.

Position Statement

Summary

- There are many medications for multiple sclerosis (MS) treatment. Medications for MS have different routes of administration as well as mechanisms of action. These disease modifying therapies (DMTs) help to decrease the number of clinical exacerbations associated with this condition and slow the progression of disability.
- Zeposia (ozanimod) has been proven to be effective in ulcerative colitis (UC), while natalizumab (Tysabri/Tyruko) has proven efficacy in Crohn's disease, with both having FDA approvals in these respective diseases.
- The intent of this policy is to allow for coverage of medications for MS in the settings where they have been proven safe and effective, when lower cost preferred options (as listed in the coverage criteria) are ineffective or not a treatment option (as described in coverage criteria).
- MS consists of two main clinical courses of disease, relapsing or primary progressive (see *Appendix B)* [1 2]:
    * Relapsing forms of MS include clinically isolated syndrome (CIS), relapsing-remitting MS (RRMS), and active secondary progressive MS (SPMS). CIS is the first clinical presentation that shows characteristics of inflammatory demyelination that could be MS, but not a definitive diagnosis of MS. All of the medications for MS are FDA approved for use in relapsing forms of MS. Rituximab may also be used off label for the treatment of relapsing forms of MS.
    * Primary progressive MS (PPMS) is the defined as progression of disability without relapses. Only Ocrevus (ocrelizumab) is FDA approved for use in PPMS.
- American Academy of Neurology (AAN) guidelines state[2]:
    * DMTs should be offered to patients with relapsing forms of MS.
    * Guidelines state the choice of initial DMT should be individualized to consider of safety, route of administration, lifestyle, cost, efficacy, adverse effects (AEs), and tolerability.
    * Disease activity, adherence, AE profiles, and mechanism of action should be considered when switching DMTs.
    * Natalizumab (Tysabri/Tyruko), fingolimod (generic, Gilenya, and Tascenso ODT), or Lemtrada (alemtuzumab) should be used in patients with highly active disease based on improved efficacy in this subgroup.
- Individual responses and tolerability of DMTs are unpredictable and may vary between patients. If one DMT provides an inadequate response, another DMT may be effective.
- There is limited evidence of increased efficacy or safety between the majority of medications for MS in reducing signs and symptoms of MS or slowing progression of disease due to a lack of head-to-head trials; therefore, the medication with lowest cost often provides the best value for members.
    * Fingolimod (generic, Gilenya, and Tascenso ODT), Zeposia (ozanimod), and Mayzent (siponimod) belong to a class of medications called sphingosine 1-phosphate (S1P) receptor modulators. Of the three, fingolimod (generic) provides the best value.
    * Dimethyl fumarate (generic, Tecfidera), Vumerity (diroximel fumarate), and Bafiertam (monomethyl fumarate) belong to a class of medications called

fumarates, of which dimethyl fumarate (generic) provides the best value.

* Currently, three glatiramer-containing products are available: Copaxone, generic glatiramer, and Glatopa. Generic glatiramer and Glatopa provide the best value to members of this health plan.

- Lemtrada (alemtuzumab) is not recommended as a first- or second-line option due to serious safety concerns[3].
  * Lemtrada (alemtuzumab) has boxed warnings describing an increased risk of autoimmunity, infusion reactions, and malignancies with its use. The FDA labeling states that it should generally be reserved for patients who have had an inadequate response to two or more DMTs for MS.
  * Because of these safety concerns, distribution of Lemtrada (alemtuzumab) is restricted with a REMS program for prescribers, health care facilities, and pharmacies.
- The safety and effectiveness of combination use of disease modifying therapies for MS medications has not been established.
- Medications for MS may be covered at the doses proven to be safe and effective in the clinical trials (as outlined in Table 4 of the coverage criteria above). The safety and effectiveness of higher doses has not been established.
- Use of medications for MS in clinical settings other than described in the coverage criteria is considered investigational.

Clinical Efficacy:

RELAPSING REMITTING MS

Lemtrada (alemtuzumab) for Relapsing Remitting MS (RRMS)[4-6]

- Two, randomized, open-label, rater-blinded, 2-year, studies compared Lemtrada (alemtuzumab) with interferon beta-1a in patients with relapsing-remitting multiple sclerosis (RRMS).
  * The CARE-MS I trial included previously untreated patients while CARE-MS II trial included patients who had at least one relapse while on an interferon beta product or glatiramer acetate.
  * In each trial, there was a statistically significantly lower annualized relapse rate for patients treated with Lemtrada (alemtuzumab) (22%-35%) compared to interferon beta-1a (40%-51%).
  * Treatment-experienced patients treated with Lemtrada (alemtuzumab) experienced a statistically significant reduction in the rate of disease progression compared to those treated with interferon beta 1a (13% vs 20%, p=0.008). The difference in rates of disease progression was not statistically significant among treatment-naïve patients.
- Extension studies for Lemtrada (alemtuzumab) suggest that efficacy is maintained through at least year five but certain patients with disease activity may require additional courses. Among patients who completed CARE-MS II, 58.0% received just no additional courses of alemtuzumab while 30.1% received one additional course at some point in the five-year follow-up period. The most common reason for additional courses was relapse.

Interferon-beta for RRMS

- There are several randomized, controlled trials comparing the efficacy of the different

interferon beta products in the treatment of relapsing-remitting multiple sclerosis, with all of them favoring interferon-beta treatment over placebo for reducing relapse rate.

Glatiramer acetate (generic, Copaxone, and Glatopa) for RRMS[7]

- The efficacy of glatiramer acetate was evaluated in five studies in patients with relapsing-remitting MS. The first four studies compared daily glatiramer to placebo and the other studies compared three times weekly glatiramer to placebo.
- Results demonstrated that glatiramer acetate was superior to placebo in reducing the number of relapses.

Teriflunomide (generic, Aubagio) for RRMS[8]

- The efficacy of teriflunomide was evaluated in three studies in patients with relapsing-remitting MS. These studies compared daily teriflunomide (7 mg or 14 mg) to placebo.
- Results demonstrated that teriflunomide was superior to placebo in reduction of annualized relapse rate and relative risk of disease progression at 108 weeks.

Fingolimod (generic, Gilenya, and Tascenso ODT) for RRMS[9 10]

- The efficacy of fingolimod was evaluated in three phase 3 studies in patients with relapsing-remitting MS. The first study compared fingolimod to placebo and the two other studies compared fingolimod to interferon beta-1a.
- Results demonstrated that fingolimod was superior to placebo and interferon beta-1a in reducing annualized relapse rates.

Mayzent (siponimod) for RRMS[11]

- Siponimod was studied in one phase 3 study in patients with SPMS with or without ongoing relapses.
    * Mayzent (siponimod) met its primary endpoint of slowing the time to 3-month confirmed disability progression (CDP). However, the key secondary endpoint of time to 20% worsening in the timed 25-foot walk test (T25FW) was not met.
    * In subgroup analyses, it was observed that efficacy was primarily in patients who were younger, had active relapses, and had active MRI lesions. This population likely had a relapsing form of MS rather than non-active SPMS, thus efficacy in non-active SPMS is unclear and further studies are needed.

Zeposia (ozanimod) for RRMS[12 13]

- Zeposia (ozanimod) was evaluated in two phase 3 studies in patients with relapsing forms of MS. Both studies compared Zeposia (ozanimod) to interferon beta-1a.
- Results showed that Zeposia (ozanimod) was superior to interferon beta-1a in reducing annualized relapse rates. However, pooled results from both studies showed that there was no improvement in disability progression over interferon beta-1a.

Ponvory (ponesimod) for RRMS[14]

- The efficacy of ponesimod was evaluated in one phase 3 study in patients with relapsing-remitting MS. The study compared daily ponesimod (Ponvory) to Aubagio (teriflunomide) for 108 weeks.
- Results demonstrated that ponesimod (Ponvory) was superior to teriflunomide (Aubagio) in reducing annualized relapse rates.

Mavenclad (cladribine) for RRMS[15]

- The efficacy of Mavenclad (cladribine) was evaluated in one phase 3 study in patients with relapsing-remitting MS. The study compared Mavenclad (cladribine) to placebo for 96 weeks.

- Results demonstrated that Mavenclad (cladribine) was superior to placebo in reducing annualized relapse rates.

Dimethyl fumarate (generic, Tecfidera), diroximel fumarate (Vumerity), and Bafiertam (monomethyl fumarate) for RRMS[16-18]

- The efficacy of dimethyl fumarate was evaluated in two phase 3 studies in patients with relapsing-remitting MS. Both studies compared dimethyl fumarate to placebo.
- Results demonstrated that dimethyl fumarate was superior to placebo in reducing annualized relapse rates.
- The efficacy of Vumerity (diroximel fumarate) was based on bioavailability studies in patients with RRMS and healthy patients comparing oral dimethyl fumarate to oral diroximel fumarate capsules.
- The efficacy of Bafiertam (monomethyl fumarate) was based on bioavailability studies in healthy patients, The studies demonstrated the bioequivalence of Bafiertam (monomethyl fumarate) to oral Tecfidera (dimethyl fumarate).

Kesimpta (ofatumumab) for RRMS[19]

- The efficacy of Kesimpta (ofatumumab) was evaluated in two phase 3 studies in patients with relapsing-remitting MS. The study compared Kesimpta (ofatumumab) to Aubagio (teriflunomide).
- Results demonstrated that Kesimpta (ofatumumab) was superior to teriflunomide (Aubagio) in reducing annualized relapse rates.

Briumvi (ublituximab-xiiy) for RRMS[20-22]

- Briumvi (ublituximab-xiiy) has been shown to significantly reduce annual relapse rate (ARR) and slow worsening of disease based on MRI outcomes in patients with relapsing forms of MS when compared to Aubagio (teriflunomide).
    * Two identical, phase 3, randomized, double-blind, double dummy, active control 96-week studies (ULTIMATE I and ULTIMATE II, total N=1089), evaluated the effects of Briumvi (ublituximab-xiiy) compared to Aubagio (teriflunomide) in patients with relapsing forms of MS. Briumvi (ublituximab-xiiy) was significantly superior to teriflunomide in reducing annualized relapse (relative risk reduction of 59% in ULTIMATE I and 49% in ULTIMATE II). On MRI outcomes, the patients in the Briumvi (ublituximab-xiiy) groups had significantly fewer new and/or enlarging T2 lesions, and less T1 lesions relative to the Aubagio (teriflunomide) groups.

Ocrevus (ocrelizumab) for RRMS[23 24]

- Ocrevus (ocrelizumab) has been shown to reduce elapse rate, slows disability progression, and slows worsening of disease based on MRI outcomes in patients with relapsing forms of MS.
    * Two identical, 96-week studies (OPERA I and OPERA II) evaluated the effects of Ocrevus (ocrelizumab) compared to Rebif (interferon beta-1a) in patients with relapsing forms of MS. Ocrevus (ocrelizumab) was superior to interferon beta-1a in reducing annualized relapse and in slowing confirmed disability progression. On MRI, the patients in the Ocrevus (ocrelizumab) group had fewer new and/or enlarging T2 lesions, less T1 lesions, and a reduced rate of total brain volume loss relative to the Rebif (interferon beta-1a) group.

Natalizumab(Tysabri/Tyruko) for RRMS[2 25 26]

- The efficacy of natalizumab (Tysabri/Tyruko) was evaluated in two phase 3 studies in patients with relapsing-remitting MS. The two studies compared natalizumab to placebo.
- Results demonstrated that natalizumab was superior to placebo in reducing annualized relapse rates and lowering the rate of disability.
- AAN guidelines state that natalizumab (Tysabri/Tyruko), fingolimod (generic, Gilenya, Tascenso ODT), or Lemtrada (alemtuzumab) should be used in patients with highly active disease.
- Although no specific guidelines exist, proposed definitions of aggressive or highly active have been developed. It may be defined as at least one of the following: an EDSS score of 4 within 5 years of onset, multiple (two or more) relapses with incomplete resolution over a one-year period, more than two MRI studies showing new or enlarging T2 lesions or gadolinium-enhancing lesions despite treatment, no response to therapy with one or more disease-modifying therapies for up to 1 year, or the presence of spinal lesions. Monitoring for treatment efficacy via MRI is recommended every 6 months.
- Natalizumab (Tysabri/Tyruko) in combination with any other disease-modifying multiple sclerosis treatment medication has not been shown to be more effective than natalizumab (Tysabri/Tyruko) alone in the treatment of multiple sclerosis and may be contraindicated due to safety concerns.

PRIMARY PROGRESSIVE MS

Ocrevus (ocrelizumab) for Primary Progressive MS (PPMS)[24 27]

- Ocrevus (ocrelizumab) has been shown to slow disability progression and slow the worsening of MRI outcomes in patients with PPMS.
    * One 120-week study (ORATORIO) evaluated the effects of Ocrevus (ocrelizumab) relative to placebo in patients with PPMS. Ocrevus (ocrelizumab) was superior to placebo reducing the proportion of patients who had sustained 12-week confirmed disability progression. The treatment group also showed a significant decrease in T2 volume and showed significantly less brain volume loss on MRI.

CROHN'S DISEASE

Natalizumab (Tysabri/Tyruko) for Crohn's Disease[25 28 29]

- FDA-approval of natalizumab (Tysabri/Tyruko) in Crohn's Disease (CD) was based on three trials: two in induction of clinical response/remission and one in the maintenance of remission.
    * Patients in the induction trials had moderately to severely active CD (Crohn's Disease Activity Index [CDAI] $\geq$ 220 and $\leq$ 450).
    * In one of the two induction studies, significant differences in response to natalizumab were only observed in the subgroup of patients with elevated C-reactive protein (CRP) levels. The second induction study used elevated CRP as an entry criterion. However, other medications (e.g. prednisone) may lower CRP levels, making this an insensitive predictor of efficacy.
    * The treatment effect in the induction studies ranged from approximately 13 to 15%.
    * In the trial that looked at maintenance of response of CD over 9 to 15 months, the treatment effect was approximately 33%.

- Concomitant use natalizumab (Tysabri/Tyruko) with immunosuppressives (6-mercaptopurine, azathioprine, cyclosporine, and methotrexate) or inhibitors of TNF-α (e.g., infliximab and adalimumab) is not recommended due to potential safety concerns.
- Natalizumab (Tysabri/Tyruko) is generally considered a last-line agent for Crohn's disease due to lack of comparative efficacy with other therapies and its potential for serious safety risks.
    * Steroids, immunosuppressives, and inhibitors of TNF-alpha are recommended prior to prescribing natalizumab (Tysabri/Tyruko).
    * A study demonstrating the efficacy of Humira (adalimumab) in patients in whom Remicade (infliximab) was not effective is the basis for recommending both Humira (adalimumab) and infliximab prior to natalizumab (Tysabri/Tyruko).
        ▪ A randomized, placebo-controlled study comparing Humira (adalimumab) with placebo in 325 patients with Crohn's disease who had lost response to treatment with, or were intolerant to, previous Remicade (infliximab) therapy demonstrated induction of remission in 21% versus 7% of patients who had received adalimumab and placebo, respectively ($p<0.001$, ABI 14%, NNT=8).
- One small trial (n = 79) studied the concomitant use of natalizumab (Tysabri/Tyruko) and Remicade (infliximab) in patients who did not achieve remission of their CD after 12 weeks of Remicade (infliximab).
    * The trial was not powered to detect differences in efficacy between treatment groups.
    * There were not enough patients in the study to determine whether there were differences in uncommon or rare adverse effects between treatment groups.
    * The natalizumab (Tysabri/Tyruko) prescribing information warns against use of this combination.
- Natalizumab (Tysabri/Tyruko) should be discontinued in patients with CD who:
    * Do not achieve therapeutic benefit after 12 weeks of induction therapy.
    * Cannot discontinue chronic concomitant steroids within six months of starting therapy.

<u>ULCERATIVE COLITIS</u>

<u>Zeposia (ozanimod) for Ulcerative Colitis[30]</u>

- Zeposia (ozanimod) was evaluated in the TRUE NORTH study, a phase 3 study that evaluated Zeposia (ozanimod) for the induction and maintenance of remission for UC versus placebo.
- Results showed that ozanimod improved rates of clinical response and remission compared to placebo. Improvements in histological remission and mucosal healing were also noted.
- Refer to Medication Policy Manual, Drugs for chronic inflammatory diseases, dru444 for treatment guidelines and severity criteria.

Investigational Uses

Lemtrada (alemtuzumab)[31-35]

- The Lemtrada REMS program mitigates off-label use of Lemtrada (alemtuzumab); however, it has been studied in other conditions. Due to a lack of published data, lack of high-quality data, or lack of positive data, these conditions are considered investigational. Details of select investigational uses are reported below.
- B-cell chronic lymphocytic leukemia:
  * A high dose formulation of Campath (alemtuzumab) was approved for the treatment of B-cell chronic lymphocytic leukemia (CLL) but was removed from the market in 2012 to prevent off-label use of Campath (alemtuzumab) in MS. Since 2012, Campath (alemtuzumab) has been available for very limited use in CLL through patient access programs. Lemtrada (alemtuzumab) is given at a lower dose when used for MS, lower doses are considered investigational for any other condition, including CLL and other cancers.
  * There have been no controlled clinical trials evaluating the use of low-dose (12 mg) Lemtrada (alemtuzumab) in B-cell chronic lymphocytic leukemia.
  * High-dose Campath (alemtuzumab) is available for patients with leukemia directly from the manufacturer, free of charge through patient access programs.
- Post-transplant antibody induction therapy:
  * There are no controlled clinical trials evaluating the use of low-dose (12 mg) Lemtrada (alemtuzumab) in the post-transplant setting.

Natalizumab (Tysabri/Tyruko)[25 36]

- A Risk Evaluation and Mitigation Strategy (REMS) Prescribing Program currently prevents off-label use of natalizumab (Tysabri/Tyruko).
- Authors of a small, open-label study in 10 patients with active ulcerative colitis reported clinical benefit at 4 weeks with administration of natalizumab. Larger, well-designed trials are needed before safety and efficacy are established for this indication.
- There are no data available to support the safety and efficacy of natalizumab (Tysabri/Tyruko) in the treatment of rheumatoid arthritis.

Ocrevus (ocrelizumab)[37-40]

- Due to a lack of published data, the use of Ocrevus (ocrelizumab) in conditions other than relapsing forms of MS and PPMS is considered investigational.
- Neuromyelitis optica spectrum disorders (NMOSD; previously known as Devic disease) are characterized by a combination of bilateral optic neuropathy and cervical myelopathy. While both NMOSD and MS are demyelinating diseases they are considered different diseases based on unique immunologic features and differences in imaging features, biomarkers, and neuropathology.
- Rituximab has been shown to the frequency of NMOSD relapses and neurologic disability based on results from one systematic review. However, the optimal treatment regimen and duration have not been determined and additional long-term safety experience is needed to clarify the role of rituximab as a first-line option.
- There is no published evidence to support the use of Ocrevus (ocrelizumab) for NMOSD.
- While Ocrevus (ocrelizumab) has a similar mechanism of action to rituximab, it has not been studied for the same indications. Thus, due to a lack of data, these conditions are considered investigational.

Kesimpta (ofatumumab) and Briumvi (ublituximab-xiiy)[19 41]

- Due to a lack of published data, the use of Kesimpta (ofatumumab) or Briumvi (ublituximab-xiiy) in conditions other than relapsing forms of MS is considered investigational.
- While Kesimpta (ofatumumab) and Briumvi (ublituximab-xiiy) have a similar mechanism of action to rituximab, it has not been studied for the same indications. Thus, due to a lack of data, these conditions are considered investigational.

Zeposia (ozanimod)[30]

- The use of combination (more than one) targeted immunomodulator for UC, such as Humira (adalimumab), or tofacitinib (Xeljanz/Xeljanz XR), is considered investigational. Ozanimod has only been studied as monotherapy for UC. There is no evidence supporting the safety or efficacy of combination therapy with another targeted immunomodulator.

Safety

Lemtrada (alemtuzumab)[3]

- Lemtrada (alemtuzumab) has boxed warnings for the following:
  * Sometimes fatal autoimmune conditions, such as immune thrombocytopenia and anti-glomerular basement membrane diseases.
  * Serious and life-threatening infusion reactions.
  * An increased risk of malignancies including thyroid cancer, melanoma, and lymphoproliferative disorders.
- Due to its significant safety concerns an FDA Risk Evaluation and Mitigation Strategy (REMS) program limits the availability of Lemtrada (alemtuzumab) to certified prescribers, healthcare facilities, and specialty pharmacies.
- Regular monitoring is required due to the potential for long-term adverse events. Complete blood count, serum creatinine levels, urinalysis should be collected prior to treatment and at monthly intervals. Thyroid function tests should be conducted prior to treatment and every three months thereafter. Baseline and annual skin exams should be conducted to monitor for melanoma.

Mayzent (siponimod)[42]

- Mayzent (siponimod) requires an initial 5-day dose titration period due to the risk of first-dose bradycardia. Additionally, first-dose monitoring is required for patients with sinus bradycardia, first- or second-degree atrioventricular block, or a history of myocardial infarction or heart failure.

Natalizumab (Tysabri/Tyruko))[25]

- Several cases of progressive multifocal leukoencephalopathy (PML), a progressive demyelinating disease of the CNS, have been associated with natalizumab (Tysabri/Tyruko) use. PML is an opportunistic viral infection of the brain that usually leads to death or severe disability.
- The natalizumab (Tysabri/Tyruko) prescribing information contains a Boxed Warning describing the increased risk of PML, which may lead to death or severe disability.
- Because of the risk of PML, distribution of natalizumab (Tysabri/Tyruko) is restricted via a REMS Prescribing Program.
  * Providers must register to prescribe, distribute, or infuse natalizumab (Tysabri/Tyruko).

    * Only patients who are registered with and who meet all the conditions of either the MS or CD REMS programs are eligible to receive natalizumab (Tysabri/Tyruko).

- The most common side effects observed in patients receiving natalizumab (Tysabri/Tyruko) include infections, acute hypersensitivity reactions, depression, and cholelithiasis (gall stones).
- There are several case reports of patients who developed melanoma after starting treatment with natalizumab (Tysabri/Tyruko)). Although cause-effect has not been established, clinicians should be aware of this potential risk, especially when considering therapy for patients with a history of melanoma.
- The natalizumab (Tysabri/Tyruko) prescribing information contains a warning regarding the potential for liver injury. In some patients this occurred as early as six days after an initial dose.

Appendix A: Disease-Modifying Agents Used in the Treatment of Multiple Sclerosis (MS)
Bafiertam (monomethyl fumarate)
Briumvi (ublituximab-xiiy)
Dimethyl fumarate (generic, Tecfidera)
Fingolimod (generic, Gilenya, and Tascenso ODT)
Glatiramer acetate (generic glatiramer, Glatopa, and Copaxone)
Interferon beta-1a (Avonex, Rebif)
Interferon beta-1b (Betaseron, Extavia)
Kesimpta (ofatumumab)
Lemtrada (alemtuzumab)
Mavenclad (cladribine)
Mayzent (siponimod)
Natalizumab (Tysabri/ biosimilar Tyruko)
Novantrone (mitoxantrone)
Ocrevus (ocrelizumab)
Plegridy (peginterferon beta-1a)
Ponvory (ponesimod)
Rituximab
Teriflunomide (generic, Aubagio)
Vumerity (diroximel fumarate)
Zeposia (ozanimod)

Rituximab is not FDA-approved for use in MS, but has evidence for efficacy[2]

Appendix B: Multiple Sclerosis Forms/Clinical Course Definitions[1 2]	
Clinically Isolated Syndrome (CIS)	The first clinical presentation that shows characteristics of inflammatory demyelination that could be MS.
Relapsing-remitting MS (RRMS)	Characterized by acute relapses that are followed by some degree of recovery. These attacks develop acutely, evolving over days to weeks. Over the next several weeks to months, most patients experience a recovery of function that is often (but not always) complete. Between attacks the patient is neurologically and symptomatically stable.
Secondary progressive MS (SPMS)	Defined as sustained progression of physical disability occurring separately from relapses, in patients who previously had RRMS. SPMS may be active or not active. Activity is determined by the presence of ongoing relapses or MRI activity. There are no clinical, imaging, immunologic, or pathologic criteria to determine when a patient transition from RRMS to SPMS, it is usually diagnosed retrospectively.
Primary progressive MS (PPMS)	Defined as progression of disability from onset without superimposed relapses. The AAN defines PPMS as the third clinical type characterized by a steady decline in function from the beginning without acute attacks.

Appendix C: Step Therapy Medications

Targeted Agents and GPIs/NDCs (multisource code)	Prior Agents and GPIs/NDCs (multisource code) Prerequisites	Look-Back Time Frame
• Bafiertam 62405550****** (M,N,O,Y) • Extavia 00078-0569-** (NDC) • Mayzent 62407070******(M,N,O,Y) • Ponvory 62407060****** (M,N,O,Y) • Vumerity 62405530****** (M,N,O,Y)	**ONE** of the following: • dimethyl fumarate 62405525**** (Y) • fingolimod 62407025****** (Y) • teriflunomide 62404070****** (Y) • glatiramer 62400030****** (Y) **AND** **ONE** of the following: • Avonex/Rebif 6240306045**** (M,N,O,Y) • • Kesimpta 62405065****** (M,N,O,Y) • • • Zeposia 62407050****** (M,N,O,Y)	180 days

Revision History

Revision Date	Revision Summary
10/10/2024	Effective 12/1/2024: • Updated preferred options to include Skyrizi (risankizumab) and Tremfya (guselkumab) for treatment of ulcerative colitis • No change to intent.
12/7/2023	• Added newly approved Tysabri (natalizumab) biosimilar Tyruko (natalizumab) to policy. • Added Briumvi (ublituximab) and Kesimpta (ofatumumab) as options for highly active disease, no change to intent.
9/14/2023	Effective 1/1/2024, Betaseron (interferon beta-1b), Mavenclad (cladribine) and Plegridy (peginterferon beta-1a) have been moved to non-preferred.
6/15/2023	New combination policy (effective 9/1/2023): • Combined the following medication policies: dru111 Tysabri (natalizumab), dru479 Ocrevus (ocrelizumab), dru511 Non-preferred MS treatments, dru570 Non-preferred Glatiramer Products, dru674 Zeposia (ozanimod), dru739 Briumvi (ublituximab-xiiy). • Prior authorization (PA) not required for the following DMTs for MS: - Generic dimethyl fumarate, generic fingolimod, generic teriflunomide, generic glatiramer (no change to coverage). - Glatiramer (Glatopa) (changed to "no PA required"). • Change in PA requirements for relapsing forms of MS (RRMS, CIS, SPMS) for the following higher-cost DMTs for MS: - Preferred branded products: now require PA and step therapy with a low-cost product. - Non-preferred branded products: modified step therapy to require a low-cost product and a higher-cost preferred brand product. • Clarification that Ocrevus (ocrelizumab) is also coverable under "particularly aggressive relapsing form of MS" criteria. • No changes to criteria or intent of Zeposia (ozanimod) for ulcerative colitis or Tysabri (natalizumab) for Crohn's disease.

Medication Policy Manual **Policy No:** dru754

Topic: Elevidys**,** delandistrogene moxeparvovec **Date of Origin:** July 1, 2023

Committee Approval Date: September 19, 2024 **Next Review Date:** 2025

Effective Date: December 1, 2024

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Elevidys (delandistrogene moxeparvovec) is an intravenous medication that has received approval from the FDA to treat Duchenne muscular dystrophy (DMD). A clinical benefit, such as improved ambulation, from Elevidys (delandistrogene moxeparvovec) treatment has yet to be established.

Policy/Criteria

Most contracts require pre-authorization approval of Elevidys (delandistrogene moxeparvovec) prior to coverage.

I. Continuation of therapy (COT): Elevidys (delandistrogene moxeparvovec) is considered investigational for all conditions, per the full policy criteria below.

Please note: *Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Elevidys (delandistrogene moxeparvovec) is considered investigational for all conditions, including Duchenne muscular dystrophy (DMD). In addition, the use of Elevidys (delandistrogene moxeparvovec) in combination with any exon skipping therapy for DMD (e.g., Amondys 45 [casimersen], Exondys 51 [eteplirsen], Vyondys 53 [golodirsen], and Viltepso [viltolarsen]) is also considered investigational.

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers Elevidys (delandistrogene moxeparvovec) coverable under the medical benefit (as a provider administered medication).

B. Although the use of Elevidys (delandistrogene moxeparvovec) for Duchenne muscular dystrophy is considered investigational, if pre-authorization is approved, Elevidys (delandistrogene moxeparvovec) will be authorized in quantities of a one treatment course per lifetime.

C. Additional infusions of Elevidys (delandistrogene moxeparvovec) will not be authorized.

Position Statement

Summary

- Elevidys (delandistrogene moxeparvovec) is a novel, intravenous gene therapy that is delivered into the skeletal muscle cells via an adeno-associated viral vector, promoted to selectively express the transgene, producing a micro version of dystrophin (SRP-9001).
- Elevidys (delandistrogene moxeparvovec) was initially approved for the treatment of Duchenne muscular dystrophy (DMD), under the FDA Accelerated Approval Program based on an increase in micro-dystrophin (SRP-9001), expressed in skeletal muscles observed in patients during phase I and II trials. Subsequently, it has received full approval based on results of a phase III trial.
- A clinical benefit (e.g., prolongation of independent ambulation, improved quality of life, or prevention of disease progression and disability) of Elevidys (delandistrogene moxeparvovec) has not been established.
    * In two small trials (Study 102 and ENDEAVOR), Elevidys (delandistrogene moxeparvovec) was shown to increase micro-dystrophin (SRP-9001) levels. However, it has not yet been proven that an increase in micro-dystrophin will translate to improved clinical outcomes, such as improved motor function.
    * The two trials reported conflicting results in functional assessment score improvement: The primary endpoint of study 102 reported no significant difference between the group treated with Elevidys (delandistrogene moxeparvovec) and placebo; while ENDEAVOR, a single arm open label trial, reported exploratory endpoints with small improvements in functional assessments compared to an external control, however the clinical relevance of the improvement is unclear as the change did not meet the defined minimal clinically important differences.
    * A confirmatory phase 3 trial of Elevidys (delandistrogene moxeparvovec) has recently failed to meet significance in the primary endpoint of change in functional assessment score from baseline when compared to placebo, and the secondary endpoints of other functional assessments failed to meet the defined minimal clinically important differences, leading to further uncertainty of a clinical benefit.
    * Safety of use in specific exon mutations is a concern, as each trial submitted to the FDA has included different exon mutation criteria, with at least one serious adverse event being reported due to use in a specific exon mutation group. The ongoing phase 3 trial is using different exon mutation criteria than current submitted trials to FDA.
    * Given the lack of overall clinical benefit and potential safety concerns, the use of Elevidys (delandistrogene moxeparvovec) for DMD is considered investigational.
- The U.S. Centers for Disease Control and Prevention (CDC) has developed general management guidelines for DMD. The CDC recommends corticosteroids and supportive care to slow disease progression. These guidelines were published prior to the submission of Elevidys (delandistrogene moxeparvovec) to the FDA, thus the use of Elevidys (delandistrogene moxeparvovec) for DMD has not yet been addressed.[1-3]

Clinical Efficacy[4-10]

- The safety and efficacy of Elevidys (delandistrogene moxeparvovec) for FDA accelerated approval was established on a two small trials, one being a phase 2 multicenter, randomized, double-blind, placebo-controlled, parallel group trial (Study 102, n=41) and the second, a phase 1b single arm, open label, 4 cohort trial (ENDEAVOR, n=38), in which only cohort 1 (n=20) has reported to date.
- Patients in both trials were ≥ 4 or <8 years of age, had genetically confirmed DMD, considered ambulatory (defined as a North Star Ambulatory Assessment [NSAA] score between 13-26), on a consist steroid dose for at least 12 weeks, and negative for antibodies to the adeno associated viral vector.
- Concurrent use of exon skipping therapies such as Amondys 45 (casimersen), Exondys 51 (eteplirsen), Vyondys 53 (golodirsen), and Viltepso (viltolarsen) were excluded from the trials.
- The primary endpoint across for both trials was the change from baseline at 12 weeks of the percent of micro-dystrophin (SRP-9001) expressed.
    * Study 102: Using the clinically available Elevidys (delandistrogene moxeparvovec) compared to placebo, the change from baseline in micro-dystrophin (SRP-9001) expressed at 12 weeks was statistically significant (23.8%, p<0.0001) compared to placebo (not reported), however the second primary endpoint of change from baseline in NSAA at 48 weeks was not significant (+1.7 vs +0.9).
    * ENDEAVOR: Using the commercially available Elevidys (delandistrogene moxeparvovec) with no competitor arm, a significant improvement in the change from baseline in micro-dystrophin (SRP-9001) expressed was shown at 12 weeks (54.2%) in cohort 1 (n=20).
- Both studies demonstrated significant improvements in micro-dystrophin (SRP-9001) expression at 12 weeks after treatment via Western blot testing; however, the effect of increasing micro-dystrophin (SRP-9001) levels on clinical outcomes has not yet been established. There have been many trials in drugs (exon skipping therapies) in which the treatment arm has shown small improvements in dystrophin, but none of those trials to date have proven a correlation of improving dystrophin levels to clinically relevant outcomes.
- The evidence regarding the effect of Elevidys (delandistrogene moxeparvovec) based on the change from baseline on the NSAA score is inconclusive. The NSAA is a functional assessment of ambulatory DMD patients used primarily in clinical trials. Lower scores suggest greater disease severity and lower ambulatory ability; a minimal clinically important difference (MCID) is estimated to be an improvement of 3.5 points. The clinical relevance of the effect that Elevidys (delandistrogene moxeparvovec) showed (improvement of +0.8 in Study 102) is unclear at this time as it falls below the MCID and was not statistically significant.
- Recent topline results from the confirmatory EMBARK (n=125) trial, a phase 3, global, multicenter, double-blind, placebo-controlled study also failed to meet the primary endpoint of change from baseline in the NSAA score, with an improvement of +0.7 when

compared to placebo at 52 weeks (+2.6 vs +1.9), again falling below the MCID and not meeting statistical significance.

- Secondary and exploratory endpoints from these three trials and a proof-of-concept trial have also reported minimal improvements in NSAA and other timed function tests, however the improvements are below the MCID for these tests and are over a short duration for a small sample size, leading to further uncertainty of a meaningful benefit.
- Although the existing evidence is promising, additional confirmatory trials are needed to establish the safety and efficacy of Elevidys (delandistrogene moxeparvovec). Elevidys (delandistrogene moxeparvovec) has not yet proven to improve any clinically relevant outcomes such as prolongation of independent ambulation or quality of life, nor has it proven prevention of disease progression, disability, or mortality.
- At this time, there is not enough data available to determine that the benefits of Elevidys (delandistrogene moxeparvovec) use would provide any meaningful benefit in DMD.

Investigational Uses[4 5]

- Elevidys (delandistrogene moxeparvovec) is considered investigational when used in combination with other exon skipping therapies for DMD, including Amondys 45 (casimersen), Exondys 51 (eteplirsen), Vyondys 53 (golodirsen), and Viltepso (viltolarsen), as concurrent use in the trials submitted to the FDA was not allowed.

Safety[4 5 11]

- Limited safety data is available, however, the most common adverse reactions reported with Elevidys (delandistrogene moxeparvovec) during phase I/II trials included vomiting, and decreased appetite. Safety data for the ongoing phase III trial has yet to be published.
- Use of Elevidys (delandistrogene moxeparvovec) in specific exon mutations is unproven, as each trial submitted to the FDA has included different exon mutation criteria, with at least one serious adverse event (immune myositis) being reported due to use in a specific exon mutation group (exon mutations 1-17), and the ongoing phase 3 trial using different exon mutation criteria than current submitted trials to FDA.

Revision History

Revision Date	Revision Summary
9/19/2024	Updated policy to reflect FDA full approval, with no change to intent.
12/7/2023	Updated policy to include new trial data, with no change to intent.
9/14/2023	Updated policy to reflect new brand name of Elevidys (delandistrogene moxeparvovec) in line with its FDA accelerated approval. No changes to criteria.
6/15/2023	New policy. Effective 7/15/2023. Use of delandistrogene moxeparvovec is considered investigational in the treatment of all conditions, including Duchenne muscular dystrophy (DMD). In addition, use of delandistrogene moxeparvovec in combination with any exon skipping therapy for DMD is considered investigational.

Drug names identified in this policy are the trademarks of their respective owners.

Topic: Bispecific T-Cell Engager (BiTE) Therapies for B-Cell Lymphoma

- Columvi, glofitamab-gxbm
- Epkinly, epcoritamab-bysp
- Lunsumio, mosunetuzumab-axgb

Date of Origin: October 15, 2023

Committee Approval Date: March 6, 2025 | **Next Review Date:** 2026

Effective Date: May 1, 2025

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

The medications in this policy are provider-administered intravenous bispecific T-cell engager (BiTE) medications used in the treatment of specific types of B-cell lymphoma. They help the immune system (T-cells) recognize and destroy B-cells that express the CD20 antigen.

Policy/Criteria

Most contracts require pre-authorization approval of bispecific T-cell engager (BiTE) therapies for B-cell lymphoma [as listed in *Table 1*] prior to coverage.

I. Continuation of therapy (COT): Bispecific T-cell engager (BiTE) therapies for B-cell lymphoma may be considered medically necessary for COT when criterion A, B, or C below is met.

A. For diagnoses NOT listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND there is documentation that the medication was covered by another health plan. Examples of documentation include the coverage approval letter from the previous health plan or paid claim.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

B. For diagnoses listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

C. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

Please note: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.

II. New starts (treatment-naïve patients): Bispecific T-cell engager (BiTE) therapies for B-cell lymphoma may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) that the applicable diagnosis-based criteria below are met (refer to *Table 1*).

Table1:

Diagnosis	Coverable Medications	ALL of the following diagnostic criteria are met:
Diffuse large B-cell lymphoma, not otherwise specified (DLBCL NOS) *Note: Includes DLBCL arising from indolent lymphoma*	- Epkinly (epcoritamab) - Columvi (glofitamab)	**1.** A diagnosis of CD20-positive DLBCL NOS. **2.** Documented disease progression on or after at least two prior systemic lymphoma therapies, including a CD20-directed monoclonal antibody (e.g., rituximab). **3.** Will be used as monotherapy. **4.** No prior use of CD20-directed BiTE therapy [as listed in *Table 1*]. **5.** **For Columvi (glofitamab) only***:* Columvi (glofitamab) will be preceded by an initial dose of Gazyva (obinutuzumab).
Follicular lymphoma (FL)	- Epkinly (epcoritamab) - Lunsumio (mosunetuzumab)	**1.** A diagnosis of follicular lymphoma (FL), **2.** The FL is Grade 1-2, or 3a. **3.** The FL relapsed after or was refractory to at least two prior systemic therapies which must have included each of the following (a and b): a. An anti-CD20-directed monoclonal antibody (see *Appendix A*). b. An alkylating agent (see *Appendix B*) or lenalidomide (generic Revlimid). **4.** Will be given as monotherapy. **5.** No prior use of CD20-directed BiTE therapy [as listed in *Table 1*].
High-grade B-cell lymphoma (HGBCL)	Epkinly (epcoritamab)	**1.** A diagnosis of CD20-positive HGBCL. **2.** Documented disease progression on or after at least two prior systemic lymphoma therapies, including a CD20-directed monoclonal antibody (e.g., rituximab). **3.** Will be used as monotherapy. **4.** No prior use of CD20-directed BiTE therapy [as listed in *Table 1*].

Large B-cell lymphoma arising from follicular lymphoma (FL)	Columvi (glofitamab)	**1.** A diagnosis of CD20-positive large B-cell lymphoma arising from FL. **2.** Documented disease progression on or after at least two prior systemic lymphoma therapies, including a CD20-directed monoclonal antibody (e.g., rituximab). **3.** Will be used as monotherapy. **4.** Columvi (glofitamab) will be preceded by an initial dose of Gazyva (obinutuzumab). **5.** No prior use of CD20-directed BiTE therapy [as listed in *Table 1*].

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers BiTE therapies for B-cell lymphoma coverable only under the medical benefit (as provider-administered medications).

B. When pre-authorization is approved, BiTE therapies for B-cell lymphoma may be authorized as follows:

Table 2. Quantity Limitations and Authorization Period

Product	Quantity Limit
Columvi (glofitamab)	Up to FDA-recommended dose and frequency limits for a maximum of 13 infusions. No additional quantities will be authorized. **Initial authorization:** 9 infusions in 24 weeks (cycles 1-8) **One-time reauthorization**: 4 infusions in 12 weeks (cycle 9-12)
Epkinly (epcoritamab)	Up to FDA-recommended dose and frequency limits until disease progression, as follows: [a] **Initial authorization:** 18 infusions in 24 weeks (cycles 1 to 6). **Initial re-authorization**: 9 infusions in 24 weeks (cycles 7 to 12). **Subsequent re-authorizations**: six infusions in 24 weeks ongoing (cycle 13 and beyond). [a] See *Table 3* for additional details regarding dosing.
Lunsumio (mosunetuzumab)	Up to FDA-recommended dose and frequency limits until disease progression, as follows: [b] **Initial authorization:** 10 infusions in 24 weeks (cycles 1 to 8). [b] **Additional authorization (up to one-time)**: [b] **1.** *For complete response*: If a complete response is achieved after the initial eight cycles of Lunsumio (mosunetuzumab), no additional cycles will be authorized.

	2. *For partial response or stable disease*: **a.** If a partial response or stable disease is achieved after the initial eight cycles of Lunsumio (mosunetuzumab), up to nine additional 21-day cycles may be authorized. **b.** No additional Lunsumio (mosunetuzumab) will be authorized (17 cycles in total).

[b] See *Table 4* for additional details regarding dosing.

C. Reauthorization: Authorization **shall** be reviewed at least every 24 weeks for documented benefit (not to exceed the maximum Quantity Limit in *Table 2* above). Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met. Specifically, documentation that the medication is providing clinical benefit, including disease stability or improvement, and lack of disease progression, based on an assessment of change in tumor burden. If there is documentation of potential disease progression, a shortened authorization (up to three months) may be approved to allow time for clarification of response to BiTE therapy, including clinical re-evaluation of the patient and reimaging.

PLEASE NOTE: Additional doses of BiTE therapy will not be authorized without a documented recent assessment by the treating provider (such as oncologist) with objective evidence of response to therapy, such as by re-imaging and use of RECIST v1.1 (modified RECIST) and/or Lugano criteria.

IV. BiTE therapies for B-cell lymphoma are considered investigational when used for all other conditions not listed in the coverage criteria above (*Table 1*), as well as

A. Epkinly (epcoritamab) or Lunsumio (mosunetuzumab): Grade 3b follicular lymphoma (FL)

Position Statement

Summary

- The bispecific T-cell engager (BiTE) therapies for B-cell lymphoma help the immune system (T-cells) recognize and destroy lymphoma cells and healthy B-lineage cells that express the CD20 antigen.
- The currently approved BiTE therapy products for B-cell lymphoma include the following:
  - Columvi (glofitamab), approved for use in DLBCL NOS and large B-cell lymphoma arising from follicular lymphoma (FL) after two or more prior lines of systemic therapy.
  - Epkinly (epcoritamab), approved for use in:

    - Diffuse large B-cell lymphoma (DLBCL) not otherwise specified (NOS) and high-grade B-cell lymphoma (HGBCL) after two or more prior lines of systemic therapy.
    - Follicular lymphoma, after two or more prior lines of systemic therapy.

  * Lunsumio (mosunetuzumab), approved for use in FL after at least two prior lines of systemic therapy, including an alkylating agent and an anti-CD20-directed monoclonal antibody.

- The intent of this policy is to allow coverage of BiTE therapies for B-cell lymphoma in the settings described above (in the coverage criteria), where they have been evaluated for efficacy, up to the doses shown to be safe in clinical trials.
- The FDA approvals were based on poor quality evidence from small, non-comparative, non-blinded studies that evaluated tumor response, a surrogate endpoint. Though tumor responses in the studies were quite high, it is not yet known if they will be durable and will translate into improved overall survival, the clinical outcome of interest.
- The patients enrolled in the studies evaluating the BiTE therapies in B-cell lymphoma had a median of three prior therapies for B-cell lymphoma. All had prior therapy with anti-CD20 monoclonal antibodies (e.g., rituximab) and anthracyclines. The populations included patients who may have had prior autologous hematopoietic stem cell transplant (HSCT) or chimeric antigen receptor T-cell (CAR T) therapy.
- It is not known how the BiTE therapies compare with other B-cell lymphoma therapies. Optimal sequencing of therapies in the subsequent-line treatment of B-cell lymphoma is also not known.
- The National Comprehensive Cancer Network (NCCN) B-cell lymphomas guideline lists the BiTE therapies for B-cell lymphoma among therapy options in the third- and subsequent-line treatment setting in the subpopulations in which they are indicated.
- The BiTE therapies for B-cell lymphoma are administered as monotherapy. Their safety and efficacy have not been established when used in combination with other therapies.
- The BiTE therapies for B-cell lymphoma must be given by trained providers who have access to facilities that have the means to effectively manage the serious adverse effects (AEs) that are associated with their administration. Package labeling indicates that both therapies need to be initiated in an inpatient setting.
- The BiTE therapies for B-cell lymphoma may cause serious AEs including cytokine release syndrome (CRS) and serious neurological toxicities which can be life threatening. Columvi (glofitamab) is preceded by a single dose of Gazyva (obinutuzumab) to deplete circulating and lymphoid tissue B cells to reduce the incidence and severity of CRS. The use of other anti-CD20 monoclonal antibodies has not been studied in this setting.
- *Reauthorization Criteria*: When coverage criteria are met, BiTE therapies (as listed in *Table 1*) are authorized for six months (24 weeks) of therapy, after which time documentation must be provided to establish that the medication is effective (or as specified in *Table 2. Quantity Limit*). Specifically, there must be documentation of clinical benefit, including disease stability or improvement and there is a lack of disease progression, based on an assessment of change in tumor burden. Documentation of

benefit must include an assessment of the most recent imaging ("restaging scans") and/or re-biopsy by the treating oncologist.

Regence Pharmacy Services performs independent analyses of oncology medication evidence, to establish coverability per the contracts with the health plan.

- Most contracts define coverability based on established clinical benefit in published, peer-reviewed literature, along with consideration of regulatory status.
- FDA approval does not in itself establish medical necessity, as unpublished, low-quality evidence, including exploratory analyses and unvalidated surrogate endpoints, may be used as the basis of approval. Regulatory approval may or may not reflect clinical benefit relative to standard of care and the recommendations of expert clinical advisors such as the Oncologic Drugs Advisory Committee (ODAC). FDA approvals generally do not consider cost compared to established therapies, or value to members.
- Likewise, NCCN clinical practice guidelines assignment of a recommendation (category 1, 2a, or 2b) does not necessarily establish medically necessity. NCCN recommendations are inconsistently supported by published, peer-reviewed literature and do not uniformly consider value of new therapies relative to existing potentially higher-value treatment options, considering effectiveness, safety, and cost.
- Medication coverage criteria are developed based on the 'medical necessity' assessment, as described above.

Regence Pharmacy Services analysis and coverage policy may differ from FDA labeled indication and/or NCCN clinical practice guidelines.

Clinical Efficacy

Background

- The bispecific T-cell engager (BiTE) therapies for B-cell lymphoma currently include Epkinly (epcoritamab), Columvi (glofitamab), and Lunsumio (mosunetuzumab).
- They target the CD20 antigen on B-cells.
- They bind to the CD3 receptor on T-cells and the CD20 antigen expressed on the surface of lymphoma cells thus initiating a T-cell -mediated immune response.

Diffuse large B-cell lymphoma (DLBCL), High-Grade B-cell lymphoma (HGBCL), and large B-cell lymphoma (LBCL)

Each received initial FDA Accelerated approval in their respective diffuse large B-cell lymphoma (DLBCL) populations based on small, single-arm, non-blinded trials that evaluated tumor response, an unvalidated surrogate endpoint, as the primary endpoint. The evidence is of poor quality. Confirmatory trials are required to confirm clinical benefit. [1,2]

- **Epkinly (epcoritamab)** was approved for DLBCL not otherwise specified (NOS), including DLBCL arising from indolent lymphoma (e.g., marginal zone lymphoma), and for high-grade B-cell lymphoma (HGBCL) after two or more lines of systemic therapy based on evidence from study GCT3013-01 (EPCORE NHL-1). [3]

    * The study (N=148) enrolled patients with CD20-positive DLBCL NOS (86%) and HGBCL (14%) who had a median of 3 prior therapies for their advanced disease. All had prior anti-CD20 monoclonal antibody (mAb) therapy, an alkylating agent, and an anthracycline.
    * Eighteen percent of the population had a prior autologous hematopoietic stem cell transplant (HSCT) and 39% had prior chimeric antigen receptor T-cell (CAR T) therapy.
    * Patients with CNS lymphoma or prior allogeneic HSCT were not allowed to participate in the study.
    * The overall response rate (ORR) was 61% and the complete response (CR) rate was 38%. The median duration of response (DOR) was 15.6 months.
- **Columvi (glofitamab)** was approved for DLBCL NOS, and large B-cell lymphoma (LBCL) arising from follicular lymphoma (FL) after two or more lines of systemic therapy based on evidence from study NP31079. [4]
    * The study (N=132) enrolled patients with CD20-positive DLBCL NOS (80%) and LBCL arising from FL (20%) who had a median of 3 prior therapies for their advanced disease. All had prior anti-CD20 mAb therapy.
    * Nineteen percent of the population had a prior autologous HSCT and 30% had prior CAR T therapy.
    * Patients with CNS lymphoma or prior allogeneic HSCT were not allowed to participate in the study.
    * The ORR was 56% and the CR rate was 43%. The median DOR was 18.4 months.
- It is not known how the efficacy of BiTE therapies for B-cell lymphoma compares with any other therapy for B-cell lymphoma as no head-to-head studies have been conducted.
- The National Comprehensive Cancer Network (NCCN) B-cell lymphomas guideline lists either Epkinly (epcoritamab) or Columvi (glofitamab) among potential therapies for DLBCL when there has been disease progression on or after at least two prior systemic therapies. Epkinly (epcoritamab) is also listed as an option for transformed FL or marginal zone lymphoma (MZL), and HGBCL. Columvi (glofitamab) is also listed as an option for transformed FL or nodal MZL. [5]

Follicular lymphoma (FL)

- Follicular lymphoma (FL) is the second most common non-Hodgkin lymphoma (NHL).
- The World Health Organization (WHO) classifies FL using several Grades (FL1-2, FL3A, FL3B) based on the number of centroblasts that are present to stratify patients based on expected outcomes. Grade 3B FL is also known as 'transformed FL' and is generally treated using therapy pathways for diffuse large B-cell lymphoma (DLBCL). [5]
- Both Lunsumio (mosunetuzumab) and Epkinly (epcoritamab) received initial FDA Accelerated approval in their respective follicular lymphoma (FL) populations based on small, single-arm, non-blinded trials that evaluated tumor response, an unvalidated surrogate endpoint, as the primary endpoint. The evidence is of poor quality. Confirmatory trials are required to confirm clinical benefit. [1,6]

- **Lunsumio (mosunetuzumab)** received FDA accelerated approval based on a single-arm, open-label study in adults with Grades 1 to 3a relapsed or refractory FL that evaluated tumor response as the primary endpoint. [7,8]
    * Patients in the study relapsed after or failed to respond to at least two prior systemic therapies (median of 3).
        - All patients had a prior alkylating agent and a prior anti-CD20-directed monoclonal antibody.
        - Three percent of patients had a prior chimeric antigen receptor (CAR) T-cell therapy for their FL.
    * Patients with prior allogeneic stem cell transplant (SCT) were excluded from participating in the study due to the high likelihood of severe immune reactions; however, 21% of the population had a prior autologous SCT.
    * The objective response rate (ORR) was 80% with 60% being complete responses. The median duration of response was 22.8 months.
    * Though the reported ORRs were very high in this study, it is not yet known how durable the responses will be, or whether Lunsumio (mosunetuzumab) will ultimately improve overall survival, the clinical outcome of interest.
- **Epkinly (epcoritamab)** received FDA accelerated approval based on a phase 2 cohort of the single-arm, open-label study [EPCORE NHL-1 (Study GCT3013-01)] (n=128). The cohort included adults with relapsed or refractory CD20+ FL, (Grades 1 to 3a) and evaluated tumor response as the primary endpoint.[9]
    * Patients in the study relapsed after or failed to respond to at least two prior systemic therapies [median of 3 (2-4)].
        - All patients had a prior anti-CD20-directed monoclonal antibody and either prior alkylating agent or lenalidomide. Although alkylating agent use was not required for enrollment in the trial, 100% of patients had prior alkylating agent. Thirty-one percent of patients had prior lenalidomide (21% lenalidomide with anti-CD20 rituximab).
        - Five percent of patients had a prior chimeric antigen receptor (CAR) T-cell therapy for their FL.
    * Patients with prior allogeneic stem cell transplant (SCT) were excluded from participating in the study due to the high likelihood of severe immune reactions; however, 19% of the population had a prior autologous SCT.
    * The objective response rate (ORR) was 82% with 62% being complete responses. More than 58.4% of responders remained in response at 18 months.
    * Though the reported ORRs were very high in this study, it is not yet known how durable the responses will be, or whether Epkinly (epcoritamab) will ultimately improve overall survival, the clinical outcome of interest.
- BiTE therapies for B-cell lymphoma [Lunsumio (mosunetuzumab) or Epkinly (epcoritamab)] have not been directly compared with any other therapy, including CAR T-cell therapies which also are associated with high ORRs.

- The National Comprehensive Cancer Network (NCCN) B-cell lymphomas guideline lists Lunsumio (mosunetuzumab) and Epkinly (epcoritamab) among potential systemic therapy options for relapsed or refractory FL (Grade 1-2) in the third- and subsequent-line treatment setting. The NCCN guideline notes that Grade 3B FL should be treated using the DLBCL pathway. [5]

Reauthorization Criteria:

When coverage criteria are met, BiTE therapies (as listed in *Table 1*) are authorized for six months (24 weeks) of therapy, after which time documentation must be provided to establish that the medication is effective. Specifically, there must be documentation of clinical benefit, including disease stability or improvement and there is a lack of disease progression, based on an assessment of change in tumor burden.

- The standard of care for evaluation of response to cancer therapy is use of the RECIST criteria for assessment of solid tumor burden and Lugano criteria for non-solid tumors, such as lymphoma, as well as iRECIST criteria for some cancer immunotherapy.[10-12] Criteria used for assessment of response vary, depending on the tumor type and the therapy. Pivotal trials of BiTE therapies for lymphoma used the following criteria, for assessment of tumor burden and response to therapy.
    * Lugano criteria.[12]
    * Lymphoma Response to Immunomodulatory Therapy Criteria (LYRIC) [modified Lugano][13]
    * RECIST v1.1 criteria (modified RECIST)[10]
- These criteria, include use of quantitative and qualitative criteria for assessment of change in tumor burden for target lesions and non-target lesions.
    * Quantitative measurements for target lesions (tumor size and % change)
    * Qualitative evaluation for non-target lesions (present/disappeared/ unequivocal progression)
- Documentation of benefit must include an assessment of the most recent imaging ("restaging scans") and/or re-biopsy by the treating oncologist. Given the complexity of the evaluation, including use of the modified RECIST and LYRIC criteria, BiTE therapies for lymphoma will not be reauthorized without an assessment of response to therapy, such a partial response (PR), complete response (CR), or stable disease (SD).
- Though not specific to the use of BiTE therapies for lymphoma, use of immunotherapy may result in pseudoprogression, due to immune and T-cell activation, which can appear similar to tumor flare. If there is documentation of potential disease progression ["unconfirmed progressive disease (UPD)"], a shortened authorization (up to three months) may be approved to allow time for clarification of response to BiTE therapies for lymphoma, including clinical re-evaluation of the patient and reimaging. Guidelines recommend reimaging for UPD after 4-8 weeks. Study protocols for BiTE therapies for lymphoma required reassessment (rescan) between 4 to 12 weeks.[14]
- If a patient has confirmed, unequivocal new lesions (progression of disease, PD), additional doses of BiTE therapies for lymphoma are not coverable. If a new lesion is equivocal, UPD reassessment by the treating oncologist, with repeat tumor assessment, with imaging and/or re-biopsy, would apply (as noted above).

Investigational Uses [15-17]

- There are ongoing studies evaluating the BiTE therapies in other types of B-cell lymphomas. However, benefit in the treatment of conditions other than the large B-cell lymphoma subtypes listed in the coverage criteria has not yet been established.
    * Lunsumio (mosunetuzumab) is currently only indicated as a monotherapy. Future studies are planned which combine it with other medications such as lenalidomide; however, the safety and efficacy of these combinations is not yet established.
    * Columvi (glofitamab) was evaluated in DLBCL NOS in the second- and subsequent-line setting where it was compared with chemotherapy (R-GemOx). Although the study reported an overall OS advantage with Columvi (glofitamab) it was largely driven by patients enrolled in Asia. In patients enrolled in European and N. American sites the OS advantage appeared to favor R-GemOx.
    * Columvi (glofitamab) is also being evaluated in mantle cell lymphoma (MCL); however, there are no comparative data or outcomes data to support a benefit in this setting.

Safety and Tolerability [1,2,6]

- All BiTE therapies for B-cell lymphoma have a Box Warning describing the risk of cytokine release syndrome (CRS). Epkinly (epcoritamab) and Lunsumio (mosunetuzumab) have an additional Box Warning for immune effector cell-associated neurotoxicity (ICANS). Like CAR T-cell therapies, BiTE therapies for B-cell lymphoma should only be administered by qualified healthcare professionals with experience and appropriate medical support to manage these toxicities.
- The most common serious adverse events associated with the BiTE therapies for B-cell lymphoma include cytokine release syndrome (CRS), sepsis, fever and neutropenia, and tumor flare.
- In clinical trials, tocilizumab (Actemra) (+/- corticosteroids) was used for management of CRS.

Dosing and Administration [1,2,6]

- The BiTE therapies for B-cell lymphoma require hospitalization when therapy is initiated.
- Epkinly (epcoritamab) is administered via subcutaneous injection. Columvi (glofitamab) is given via intravenous infusion over two to four hours.
- <u>For Columvi (glofitamab) – DLBCL and Large B-cell lymphoma arising from FL</u>:
    * Given for a maximum of 12 cycles [cycles are 21 days each]
    * Cycle 1 consists of two test infusions (“step up dose 1” and “test dose 2”), followed by 11 maintenance doses, given once every 21-day cycle.
    * A single infusion of Gazyva (obinutuzumab) is given prior to initiating therapy with Columvi (glofitamab) to deplete circulating and lymphoid tissue B cells to reduce the incidence and severity of CRS.

- For Epkinly (epcoritamab) for DLBCL, HGBCL, and FL:
  * Cycle 1:
    - For DLBCL and HGBCL: Cycle 1 consists of two test infusions ("step up dose 1" and "step up dose 2"), followed by two maintenance doses, to complete the first 28-day cycle. For FL: Cycle 1 consists of three test infusions ("step up dose 1," "step up dose 2," and "step up dose 3"), followed by one maintenance dose, to complete the first 28-day cycle.
  * Cycle 2 and 3: four doses in each 28-day cycle.
  * Cycles 4 to 9: two doses per 28-day cycle.
  * Cycles 10 and beyond: one dose per 28-day cycle

Table 3. Epkinly doses per cycle -DLBCL, HGBCL, and FL [a]

	Doses per cycle		**Doses per cycle**
Cycle 1	4 doses	**Cycle 7**	2 doses
Cycle 2	4 doses	**Cycle 8**	2 doses
Cycle 3	4 doses	**Cycle 9**	2 doses
Cycle 4	2 doses	**Cycle 10**	1 dose
Cycle 5	2 doses	**Cycle 11**	1 dose
Cycle 6	2 doses	**Cycle 12**	1 dose
Authorization #1	**18 doses**	**Authorization #2**	**9 doses**

[a] Authorization #3 (and beyond): six doses per 24 weeks.

- For Lunsumio (mosunetuzumab) for FL:
  * Given on Day 1 of each 21-day cycle.
  * Cycle 1 consists of two test infusions ("step up dose 1" on day 1 and "test dose 2" on day 8), followed by one maintenance dose, to complete the first 21-day cycle.
  * Cycles 2 to 8: one dose per 21-day cycle.
  * Lunsumio (mosunetuzumab) is given for an initial 8 cycles at which point response to therapy is assessed.
    - If the patient has a complete response to therapy, no additional medication is given.
    - If there is a partial response or stable disease, up to nine additional cycles (Cycles 9 to 17) of Lunsumio (mosunetuzumab) may be administered (total of 17 cycles).
  * Refer to the Lunsumio (mosunetuzumab) prescribing information for the specific information regarding dose, dosing intervals, and infusion times.

Table 4. Lunsumio (mosunetuzumab**) doses per cycle - FL**

Revision History

Revision Date	Revision Summary
3/6/2025	No changes to coverage criteria with this annual review.
12/12/2024	**Effective 1/15/2025:** • Add coverage for Epkinly (epcoritamab) for relapsed or refractory follicular lymphoma (new indication). • Add Lunsumio, mosunetuzumab-axgb, another BiTE for B-cell lymphoma (archive dru745) and modified criteria to align with Epkinly (epcoritamab), for administrative purposes (no change to intent).
9/19/2024	**Effective 1/1/2025:** • Changed all approvals from every 12 months to every 24 weeks (six months). Ongoing therapy (beyond 24 weeks) will be subject to reauthorization review every 24 weeks, for documentation of disease stability or improvement and lack of disease progression. Update Quantity Limits to align with authorization periods. • Added additional clarification for Columvi (glofitamab) surrounding authorization limits stating coverage will be provided for up to 12 months or until disease progression (as per FDA-approved dosing).
3/21/2024	Added additional clarification for Columvi (glofitamab) surrounding authorization limits stating coverage will be provided for up to 12 months or until disease progression (as per FDA-approved dosing).
12/7/2023	Updated Epkinly (epcoritamab) continued authorization criteria to include the language "until disease progression" for consistency across other oncology policies.
9/14/2023	New policy (effective 10/15/2023). • Limits coverage of BiTE therapies for diffuse large B-cell lymphoma (DLBCL) when used as monotherapy as follows: - ***Epkinly (epcoritamab):*** Coverable for CD20-positive, relapsed or refractory DLBCL not otherwise specified (NOS) [including DLBCL arising from low-grade lymphoma] and high-grade B-cell lymphoma (HGBCL) when disease has progressed on or after at least two prior systemic lymphoma therapies. - ***Columvi (glofitamab):*** Coverable for CD20-positive relapsed or refractory DLBCL NOS, or large B-cell lymphoma (LBCL) arising from follicular lymphoma (FL) when disease has progressed on or after at least two prior systemic lymphoma therapies. • Sequential use of BiTE therapies for DLBCL has not been studied or shown to be effective and is therefore not coverable.

Drug names identified in this policy are the trademarks of their respective owners.

Medication Policy Manual | **Policy No:** dru762

Topic: Complement Inhibitors for the Eye | **Date of Origin:** July 15, 2024

- Izervay, avacincaptad pegol
- Syfovre, pegcetacoplan

Committee Approval Date: June 20, 2024 | **Next Review Date:** 2024

Effective Date: July 15, 2024

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Syfovre (pegcetacoplan) and Izervay (avacincaptad pegol) are intravitreal (directly into the eye) complement inhibitors used for the treatment of geographic atrophy (GA) secondary to age-related macular degeneration (AMD).

Policy/Criteria

Most contracts require pre-authorization approval of Complement Inhibitors for the Eye (as listed in Table 1) prior to coverage.

I. Continuation of therapy (COT): Complement Inhibitors for the Eye (as listed in Table 1) may be considered medically necessary for COT when criterion A, B, or C below is met.

A. For diagnoses NOT listed in the coverage criteria below, full policy criteria must be met for coverage.

OR

B. For diagnoses listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

C. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

Please note*: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Complement Inhibitors for the Eye (as listed in *Table 1*) may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) confirming that criteria A and B below are met:

A. A diagnosis of **geographic atrophy (GA) secondary to age-related macular degeneration (AMD) only** has been established by a specialist in ophthalmology.

AND

B. **For Izervay (avacincaptad pegol) only:** There is clinical documentation (including, but not limited to chart notes) that the GA secondary to AMD is located outside of the foveal center (see *Appendix 1* for terminology).

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers Complement Inhibitors for the Eye (as listed in *Table 1*) coverable only under the medical benefit (as provider-administered medications).

B. When pre-authorization is approved, Complement Inhibitors for the Eye will be authorized for 12 months, in quantities outlined in *Table 1*.

TABLE 1. Complement Inhibitors for the Eye

Product	Quantity Limit			
Syfovre (pegcetacoplan) 15mg (0.1ml of 150mg/ml solution)	Single eye treated		Both eyes treated	
	Monthly injection	Every Other Month injection	Monthly injection	Every Other Month injection
	1 vial per 25 days	1 vial per 60 days	2 vials per 25 days	2 vials per 60 days
Izervay (avacincaptad pegol) 2mg (0.1ml of 20mg/ml solution)	Single eye treated Monthly injection		Both eyes treated Monthly injection	
	1 vial per 28 days		2 vials per 28 days	

C. Continued Authorization:

a. **For Syfovre (pegcetacoplan) only**: Authorization **shall** be reviewed at least annually. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, such as disease stability or improvement, such as a reduction in progression of geographic atrophy lesion area size relative to baseline.

b. **For Izervay (avacincaptad pegol) only**: No continued authorization will be granted after a one-year total duration of therapy, per the current prescribing information for Izervay (avacincaptad pegol).

IV. Complement Inhibitors for the Eye (as listed in Table 1) are considered investigational when used for all other conditions, including but not limited to:

A. Geographic atrophy secondary to Stargardt disease

B. Geographic atrophy secondary to cone rod dystrophy

C. Geographic atrophy secondary to toxic maculopathies

D. Geographic atrophy secondary to ANY condition OTHER THAN age-related macular degeneration (AMD).

Position Statement

Summary

- The intent of this policy is to allow coverage for Complement Inhibitors for the Eye (as listed in Table 1) for the treatment of geographic atrophy secondary to age-related macular degeneration, when the diagnosis has been established by a specialist in ophthalmology, up to the doses shown to be safe and effective in clinical trials.
- Syfovre (pegcetacoplan), a C3 protein complement inhibitor, was evaluated in two phase 3 trials (OAKS and DERBY) and found to reduce GA lesion growth with either monthly or every other month injections. The trials evaluated a *broad* geographic atrophy (GA) population, involving patients with ***both*** extrafoveal (GA lesion border more than 1 micrometer from foveal center point) and foveal (GA lesion present at the center point of fovea) geographic atrophy secondary to age-related macular degeneration (AMD). [1 2]
- Izervay (avacincaptad pegol),a C5 protein complement inhibitor, was evaluated in two, phase 3 trials and found to reduce GA lesion growth with monthly injections. These two trials evaluated ***only*** subjects with non-foveal (see *Appendix 1*) geographic atrophy secondary to age-related macular degeneration. [3-6]
- Pivotal trials had high rates of discontinuation and ocular adverse events, due to treatment being given by intravitreal administration.
- The safety and efficacy of Syfovre (pegcetacoplan) and Izervay (avacincaptad pegol) in the treatment of geographic atrophy secondary to any condition *other than* age-related macular degeneration (AMD) is unknown. Pivotal trials excluded subjects with geographic atrophy secondary to any other condition, other than age-related macular degeneration.
- In clinical trials, both Syfovre (pegcetacoplan) and Izervay (avacincaptad pegol) were associated with *new onset* neovascular (wet) AMD (nAMD), prompting additional treatment with vascular endothelial growth factor (VEGF) inhibitors.
- There are no head-to-head trials comparing Syfovre (pegcetacoplan) and Izervay (avacincaptad pegol) to one another.
- Complement Inhibitors for the Eye may be covered for the doses shown to be safe and effective in clinical trials.
- Izervay (avacincaptad pegol) may be covered for up to 1 year of treatment (per current prescribing information). The safety and effectiveness of higher, more frequent doses or treatment duration longer than 1 year have not been established.

Disease Background (see Appendix 1 for Terminology)

Geographic Atrophy (GA) Secondary to Age-related Macular Degeneration (AMD)

- Geographic atrophy is a late-stage (advanced) form of dry age-related macular degeneration characterized by the expansion of atrophic lesions in the outer retina which cause progressive and irreversible loss of photoreceptors, retinal pigment epithelium (RPE) and choriocapillaris (the dense network of capillaries that nourishes the outer layers of the retina). Lesions often begin in the extrafoveal regions and expand

to the fovea (center of the macula where vision is the sharpest) later in the disease (median 2.5-year timeframe from non-foveal to foveal progression). [1 7 8]

- Several lesion characteristics determine the rate of GA progression: baseline GA lesion size (larger lesions progress faster), lesion focality (multifocal lesions have higher progression rates than unifocal lesions), lesion location (non-foveal lesions progress faster than foveal lesions), and bilateral GA (more rapid progression if present in both eyes). [7]
- The goal of treatment with complement inhibitors for the eye is preservation of functional retinal cells by reduction of lesion area size, thereby slowing progression of the disease.

Clinical Efficacy

Syfovre (pegcetacoplan)

- At 24 months, the OAKS and DERBY trials showed statistically significant results in favor of Syfovre (pegcetacoplan) compared to placebo for the reduction of lesion area size, in subjects ≥60 years old (mean 78 years of age), with unifocal and multifocal, foveal and non-foveal, predominantly bilateral geographic atrophy, without choroidal neovascularization (CNV) in the treated eye only (subjects could have CNV in the fellow eye, which is a risk factor for developing CNV in the treated eye) at baseline. [1 2 9]
- In the OAKS trial, at 24 months, treatment with Syfovre (pegcetacoplan) showed a 22% and 18% lesion area growth reduction in the monthly and every other month injection frequencies, respectively.[1]
- In the DERBY trial, at 24 months, treatment with Syfovre (pegcetacoplan) showed a 19% and 16% lesion area growth reduction in the monthly and every other month injection frequencies, respectively. [2]
- Between the two trials, efficacy was higher for Syfovre (pegcetacoplan) treatment with *monthly* injections, compared to every other month injections, however, overall adverse events were higher in the monthly injection cohort as well.
- Per literature report and expert feedback, the use of an anatomical endpoint (lesion area size reduction) is appropriate in GA given the significance of lesions in the progression of GA secondary to AMD. It is a reproducible endpoint with correlation to disease progression and severity.
- Epidemiological studies, literature reports and expert feedback have estimated that more than a 20% reduction in lesion area size would have clinical benefit in retinal tissue structure preservation, if not visual acuity
- In the OAKS and DERBY trials, no statistically significant difference was noted in the secondary endpoints that measured visual function, including best corrected visual acuity (BCVA). Per literature reports and expert feedback, BCVA often underrepresents functional deficits in geographic atrophy due to foveal sparing in some patients; there is not a strong correlation between BCVA changes and lesion size, and BCVA is a poor metric of visual function in geographic atrophy secondary to AMD. [1 2 10]

Izervay (avacincaptad pegol)

- At 12 months, the GATHER1 and GATHER2 trials showed statistically significant results in favor of Izervay (avacincaptad pegol) compared to placebo for the reduction of growth rate in lesion area size, in subjects ≥50 years old (mean age 78 years), with unifocal and multifocal lesions, *only non-foveal* lesions, predominantly bilateral geographic atrophy, without choroidal neovascularization in *either* eye (treated or fellow) at baseline. [3-6 11]
    * In GATHER1, at 12 months, the reduction in the mean GA growth rate was 27.4 % (p=0.0072) for the Izervay (avacincaptad pegol) 2 mg group compared to its corresponding sham-treated group.[3]
    * In GATHER2, at 12 months, the reduction in the mean GA growth rate was 14% (p=0.0064) for the Izervay (avacincaptad pegol) 2mg treatment group compared to the sham group. [6]
    * In the GATHER1 and GATHER 2 trials, no statistically significant difference was noted in the secondary endpoints that measured visual function, including best corrected visual acuity (BCVA). [3-6]
- Safety and efficacy data for the use of Izervay (avacincaptad pegol) in the treatment of GA secondary to AMD beyond 12 months is still pending and unpublished.

Investigational Uses

There is insufficient evidence to establish the efficacy of Syfovre (pegcetacoplan) or Izervay (avacincaptad pegol) for the treatment of other conditions, including but not limited to geographic atrophy (GA) secondary to Stargardt disease, GA secondary to cone rod dystrophy, GA secondary to toxic maculopathies, or GA secondary to any disease other than age-related macular degeneration. Subjects with geographic atrophy secondary to any other condition, other than age-related macular degeneration, were excluded from the approval trials for Syfovre (pegcetacoplan) and Izervay (avacincaptad pegol). Therefore, it is unknown whether Syfovre (pegcetacoplan) and Izervay (avacincaptad pegol) are effective and safe in treating geographic atrophy resulting from conditions other than AMD.

Safety[12 13]

- In pivotal trials for Syfovre (pegcetacoplan) and Izervay (avacincaptad pegol), adverse events occurred at high rates in both the active treatment and sham-treated groups. In the trials, new onset wet AMD (or CNV) occurred at a higher rate in the active treatment groups compared to the sham-treated groups, at a rate of 12% for both Syfovre (pegcetacoplan) and Izervay (avacincaptad pegol) at 24 and 18 months, respectively. Other common adverse events noted in pivotal trials were increased intraocular pressure, conjunctival hemorrhage, blurred vison, vitreous floaters, and eye pain.

Dosing [12 13]

Medication	Dose	Frequency	Maximum Treatment Duration
Syfovre (pegcetacoplan)	15 mg (0.1ml of 150mg/ml solution) into each affected eye	Monthly (every 25 days) **OR** every Other Month (every 60 days)	NONE
Izervay (avacincaptad pegol)	2 mg (0.1 ml of 20mg/ml solution) into each affected eye	Monthly (every 28 days)	1 year maximum per prescribing information

Appendix 1: Terminology

Terminology	**Synonyms/Definitions**
Geographic atrophy	Advanced (late) stage dry AMD (atrophic lesions in the retina cause progressive degeneration of photoreceptors, retinal pigment epithelium, and choriocapillaris).
Dry age-related macular degeneration (dry AMD)	Non-exudative AMD, non-neovascular AMD, atrophic AMD
Foveal	Sub-foveal
Non-Foveal*****	Extrafoveal, perifoveal, outside of the fovea
Bilateral	In both eyes
Unilateral	In a single eye
Multifocal	Multiple lesions
Unifocal	Single lesion
Choriocapillaris	Capillaries that nourish the outer layers of the retina
Wet age-related macular degeneration (wet AMD)	Exudative AMD, neovascular AMD, choroidal neovascularization (CNV)

*** Izervay is covered ONLY for non-foveal geographic atrophy secondary to AMD**

Medication Policy Manual

Policy No: dru766

Topic: Gene therapies for sickle cell disease

- Casgevy (exagamglogene autotemcel)
- Lyfgenia (lovotibeglogene autotemcel)

Date of Origin: January 15, 2024

Committee Approval Date: June 20, 2024

Next Review Date: 2025

Effective Date: July 15, 2024

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of medication policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Medications in this policy are gene therapies approved by the FDA to treat sickle cell disease (SCD).

PLEASE NOTE:

This policy does not apply to Casgevy (exagamglogene autotemcel) for use in beta thalassemia. Please refer to policy dru698 gene therapies for beta thalassemia for coverage details.

Policy/Criteria

Most contracts require pre-authorization of gene therapies for sickle cell disease (SCD) prior to coverage.

I. Gene therapies for SCD are considered investigational, except for those situations specifically addressed in the policy criteria below.

PLEASE NOTE: Under this criterion, any products not specifically addressed in this policy will be considered investigational.

II. Continuation of therapy (COT): Gene therapies for SCD may be considered medically necessary for COT when full policy criteria below are met, including quantity limit. However, Gene therapies for SCD are not coverable for repeated doses and are not coverable if a patient has previously received prior gene therapy for SCD.

***Please note**: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

III. New starts (treatment naïve patients): Gene therapies for SCD may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) that criteria A and B below are met.

A. A diagnosis of **sickle cell disease** (SCD), established by a hematologist, when there is clinical documentation that all criteria (1 through 5) below are met:

1. The SCD is genetically confirmed as having the **HbSS genotype**.

AND

2. The patient is 12 years of age or older at the time of infusion.

AND

3. Standard therapy with hydroxyurea is ineffective after at least 6 months of therapy, unless not tolerated, or use is contraindicated. If unable to tolerate hydroxyurea, dose lowering attempts must be made to achieve the maximally tolerated therapeutic doses.

AND

4. Documentation of at least two vaso-occlusive crises (VOCs) in the prior 12-month period (as defined in *Appendix 1*).

AND

5. No prior hematopoietic stem cell transplantation (HSCT).

AND

B. The patient is a suitable candidate for gene therapies for SCD and meets all of the following criteria (1, 2, and 3) below:

1. No prior use of gene therapy (see *Appendix 2*).

AND

2. Patient is fit for therapy, as defined by meeting all the criteria (a, b, and c) below.

a. The patient has a Karnofsky or Lansky performance status (KPS) of at least 80 (or ECOG performance status of 0 or 1; the patient is ambulatory and able to carry out work of a light or sedentary nature).

AND

b. The patient has adequate and stable kidney, liver, and cardiac function (provider attestation).

AND

c. The patient has no active systemic infections (including, but not limited to HCV, HBV, and HIV infection) (provider attestation).

AND

3. Treatment with HSCT is contraindicated (including, but not limited to lack of a Human leukocyte antigen (HLA) matched related donor, comorbidities, and age).

PLEASE NOTE: Suitability for gene therapy must be documented in recent clinical documentation (such as in chart notes, laboratory reports), which MUST include evaluation for HSCT [bone marrow transplant (BMT)].

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers Gene Therapies for SCD coverable only under the medical benefit (as provider-administered medications).

B. When pre-authorization is approved, Gene Therapies for SCD will be authorized in quantities of one treatment course per lifetime.

C. Additional infusions of Gene Therapies for SCD will not be authorized.

IV. Investigational Uses

A. Repeated doses of Gene Therapies for SCD or any other gene therapy products for SCD, including for gene therapy previously given as part of a clinical trial.

B. Unless otherwise specified in the coverage criteria above, Gene therapies for SCD are considered investigational when used for all other conditions, including, but not limited to:

1. ***Lyfgenia (lovotibeglogene autotemcel) only:*** Beta-thalassemia.

2. SCD genotypes other than HbSS.

3. Use in combination with another gene therapy for SCD.

Position Statement

Summary

- Gene therapies for sickle cell disease (SCD) are ex-vivo therapies that have received FDA approval and include the following:
    * Casgevy (exagamglogene autotemcel), a novel clustered regularly interspaced short palindromic repeats **(**CRISPR) and Cas9 gene-editing cell therapy, that targets BCL11A gene to increase production of fetal Hb.
    * Lyfgenia (lovotibeglogene autotemcel) uses a lentiviral vector to encode a functional copy of the beta globin gene, to produce anti-sickling hemoglobin (Hb).
- Gene therapies for SCD are a one-time IV infusion. However, they are very complex, high-cost therapy and require several phases of administration, extended hospitalization, and extensive supportive care, similar to a hematopoietic stem cell transplant (HSCT).
- The intent of this policy is to allow for coverage of gene therapies for SCD in patients with refractory SCD, a confirmed HbSS genotype, multiple vaso-occlusive crises (VOCs) per year despite standard SCD therapy, and who are clinically suitable to receive gene therapies for SCD.
- Current available evidence for gene therapies for SCD is limited to small, single-arm, non-randomized trials that evaluated freedom from severe VOCs.
    * At the most recent data analyses of the pivotal trials for Casgevy and Lyfgenia, a majority of patients were severe VOC-free for a year or more.
    * However, the long-term impact of these gene therapies for SCD on other clinically relevant outcomes, such as overall survival (OS), is currently unknown.
- SCD standard of care therapies, including hydroxyurea and HSCT, have proven long-term efficacy. However, they are not effective for all patients with SCD (recurrent VOCs despite treatment) or are not tolerated (hydroxyurea). In addition, many patients with SCD do not have an available HLA-matched related donor for HSCT or are not suitable candidates for HSCT. For these specific populations, the potential benefit of these gene therapies for SCD may outweigh the risks.
- Currently, there is insufficient evidence to establish the safety and efficacy in other settings, including other genotypes for SCD. Additional trials are ongoing.
- Gene therapies for SCD may be covered for up to one dose per lifetime. There is no data on the safety or efficacy of repeated doses, or use of more than one gene therapy for SCD.

Disease Background[1-3]

- Sickle cell disease (SCD), is a rare, recessive hemolytic anemia, caused by a mutation in the beta-globin gene. It is characterized by the formation of sickle hemoglobin (HbS), which is rigid and less flexible than fetal hemoglobin (HbF) or normal adult hemoglobin (Hb).
- Patients with SCD experience acute and chronic debilitating pain episodes as well as other events related to vaso-occlusion, referred to as vaso-occlusive crises/events (VOCs/VOEs). VOCs can lead to significant morbidity and mortality, with need for

acute care (unscheduled office visits, emergency department visits, and/or hospitalizations) and a negative impact on quality of life.

- Symptoms of SCD include episodes of severe pain, fatigue, anemia, acute chest syndrome (ACS), and infections, with chronic complications consisting of pulmonary hypertension, renal impairment, hepatotoxicity, splenic dysfunction, and stroke.

Clinical Efficacy

Casgevy (exagamglogene autotemcel)[1 4-6]

- The safety and efficacy of Casgevy (exagamglogene autotemcel) was established primarily on results from the ongoing CLIMB SCD-121 study (n=44), a small phase 2/3, non-randomized, open-label, single arm trial in patients with genetically confirmed SCD.
  - * Patients were aged 12 to 35
  - * All patients had severe SCD defined as at least two severe VOCs per year each of the previous two years, with the mean of VOC incidence for enrolled patients of 4.1 over the previous two years. Severe VOCs were defined as either an acute pain event requiring a medical office visit which included receiving pain medications or red blood cell transfusion (RBCTs), an ACS event, priapism ≥ 2 hours, or splenic sequestration.
  - * All patients were fit for Casgevy (exagamglogene autotemcel) therapy, defined as having a Karnofsky or Lansky performance status ≥ 80, adequate organ function, no active infections, clinically stable, and eligible for a HSCT but without an HLA-matched related donor. Patients with severe liver, renal, or cardiac dysfunction and those with a prior HSCT were excluded from trial enrollment.
  - * The trial enrolled of both HbSS and HbSβ^0 genotypes, However, 40 patients (91%) had an HbSS genotype while only three (7%) were HbSβ^0.
  - * The primary endpoint was the number of patients free from severe VOCs for 12 consecutive months.
  - * At the most recent available data cut-off (June 2023), 29 of the 31 eligible patients for the primary endpoint were severe VOC-free for 12 consecutive months (93.5%, P<0.0001), with the mean duration of effect of 22.3 months.
  - * The number of HbSβ^0 patients included in the most recent data cut is unknown. Given the limited number of patients with HbSβ^0 enrolled in the trial (n=3), the efficacy and safety of Casgevy (exagamglogene autotemcel) in patients with a genotype other than the HbSS genotype is unknown at this time.
  - * In the near future, additional follow up data is expected, further evaluating the durability and safety of Casgevy (exagamglogene autotemcel) in other SCD genotypes.
  - * Patients undergo myeloablative chemotherapy prior to Casgevy (exagamglogene autotemcel) infusion, with patients in the CLIMB 121-SCD trial requiring a median of 27 days of inpatient hospitalization from conditioning to discharge.

- At this time, the safety and efficacy of Casgevy (exagamglogene autotemcel) in SCD genotypes other than HbSS is uncertain. Therefore, the use of Casgevy (exagamglogene autotemcel) in any SCD genotype other than HbSS is considered investigational.

Lyfgenia (lovotibeglogene autotemcel)[1 7-9]

- The safety and efficacy of Lyfgenia (lovotibeglogene autotemcel) was established primarily from cohort C results in the ongoing HGB-206 study (n=36), a small phase 1/2 nonrandomized, open-label, single arm trial in patients with genetically confirmed SCD.
    * Patients in cohort C were aged 12 to 50. All patients had severe SCD defined as ≥ 4 severe vaso-occlusive crises (VOCs) in the previous two years, despite prior hydroxyurea use that had been treated for SCD for at least 24-months.
    * All patients were fit for Lyfgenia (lovotibeglogene autotemcel) therapy, defined as having adequate organ function, no active infections, and clinically stable. Patients with severe liver, renal, or cardiac dysfunction and those with a prior HSCT were excluded from trial enrollment.
    * The trial protocol allowed for enrollment of HbSS, HbSβ$^+$ and HbSβ^0 genotypes. However, all patients enrolled had an HbSS genotype.
    * The primary endpoint was the number of patients with complete resolution of severe vaso-occlusive events (VOEs) starting six months after the infusion until 18 months post infusion (one year free of severe VOEs).
    * Severe VOEs were defined as an event with no other cause than vaso-occlusion that required one of the following:
        - Hospital or ER visit that exceed 24 hours.
        - At least two visits to a day unit or ER during a 72-hour period (with both requiring IV treatment.
        - Priapism lasting more than two hours and leading to medical facility visit.
    * At the most recent available data cut-off (August 2022), 28 of the 32 patients eligible for the primary endpoint had complete resolution of severe VOEs for 12 consecutive months (88%), with the median follow up of duration of 32 months.
    * Given that HbSS genotypes were the only genotypes enrolled in the pivotal trial, the efficacy and safety of Lyfgenia (lovotibeglogene autotemcel) in patients with a genotype other than the HbSS genotype is unknown at this time.
    * In the near future, additional follow up data is expected, further evaluating the durability and safety of Lyfgenia (lovotibeglogene autotemcel) in other SCD genotypes.
    * Patients undergo myeloablative chemotherapy prior to Lyfgenia (lovotibeglogene autotemcel) infusion, with patients in the HGB-206 trial requiring a median of 36 days of inpatient hospitalization from conditioning to discharge.
- At this time, the safety and efficacy of Lyfgenia (lovotibeglogene autotemcel) in SCD genotypes other than HbSS is unknown. Therefore, the use of Lyfgenia (lovotibeglogene autotemcel) in any SCD genotype other than HbSS is considered investigational.

Clinical Guidelines/Standard of Care Treatment[1-3]

- The treatment of patients with SCD requires a multidisciplinary approach due to the number of complications associated with the disease.
- Current treatment approaches for patients with SCD mainly address reducing vaso-occlusive crises (VOCs), both frequency and severity.
- Guidelines recommend hydroxyurea as first-line treatment, for at least six months at the maximum tolerated dose. Clinical response to hydroxyurea may take up to six months.
- Other available treatment options for SCD include Oxbryta (voxelotor), Adakveo (crizanlizumab), and Endari (L-glutamine). However, none of these medications are included in guidelines. All have shown less efficacy when indirectly compared to hydroxyurea.
- The key components of symptomatic relief consist of red blood cell transfusion (RBCTs) and analgesics.
- Currently, HSCT is the only proven cure for SCD (>90% success rate), with the greatest benefit seen in young patients. Guidelines recommend HLA-matched related HSCT in patients with recurrent VOCs despite optimal standard of care.
- However, use of HSCT is limited by availability of HLA-matched related donors. Only 15-20% of eligible patients will have a matched related donor. and the clinical stability of the patient being treated (adequate organ function, comorbidities, age etc.).

Safety[1 4 8]

- The most common grade ≥ 3 treatment-emergent adverse events (AEs) seen during pivotal trials with gene therapies for SCD were thrombocytopenia, neutropenia, anemia, leukopenia, febrile neutropenia.
- The AEs noted above are consistent with those typically seen with the myeloablative conditioning regimen used prior to the gene therapy for SCD infusion.
- Long-term safety data is very limited as these trials are still ongoing, with a small sample size and a short treatment duration for a chronic disease.
- Additional safety data is needed to establish potential long-term toxicities that may be associated with these novel gene therapies for SCD, including the risk for malignancies or off target mutations.

Appendix 1:

Definition of vaso-occlusive crises (VOCs)[1]
Any event having no other cause than vaso-occlusion resulting in one of the following: - Acute pain episode/crises severe enough to require a visit to a medical facility for which the patient received either pain medication and/or a red blood cell transfusion (RBCT). - Acute chest syndrome. - Priapism ≥ 2 hours - Splenic or hepatic sequestration

Appendix 2:

Gene Therapies [a]
- Casgevy (exagamglogene autotemcel) - Lyfgenia (lovotibeglogene autotemcel) - Zynteglo (betibeglogene autotemcel) - Chimeric antigen receptor (CAR) T-cell therapies - Roctavian (valoctocogene roxaparvovec) - Hemgenix (etranacogene dezaparvovec)

[a] Including, but not limited to these gene therapies

Medication Policy Manual **Policy No:** dru773

Topic: Medications for molluscum contagiosum **Date of Origin:** April 15, 2024

- Ycanth, cantharidin topical solution
- Zelsuvmi, berdazimer topical gel

Committee Approval Date: September 19, 2024 **Next Review Date:** 2025

Effective Date: December 1, 2024

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Medications included in this policy are used for the treatment of molluscum contagiosum (MC), a common viral infection of the skin resulting in the formation of raised lesions.

Policy/Criteria

Most contracts require pre-authorization approval of medications for molluscum contagiosum prior to coverage.

I. Continuation of therapy (COT): Medications for molluscum contagiosum (as listed in *Table 1*) may be considered medically necessary for COT when full policy criteria below are met, including diagnostic criteria (at baseline), and quantity limit.

Please note: *Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Medications for molluscum contagiosum (as listed in *Table 1*) may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) that following criterion A and B below are met.

A. A **diagnosis of molluscum contagiosum (MC)** has been established and criteria 1 or 2 below are met:

1. MC lesions have been present for at least 6 months.

OR

2. The MC lesions are extremely bothersome due to itching, pain, location, concern for spread, concomitant atopic dermatitis, or a bacterial infection. (provider attestation)

AND

B. The **existing** MC infection has not previously been treated with a medication for MC listed in this policy (see *Table 1*).

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers Ycanth (cantharidin solution) coverable only under the medical benefit (as a provider-administered medication).

B. Pharmacy Services considers Zelsuvmi (berdazimer gel) coverable only under the pharmacy benefit (as self-administered medication).

C. When pre-authorization is approved, medications for molluscum contagiosum will be authorized in the following quantities as outlined in *Table 1* below.

Table 1: Medications for molluscum contagiosum

Product	Quantity Limit
Ycanth (cantharidin solution)	Up to 8 applicators (one treatment course) per year (max 2 applicators every 21 days for 12 weeks).
Zelsuvmi (berdazimer gel)	Up to 3 cartons (one treatment course) per year (1 carton every 4 weeks for 12 weeks).

IV. Medications for molluscum contagiosum (MC) are considered investigational when used for all other conditions, including but not limited to:

A. Treatment of MC lesions beyond 12 weeks.

B. Sequential use for the same infection, or combination use with each other (see *Table 1* for included products).

Position Statement

Summary

- Medications for molluscum contagiosum (MC) are topically administered medications approved for the treatment of MC and include the following:
  * Ycanth (cantharidin), a blistering agent (vesicant), available as a solution that must be applied by a trained healthcare provider.
  * Zelsuvmi (berdazimer), a nitric oxide releasing agent, available as a gel that can be applied at home.
- The intent of the policy is to allow coverage of medications for MC in patients with a confirmed diagnosis of MC, when lesions are persistent or extremely bothersome, and have not been previously treated with a medication for MC, as detailed in the above coverage criteria.
- Medications for MC received full approval by the FDA based on significant improvement in the percent of patients achieving complete clearance of MC lesions after 12 weeks compared to vehicle, a relevant endpoint in MC that is considered clinically curative. However, due to the self-resolving nature of MC and the small sample size of the trials, the true clinical impact of medication for MC is uncertain.
- MC is a self-limiting disease and typically resolves in six to twelve months. In healthy patients, treatment is frequently not needed. Therefore, treatment of non-bothersome lesions prior to 6 months is not covered.
- The effectiveness of one medication for MC (as listed in *Table 1*) relative to another is unknown, given the lack of comparative clinical trials.
- Medications for MC may be covered at the doses proven to be safe and effective in the clinical trials (as outlined in *Table 1* of the coverage criteria above). The safety and effectiveness of higher doses, use beyond 12 weeks, and repeat dosing for the same infection has not been established.
- Use of medications for MC in clinical settings other than described in the coverage criteria is considered investigational.

Disease Background [1-3]

- MC is a common, highly contagious, viral infection of the skin, primarily affecting children. It is characterized by small, smooth, and firm lesions on the skin.
- Transmission of MC is common and occurs through direct patient-to-patient contact and can be spread to other parts of one's own body. MC remains contagious until the lesions resolve, which is when the disease is considered cured.
- In most healthy patients, MC is self-resolving without scaring in 6-12 months; however, it can persist for much longer.

- MC lesions are typically benign. However, patients can still suffer discomfort due to itching, pain, secondary bacterial infections, worsening of atopic dermatitis (AD) or potential scarring.
- Currently, no consensus guidelines exist for treatment of MC due to the self-limiting nature of the infection. However, the American Academy of Dermatology (AAD) and the Centers for Disease Control and Prevention (CDC) state treatment of MC may be recommended in patients that have extremely bothersome lesions due to itching, pain, genital location, history of underlying atopic disease, concurrent bacterial infection, or a concern for spread.

Clinical Efficacy

Ycanth (cantharidin) solution for MC[1 4 5]

- The efficacy of Ycanth (cantharidin) was established by two identical phase 3, multicenter, randomized, double-blind, vehicle-controlled trials (CAMP-1 and CAMP-2), which included a total of 528 adult and pediatric patients with MC.
    * All patients were ≥ 2 years of age and had a diagnosis of MC with treatable lesions (lesions close to mucosal membranes or eyelids were excluded).
    * Patients had an average age of 7 years, lesion count of 21, and had been diagnosed with MC for over 4 months.
    * Patients were randomized 3:2 to receive Ycanth (cantharidin) or a vehicle control to be applied every 3 weeks in office for a maximum 4 applications (days 0, 21, 42 and 63).
    * The primary endpoint in both trials was the percent of patients achieving complete clearance of all treatable MC lesions (present at baseline or appearing during trial) compared to the vehicle control at day 84, a clinically meaningful endpoint in MC as complete clearance of lesions is considered clinically curative.
- Ycanth (cantharidin) demonstrated significant rates of improvement in the percentage of patients achieving a complete clearance of treatable MC lesions compared to the vehicle control at 84 days in both CAMP-1 and CAMP-2 trials (29% and 40% improvement over vehicle respectively.)
- However, short trial duration, lack of an active comparator, and the self-resolving nature of MC limit the certainty of effect with Ycanth (cantharidin) treatment.
- Efficacy and safety of Ycanth (cantharidin) use past 12 weeks is unknown and is considered investigational.

Zelsuvmi (berdazimer) gel for MC[6-8]

- The efficacy of Zelsuvmi (berdazimer) was established from the results of two phase 3, multicenter, randomized, double-blind, vehicle-controlled trials: the pivotal B-SIMPLE4 trial and the supportive B-SIMPLE2 trial. These trials included a total of 1,246 adult and pediatric patients with MC, with the majority of those included in the larger more robust B-SIMPLE4 trial (n=891).
    * All patients were at least 6 months of age and had a diagnosis of MC with 3-70 lesions (lesions close to mucosal membranes or eyelids were excluded).
    * Patients had an average age of 6.6 years, lesion count of 20, and had been diagnosed with MC for of over 6 months.

    * Patients were randomized 1:1 in B-SIMPLE4 or 2:1 in B-SIMPLE2 to receive Zelsuvmi (berdazimer) or a vehicle control to be applied once daily for a total of 12 weeks.
    * The primary endpoint in both trials was the percent of patients achieving complete clearance of all MC lesions (present at baseline or appearing during trial) compared to the vehicle control at week 12, a clinically meaningful endpoint in MC as complete clearance of lesions is considered clinically curative.
- Zelsuvmi (berdazimer) demonstrated significant rates of improvement in the percentage of patients achieving a complete clearance of MC lesions compared to the vehicle control at 12 weeks in the pivotal B-SIMPLE4 trial (13% improvement over vehicle).
- Although Zelsuvmi (berdazimer) showed an improvement over vehicle in the complete clearance of MC lesions in the supportive B-SIMPLE2 trial, it failed to meet statistical significance (9% improvement over vehicle, p=0.062)
- Short trial duration, lack of an active comparator, inconsistent efficacy results across trials, and the self-resolving nature of MC limit the certainty of effect with Zelsuvmi (berdazimer) treatment.
- Efficacy and safety of Zelsuvmi (berdazimer) use past 12 weeks is unknown and is considered investigational.

Investigational Uses[4 6 7]

- Medications for MC (see *Table 1*) use past 12 weeks, combination use, or sequential use of each product for the same infection has not been studied; therefore, use in these instances is considered investigational.

Safety[5]

- Ycanth (cantharidin) solution has warnings for toxicities associated with improper administration and flammability, even after drying. Therefore, it must be administered by a trained healthcare professional.

Revision History

Revision Date	Revision Summary
9/19/2024	No criteria changes with this annual review.
3/21/2024	New policy for medications for molluscum contagiosum: • Added newly FDA-approved Ycanth (cantharidin) solution and Zelsuvmi (berdazimer) gel, with intent to allow coverage of medications for MC in patients with a confirmed diagnosis of MC, in which lesions have been present for at least 6 months, or for lesions that are extremely bothersome, and have not been previously treated with a medication for MC as detailed in the above coverage criteria.

Drug names identified in this policy are the trademarks of their respective owners.

Medication Policy Manual | **Policy No:** dru774

Topic: Loqtorzi, toripalimab-tpzi | **Date of Origin:** April 15, 2024

Committee Approval Date: September 19, 2024 | **Next Review Date:** 2025

Effective Date: January 1, 2025

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Loqtorzi (toripalimab) is an intravenously administered immunotherapy used in the management of nasopharyngeal carcinoma (NPC). It belongs to a class of medications called programmed death receptor-1 (PD-1) blocking antibodies.

Policy/Criteria

Most contracts require pre-authorization approval of Loqtorzi (toripalimab) prior to coverage.

I. Continuation of therapy (COT): Loqtorzi (toripalimab) may be considered medically necessary for COT when criterion A, B, or C below is met.

A. For diagnoses NOT listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND there is documentation that the medication was covered by another health plan. Examples of documentation include the coverage approval letter from the previous health plan or paid claim.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

B. For diagnoses listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

C. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

Please note*: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Loqtorzi (toripalimab) may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) that criteria A, B, and C below are met:

A. A diagnosis of **nasopharyngeal carcinoma (NPC)**, recurrent locally advanced (unresectable) or metastatic.

AND

B. Loqtorzi (toripalimab) will be used in one of the following settings (1. or 2.):

1. In the first-line setting when both criteria (a and b) are met:

a. Used in combination with cisplatin and gemcitabine.

AND

b. No prior systemic therapy for recurrent or metastatic disease.

OR

2. In the subsequent-line setting when both criteria (a and b) are met:

a. Loqtorzi (toripalimab) is used as monotherapy.

AND

b. There has been disease progression on or after a platinum-containing chemotherapy regimen.

AND

C. No prior programmed death receptor-1 (PD-1) blocking antibody (PD-1 inhibitor) or programmed death-ligand 1 (PD-L1) blocking antibody (PD-L1 inhibitor) therapy. (see *Appendix 1*)

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy services considers Loqtorzi (toripalimab) coverable only under the medical benefit (as a provider-administered medication).

B. When pre-authorization is approved, Loqtorzi (toripalimab) will be authorized in the following quantities:

- ***In combination with chemotherapy:*** For 24 weeks in doses up to 240 mg every three weeks until disease progression, or for up to 24 months.
- ***As monotherapy:*** For 24 weeks in doses up to 3 mg/kg every two weeks until disease progression.

C. Reauthorization: Authorization **shall** be reviewed at least every 24 weeks for documented benefit. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met. Specifically, documentation that the medication is providing clinical benefit, including disease stability or improvement, and lack of disease progression, based on an assessment of change in tumor burden. If there is documentation of potential disease progression, a shortened authorization (up to three months) may be approved to allow time for clarification of response to Loqtorzi (toripalimab), including clinical re-evaluation of the patient and reimaging.

PLEASE NOTE: Additional doses of Loqtorzi (toripalimab) will not be authorized without a documented recent assessment by the treating provider (such as oncologist) with objective evidence of response to therapy, such as by re-imaging and use of iRECIST criteria.

IV. Loqtorzi (toripalimab) is considered investigational when used for all other conditions.

Position Statement

Summary

- Loqtorzi (toripalimab) is an intravenously administered programmed death receptor-1 (PD-1) blocking antibody. It is indicated for the treatment of adult patients with metastatic or locally advanced (unresectable) nasopharyngeal carcinoma (NPC).
- The intent of this policy is to cover Loqtorzi (toripalimab) in settings where it has been studied and shown to be safe and effective, as detailed in the coverage criteria, with consideration for other available treatment options.
    * Where there is lack of proven additional benefit and/or lack of demonstrated health outcome (such as overall survival or improved quality of life) relative to alternative therapies, use of Loqtorzi (toripalimab) alone or in combination with other therapies is not coverable ("not medically necessary" or "investigational").
    * It is important to note that the fact that a medication is FDA approved for a specific indication does not, in itself, make the treatment medically reasonable and necessary.
- Many of the clinical indications for immunotherapies (PD-1, PD-L1, and others) have been approved by the FDA and endorsed by clinical guidelines based on surrogate measures such as overall tumor response rate (ORR) and progression-free survival (PFS) which are not proven to accurately predict clinically important outcomes such as improved overall survival or improved quality of life.
- The initial approval for Loqtorzi (toripalimab) was based on trial data in locally advanced or metastatic NPC. NPC is classified as a head and neck cancer; however, it is generally more difficult to treat so patients with NPC have historically been excluded from head and neck cancer clinical trials. Loqtorzi (toripalimab) is currently the only PD-1 inhibitor therapy that has been specifically studied in patients with NPC.
- The National Comprehensive Cancer Network (NCCN) guidelines include Loqtorzi (toripalimab) among the recommendations for front- (in combination with chemotherapy) or subsequent-line (as a monotherapy) treatment of advanced NPC that is not amenable to curable surgery or curable radiotherapy.
- As with other PD-1/PD-L1 inhibitor therapies the primary adverse effects of concern with Loqtorzi (toripalimab) are immune-mediated toxicities (e.g., endocrinopathies, colitis, hepatitis).
- Loqtorzi (toripalimab) was studied and FDA approved in the doses listed in the product prescribing information. Use of doses or frequencies exceeding these quantities are considered investigational.
- Optimal sequencing of chemotherapy and immunotherapy in many cancers is unknown or the data is evolving. Currently, sequential use of immunotherapies is not supported by current evidence. Specifically, there is no evidence to support the sequential use of different PD-1 or PD-L1 inhibitors once there is disease progression on prior PD-1 or PD-L1 inhibitor therapy, as well as use of adjuvant PD-1/PD-L1 inhibitor after neoadjuvant PD-1/PD-L1 inhibitor therapy (unless explicitly listed in the coverage criteria). Therefore, the use of sequential courses of PD-1/PD-L1 immunotherapy is not coverable.

- There are ongoing studies using Loqtorzi (toripalimab) in a variety of other cancers. However, although initial evidence may be promising, the potential for clinical benefit in these conditions is still being investigated. Therefore, use in settings other than that which is described above are considered investigational.
- *Reauthorization Criteria*: When coverage criteria are met, Loqtorzi (toripalimab) is authorized for six months (24 weeks) of therapy, after which time documentation must be provided to establish that the medication is effective. Specifically, there must be documentation of clinical benefit, including disease stability or improvement and there is a lack of disease progression, based on an assessment of change in tumor burden.
    * The standard of care for evaluation of response to cancer immunotherapy, such as Loqtorzi (toripalimab), is use of the iRECIST criteria for assessment of tumor burden. [1]
    * The iRECIST criteria include use of quantitative and qualitative criteria for assessment of change in tumor burden for target lesions and non-target lesions. [2]
        - Quantitative measurements for target lesions (tumor size and % change)
        - Qualitative evaluation for non-target lesions (present/disappeared/ unequivocal progression)
    * Documentation of benefit must include an assessment of the most recent imaging ("restaging scans") by the treating oncologist. Given the complexity of the evaluation, including use of the iRECIST criteria, Loqtorzi (toripalimab) will not be reauthorized without an assessment of response to therapy, such a partial response (iPR), complete response (iCR), or stable disease (iSD).
    * Use of immunotherapy may result in pseudoprogression, due to immune and T-cell activation, which can appear similar to tumor flare. If there is documentation of potential disease progression ["unconfirmed progressive disease (iUPD)"], a shortened authorization (up to three months) may be approved to allow time for clarification of response to Loqtorzi (toripalimab), including clinical re-evaluation of the patient and reimaging. Guidelines recommend reimaging for iUPD after 4-8 weeks.
    * If a patient has confirmed, unequivocal new lesions (progression of disease, iPD), additional Loqtorzi (toripalimab) is not coverable. If a new lesion is equivocal, iUPD reassessment by the treating oncologist with repeat imaging would apply (as noted above).

Regence Pharmacy Services performs independent analyses of oncology medication evidence, to establish coverability per the contracts with the health plan.

- Most contracts define coverability based on established clinical benefit in published, peer-reviewed literature, along with consideration of regulatory status.
- FDA approval does not in itself establish medical necessity, as unpublished, low-quality evidence, including exploratory analyses and unvalidated surrogate endpoints, may be used as the basis of approval. Regulatory approval may or may not reflect clinical benefit relative to standard of care and the recommendations of expert clinical advisors such as the Oncologic Drugs Advisory Committee (ODAC). FDA approvals generally do not consider cost compared to established therapies, or value to members.

- Likewise, NCCN clinical practice guidelines assignment of a recommendation (category 1, 2a, or 2b) does not necessarily establish medically necessity. NCCN recommendations are inconsistently supported by published, peer-reviewed literature and do not uniformly consider value of new therapies relative to existing potentially higher-value treatment options, considering effectiveness, safety, and cost.
- Medication coverage criteria are developed based on the 'medical necessity' assessment, as described above.

Regence Pharmacy Services analysis and coverage policy may differ from FDA labeled indication and/or NCCN clinical practice guidelines.

Background [3 4]

- Nasopharyngeal carcinoma (NPC) is classified as a head and neck cancer; however, it differs in epidemiology, histology, natural history, and response to treatment. Because it is generally more difficult to treat than head and neck cancer, patients with NPC have been historically excluded from enrollment in head and neck cancer clinical trials.
- NPC is most prevalent in Southeast Asia, especially Southern China. It is much less common in the U.S. and Western Europe.
- The two most common histological subtypes of NPC are keratinizing squamous cell carcinoma (SCC) and non-keratinizing SCC. NPC with keratinizing histology is less responsive to radiation therapy and is associated with lower survival rates. This more difficult to treat histology makes up only 2% of cases in SE Asia, but up to 25% of cases in North America.
- NPC tends to metastasize early. At the time of diagnosis lymph node metastasis is present in 75% to 90% of cases, and distant metastasis is present in 5% to 11% of cases.

Clinical Efficacy

- The efficacy of Loqtorzi (toripalimab) in locally advanced (unresectable) or metastatic nasopharyngeal carcinoma (NPC) was evaluated in two pivotal studies:

  Front-line setting in combination with chemotherapy [JUPITER-02] [5]

  * This randomized, double-blind controlled trial enrolled patients with primary recurrent or metastatic NPC whose disease was not amenable to local/regional or curative treatment and who had no prior systemic therapy in this setting.
  * The study was conducted in Southeast Asia. Nearly all (99%) patients in the study had NPC with nonkeratinizing histology.
  * Seventy-five percent of patients had NPC tumors that were PD-L1 positive (≥1%).
  * Patients received either Loqtorzi (toripalimab) in combination with standard-of-care platinum-based chemotherapy or chemotherapy alone (placebo group).
  * Median progression-free survival (PFS) was 11.7 months and 8 months in the Loqtorzi (toripalimab) and placebo groups, respectively. The data for the overall survival endpoint is not mature.
  * Study limitations include lack of representation of tumors with keratinizing histology which is present in up to 25% of cases in the U.S., the high proportion (75%) of PD-L1-postive tumors which may have driven the PFS results, and the

use of a surrogate endpoint that has not been shown to predict improvement in clinical outcomes.

Subsequent-line setting as monotherapy [POLARIS-02] [6]

* This uncontrolled (single-arm) observational study enrolled patients with recurrent or metastatic (98%) NPC that progressed on or after standard-of-care platinum-based chemotherapy.
* The study was conducted in China. Nearly all (96%) patients had NPC with nonkeratinizing histology, the predominant histology in this geographic region.
* All patients received Loqtorzi (toripalimab) as monotherapy every two weeks until disease progression.
* The study evaluated tumor response as the primary endpoint. The objective response rate (ORR) was 20.5% with a complete response rate of 2.6%.
* Study limitations include high potential for bias due to single-arm study design, lack of representation of tumors with keratinizing histology which is present in up to 25% of cases in the U.S. and generally has poorer outcomes, and use of a surrogate endpoint which is not predictive of clinical benefit.

- NPC is considered a head and neck cancer; however, because it is more difficult to treat, patients with NPC have historically been excluded from head and neck cancer clinical trials. Loqtorzi (toripalimab) is the first PD-1 inhibitor to specifically be studied in NPC. Though it shows promise in this treatment setting, there is no data to date showing that it improves clinical outcomes such as overall survival or quality of life.

Guidelines [4]

- The National Comprehensive Cancer Network (NCCN) Head and Neck Cancer guideline lists Loqtorzi (toripalimab) among potential first- and subsequent-line therapy options for recurrent or metastatic NPC when surgery and radiation are not curative options.

Investigational Uses [7]

- Loqtorzi (toripalimab) is currently being studied in several other types of cancer including other head and neck cancers, such as squamous cell carcinoma of the head and neck (SCCHN), and small cell lung cancer (SCLC). However, to date, Loqtorzi (toripalimab) has not been shown to be an effective therapy for any other type of cancer.

Safety [8]

- The primary adverse effects (AEs) of interest for Loqtorzi (toripalimab) include immune-mediated reactions and infusion reactions. Immune-related AEs can affect any organ system or tissue (e.g., colitis, pneumonitis, hepatitis, endocrinopathies, nephritis with renal dysfunction, and dermatologic reactions).
- Overall, the safety of Loqtorzi (toripalimab) appear to be similar to other PD-1 and PD-L1 inhibitors.

Dosing *[8]*

- Loqtorzi (toripalimab) is given via intravenous infusion over 30 to 60 minutes.
- When given in combination with chemotherapy Loqtorzi (toripalimab) is given in a dose of 240 mg every three weeks until disease progression, or for a maximum of 24 months. As a monotherapy it is dosed as 3 mg/kg every two weeks until disease progression.

Revision History

Revision Date	Revision Summary
9/19/2024	• **Effective 1/1/2025:** Changed reauthorization from 'may' to 'shall.' Operationally, all approvals will be for 24 weeks (6 months). Ongoing therapy (beyond 24 weeks) will be subject to reauthorization review every 24 weeks, for documentation of disease stability or improvement and lack of disease progression.
3/21/2024	New policy (effective 4/15/2024). - Limits coverage of Loqtorzi (toripalimab) to patients with locally advanced (unresectable) or metastatic nasopharyngeal carcinoma (NPC) in combination with platinum-based chemotherapy as a front-line therapy, or as a monotherapy for patients whose disease has progressed on, or after, front-line platinum-based chemotherapy. - Use is limited to patients who have not received prior PD-1/PD-L1 therapy. - All other uses are considered investigational.

Drug names identified in this policy are the trademarks of their respective owner.

- Nexletol, bempedoic acid
- Nexlizet, bempedoic acid/ezetimibe
- Praluent, alirocumab
- Repatha, evolocumab

Committee Approval Date: March 21, 2024 **Next Review Date:** 2025

Effective Date: June 1, 2024

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

High-cost medications for cholesterol work through a variety of mechanisms to treat atherosclerotic cardiovascular disease (ASCVD) and/or familial hypercholesteremia.

Policy/Criteria

Most contracts require pre-authorization approval of high-cost medications for cholesterol prior to coverage.

I. Continuation of therapy (COT): High-cost medications for cholesterol may be considered medically necessary for COT when criteria A, B, or C AND D below is met.

A. For diagnoses NOT listed in the coverage criteria below, full policy criteria must be met for coverage.

OR

B. For diagnoses listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

C. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

AND

D. For Leqvio (inclisiran) only: Site of care administration requirements are met [refer to Pharmacy Services Medication Policy Manual, Site of Care Review, dru408].

Please note: *Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): High-cost medications for cholesterol may be considered medically necessary when criteria A and B below are met.

A. **Leqvio (inclisiran) only**: Site of care administration requirements are met [refer to Pharmacy Services Medication Policy Manual, Site of Care Review, dru408].

AND

B. At least one of the following diagnostic criterion 1, 2 or 3 below is met.

1. **Leqvio (inclisiran), Nexletol (bempedoic acid), Nexlizet (bempedoic acid/ezetimibe), Praluent (alirocumab), Repatha (evolocumab): Heterozygous familial hypercholesterolemia** (HeFH) when both criteria (a and b) are met.

a. The requested PCSK9 inhibitor has been prescribed by or in conjunction with a specialist in cardiology or lipid management

and there is clinical documentation of at least one of the following (i, ii, or iii):

i. A definitive diagnosis of FH using Simon Broome diagnostic criteria or Dutch Lipid Clinic Network criteria (see *Appendices 1 and 2*).

OR

ii. An untreated low-density lipoprotein cholesterol (LDL-C) of ≥ 190 mg/dL (or ≥ 160 mg/dL in patients less than 20 years of age) with at least one of the following:

1. Physical signs of FH, such as presence of tendon xanthomas, premature corneal arcus, tuberous xanthomas, or xanthelasma.

OR

2. Family History of FH.

OR

iii. Presence of a causal mutation for FH by DNA testing (e.g., a mutation in the LDLR, APOB, PCSK9, or LDLRAP1 genes).

b. Treatment with maximally tolerated lipid lowering therapy has failed to achieve an LDL-C of less than 100 mg/dL after at least 12 weeks of therapy. The treatment regimen must include <u>all the following</u> (i, ii, and iii), unless contraindicated or not tolerated:

i. A high-intensity statin (atorvastatin or rosuvastatin). If one high-intensity statin has not been tolerated due to statin-associated side effects, then at least one other statin must have been tried at a lower dose.

AND

ii. Ezetimibe.

AND

iii. **For Leqvio (inclisiran) only:** Praluent (alirocumab) or Repatha (evolocumab).

OR

2. **Evkeeza (evinacumab-dgnb)**, **Praluent (alirocumab), Repatha (evolocumab): homozygous familial hypercholesterolemia (HoFH)** when criteria a, b, and c below are met:

a. The requested PCSK9 inhibitor has been prescribed by or in conjunction with a specialist in cardiology or lipid management and there is clinical documentation of at least one of the following (i or ii):

i. Genetic confirmation of two mutant alleles at the *LDLR, APOB, PCSK9,* or *LDLRAP1* gene locus.

OR

ii. An untreated low-density lipoprotein cholesterol (LDL-C) of > 500 mg/dL (or a treated LDL-C of > 300 mg/dL) with either (1 or 2):

1. Cutaneous or tendon xanthoma before age 10 years.

OR

2. Evidence of heterozygous familial hypercholesterolemia in both parents.

AND

b. Treatment with maximally tolerated statin therapy has been ineffective, contraindicated, or not tolerated.

AND

c. **For Evkeeza (evinacumab-dgnb) only:** Repatha [evolocumab] or Praluent [alirocumab] therapy has been ineffective, contraindicated, or not tolerated.

OR

3. **Leqvio (inclisiran), Nexletol (bempedoic acid), Nexlizet (bempedoic acid/ezetimibe), Praluent (alirocumab), Repatha (evolocumab): clinical atherosclerotic cardiovascular disease (ASCVD) or at risk for ASCVD event** when criteria a, b, and c below are met (see *Appendix 6* for definitions of ASCVD).

a. The requested PCSK9 inhibitor has been prescribed by or in conjunction with a specialist in cardiology or lipid management.

AND

b. At least one of the following (i or ii):

i. **Primary prevention:** Pre-treatment LDL-C ≥190 mg/dL **AND** more than one high-risk condition (see Appendix 8)

OR

ii. **Secondary prevention**: The member has had at least one major ASCVD event (see Appendix 8) **AND** at least one of the following (1, 2, 3, or 4):

1. Very high risk ASCVD (see Appendix 8)

OR

2. Diabetes (DM)

OR

3. Chronic kidney disease (CKD), not on dialysis

OR

4. Pre-treatment LDL ≥190 mg/dL

AND

c. Treatment with maximally tolerated lipid lowering therapy has failed to achieve an LDL-C of less than 55 mg/dL after at least 12 weeks of therapy. The treatment regimen must include all the

following (i, ii, and iii), unless contraindicated or not tolerated.

i. A high-intensity statin (atorvastatin or rosuvastatin). If one high-intensity statin has not been tolerated due to statin-associated side effects, then at least one other statin must have been tried at a lower dose.

AND

ii. Ezetimibe.

AND

iii. **For Leqvio (inclisiran) only:** Praluent (alirocumab) or Repatha (evolocumab).

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers Nexletol (bempedoic acid), Nexlizet (bempedoic acid/ezetimibe), Praluent (alirocumab) and Repatha (evolocumab) to be coverable only under the pharmacy benefit (as self-administered medications).

B. Regence Pharmacy Services considers Evkeeza (evinacumab-dgnb) and Leqvio (inclisiran) to be coverable only under the medical benefit (as provider-administered medications).

C. When pre-authorization is approved, high-cost medications for cholesterol will be authorized in the following quantities:

Medication	**Authorization Limit**
Evkeeza (evinacumab-dgnb)	Up to 15 mg/kg once monthly. For doses exceeding 1200 mg, dose rounding down to the nearest available vial size (within 10% of calculated dose) is required.
Leqvio (inclisiran)	Loading Dose: Up to 284 mg initially followed by 284 mg in 3 months. Maintenance Dose: Up to 284 mg every 6 months.
Nexletol (bempedoic acid) Nexlizet (bempedoic acid/ ezetimibe)	Up to 30 tablets per 30 days.
Praluent (alirocumab)	Up to 150 mg every 2 weeks or 300 mg every 4 weeks.
Repatha (evolocumab)	Up to 140 mg every other week or 420 mg once monthly.

D. Authorization may be reviewed at least annually. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, such as disease stability or improvement.

IV. High-cost medications for cholesterol are considered not medically necessary when used for:

A. Non-familial hyperlipidemia/hypercholesterolemia.

V. High-cost medications for cholesterol are considered investigational when used for all other conditions, including but not limited to:

A. Combination use of high-cost medications for cholesterol as listed in this policy and/or Juxtapid (lomitapide).

B. Evkeeza (evinacumab-dgnb): for other causes of hypercholesterolemia, including those with heterozygous familial hypercholesterolemia (HeFH); or for prevention of cardiovascular disease.

Position Statement

Summary

- The intent of this policy is to limit coverage of high-cost medications for cholesterol to patients with a confirmed diagnosis of homozygous familial hypercholesterolemia (HoFH), heterozygous familial hypercholesterolemia (HeFH), or at high-risk for cardiovascular events, who have tried and failed lower cost therapies (as detailed in the coverage criteria).
- HeFH and HoFH may be diagnosed via clinical criteria, such as baseline LDL values, family history, and physical manifestations of FH, or through genetic testing. Commonly used diagnostic criteria include Simon Broome Diagnostic Criteria and Dutch Lipid Clinic Network Criteria for Heterozygous FH Diagnosis
    * Treatment guidelines recommend the use of a maximally tolerated high-intensity statin as first-line pharmacotherapy for patients with HeFH or HoFH, even in patients who are LDL receptor negative, as they have been shown to reduce cardiovascular (CV) and all-cause mortality.
    * National Lipid Association (NLA) treatment guidelines for HeFH recommend targeting a 50% reduction in LDL-C from baseline; however higher risk patients may require a more aggressive treatment goal of less than 100 mg/dL. Patients will generally require treatment with multiple agents to achieve LDL-C goals.
    * Non-statins may be considered in patients who are unable to reach target LDL-levels or who are statin intolerant. PCSK9 inhibitors are endorsed as add-on therapy for HeFH or HoFH.
    * In HoFH, Evkeeza (evinacumab-dgnb) has not been proven to be safer or more effective than statins or PCSK9 inhibitors but is more costly.
- Although there is no universally accepted definition of statin intolerance, most experts recommend patients have unacceptable muscle-related symptoms that resolved with discontinuation and recur with rechallenge on at least two (and preferably three)

statins.[1] Hydrophilic statins, rosuvastatin and pravastatin, tend to be associated with less muscle-side effects.

- ACC/AHA Guidelines define clinical ASCVD as acute coronary syndromes, a history of MI, stable or unstable angina, coronary or other arterial revascularization, stroke, TIA, or peripheral arterial disease presumed to be of atherosclerotic origin.
    * 2018 American College of Cardiology (ACC)/American Heart Association (AHA) Guidelines on the Management of blood cholesterol recommend high-intensity statins for high-risk patients, such as those with clinical ASCVD or with HeFH. On average, high-intensity statins lower LDL-C by approximately ≥50%. Statins have been proven to reduce cardiovascular (CV) events and mortality; thus, they are the preferred treatment to reduce the risk ASCVD and recommended as the first-line treatment by multiple guidelines.
    * If additional LDL-C lowering is needed, ezetimibe is widely available as a generic and has proven safety and tolerability along with CV outcomes benefit (based on results from the IMPROVE-IT study). The addition of ezetimibe to statin therapy typically reduces LDL-C by roughly 25% in patients with hyperlipidemia.
    * Treatment with either Praluent (alirocumab) or Repatha (evolocumab) in combination with a statin modestly improved CV outcomes.
    * The use of medications with proven CV benefits is required prior to coverage of Leqvio (inclisiran) or Evkeeza (evinacumab-dgnb), as outlined in the coverage criteria, as the CV benefits of either are unknown at this time.
    * PCSK9 inhibitors appear to be well-tolerated. However, additional long-term studies and clinical experience is needed with Leqvio (inclisiran) and Evkeeza (evinacumab-dgnb).
- Evkeeza (evinacumab-dgnb) may be covered for up to 15 mg/kg every four weeks, the dose studied in clinical trials. The safety and effectiveness of higher doses have not been established. Dose rounding down to the nearest available vial size may be required within 10% of the calculated dose to reduce product waste without sacrificing efficacy. Dose rounding within 10% of a calculated dose is an accepted industry standard and has been adopted in various clinical care areas.
- High-cost medications for cholesterol have not been studied in combination with one another or Juxtapid (lomitapide).

Clinical Efficacy

Evkeeza (evinacumab)[2 3]

- The efficacy and safety of evinacumab was evaluated in ELIPSE, a phase 3, double-blind, placebo-controlled trial of patients with genetically or clinically confirmed HoFH on stable lipid-lowering therapy.
    * Patients were randomly assigned to an IV infusion of evinacumab 15 mg/kg or placebo every four weeks.
    * 63% of patients were receiving at least three lipid-modifying drugs at baseline; 94% were on a statin and 77% were on a PCSK9 inhibitor.

    * The between group decrease in LDL-C from baseline to week 24 was 49% (absolute change of -132 mg/dL), in favor of Evkeeza (evinacumab-dgnb).
    * The effects of Evkeeza (evinacumab-dgnb) on cardiovascular morbidity and mortality have not yet been determined.

Leqvio (inclisiran)

- The body of evidence supports that Leqvio (inclisiran) produces substantial reductions in LDL-C. [4 5]
    * The primary endpoint in the majority of Leqvio (inclisiran) phase 3 studies was percent change in LDL-C.
    * Reductions in LDL-C ranged from 40% to 51% in patients with clinical ASCVD or HEFH.
- Although the data continues to evolve, CV outcomes data for Leqvio (inclisiran) is not yet available.

Nexletol/Nexlizet (bempedoic acid/ezetimibe)

- The evidence of efficacy for bempedoic acid in cardiovascular disease (CVD) reduction is based on the CLEAR trial, which was a phase 3, double-blind, placebo-controlled, randomized trial in patients unwilling/unable to take guideline-recommended doses of statins. ~70% of patients had established cardiovascular disease and ~23% were on a low dose statin.[6]
- Bempedoic acid met its primary endpoint of reducing 4-point MACE (major adverse cardiovascular event; defined as death from cardiovascular causes, nonfatal myocardial infarction, nonfatal stroke, or coronary revascularization) by 13% and significantly reduced the risk of heart attack and coronary revascularization by 23% and 19%, respectively, compared to placebo. The median follow up was 40.6 months.[6]
- Bempedoic acid did not significantly reduce the rate of fatal or nonfatal stroke, cardiovascular death, or death from any cause compared to placebo. Reductions of LDL-C were modest.

Praluent (alirocumab)

- The ODYSSEY OUTCOMES study evaluated the impact of Praluent (alirocumab) on cardiovascular outcomes in patients with a history of acute coronary syndrome (ACS) in the past 1 to 12 months. The primary endpoint was the composite of cardiovascular death, MI, stroke, and hospitalization for unstable angina. Patients were randomized to either Praluent (alirocumab) 75 mg every two weeks or placebo. All patients were on background high-intensity statins or their maximally-tolerated dose of atorvastatin or rosuvastatin.
    * After a median follow-up of 2.8 years, Praluent (alirocumab) reduced the risk of the primary endpoint compared to placebo (9.5% vs. 11.1%, respectively; hazard ratio, 0.85; 95% CI, 0.78 to 0.93; P<0.001). The secondary endpoint of the composite of death from any cause, non-fatal MI, and non-fatal stroke also favored alirocumab compared to placebo (10.3% vs. 11.9%, respectively; hazard ratio 0.86; 95% CI 0.79 to 0.93; P<0.001).

- The body of evidence supports that Praluent (alirocumab) produces substantial reductions in LDL-C. [7 8]
    * The primary endpoint in the majority of Praluent (alirocumab) phase 3 studies was percent change in LDL-C.
    * Among ten placebo- and active controlled phase 3 studies, Praluent (alirocumab) reduced LDL-C by approximately 43 to 61 percent from baseline. The studies included a several populations, including those with HeFH and/or clinical ASCVD. Studies ranged in duration from 12 to 78 weeks. Results were statistically significant versus placebo and versus ezetimibe.
    * In patients with HoFH the mean LDL-C reduction was approximately 36%.[9]

Repatha (evolocumab)

- The FOURIER study evaluated the impact of evolocumab on cardiovascular outcomes in patients with clinical ASCVD. The primary endpoint was the composite of cardiovascular death, MI, stroke, hospitalization for unstable angina, or coronary revascularization. Patients were randomized to either Repatha (evolocumab) or placebo and all patients were on background high or moderate intensity statin therapy. [10]
    * After a median follow-up of 26 months, evolocumab modestly reduced the risk of the primary endpoint compared to placebo (9.8% vs. 11.3%, respectively; hazard ratio, 0.85; 95% CI, 0.79 to 0.92; P<0.001).
    * Evolocumab also significantly reduced the risk of the key secondary composite of CV death, MI, or stroke compared to placebo (5.9% vs. 7.4%, respectively; hazard ratio, 0.80; 95% CI, 0.73 to 0.88; P<0.001). However, results for cardiovascular mortality alone were not statistically significant.
- The body of evidence supports that Repatha (evolocumab) produces substantial reductions in LDL-C. [11]
    * The primary endpoint in the majority of Repatha (evolocumab) phase 3 studies was percent change in LDL-C. Reductions in LDL-C ranged from 54% to 71% in patients with clinical ASCVD or HeFH. [11]
    * In patients with HoFH the mean LDL-C reduction was approximately 31%. [12]

Guidelines

ASCVD[1 13 14]

- The 2022 American College of Cardiology (ACC), endorsed by the National Lipid Association (NLA) Expert Consensus Decision Pathway on the Role of Non-statin Therapies for LDL-Cholesterol Lowering in the Management of Atherosclerotic Cardiovascular Disease Risk state that PCSK9 inhibitors are reasonable for patients with very high risk ASCVD who cannot achieve an ≤50% reduction in LDL-C from baseline and LDL-C <55 mg/dL while on a high-intensity statin and ezetimibe.
    * Very high risk is defined as a history of multiple major ASCVD events or one major ASCVD event and multiple high-risk condition (see *Appendix 8*).
    * The 2018 American Heart Association (AHA)/ACC/multi-society cholesterol guideline includes patients with CKD not on dialysis as a higher-risk subset of

patients with ASCVD who may merit consideration for more intensive LDL-C lowering. Issues surrounding the use of statins and non-statin therapies in patients on maintenance dialysis are less clear. Several statin trials found no significant benefit for patients on maintenance hemodialysis in any vascular outcomes in the context of their extremely high all-cause mortality rates. No phase 3 data is available for use of high-cost medications for cholesterol in patients with dialysis, as they were excluded from trials.

* For people with diabetes and ASCVD, treatment with high-intensity statin therapy is recommended to target an LDL cholesterol reduction of ≥50% from baseline and an LDL cholesterol goal of <55 mg/dL (<1.4 mmol/L). Addition of ezetimibe or a PCSK9 inhibitor with proven benefit in this population is recommended if this goal is not achieved on maximum tolerated statin therapy.

- Thresholds of ≤50% reduction in LDL-C from baseline and LDL-C <55 mg/dL are variable and individualized based on patient characteristics and risk factors for ASCVD.
- Guidelines acknowledge that the evidence supporting the use of ezetimibe before PCSK9 inhibitors is limited. Although, patients in both PCSK9 inhibitor outcomes studies were permitted to use ezetimibe, very few did. The recommendation placing ezetimibe ahead of PCSK9 inhibitors is primarily due to wide availability as a generic and proven safety and tolerability.

HeFH

- National Lipid Association (NLA) treatment guidelines for HeFH recommend targeting a 50% reduction in LDL-C from baseline; however higher risk patients may require a more aggressive treatment goal of less than 100 mg/dL. High risk HeFH patients included those with clinically evident CHD or other atherosclerotic cardiovascular disease, diabetes, a family history of very early CHD (in men < 45 years of age and women < 55 years of age), current smoking, two or more CHD risk factors, or high lipoprotein (a) ≥ 50 mg/dL. Intensification of therapy may also be considered in patients without any of the listed previously factors, if LDL-C remains ≥ 160 mg/dL (or non-HDL cholesterol ≥ 190 mg/dL), or if an initial 50% decrease is LDL-C is not achieved. [15]
- NLA guidelines recommend statins as the initial treatment for all patients with FH. Ezetimibe, niacin, and bile acid sequestrants are considered reasonable treatment options for intensification of therapy, or for those intolerant of statins. EAS guidelines for HeFH provide generally similar treatment recommendations but recommend different target LDL levels. [15]

HOFH[16 17]

- HoFH is a very rare type of familial hypercholesterolemia (FH), an autosomal dominant lipid disease that is characterized by abnormally elevated LDL-C levels and an increased propensity for early onset cardiovascular disease.
- Genetic confirmation of two mutant alleles at the LDLR, APOB, PCSK9, or LDLRAP1 gene locus is confirmative of the presence of HoFH.

Investigational Uses

- High-cost medications for cholesterol have not been studied in combination with one another or Juxtapid (lomitapide).
- There are no published clinical trials evaluating the safety or efficacy of Evkeeza (evinacumab-dgnb) for the treatment of other causes of hypercholesterolemia, including those with heterozygous FH (HeFH) and prevention of cardiovascular disease (CVD).

Dosing considerations

- For primary hyperlipidemia, the recommended starting dose for Praluent (alirocumab) is 75 mg administered subcutaneously once every 2 weeks. For those with HoFH or HeFH on lipid apheresis or if the LDL-C response is inadequate, the dose may be increased to the maximum dose of 150 mg administered every 2 weeks. An alternative starting dose of 300 mg every 4 weeks may also be considered.[8]
- The recommended starting dose of Repatha (evolocumab) for patients with HeFH or clinical ASCVD is 140 mg once every 2 weeks or 420 mg once monthly, administered subcutaneously. The recommended starting dose for patients with HoFH is 420 mg once monthly. For patients with HoFH who are either on lipid apheresis or the LDL-C response is inadequate after 12 weeks, the dose may be increased to the maximum dose of 420 mg administered every 2 weeks.[11] However, in patients with HoFH who either require dose escalation or are undergoing LDL apheresis, Praluent (alirocumab) is often the most cost-effective option.
- The recommended dose of Leqvio (inclisiran) is 284 mg given subcutaneously as a single injection, repeated at 3 months, then every 6 months thereafter.[18]

Appendix 1: Dutch Lipid Clinic Network criteria [19]	
Criteria	**Points**
Group 1: family history	
First-degree relative with known premature (age <55 for males or < 60 for females) coronary heart disease *OR* First-degree relative with known LDL cholesterol above 95th percentile	1
First-degree relative with tendon xanthoma and/or corneal Arcus *OR* Children < 18 years with LDL cholesterol above 95th percentile	2
Group 2: clinical history	
Premature coronary heart disease (age <55 for males or < 60 for females)	2
Premature cerebral or peripheral vascular disease (age <55 for males or < 60 for females)	1
Group 3: physical examination	
(i) Tendon xanthoma	6
(ii) Corneal arcus in a person before age 45	4
Group 4: biochemical results (LDL-C)	
≥8.5 mmol/L (≥330 mg/dL)	8
6.5–8.4 mmol/L (250–329 mg/dL)	5
5.0–6.4 mmol/L (190–249 mg/dL)	3
4.0–4.9 mmol/L (155–189mg/dL)	1
Group 5: molecular genetic testing (DNA analysis)	
(i) Causative mutation shown in the LDLR, APOB, or PCSK9 genes	8
Scoring	
> 8 points: Definite FH 6-8 points: Probable FH 3-5 points: Possible FH <3 points: Unlikely FH	

Appendix 2: Simon Broome Register Diagnostic Criteria for Definitive FH [16]
Adults: Total cholesterol levels > 290 mg/dL (7.5 mmol/L) or LDL-C > 190 mg/dL (4.9 mmol/L). Children less than 16 years of age: Total cholesterol levels > 260 mg/dL (6.7 mmol/L) or LDL-C > 155 mg/dL (4.0 mmol/L). Plus at least one of the two: **1.** Physical findings: tendon xanthomas or tendon xanthomas in a first or second degree relative. **OR** **2.** DNA-based evidence of an LDL-receptor mutation, familial defective apo B-100, or a PCSK9 mutation.

Appendix 3: Risk Factors for Statin-Associated Muscle Symptoms [13 20]
Hypothyroidism
Multiple or serious co-morbidities, including reduced renal or hepatic function
Rheumatologic disorders such as polymyalgia rheumatica
Steroid myopathy
Vitamin D deficiency
Primary muscle diseases
Acute infection
Organ transplant recipients
Severe trauma
HIV
Diabetes mellitus
Major Surgery
History of creatinine kinase elevation
History of pre-existing/unexplained muscle/joint/tendon pain
Genetic factors such as polymorphisms in genes encoding cytochrome P450 isoenzymes or drug transporter
High level of physical activity
Dietary effects (excessive grapefruit or cranberry juice)
Excess alcohol
Drug abuse (cocaine, amphetamines, heroin)

Appendix 4: Examples of Drug-drug interactions that may increase the risk of skeletal muscle effects with High-Intensity Statins
Strong inhibitors of CYP 3A4 (e.g., clarithromycin, itraconazole, protease inhibitors)
Grapefruit Juice
Cyclosporine
Gemfibrozil and other fibrates
Niacin
Colchicine

Appendix 5: Contraindications to Statin Therapy [21 22]
Active liver disease, which may include unexplained persistent elevations in hepatic transaminase levels
History of rhabdomyolysis
Hypersensitivity
Nursing Mothers
Pregnancy

Appendix 6: Clinical Atherosclerotic Cardiovascular Disease (ASCVD) [13]
Acute coronary syndromes
History of coronary or other arterial revascularization
History of myocardial infarction
History of stable or unstable angina
History of stroke or transient ischemic attack (TIA)
Peripheral arterial disease presumed to be of atherosclerotic origin

Appendix 7: Statin Comparison Chart [13]		
% LDL- C Lowering	**Statin Name**	**Strength**
Low-intensity: < 30%	Fluvastatin	20 mg, 40 mg
	Lovastatin	10 mg, 20 mg
	Lovastatin ER (Altoprev)	20 mg
	Pitavastatin (Livalo)	1 mg
	Pravastatin	10 mg, 20 mg
	Simvastatin	5 mg, 10 mg
Moderate-intensity: 31% - 49%	Atorvastatin	10 mg, 20 mg
	Fluvastatin ER (Lescol XL)	80 mg
	Lovastatin	40 mg
	Lovastatin ER (Altoprev)	40 mg, 60 mg
	Pitavastatin (Livalo)	2 mg, 4 mg
	Pravastatin	40 mg, 80 mg
	Rosuvastatin	5 mg, 10 mg
	Simvastatin	20 mg, 40 mg
High-intensity: ≥ 50%	Atorvastatin	40 mg, 80 mg
	Rosuvastatin	20 mg, 40 mg

Appendix 8: AHA/ACC Definition of Very-High Risk ASCVD [13]	
Very high risk includes a history of multiple major ASCVD events or one major ASCVD event and multiple high-risk conditions.	
Major ASCVD Events	**High-Risk Conditions**
Recent ACS (in past 12 months)	Age ≥ 65 years
History of MI (other than recent ACS event)	HeFH
History of ischemic stroke	History of prior coronary artery bypass surgery or percutaneous coronary intervention outside of the major ASCVD event
Symptomatic Peripheral arterial disease (History of claudication with ABI< 0.85, or previous revascularization or amputation)	Diabetes mellitus
	Hypertension
	Chronic Kidney Disease
	Current Smoking
	Persistently elevated LDL-C (≥ 100 mg/dL) despite maximally tolerated statin therapy and ezetimibe
	History of congestive heart failure

Revision History

Revision Date	Revision Summary
3/21/2024	Effective 6/1/2024 • Combined policy including PCSK9 inhibitors, Evkeeza (evinacumab), and Nexletol/Nexlizet (bempedoic acid/ezetimibe). • ASCVD risk category expanded to include secondary prevention with diabetes, chronic kidney disease or very high LDL-C at baseline. Primary prevention covered for very high LDL-C with multiple risk factors for an ASCVD event based on guideline updates. • LDL-C goal updated to be in-line with society guidelines.

Drug names identified in this policy are the trademarks of their respective owners.

Medication Policy Manual **Policy No:** dru780

Topic: Non-Cosmetic Use of Medications and Products

- Kybella, deoxycholic acid
- Prolaryn, glycerin/carboxymethylcellulose gel implant
- Radiesse, calcium hydroxylapatite
- Sculptra, poly-l-lactic acid

Date of Origin: April 15, 2024

Committee Approval Date: September 19, 2024 **Next Review Date:** 2025

Effective Date: January 1, 2025

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language takes precedence.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Some medications and products may be used for cosmetic and non-cosmetic purposes. The purpose of this policy is to confirm these products are not being used for cosmetic reasons. Products with potential cosmetic use may be covered when being used for a non-cosmetic purpose (e.g., HIV-associated facial lipodystrophy or vocal cord paralysis). When used for cosmetic purposes, medications and other medical products are contract excluded.

PLEASE NOTE: *This policy does not apply services that are prescribed for gender affirming care; please refer to Cross References for applicable policies*

Policy/Criteria

I. Continuation of therapy (COT): Products in *Appendix 1* may be considered medically necessary for COT when full policy criteria below are met, including quantity limit.

Please note: *Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Products in *Appendix 1* may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) confirming that the following criteria A and B below are met:

A. The requested product is not used for cosmetic purposes, defined as treatment directed at improving aesthetic appearance or changing the appearance to normal structures of the body (e.g., providing volume for wrinkles around the eyes, cheeks, lips, or neck).

AND

B. The requested product would be used for the sole purpose of treating a medical complication (e.g., HIV-associated facial lipodystrophy, vocal cord paralysis).

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers products in *Appendix 1* to be coverable under the medical benefit. Determination of coverage under the medical benefit is based on group-specific benefits, as defined in the group and member contract.

B. Continued authorization **may** be reviewed at least every 12 months.

IV. Products in *Appendix 1* are considered not medically necessary when used for cosmetic purposes, defined as treatment directed at improving aesthetic appearance or changing the appearance to normal structures (e.g., skin wrinkles, sagging cheeks, nasolabial folds, undereye hollows).

PLEASE NOTE: *This policy does not apply services that are prescribed for gender affirming care; please refer to Cross References for applicable policies.*

Position Statement

Summary

- The intent of this policy is to determine whether a medication or product is being used for a medical purpose versus a cosmetic purpose, which is defined as treatment directed at improving aesthetic appearance or changing the appearance to normal structures of the body (e.g., providing volume for wrinkles around the eyes, cheeks, lips, or neck). When performed solely to alter appearance without an associated functional impairment or medical complication, these medications and products are considered cosmetic and contractually excluded. Use for the treatment of a medical complication without a cosmetic purpose is covered and considered medically necessary.
- Coverage criteria for gender-affirming care can be found in separate coverage policies (see *Cross References* table below).

Appendix 1
Kybella (deoxycholic acid)
Prolaryn, glycerin/carboxymethylcellulose gel implant
Radiesse (calcium hydroxylapatite)
Sculptra (poly-l-lactic acid)

Medication Policy Manual

Policy No: dru781

Topic: Lenmeldy, atidarsagene autotemcel

Date of Origin: July 15, 2024

Committee Approval Date: June 20, 2024

Next Review Date: 2025

Effective Date: July 15,2024

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of medication policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Lenmeldy (atidarsagene autotemcel) is an intravenous (IV) gene therapy used to treat a rare lysosomal disease, metachromatic leukodystrophy (MLD).

Policy/Criteria

Most contracts require pre-authorization approval of Lenmeldy (atidarsagene autotemcel) prior to coverage.

I. Continuation of therapy (COT): Lenmeldy (atidarsagene autotemcel) may be considered medically necessary for COT when full policy criteria below are met, including quantity limit.

***Please note**: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment naïve): Lenmeldy (atidarsagene autotemcel) may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) that criteria A through D below are met.

A. A diagnosis of **metachromatic leukodystrophy** (MLD), has been established by a specialist in neurology or genetics.

AND

B. MLD diagnosis has been confirmed by meeting all of the following criteria (1, 2, and 3) below:

1. Arylsulfatase-A (ARSA) enzyme levels of < 10%.

AND

2. Genetic confirmation of ARSA mutation.

AND

3. A positive urinary analysis for the presence of sulfatides.

AND

C. Patient MLD subtype has been confirmed as one of the following (1, 2, or 3) below:

1. **Pre-symptomatic late-infantile (PSLI)** by having the absence of neurologic symptoms.

OR

2. **Pre-symptomatic early juvenile (PSEJ)** by having the absence of neurologic symptoms.

OR

3. **Early symptomatic early juvenile (ESEJ**) by meeting both of the following criteria (a and b):

a. Intelligence quotient of ≥ 70.

AND

b. Ability to walk independently for ≥ 10 steps.

AND

D. The patient is a suitable candidate for Lenmeldy (atidarsagene autotemcel) and meets all of the following criteria (1 through 4) below:

1. No prior history of hematopoietic stem cell therapy (HSCT).

AND

2. Patient is fit for therapy, as defined by meeting all the criteria (a and b) below.

a. The patient has adequate and stable kidney, liver, and cardiac function (provider attestation).

AND

b. The patient has no active systemic infections (including, but not limited to HCV, HBV, and HIV infection) (provider attestation).

AND

3. Treatment with HSCT is contraindicated (including, but not limited to lack of matched donor, comorbidities, and age.)

AND

4. The patient is less than 7 years of age at the time of infusion.

PLEASE NOTE: Suitability for therapy must be documented in recent clinical documentation (such as in chart notes, laboratory reports), which MUST include evaluation for HSCT [bone marrow transplant (BMT)].

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers Lenmeldy (atidarsagene autotemcel) coverable only under the medical benefit (as a provider-administered medication).

B. When pre-authorization is approved, Lenmeldy (atidarsagene autotemcel) may be authorized in quantities of one treatment course per lifetime.

C. Additional infusions of Lenmeldy (atidarsagene autotemcel) will not be authorized.

IV. Lenmeldy (atidarsagene autotemcel) is considered investigational when used for all other conditions, including, but not limited to:

A. Late juvenile MLD

B. Adult MLD

C. Patients 7 years of age or older

Position Statement

Summary

- Lenmeldy (atidarsagene autotemcel) is an approved intravenously (IV) administered gene therapy that uses a lentiviral vector to encode functional copies of the arylsulfatase-A (ARSA) gene into hematopoietic stem cells, allowing for adequate production of the ARSA enzyme.
- Lenmeldy (atidarsagene autotemcel) is a one-time IV infusion. However, it is a very complex, high-cost therapy and require several phases of administration, extended hospitalization, and extensive supportive care, similar to a HSCT.
- The intent of this policy is to allow for coverage of Lenmeldy (atidarsagene autotemcel) in patients with a confirmed diagnosis of early onset MLD, when prescribed by a specialist, who are clinically suitable to receive Lenmeldy (atidarsagene autotemcel), as detailed in the coverage criteria.
- Patients must be otherwise clinically stable and healthy enough to receive a hematopoietic stem cell transplant (HSCT).
- Current available evidence for Lenmeldy (atidarsagene autotemcel) is limited to an integrated analysis of two, small single-arm, non-randomized trials plus an expanded access program, that evaluated severe motor impairment-free survival and severe cognitive impairment across three subtypes of MLD, reporting the following efficacy results from the most recent data analysis:
    * Presymptomatic late-infantile (PSLI): 19/20 patients were free of severe motor and cognitive impairment compared to zero in the natural history trial.
    * Presymptomatic early juvenile (PSEJ): 3/6 evaluable patients maintained ambulation and cognition past the age for which decline would be expected.
    * Early symptomatic early juvenile (ESEJ): 4/8 evaluable patients had favorable cognitive outcomes in the setting of severe motor decline, not following the natural course of MLD disease progression.
    * However, due to an extremely small sample size and limited efficacy in the PSEJ and ESEJ subtypes, the long-term-clinically meaningful outcomes in these subtypes remain unclear.
- Prior to the approval of Lenmeldy (atidarsagene autotemcel), treatment of MLD was mainly supportive in nature with HSCT being the only guideline recommended treatment option with proven efficacy in patients with MLD. However, not all patients suffering from MLD are eligible for an HSCT due to an unmatched donor, age, or other comorbidities. For this specific population, the potential benefit of Lenmeldy (atidarsagene autotemcel) may outweigh the risks.
- At this time, there is insufficient evidence to establish the safety and efficacy in other settings, including other subtypes for MLD. Additional trials are ongoing.
- Lenmeldy (atidarsagene autotemcel) may be covered for up to one dose per lifetime. There is no data on the safety or efficacy of repeated doses.

Disease Background[1-4]

- Metachromatic leukodystrophy (MLD), is a rare, recessive lysosomal disorder, caused by a mutation in the arylsulfatase-A (ARSA) gene, leading to an accumulation of sulfatides, triggering myelin sheath destruction in the peripheral and central nervous system, resulting in progressive loss of motor function, cognition, and ultimately death.
- The clinical spectrum of MLD is broad and heterogenous with three distinct clinical subtypes, categorized by age of onset, with earlier onset associated with a more severe and rapid disease course.
    * Late infantile:50-60% of MLD, severest form, onset <30 months, life expectancy <5 years.
    * Juvenile: 20-30% of MLD, onset >30 months to 6 years (early juvenile), 7-16 (late juvenile), life expectancy 10-20 years.
    * Adult: 10-30% of MLD, onset ≥17 years of age, slowly progressive, life expectancy >20 years.
- Each subtype above is classified even further based on presence or absence of symptoms; presymptomatic, early symptomatic, and late symptomatic.
- Symptoms of MLD vary depending on subtype and include learning disabilities, behavioral difficulties, gait disturbances, peripheral neuropathy, seizures, developmental delay, and loss of communication, ambulation, and ability to swallow.

Clinical Efficacy

Lenmeldy (atidarsagene autotemcel)[1 2 4-6]

- The safety and efficacy of Lenmeldy (atidarsagene autotemcel) was established primarily from results of an integrated analysis of two small, non-randomized, single-arm, open-label trials plus an expanded access program (n=37), in pediatric patients with MLD.
    * Patients were <7 years of age, with biochemical and genetically confirmed MLD. PSLI and PSEJ patients were negative for symptoms and ESEJ patients were required to have an intelligence quotient (IQ) of ≥ 70 and the ability to walk independently for ≥ 10 steps.
    * In addition, all patients were clinically suitable for Lenmeldy (atidarsagene autotemcel) therapy (adequate organ function with no active infections). Patients with severe liver, renal, or cardiac dysfunction and those with a prior HSCT were excluded from trial enrollment.
    * The patients were divided based on subtype (PSLI, n=20; PSEJ, n=7; ESEJ, n=10) and then compared to a retrospective observational natural history trial (n=41) as well as untreated sibling comparators for efficacy analysis.
    * However, due to varying baseline MLD disease severity in the PSEJ and ESEJ subtypes across trials, the FDA evaluated efficacy only on an individual basis compared to medical literature and available sibling comparators for these subtypes.

    - The primary endpoint was severe motor impairment free survival (sMFS) defined as time from birth to first occurrence of loss of locomotion and loss of sitting without support at 18 months, a clinically meaningful endpoint for MLD.
    - Severe cognitive impairment and overall survival (OS) were key secondary endpoints, which are also clinically relevant measures for MLD.
- At the most recent available data cut-off, the efficacy results for each MLD subtype were reported:
    - PSLI: 19/20 (95%) had not progressed to severe motor or cognitive impairment, while all patients (n=28) of natural history trial with PSLI had. In addition, evaluable treated patients saw an increase in OS of 58% at 6 years of age.
    - PSEJ: 3 current evaluable patients (3 had insufficient length of treatment and 1 died), retained the ability to walk (ages 8-13.6) with none progressing to severe cognitive impairment, surpassing the history of untreated patients. None of the treated siblings had severe motor impairment compared to 50% (2 of 4) of those untreated. OS was not evaluated due to insufficient length of treatment.
    - ESEJ: 4 of 8 patients (2 died), reported favorable cognitive outcomes in the setting of severe motor decline (never before reported in MLD disease history), with only 2 treated patients progressing to severe cognitive impairment. No evidence has been shown for OS benefit in ESEJ patients to date.
- However, an extremely small sample size, durability of effect, lack of a true comparator group, and limited efficacy data in the PSEJ and ESEJ setting, limit the certainty.
- In the near future, additional follow up data is expected, further evaluating the durability and safety of Lenmeldy (atidarsagene autotemcel) in these and other MLD subtypes.
- At this time, the safety and efficacy of Lenmeldy (atidarsagene autotemcel) in MLD subtypes other than PSLI, PSEJ, and ESEJ or for use in patients ≥7 years of age is unknown. Therefore, the use of Lenmeldy (atidarsagene autotemcel) in any MLD subtype other than those listed in coverage criteria is considered investigational.

Clinical Guidelines/Standard of Care Treatment[3 7 8]

- The treatment of patients with MLD requires a multidisciplinary approach due to the number of complications associated with the disease.
- Current treatment approaches for patients with MLD are mainly supportive in nature, with the key components of symptomatic relief consisting of anti-epileptics, muscle relaxers, pain relief, and physical therapy.
- Currently, HSCT is the only proven disease modifying treatment for MLD. Patients with early juvenile MLD who are treated with an HSCT having reported better gross motor and language outcomes and lower MRI severity scores compared to those that are untreated.
- Both the American College of Medical Genetics and Hunter's Hope Leukodystrophy Care Network most recent guidelines recommend HSCT as a treatment option in patients with presymptomatic disease or early symptomatic disease only, as HSCT benefit in those with symptomatic or advanced disease are unlikely to benefit from treatment.

- However, the use of HSCT is limited by availability of matched donors for the stem cell donation and the clinical stability of the patient being treated (adequate organ function, age, etc.).

Safety[1 2 4 6]

- The most common grade ≥ 3 treatment-emergent adverse events (AEs) seen during pivotal trials with Lenmeldy (atidarsagene autotemcel) were febrile neutropenia, stomatitis, neutropenia, gastroenteritis, and vomiting.
- The AEs noted above are consistent with those typically seen with the myeloablative conditioning regimen used prior to the Lenmeldy (atidarsagene autotemcel) infusion.
- Long-term safety data is limited as these trials are still ongoing, they are of a small sample size with a short treatment duration in regard to a chronic disease such as MLD.
- Additional safety data is warranted regarding potential long-term toxicities that may be associated with this novel gene therapy for MLD, including the risk for malignancies.

Medication Policy Manual | **Policy No:** dru784

Topic: Amtagvi, lifileucel | **Date of Origin:** July 15, 2024

Committee Approval Date: June 20, 2024 | **Next Review Date:** 2025

Effective Date: July 15, 2024

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Amtagvi (lifileucel) is an immunotherapy that is designed to target malignant melanoma. The immune cells, also referred to as tumor-infiltrating lymphocytes (TILs), are manufactured from an individual patient's tumor cells via a complex process, and then reinfused back into the patient after a chemotherapy conditioning regimen.

Policy/Criteria

Most contracts require pre-authorization approval of Amtagvi (lifileucel) prior to coverage.

I. Continuation of therapy (COT): Amtagvi (lifileucel) may be considered medically necessary when full policy criteria below are met, including quantity limit. However, Amtagvi (lifileucel) is not coverable for repeated doses and is not coverable if a patient has previously received prior tumor-infiltrating lymphocyte (TIL) therapy.

***Please note**: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Amtagvi (lifileucel) may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) that criteria A, B, C, and D below are met:

A. A diagnosis of **cutaneous melanoma**, locally advanced (unresectable) or metastatic.

AND

B. There has been disease progression on or after the following (1 and 2):

1. An anti-programmed death receptor-1 (PD-1)-based regimen (as listed in *Appendix 1*)

AND

2. ***For BRAF V600 mutation-positive tumors:*** A combination BRAF/MEK inhibitor therapy. (see to *Appendix 2*)

AND

C. Suitability for Amtagvi (lifileucel) therapy as defined by all of the following (1 through 4):

Note: Suitability for Amtagvi (lifileucel) must be documented in recent clinical documentation (such as chart notes, laboratory reports).

1. The patient does not have untreated or active brain metastases.

AND

2. The patient has an ECOG performance status of 0 or 1. (*Appendix 3*)

AND

3. The patient has adequate and stable kidney, liver, and cardiac function (provider attestation).

AND

4. The patient has no active systemic infections [including, but not limited to HCV, HBV, and HIV infection] (provider attestation).

AND

D. No prior use of tumor-infiltrating lymphocyte (TIL) therapy.

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy services considers Amtagvi (lifileucel) coverable only under the medical benefit (as a provider-administered medication).

B. When pre-authorization is approved, Amtagvi (lifileucel) will be authorized in quantities of one-time treatment course per lifetime.

IV. Investigational Uses:

A. Repeat doses of Amtagvi (lifileucel), including for Amtagvi (lifileucel) previously given as part of a clinical trial.

B. Amtagvi (lifileucel) is considered investigational for all other conditions not specifically addressed in the coverage criteria defined above.

PLEASE NOTE: Any products not specifically addressed in this policy will be considered investigational.

Position Statement

Summary

- Amtagvi (lifileucel) is a tumor-derived autologous T-cell immunotherapy. The immune cells, or tumor-infiltrating lymphocytes (TILs), are designed to attack malignant melanoma cells. The manufacture and administration of this product is a complex process.
- Amtagvi (lifileucel) is indicated for the treatment of adults with unresectable or metastatic cutaneous melanoma that has previously been treated with a PD-1 blocking antibody [e.g., Opdivo (nivolumab), Keytruda (pembrolizumab)] and, if the tumor is BRAF V600 mutation-positive, a BRAF inhibitor either with or without a MEK inhibitor (see *Appendix 2*).
- The intent of this policy is to allow for coverage of Amtagvi (lifileucel) for unresectable or metastatic cutaneous melanoma when disease has progressed after standard-of-care front-line therapies and the patient is found fit to receive this intensive therapy regimen, as specified in the coverage criteria above.
- The approval of Amtagvi (lifileucel) is based on low-quality evidence from a single-arm, open-label study (no randomization, blinding, or comparator) that evaluated tumor response rate, an unvalidated surrogate endpoint, as the primary endpoint. The study included patients with unresectable or metastatic (stage IIIC or IV) cutaneous melanoma that had progressed after treatment with a PD-1 inhibitor and a BRAF inhibitor or BRAF plus MEK inhibitor if BRAF V600 mutation-positive.
- Because this is an intensive therapy involving lymphodepleting chemotherapy and infusion of Proleukin (aldesleukin), patients must be determined to be sufficiently fit. This includes careful assessment of performance status, organ function, and infection status. In addition, patients with untreated or active brain metastases were excluded from the pivotal clinical trial.

- Serious side effects, including death, have been reported with Amtagvi (lifileucel). Boxed warnings include treatment-related mortality, prolonged severe cytopenia, severe infection, cardiopulmonary disorders, and renal impairment. Administration is done in an inpatient setting with access to an intensive care facility and specialists who are skilled in cardiopulmonary or intensive care medicine.
- The National Comprehensive Cancer Network (NCCN) recommendation for Amtagvi (lifileucel) parallels the FDA indication. The guideline states that it should not be used if the patient has poor performance status, inadequate organ function, or untreated or active brain metastases.
- Amtagvi (lifileucel) was studied, and FDA approved as a one-time treatment in the dose listed in the package label. Use beyond a single treatment is considered investigational.
- The safety and effectiveness of Amtagvi (lifileucel) have not been adequately studied in other disease settings. Therefore, use in settings other than that which is described above are considered investigational.

Regence Pharmacy Services performs independent analyses of oncology medication evidence, to establish coverability per the contracts with the health plan.

- Most contracts define coverability based on established clinical benefit in published, peer-reviewed literature, along with consideration of regulatory status.
- FDA approval does not in itself establish medical necessity, as unpublished, low-quality evidence, including exploratory analyses and unvalidated surrogate endpoints, may be used as the basis of approval. Regulatory approval may or may not reflect clinical benefit relative to standard of care and the recommendations of expert clinical advisors such as the Oncologic Drugs Advisory Committee (ODAC). FDA approvals generally do not consider cost compared to established therapies, or value to members.
- Likewise, NCCN clinical practice guidelines assignment of a recommendation (category 1, 2a, or 2b) does not necessarily establish medically necessity. NCCN recommendations are inconsistently supported by published, peer-reviewed literature and do not uniformly consider value of new therapies relative to existing potentially higher-value treatment options, considering effectiveness, safety, and cost.
- Medication coverage criteria are developed based on the 'medical necessity' assessment, as described above.

Regence Pharmacy Services analysis and coverage policy may differ from FDA labeled indication and/or NCCN clinical practice guidelines.

Background [1,2]

- Amtagvi (lifileucel) is made from tumor-infiltrating lymphocytes (TILs) harvested from a patient's tumor. Patients who are not able to undergo surgery or patients from whom an adequate amount tumor tissue cannot be harvested are not eligible for this therapy.
- The turnaround time for the manufacture of Amtagvi (lifileucel) is approximately 34 days, not including time for shipment. The long wait time may be an issue for some patients.
- Prior to administration of Amtagvi (lifileucel), patients are pretreated with lymphodepleting chemotherapy for 7 days. After the Amtagvi (lifileucel) infusion,

Proleukin (aldesleukin) is administered every 8 to 12 hours for up to six doses. This therapy needs to be given in an inpatient hospital setting with access to an intensive care facility and specialists who are skilled in cardiopulmonary or intensive care medicine.

Clinical Efficacy *[2,3]*

- Efficacy was evaluated in a single-arm study [Study C-144-01] in 73 patients who received Amtagvi (lifileucel) for their unresectable or metastatic (stage IIIC or IV) cutaneous melanoma. *This is an FDA accelerated approval.*
    * Patients enrolled in the study had at least one prior systemic therapy, which must have included a PD-1 blocking antibody and, if BRAF V600 mutation-positive, a BRAF/MEK inhibitor therapy. The median number of prior lines of systemic therapy in the study population was three (range 1 to 8).
    * All patients had prior PD-1 inhibitor therapy, 86% had prior anti-CTLA-4 therapy [e.g., Yervoy (ipilimumab)], 58% had combination PD-1 inhibitor/anti-CTLA-4 therapy, and 27% had prior BRAF or BRAF+MEK inhibitor therapy.
    * All patients were required to have good performance status (EGOC PS of 0 or 1), acceptable hematologic parameters, and adequate organ function.
    * Patients with uncontrolled or symptomatic brain metastasis, ocular or uveal melanoma, an organ allograft, or prior cell transfer therapy were not included in the study.
    * Amtagvi (lifileucel) administration was preceded by a seven-day lymphodepleting course of chemotherapy and was followed by a six-dose course of Proleukin (aldesleukin).
    * Tumor response was the primary endpoint. The overall response rate was 32% with 4% complete responses. The median duration of response was not reached; however, 57% of patients were still responding at $\geq$6 months and 44% at $\geq$12 months.
- The quality of the evidence for Amtagvi (lifileucel) is poor. The study was not controlled (no comparator group) nor blinded so there is a great potential for bias. Additionally, tumor response has not been shown to be an accurate predictor of important clinical outcomes such as improved overall survival or quality of life. Additional, higher quality evidence is needed before it can be determined whether the benefit of Amtagvi (lifileucel) outweighs the significant harms associated with its use.

Guidelines *[4]*

- The National Comprehensive Cancer Network (NCCN) cutaneous melanoma guideline lists Amtagvi (lifileucel) among its recommendations for second- or subsequent-line treatment of metastatic or unresectable cutaneous melanoma after therapy with a PD-1 inhibitor therapy and, if the tumor is BRAF V600 mutation-positive, a BRAF and MEK inhibitor combination. Amtagvi (lifileucel) should not be used in patients with poor performance status, inadequate organ function, or untreated or active brain metastases.

Investigational and Other Uses [5]

- Amtagvi (lifileucel) has not been studied in cancer settings other than that which is described in the coverage criteria described in this policy. Any use outside of this setting (subsequent-line treatment of unresectable or metastatic cutaneous melanoma) is considered investigational.

Safety [1,2]

- Serious adverse effects (AEs) including death, have occurred after infusion of Amtagvi (lifileucel). Refer to package labeling for guidance on its use.
- Boxed warnings include treatment-related mortality, prolonged severe cytopenia, severe infection, cardiopulmonary disorders, and renal impairment.

Dosing and Administration [1]

- Amtagvi (lifileucel) is administered as a single intravenous dose of tumor-derived T-cells containing 7.5×10^9 to 72×10^9 viable cells (for autologous use only).
- The turnaround time for the manufacture of Amtagvi (lifileucel) is approximately 34 days, not counting time for shipment.
- Prior to infusion, patients are pretreated with lymphodepleting chemotherapy for seven days. Infusion of lifileucel should be as soon as possible after 24 hours have elapsed following the final chemotherapy (fludarabine) infusion, but no later than 4 days.
- Beginning 3 to 24 hours after the lifileucel infusion, aldesleukin is administered every 8 to 12 hours for up to 6 doses.
- Amtagvi (lifileucel) needs to be administered in an inpatient hospital setting with access to an intensive care facility and specialists who are skilled in cardiopulmonary or intensive care medicine.
- Treatment with Amtagvi (lifileucel) is only available through select treatment centers authorized by the manufacturer. Refer to: https://www.amtagvi.com/support-and-resources/authorized-treatment-center/
- In some regions, site of care may be further limited by providers.

Appendix 3: Eastern Cooperative Oncology Group (ECOG) Performance Status Definitions	
Grade	***Definition***
0	Fully active, able to carry on all pre-disease performance without restriction.
1	Restricted in physically strenuous activity but ambulatory and able to carry out work of a light or sedentary nature (e.g., light housework, office work).
2	Ambulatory and capable of all self-care but unable to carry out any work activities. Up and about more than 50% of waking hours.
3	Capable of only limited self-care, confined to bed or chair more than 50% of waking hours.
4	Completely disabled. Cannot carry on any self-care. Totally confined to bed or chair.
5	Dead

Revision History

Revision Date	Revision Summary
6/20/2024	New policy (effective 7/15/2024). - Limits coverage of Amtagvi (lifileucel) to patients with unresectable or metastatic cutaneous melanoma who have had prior treatment with a PD-1 inhibitor antibody and, if BRAF V600 mutation-positive, BRAF or BRAF/MEK inhibitor therapy. - Patients must be determined to be suitable to receive therapy with Amtagvi (lifileucel) including adequate performance status, adequate organ function, no untreated or active brain metastases, and no active systemic infections. - Use beyond one treatment per lifetime is considered investigational. - All other uses are considered investigational.

Drug names identified in this policy are the trademarks of their respective owner.

Medication Policy Manual

Policy No: dru785

Topic: Tevimbra, tislelizumab-jsgr

Date of Origin: July 15, 2024

Committee Approval Date: June 20, 2024

Next Review Date: 2025

Effective Date: July 15, 2024

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Tevimbra (tislelizumab) is an intravenously administered immunotherapy used in the management of specific types of cancer [such as esophageal squamous cell carcinoma (ESCC)]. It belongs to a class of medications called programmed death receptor-1 (PD-1) blocking antibodies.

Policy/Criteria

Most contracts require pre-authorization approval of Tevimbra (tislelizumab) prior to coverage.

I. Continuation of therapy (COT): Tevimbra (tislelizumab) may be considered medically necessary for COT when criterion A, B, or C below is met.

A. For diagnoses NOT listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND there is documentation that the medication was covered by another health plan. Examples of documentation include the coverage approval letter from the previous health plan or paid claim.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

B. For diagnoses listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

C. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

Please note*: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Tevimbra (tislelizumab) may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) that criteria A, B, C, and D below are met:

A. A diagnosis of **esophageal squamous cell carcinoma (ESCC)**, locally advanced (unresectable) or metastatic.

AND

B. Disease progression on or after at least one prior systemic therapy for advanced disease (locally advanced or metastatic). [Note: This includes disease recurring within 6 months of completing neoadjuvant or neoadjuvant chemotherapy]

AND

C. Tevimbra (tislelizumab) will be used as monotherapy.

AND

D. No prior programmed death receptor-1 (PD-1) blocking antibody (PD-1 inhibitor) or programmed death-ligand 1 (PD-L1) blocking antibody (PD-L1 inhibitor) therapy (see *Appendix 1*).

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy services considers Tevimbra (tislelizumab) coverable only under the medical benefit (as a provider-administered medication).

B. When pre-authorization is approved, Tevimbra (tislelizumab) will be authorized in doses up to 200 mg every three weeks until disease progression.

C. Authorization **may** be reviewed at least annually. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, such as disease stability or improvement, and lack of disease progression based on an assessment of change in tumor burden.

IV. Tevimbra (tislelizumab) is considered not medically necessary when used as an add-on to chemotherapy for first-line treatment of locally advanced (unresectable) or metastatic ESCC.

V. Tevimbra (tislelizumab) is considered investigational when used for all other conditions including, but not limited to, esophageal adenocarcinoma.

Position Statement

Summary

- Tevimbra (tislelizumab) is an intravenously administered programmed death receptor-1 (PD-1) blocking antibody. It is indicated as a single agent for the treatment of adult patients with locally advanced (unresectable) or metastatic esophageal squamous cell carcinoma (ESCC). It is the third PD-1 inhibitor approved in this treatment setting.
- The intent of this policy is to allow for coverage of Tevimbra (tislelizumab) when used as a single agent for locally advanced (unresectable) or metastatic ESCC that has recurred or progressed after prior standard-of-care chemotherapy.
- The use of Tevimbra (tislelizumab) after disease progression on prior immune checkpoint inhibitor therapy (e.g., PD-1 or PD-1 inhibitors) has not been evaluated.
- The approval of Tevimbra (tislelizumab) as a second- or subsequent-line therapy for locally advanced (unresectable) or metastatic ESCC is based on evidence from a randomized controlled trial which demonstrated an overall survival advantage for Tevimbra (tislelizumab) relative to single-agent chemotherapy.
- Esophageal cancer is classified as having either squamous cell carcinoma (ESCC) or adenocarcinoma histology. Tevimbra (tislelizumab) has only been evaluated in ESCC.

- Tevimbra (tislelizumab) has also been evaluated as an add-on to front-line chemotherapy in first-line treatment of locally advanced (unresectable) or metastatic ESCC; however, unlike Opdivo (nivolumab) and Keytruda (pembrolizumab), it is not FDA-approved in this setting. Although all three PD-1/PD-L1 inhibitor therapies appear similar with respect to safety and efficacy, the relative cost of Tevimbra (tislelizumab) is not available; therefore, Tevimbra (tislelizumab) is currently considered 'not medically necessary' in the front-line setting for advanced ESCC.
- As with other PD-1/PD-L1 inhibitor therapies, the primary adverse effects of concern with Tevimbra (tislelizumab) are immune-mediated toxicities (e.g., endocrinopathies, colitis, hepatitis).
- At this time, the National Comprehensive Cancer Network (NCCN) guidelines do not yet include recommendations for Tevimbra (tislelizumab). Opdivo (nivolumab), Keytruda (pembrolizumab), and single-agent chemotherapy are listed among the preferred recommendations for locally advanced or metastatic ESCC that has progressed after prior systemic therapy.
- Tevimbra (tislelizumab) was studied, and FDA approved, in the doses listed in the product prescribing information. Use of doses or frequencies exceeding these quantities are considered investigational.
- The safety and effectiveness of Tevimbra (tislelizumab) have not been adequately studied in other disease settings. Therefore, use in settings other than that which is described in the coverage criteria above are considered investigational.

Regence Pharmacy Services performs independent analyses of oncology medication evidence, to establish coverability per the contracts with the health plan.

- Most contracts define coverability based on established clinical benefit in published, peer-reviewed literature, along with consideration of regulatory status.
- FDA approval does not in itself establish medical necessity, as unpublished, low-quality evidence, including exploratory analyses and unvalidated surrogate endpoints, may be used as the basis of approval. Regulatory approval may or may not reflect clinical benefit relative to standard of care and the recommendations of expert clinical advisors such as the Oncologic Drugs Advisory Committee (ODAC). FDA approvals generally do not consider cost compared to established therapies, or value to members.
- Likewise, NCCN clinical practice guidelines assignment of a recommendation (category 1, 2a, or 2b) does not necessarily establish medically necessity. NCCN recommendations are inconsistently supported by published, peer-reviewed literature and do not uniformly consider value of new therapies relative to existing potentially higher-value treatment options, considering effectiveness, safety, and cost.
- Medication coverage criteria are developed based on the 'medical necessity' assessment, as described above.

Regence Pharmacy Services analysis and coverage policy may differ from FDA labeled indication and/or NCCN clinical practice guidelines.

Background [1]

- Esophageal cancers are classified by histology as either squamous cell carcinoma (ESCC) or adenocarcinoma.
- There are differences in the treatment pathways based on disease histology. At this time, Tevimbra (tislelizumab) has only been studied in ESCC.

Clinical Efficacy

- *Subsequent therapy*: The efficacy of Tevimbra (tislelizumab) as a single agent in recurrent (previously treated) locally advanced (unresectable) or metastatic esophageal squamous cell carcinoma (ESCC) was evaluated in a randomized controlled trial (RCT) where it was compared with single-agent chemotherapy [RATIONALE-302 Study; N=512]. [2]
    * Patients enrolled in the study had disease progression on or after prior systemic therapy in the advanced or metastatic disease setting. The study also included patients whose disease recurred within 6 months of completing a course of neoadjuvant or adjuvant chemotherapy or chemoradiotherapy.
    * Patients with active brain metastases, histology other than ESCC, or who had prior PD-1/PD-L1 inhibitor therapy were excluded from the study.
    * The study compared Tevimbra (tislelizumab) 200 mg IV every 3 weeks versus investigator's choice of single agent chemotherapy (paclitaxel, docetaxel, or irinotecan).
    * Median overall survival (OS) was 8.6 months and 6.3 months in the Tevimbra (tislelizumab) and chemotherapy treatment arms, respectively. This is a statistically significant difference.
- *First-line therapy*: A second RCT [RATIONALE-306; N=649] studied Tevimbra (tislelizumab) as an add-on to standard front-line chemotherapy in patients with locally advanced (unresectable) or metastatic ESCC where it was compared with placebo plus standard front-line chemotherapy. [3] *Tevimbra (tislelizumab) is not currently FDA-approved in this setting.*
    * The study enrolled patients who had no prior therapy for their locally advanced or metastatic ESCC and the disease was not amenable to definitive therapies (curative intent) including surgery and radiation. If patients had received prior neoadjuvant or adjuvant platinum-based chemotherapy, a treatment-free interval (no disease progression) of at least 6 months was required.
    * Patients with active brain metastases, histology other than ESCC, or who had prior PD-1/PD-L1 inhibitor therapy were excluded from the study.
    * The study compared Tevimbra (tislelizumab) plus a platinum doublet with placebo plus a platinum doublet. The platinum (cisplatin or oxaliplatin) was stopped after six cycles. Tevimbra (tislelizumab) was continued until disease progression.
    * An OS benefit was observed with Tevimbra (tislelizumab) relative to placebo with median OS of 17.2 months and 10.6 months, respectively.

* Both Opdivo (nivolumab) and Keytruda (pembrolizumab) are already FDA approved in this first-line treatment setting. However, unlike Opdivo (nivolumab) and Keytruda (pembrolizumab), Tevimbra (tislelizumab)is not FDA-approved in this setting. Although there is no directly comparative evidence, all three PD-1/PD-L1 inhibitor therapies appear similar with respect to safety and efficacy. However, the relative cost of Tevimbra (tislelizumab) is not yet available. As the clinical value of Tevimbra (tislelizumab) cannot yet be calculated, Tevimbra (tislelizumab) is considered 'not medically necessary' in the front-line setting for advanced ESCC as there are similar alternatives.

Guidelines [1]

- The National Comprehensive Cancer Network (NCCN) Esophageal Cancer guideline lists the following as preferred, category 1 recommendations for unresectable locally advanced, recurrent, or metastatic ESCC:
  * ***Front-line:*** The combination of a fluoropyrimidine and a platin (cisplatin or oxaliplatin) plus Opdivo (nivolumab) OR a fluoropyrimidine and cisplatin plus Keytruda (pembrolizumab). Keytruda (pembrolizumab) is only recommended for tumors with PD-L1 CPS $\geq$10.
  * ***Second- and subsequent-line:*** Single agent Opdivo (nivolumab), Keytruda (pembrolizumab), or Tevimbra (tislelizumab); OR single agent docetaxel, paclitaxel, or irinotecan. Keytruda (pembrolizumab) is only recommended for tumors with PD-L1 CPS $\geq$10.
  * The use of PD-1 inhibitors [such as Opdivo (nivolumab) or Keytruda (pembrolizumab)] is only recommended if there has been no prior tumor progression on checkpoint inhibitor therapy (e.g., PD-1 or PD-L1 inhibitor).

Investigational and Other Uses [3,4]

- Tevimbra (tislelizumab) is currently being studied in several other types of cancers including non-small cell lung cancer (NSCLC), squamous cell cancer of the head and neck (SCCHN), ovarian cancer, and gastric cancer. However, to date, Tevimbra (tislelizumab) has not been shown to be an effective therapy for these cancers.

Safety [5]

- The primary adverse effects (AEs) of interest for Tevimbra (tislelizumab) include immune-mediated reactions and infusion reactions. Immune-related AEs can affect any organ system or tissue (e.g., colitis, pneumonitis, hepatitis, endocrinopathies, nephritis with renal dysfunction, and dermatologic reactions).
- Overall, the safety of Tevimbra (tislelizumab) appears to be similar to other PD-1 and PD-L1 inhibitors.

Dosing [5]

- Tevimbra (tislelizumab) is given via intravenous infusion over 30 to 60 minutes.
- Tevimbra (tislelizumab) is given as a single agent in a dose of 200 mg every three weeks. It is administered until disease progression.

Medication Policy Manual | **Policy No:** dru791

Topic: Anktiva, nogapendekin alfa inbakicept | **Date of Origin:** December 1, 2024

Committee Approval Date: December 12, 2024 | **Next Review Date:** 2025

Effective Date: March 1, 2025

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Anktiva (nogapendekin alfa inbakicept) is an intravesically administered (instilled into the bladder via a catheter and retained for two hours) interleukin-15 (IL-15) receptor agonist approved for use in combination with Bacillus Calmette-Guérin (BCG) for adults with BCG-unresponsive non-muscle invasive bladder cancer (NMIBC) with carcinoma in situ (CIS).

Policy/Criteria

Most contracts require pre-authorization approval of Anktiva (nogapendekin alfa inbakicept) prior to coverage.

I. Continuation of therapy (COT): Anktiva (nogapendekin alfa inbakicept) may be considered medically necessary for COT when criterion A, B, or C below is met.

A. For diagnoses NOT listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND there is documentation that the medication was covered by another health plan. Examples of documentation include the coverage approval letter from the previous health plan or paid claim.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

B. For diagnoses listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

C. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

Please note*: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Anktiva (nogapendekin alfa inbakicept) may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) that criteria A through E below are met:

A. A diagnosis of **non-muscle invasive bladder cancer (NMIBC) with carcinoma *in situ* (CIS)** either with or without papillary tumors.

AND

B. The tumor is Bacillus Calmette-Guérin (BCG)-unresponsive as defined by the following (1 or 2):

1. Persistent or recurrent CIS alone after adequate BCG therapy (refer to *Appendix 1*)

OR

2. Recurrent Ta/T1 disease within 12 months of BCG therapy.

AND

C. The patient is ineligible or has elected not to undergo a cystectomy (removal of the bladder).

AND

D. Treatment with each of the following was not tolerated or is contraindicated (1 and 2):

1. Keytruda (pembrolizumab)

AND

2. Adstiladrin (nadofaragene firadenovec).

AND

E. Anktiva (nogapendekin alfa inbakicept) will be administered in combination with Bacillus Calmette-Guerin (BCG).

III. Administration, Quantity Limitations (QL), and Authorization Period

A. Regence Pharmacy Services considers Anktiva (nogapendekin alfa inbakicept) coverable only under the medical benefit (as a provider-administered medication).

B. When pre-authorization is approved, Anktiva (nogapendekin alfa inbakicept) may be approved in quantities and time periods as follows in *Table 1*:

Table 1. Anktiva (nogapendekin alfa inbakicept) QL Authorization per Dosing Phase:

Dosing Phase	**Doses / Time period** (authorization duration)	**Notes**
Initial Induction	Weeks 0 to 12 (6 doses/ 3 months)	If CR at Month 3, proceed to *Initial Maintenance*.
Second Induction [a]	Weeks 13 to 24 (6 doses / 3 months)	If CR to *Second Induction* after 3 months, proceed to *Initial Maintenance* ('restart the clock' to Month 4)
Initial Maintenance (dosed every 3rd month)	Month 4-6 and Month 7-9 (6 doses / 6 months)	Dosing in Month 4 and Month 7 only
	Month 10-12 and Month 13-18 (6 doses / 6 months)	Dosing in Month 10 and Month 13 only
Ongoing maintenance (dosed every 6th month)	Month 19-24 (3 doses/ 6 months)	Dosing in Month 19 only
	Month 25-30 (3 doses / 6 months)	Dosing in Month 25 only
	Month 31-36 (3 doses / 6 months)	Dosing in Month 31 only
	Month 37 (3 doses / 1 month)	Dosing in Month 37 only

CR: complete response

[a] Second Induction is coverable only if no complete response at Month 3 with Initial Induction. After Second Induction, subsequent authorization will be per Initial Maintenance.

C. Re-authorization: Authorization **shall** be reviewed at least every 6 months (or as listed in *Table 1* above) to confirm current medical necessity criteria are met, and that the medication is providing clinical benefit, such as disease stability or improvement. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met. Specifically, documentation that the medication is providing clinical benefit, including disease stability or improvement, and lack of disease progression, based on an assessment of change in tumor burden. If there is documentation of potential disease progression, a shortened authorization (up to three months) may be approved to allow time for clarification of response to Anktiva (nogapendekin alfa inbakicept), including clinical re-evaluation of the patient and assessment of tumor status.

PLEASE NOTE: Additional doses of Anktiva (nogapendekin alfa inbakicept) will not be authorized without a documented recent assessment by the treating provider (such as a urologist or oncologist) with objective evidence of response to therapy, such as by cystoscopy, biopsy, urine cytology, or other imaging ("restaging scans").

IV. Anktiva (nogapendekin alfa inbakicept) is considered investigational when used for all other conditions.

Position Statement

Summary

- Anktiva (nogapendekin alfa inbakicept) is an interleukin-15 (IL-15) receptor agonist that is administered via instillation into the bladder through a urinary catheter. It exerts anti-tumor activity through its activation and proliferation of natural killer (NK), CD8+, and memory T cells.
- Anktiva (nogapendekin alfa inbakicept) is indicated in combination with Bacillus Calmette-Guerin (BCG) for the treatment of non-muscle invasive bladder cancer (NMIBC) with carcinoma *in situ* (CIS), either with or without papillary tumors, that was unresponsive to prior therapy with BCG.
- The purpose of this policy is to allow for coverage of Anktiva (nogapendekin alfa inbakicept) for NMIBC with CIS in patients who were unresponsive to prior therapy with BCG when patients are ineligible for or have elected not to undergo cystectomy and therapy with both Keytruda (pembrolizumab) and Adstiladrin (nadofaragene firadenovec) was not tolerated or is contraindicated.
- The approval of Anktiva (nogapendekin alfa inbakicept) was based on evidence from a single-arm, observational study that evaluated tumor response in patients with BCG-unresponsive, high-risk, NMIBC with CIS. Sixty-two percent of patients were considered to have complete response at any time during their treatment.
- Tumor response is an unvalidated surrogate endpoint. There is currently no evidence that Anktiva (nogapendekin alfa inbakicept) provides any clinically meaningful benefit such as improved symptom control or improved overall survival.
- Both Keytruda (pembrolizumab) and Adstiladrin (nadofaragene firadenovec) are also approved for use in BCG-unresponsive NMIBC with CIS based on a similar level of evidence. Anktiva (nogapendekin alfa inbakicept) has not been compared with these or with any other NMIBC therapies.
- Anktiva (nogapendekin alfa inbakicept) has not been shown to be safer or more effective than other therapies for BCG-unresponsive NMIBC with CIS; however, it is the most costly.
- Like other systemic and intravesical administered therapies for NMIBC with CIS, Anktiva (nogapendekin alfa inbakicept) labeling contains a warning that delaying cystectomy (removal of the bladder) can lead to the development of metastatic bladder cancer which can be lethal.
- The National Comprehensive Cancer Network (NCCN) bladder cancer guideline lists Anktiva (nogapendekin alfa inbakicept), Keytruda (pembrolizumab) and Anktiva (nogapendekin alfa inbakicept) as treatment options for BCG-unresponsive NMIBC with CIS.
- Anktiva (nogapendekin alfa inbakicept) was studied and FDA approved in the doses listed in the product prescribing information. Use of doses or frequencies exceeding these quantities are considered investigational.
- The safety and effectiveness of Anktiva (nogapendekin alfa inbakicept) have not been adequately studied in other disease settings. Therefore, use in settings other than that which is described above are considered investigational.
- *Reauthorization Criteria*: When coverage criteria are met, Anktiva (nogapendekin alfa inbakicept) is authorized for six months (24 weeks) of therapy, after which time

documentation must be provided to establish that the medication is effective. Specifically, there must be documentation of clinical benefit, including disease stability or improvement and there is a lack of disease progression, based on an assessment of change in tumor burden. Documentation of benefit must include the most recent objective assessment of tumor status, which may include cystoscopy, biopsy, urine cytology, or other imaging ("restaging scans") by the treating urologist (or oncologist). Given the complexity of the evaluation, including use of the criteria, Anktiva (nogapendekin alfa inbakicept) will not be reauthorized without an assessment of response to therapy, such a partial response (PR), complete response (CR), or stable disease (SD).

Regence Pharmacy Services performs independent analyses of oncology medication evidence, to establish coverability per the contracts with the health plan.

- Most contracts define coverability based on established clinical benefit in published, peer-reviewed literature, along with consideration of regulatory status.
- FDA approval does not in itself establish medical necessity, as unpublished, low-quality evidence, including exploratory analyses and unvalidated surrogate endpoints, may be used as the basis of approval. Regulatory approval may or may not reflect clinical benefit relative to standard of care and the recommendations of expert clinical advisors such as the Oncologic Drugs Advisory Committee (ODAC). FDA approvals generally do not consider cost compared to established therapies, or value to members.
- Likewise, NCCN clinical practice guidelines assignment of a recommendation (category 1, 2a, or 2b) does not necessarily establish medically necessity. NCCN recommendations are inconsistently supported by published, peer-reviewed literature and do not uniformly consider value of new therapies relative to existing potentially higher-value treatment options, considering effectiveness, safety, and cost.
- Medication coverage criteria are developed based on the 'medical necessity' assessment, as described above.

Regence Pharmacy Services analysis and coverage policy may differ from FDA labeled indication and/or NCCN clinical practice guidelines.

Background *[1 2]*

- Approximately 10% of non-muscle invasive bladder cancer (NMIBC) cases are classified as carcinoma in situ (CIS). CIS is a high-grade tumor confined to the urothelial layer of the bladder. CIS is prone to recurrence and progression to invasive disease and metastasis.
- Management of NMIBC is aimed at reducing disease recurrence and preventing progression to more advanced stages.

Clinical Efficacy *[2 3]*

- The efficacy of Anktiva (nogapendekin alfa inbakicept) is based on a low-quality, single-arm study [QUILT-3.032] in patients with Bacillus Calmette-Guerin (BCG)-unresponsive, high-risk NMIBC with CIS that evaluated tumor response as the primary endpoint.

    * Enrolled patients all had NMIBC with CIS. Patients with a diagnosis of NMIBC with CIS and Ta/T1 papillary disease were also allowed to participate.
    * BCG-unresponsive disease was defined as persistent or recurrent CIS alone or with Ta/T1 (papillary) disease within 12 months of adequate BCG therapy. Adequate BCG therapy was defined as a minimum of 5 of 6 doses of an initial induction course plus either 1) at least 2 of 3 doses of maintenance therapy, or 2) at least 2 of 6 doses of a second induction course.
    * Sixty-two percent of patients in the study had a complete response at any time during the study, and 58% of patients had continued response at 12 months or more.
    * Tumor response has not been shown to accurately predict improvement in any clinically important outcome (e.g., improved quality of life or overall survival). A median of 12 doses of Anktiva (nogapendekin alfa inbakicept) was received by patients over the course of the study.
- Keytruda (pembrolizumab) and Adstiladrin (nadofaragene firadenovec) have also been evaluated and are approved for use in BCG-unresponsive high-risk NMIBC with CIS. The evidence for all three therapies is of similar quality (single-arm trials that evaluate tumor response as a surrogate endpoint). [3-5] There is no evidence directly comparing any of these therapies.

Guidelines *[1]*

- The National Comprehensive Cancer Network (NCCN) bladder cancer guideline lists cystectomy (removal of the bladder) as the preferred therapy for BCG-unresponsive or -intolerant NMIBC. Intravesical administration of chemotherapy (e.g., gemcitabine, mitomycin), Adstiladrin (nadofaragene firadenovec), Anktiva (nogapendekin alfa inbakicept), and systemic Keytruda (pembrolizumab) are also listed as potential therapy options.

Reauthorization Criteria**:**

- When coverage criteria are met, Anktiva (nogapendekin alfa inbakicept) is authorized for six months (24 weeks) of therapy, after which time documentation must be provided to establish that the medication is effective. Specifically, there must be documentation of clinical benefit, including disease stability or improvement and there is a lack of disease progression, based on an assessment of change in tumor burden.
    * Criteria used for assessment of response to therapy for cancer varies, depending on the tumor type and the therapy. Per the pivotal trial protocol of Anktiva (nogapendekin alfa inbakicept), progression was defined as presence or development of any of the following: [6]
        - Development of (including recurrence of) or increase in stage to: Lamina propria invasion (e.g., recurrence of T1; increase from Ta to T1 or carcinoma in situ (CIS) to T1)
        - Muscle-invasive disease (stage ≥ T2)
        - Lymph node (N+) or distant metastasis (M1)
        - Increase in grade from low to high (including CIS)

    * Documentation of benefit must include the most recent objective assessment of tumor status, which may include cystoscopy, biopsy, urine cytology, or other imaging ("restaging scans") by the treating urologist (or oncologist). Given the complexity of the evaluation, including use of the criteria, Anktiva (nogapendekin alfa inbakicept) will not be reauthorized without an assessment of response to therapy, such a partial response (PR), complete response (CR), or stable disease (SD).
    * If there is documentation of potential disease progression ["unconfirmed progressive disease (UPD)"], a shortened authorization (up to three months) may be approved to allow time for clarification of response to Anktiva (nogapendekin alfa inbakicept), including clinical re-evaluation of the patient and an assessment of change in tumor burden, which may include cystoscopy, biopsy, and urine cytology.
- If a patient has confirmed, unequivocal new lesions (progression of disease, PD), additional Anktiva (nogapendekin alfa inbakicept) is not coverable. If a new lesion is equivocal, UPD reassessment by the treating oncologist with repeat assessment of tumor burden would apply (as noted above).

Investigational and Other Uses

- Use of Anktiva (nogapendekin alfa inbakicept) in any setting other than that listed under coverage criteria in Section II. is considered investigational.

Safety *[3-5]*

- Most adverse effects from Anktiva (nogapendekin alfa inbakicept) are local and include dysuria, hematuria, urinary frequency or urgency, and urinary tract infections.
- Systemic side effects may include increased creatinine, increased potassium, musculo-skeletal pain, chills, and pyrexia.
- Though Adstiladrin (nadofaragene firadenovec), Anktiva (nogapendekin alfa inbakicept), and Keytruda (pembrolizumab) each have different side effect profiles, there is no directly comparative evidence to establish that one therapy is better tolerated than another.

Dosing *[3]*

- Anktiva (nogapendekin alfa inbakicept) is given via intravesical administration (infused into the bladder) by a urologist and is retained in the bladder for 2 hours. It is given in combination with BCG.
- Anktiva (nogapendekin alfa inbakicept) is administered on the following schedule:

Phase	Dose	Number of doses
Induction (initial) [week 0-6]	400 mcg once per week x 6 weeks	6
Following 6 weeks [week 7-12]	No active treatment	0
At Month 3 (week 12): assess response - If complete response not achieved at 3 months (Week 12): proceed to Induction #2 [6 doses] - If complete response at 3 months (Week 12): proceed to Maintenance (initial) [15 doses]		
Induction #2(if complete response not achieved at 3 months)	400 mcg once per week x 6 weeks	6
Maintenance (initial) If complete response at 3 months (Week 12) OR after Induction #2	400 mcg once per week x 3 weeks at Month 4, 7, 10, 13, and 19	15
Maintenance (ongoing) (for complete response at Month 25 and later)	400 mcg once per week x 3 weeks at Month 25, 31, and 37	9

- A treatment course consists of 36 doses of Anktiva (nogapendekin alfa inbakicept). The safety and efficacy of repeat treatment courses has not been studied.

Appendix 1: Standard Definition of BCG Failure [7]

BCG-unresponsive CIS: Persistent or recurrent CIS alone or with recurrent Ta/T1 disease within 12 months of adequate BCG therapy.

Adequate BCG therapy is defined as at least five of six doses of an initial induction course plus at least two or three doses of maintenance BCG, or at least five of six doses of initial induction course plus at least two of six doses of a second induction course

Appendix 2: AJCC Staging of NMIBC [1] (refer to Figure 1 below)

T = Primary tumor

Ta = Noninvasive papillary tumor

Tis = Urothelial carcinoma *in situ* (CIS; 'flat tumor')

T1 = Tumor invades lamina propria (subepithelial connective tissue)

Figure 1: Bladder Cancer Classification [8]

Medication Policy Manual | **Policy No:** dru792

Topic: Imdelltra, tarlatamab | **Date of Origin:** December 1, 2024

Committee Approval Date: December 12, 2024 | **Next Review Date:** 2025

Effective Date: January 15, 2025

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Imdelltra (tarlatamab) is an intravenously infused bispecific T-cell engager (BiTE) medication used in the treatment of small cell lung cancer (SCLC). It helps the immune system (T-cells) recognize and destroy cancer cells that express the DLL3 antigen. The DLL3 antigen is present in most SCLCs.

Policy/Criteria

Most contracts require pre-authorization approval of Imdelltra (tarlatamab) prior to coverage.

I. Continuation of therapy (COT): Imdelltra (tarlatamab) may be considered medically necessary for COT when criterion A, B, or C below is met.

A. For diagnoses NOT listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND there is documentation that the medication was covered by another health plan. Examples of documentation include the coverage approval letter from the previous health plan or paid claim.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

B. For diagnoses listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

C. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

Please note*: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Imdelltra (tarlatamab) may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) that criteria A, B, and C below are met:

A. A diagnosis of **extensive-stage small cell lung cancer (ES-SCLC), relapsed or refractory.**

AND

B. There was disease progression on or after platinum-based chemotherapy.

AND

C. Imdelltra (tarlatamab) will be used as monotherapy.

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers Imdelltra (tarlatamab) coverable only under the medical benefit (as a provider-administered medication).

B. **Initial Authorization:** When pre-authorization is approved, Imdelltra (tarlatamab) will be authorized for a step-up dose of 3 doses within the first 4 weeks, followed by up to 10 mg every two weeks, for 24 weeks, until disease progression.

C. **Continued Authorization:** When continued authorization is approved, Imdelltra (tarlatamab) will be authorized in doses up to 10 mg every two weeks, for 24 weeks, until disease progression. Authorization **shall** be reviewed at least every 24 weeks for documented benefit. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met. Specifically, documentation that the medication is providing clinical benefit, including disease stability or improvement, and lack of disease progression, based on an assessment of change in tumor burden. If there is documentation of potential disease progression, a shortened authorization (up to three months) may be approved to allow time for clarification of response to Imdelltra (tarlatamab), including clinical re-evaluation of the patient and reimaging.

PLEASE NOTE: Additional doses of Imdelltra (tarlatamab) will not be authorized without a documented recent assessment by the treating provider (such as oncologist) with objective evidence of response to therapy, such as by re-imaging and use of RECIST v1.1 (modified RECIST) criteria.

IV. Imdelltra (tarlatamab) is considered investigational when used for all other conditions.

Position Statement

Summary

- Imdelltra (tarlatamab) is an intravenously administered bispecific T-cell engager (BiTE) medication. It is indicated as a single agent for the treatment of extensive-stage small cell lung cancer (ES-SCLC) after disease progresses on or after platinum-based chemotherapy. It binds to the DLL3 antigen which is present on the majority of SCLC tumor cells.
- The intent of this policy is to allow for coverage of Imdelltra (tarlatamab) when used as a single agent therapy for ES-SCLC that has progressed after standard of care platinum-based chemotherapy.
- The accelerated approval of Imdelltra (tarlatamab) in progressive ES-SCLC is based on a preliminary open-label, single-arm, observational study that evaluated tumor response [objective response rate (ORR)] as a surrogate endpoint. There is currently no evidence that it provides any clinically meaningful benefit, and there is no comparative evidence.

- Zepzelca (lurbinectedin), and alkylating chemotherapy drug, is also approved in this treatment setting. The quality of evidence is similar to the evidence for Imdelltra (tarlatamab). There is no evidence comparing these two therapies.
- Like other BiTE therapies, Imdelltra (tarlatamab) carries a box warning for cytokine release syndrome (CRS) and neurological toxicity. Common adverse effects include neutropenia, anemia, infections, and hepatotoxicity.
- The National Comprehensive Cancer Network (NCCN) guidelines list Imdelltra (tarlatamab) among potential 'Other' recommended subsequent-line therapies for ES-SCLC.
- Imdelltra (tarlatamab) was studied and FDA approved in the doses listed in the product prescribing information. Use of doses or frequencies exceeding these quantities are considered investigational.
- The safety and effectiveness of Imdelltra (tarlatamab) have not been adequately studied in other disease settings. Therefore, use in settings other than that which is described above are considered investigational.
- *Reauthorization Criteria*: When coverage criteria are met, Imdelltra (tarlatamab) is authorized for six months (24 weeks) of therapy, after which time documentation must be provided to establish that the medication is effective. Specifically, there must be documentation of clinical benefit, including disease stability or improvement and there is a lack of disease progression, based on an assessment of change in tumor burden. Documentation of benefit must include an assessment of the most recent imaging ("restaging scans") by the treating oncologist.

Regence Pharmacy Services performs independent analyses of oncology medication evidence, to establish coverability per the contracts with the health plan.

- Most contracts define coverability based on established clinical benefit in published, peer-reviewed literature, along with consideration of regulatory status.
- FDA approval does not in itself establish medical necessity, as unpublished, low-quality evidence, including exploratory analyses and unvalidated surrogate endpoints, may be used as the basis of approval. Regulatory approval may or may not reflect clinical benefit relative to standard of care and the recommendations of expert clinical advisors such as the Oncologic Drugs Advisory Committee (ODAC). FDA approvals generally do not consider cost compared to established therapies, or value to members.
- Likewise, NCCN clinical practice guidelines assignment of a recommendation (category 1, 2a, or 2b) does not necessarily establish medically necessity. NCCN recommendations are inconsistently supported by published, peer-reviewed literature and do not uniformly consider value of new therapies relative to existing potentially higher-value treatment options, considering effectiveness, safety, and cost.
- Medication coverage criteria are developed based on the 'medical necessity' assessment, as described above.

Regence Pharmacy Services analysis and coverage policy may differ from FDA labeled indication and/or NCCN clinical practice guidelines.

Background *[1]*

- Small cell lung cancer (SCLC) makes up approximately 14% of lung cancers in the U.S. SCLC grows quickly and spreads rapidly.
- Platinum-based chemotherapy has been shown to palliate symptoms and improve overall survival; however, the majority of patients relapse after treatment, usually within the first year after diagnosis.

Clinical Efficacy

- The efficacy of Imdelltra (tarlatamab) as a single agent therapy for progressive (previously treated) extensive-stage small cell lung cancer (ES-SCLC) was evaluated in a single-arm, observational trial (n=100) [DeLLphi-304] that evaluated tumor response [objective response rate (ORR)] as a surrogate endpoint. [2, 3]
    * Patients in the study were treated with at least two prior lines of therapy. All received prior therapy with a platinum doublet (front-line standard of care).
    * Nearly all (98%) patients had metastatic disease. Twenty-three percent had brain metastasis and 39% had liver metastasis.
    * The ORR was 40% with 2% of patients having a complete response. The median duration of response was 9.7 months
    * There is no evidence comparing Imdelltra (tarlatamab) with any other therapy including Zepzelca (lurbinectedin) or best supportive care.
- Imdelltra (tarlatamab) was approved via the FDA accelerated pathway. Clinically meaningful benefit from this therapy has not been established.

Guidelines *[1]*

- The National Comprehensive Cancer Network (NCCN) small cell lung cancer guideline lists Imdelltra (tarlatamab) among 'Other' recommended regimens for the treatment of progressive ES-SCLC. Single-agent chemotherapy (e.g., topotecan, irinotecan) and Zepzelca (lurbinectedin) are also listed among potential therapies in this setting.

Reauthorization Criteria:

When coverage criteria are met, Imdelltra (tarlatamab) is authorized for six months (24 weeks) of therapy, after which time documentation must be provided to establish that the medication is effective. Specifically, there must be documentation of clinical benefit, including disease stability or improvement and there is a lack of disease progression, based on an assessment of change in tumor burden.

- The standard of care for evaluation of response to cancer therapy is use of the RECIST criteria for assessment of tumor burden,[4] as well as iRECIST criteria for some cancer immunotherapy.[5] Criteria used for assessment of response vary, depending on the tumor type and the therapy. Pivotal trials of Imdelltra (tarlatamab) BiTE therapy used the RECIST v1.1 criteria (modified RECIST) for assessment of tumor burden.[4]
- The modified RECIST, as well as iRECIST criteria, include use of quantitative and qualitative criteria for assessment of change in tumor burden for target lesions and non-target lesions. [4 6]

    * Quantitative measurements for target lesions (tumor size and % change)
    * Qualitative evaluation for non-target lesions (present/disappeared/ unequivocal progression)
- Documentation of benefit must include an assessment of the most recent imaging ("restaging scans") by the treating oncologist. Given the complexity of the evaluation, including use of the modified RECIST criteria, Imdelltra (tarlatamab) will not be reauthorized without an assessment of response to therapy, such a partial response (PR), complete response (CR), or stable disease (SD).
- Though not specific to the use of Imdelltra (tarlatamab), use of immunotherapy may result in pseudoprogression, due to immune and T-cell activation, which can appear similar to tumor flare. If there is documentation of potential disease progression ["unconfirmed progressive disease (UPD)"], a shortened authorization (up to three months) may be approved to allow time for clarification of response to Imdelltra (tarlatamab), including clinical re-evaluation of the patient and reimaging. Guidelines recommend reimaging for UPD after 4-8 weeks.
- If a patient has confirmed, unequivocal new lesions (progression of disease, PD), additional Imdelltra (tarlatamab) is not coverable. If a new lesion is equivocal, UPD reassessment by the treating oncologist with repeat imaging would apply (as noted above).

Investigational and Other Uses *[7]*

- Imdelltra (tarlatamab) is being evaluated in combination with Imfinzi (durvalumab) as a possible maintenance therapy for ES-SCLC after completion of first-line chemotherapy. However, efficacy in this setting is not established and the study is ongoing.
- Use of Imdelltra (tarlatamab) in any setting other than that/those listed under coverage criteria in Section II. is considered investigational.

Safety *[3]*

- Like other BiTE therapies, Imdelltra (tarlatamab) carries a box warning for cytokine release syndrome (CRS) and neurological toxicity. Close monitoring is required while initiating therapy.
- Use of Imdelltra (tarlatamab) is also associated with cytopenias, hepatoxicity, and hypersensitivity reactions.

Dosing *[3]*

- Imdelltra (tarlatamab) is given via intravenous infusion over 60 minutes. Step-up dosing with close monitoring is required when initiating therapy.
- The target dose (after initial step-up dosing) of Imdelltra (tarlatamab) is 10 mg every two weeks. It is administered until disease progression.

Medication Policy Manual | **Policy No:** dru799

Topic: Rytelo, imetelstat | **Date of Origin:** March 1, 2024

Committee Approval Date: December 12, 2024 | **Next Review Date:** 2025

Effective Date: March 1, 2024

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Rytelo (imetelstat) is an injected medication used to reduce the need for regular red blood cell transfusions (RBCTs) in patients who have anemia associated with myelodysplastic syndromes (MDS) that has not responded to erythropoiesis stimulating agents (ESAs).

Policy/Criteria

Most contracts require pre-authorization approval of Rytelo (imetelstat) prior to coverage.

I. Continuation of therapy (COT): Rytelo (imetelstat) may be considered medically necessary for COT when criterion A, B, or C below is met.

A. For diagnoses NOT listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND there is documentation that the medication was covered by another health plan. Examples of documentation include the coverage approval letter from the previous health plan or paid claim.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

B. For diagnoses listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

C. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

Please note*: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Rytelo (imetelstat) may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) that criteria A, B, C, D, and E below are met:

A. Rytelo (imetelstat) is prescribed by, or in consultation with, a hematologist.

AND

B. A diagnosis of **myelodysplastic syndrome (MDS), low- to intermediate-1-risk**, without a del(5q) cytogenetic abnormality**.**

AND

C. Documented transfusion dependence, defined as transfusion of at least 8 units of packed red blood cells (RBCs) in the previous 16 weeks.

AND

D. Erythropoiesis-stimulating agents (ESAs) were ineffective, not tolerated, or are contraindicated.

AND

E. **When positive for ring sideroblasts (RS):** Prior therapy with Reblozyl (luspatercept) was not effective or not tolerated.

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy services considers Rytelo (imetelstat) coverable only under the medical benefit (as a provider-administered medication).

B. When pre-authorization is approved, Rytelo (imetelstat) will be authorized in doses of up to one, 7.1 mg/kg infusion every four weeks.

C. Authorization **shall** be reviewed as follows to confirm that medical necessity criteria are met, and that the medication is effective.

1. Initial authorization: Authorization shall be reviewed after 24 weeks. If there is no documented decrease in transfusion burden after 24 weeks, no further Rytelo (imetelstat) will be authorized for coverage.

NOTE: This time frame is based on response after 21 weeks (seven doses) plus time to reassess the patient.

2. Continued authorization (after the initial 24-week period): Authorization shall be reviewed annually.

3. For all authorizations (initial and continued authorization): Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit evidenced by a reduction or sustained reduction in the need for RBC transfusions (RBCTs).

IV. Rytelo (imetelstat) is considered investigational when used for MDS with a del(5q) cytogenetic abnormality and for all other conditions.

Position Statement

Summary

- Rytelo (imetelstat) is an intravenously administered medication approved for use in patients with low- to intermediate-1-risk myelodysplastic syndromes (MDS) with transfusion-dependent anemia who are no longer responding to, or are ineligible for, erythropoiesis-stimulating agents (ESAs).
- The intent of this policy is to allow coverage of Rytelo (imetelstat) when used as a single agent for MDS-associated transfusion-dependent anemia when therapy with ESAs is not effective or not an option for ring sideroblast-negative disease, and ESAs plus Reblozyl (luspatercept) is not effective or not an option for ring sideroblast-positive disease.
- The efficacy of Rytelo (imetelstat) in MDS-associated anemia is based on a small study where it was found to lead to transfusion independence at 8 and 24 weeks relative to placebo in approximately one in four patients. Reducing RBC transfusions can decrease iron overload and other risks associated with chronic RBC transfusions.
- Though it may improve anemia in some patients Rytelo (imetelstat) has not been shown to modify the course of MDS or to positively impact quality of life measures such as fatigue.
- Rytelo (imetelstat) is associated with a high incidence of grade 3 and 4 adverse effects (AEs) including neutropenia and thrombocytopenia which impact two out of every three patients who receive this therapy. This may result in the need for platelet transfusions, growth factors, and antibiotics to treat infections. These supportive measures have the potential to increase clinical burden and overall medical resource utilization.
- Reblozyl (luspatercept), another medication with a similar MDS indication, appears to have efficacy similar to Rytelo (imetelstat) but is associated with substantially fewer AEs and may be superior in patients with MDS with ring sideroblasts. A head-to-head study is necessary to better define their relative net health benefit.
- The National Comprehensive Cancer Network (NCCN) MDS guideline lists Rytelo (imetelstat) as a therapy option for patients with lower-risk MDS who have transfusion-dependent anemia that is not responsive to ESAs and Reblozyl (luspatercept).
- Rytelo (imetelstat) was studied and is FDA approved in the doses listed in the product prescribing information. Use of doses or frequencies exceeding these quantities are considered investigational.
- The safety and effectiveness of Rytelo (imetelstat) have not been adequately studied in other disease settings. Therefore, use in settings other than that which is described above are considered investigational.

Regence Pharmacy Services performs independent analyses of oncology medication evidence, to establish coverability per the contracts with the health plan.

- Most contracts define coverability based on established clinical benefit in published, peer-reviewed literature, along with consideration of regulatory status.
- FDA approval does not in itself establish medical necessity, as unpublished, low-quality evidence, including exploratory analyses and unvalidated surrogate endpoints, may be used as the basis of approval. Regulatory approval may or may not reflect clinical benefit

relative to standard of care and the recommendations of expert clinical advisors such as the Oncologic Drugs Advisory Committee (ODAC). FDA approvals generally do not consider cost compared to established therapies, or value to members.

- Likewise, NCCN clinical practice guidelines assignment of a recommendation (category 1, 2a, or 2b) does not necessarily establish medically necessity. NCCN recommendations are inconsistently supported by published, peer-reviewed literature and do not uniformly consider value of new therapies relative to existing potentially higher-value treatment options, considering effectiveness, safety, and cost.
- Medication coverage criteria are developed based on the 'medical necessity' assessment, as described above.

Regence Pharmacy Services analysis and coverage policy may differ from FDA labeled indication and/or NCCN clinical practice guidelines.

Background *[1,2]*

- Myelodysplastic syndromes (MDS) are rare hematologic malignancies that are characterized by anemia, ineffective erythropoiesis, dysplastic changes in hematologic cells, and neutropenia and thrombocytopenia.
- MDS is categorized into four risk categories including low, intermediate-1, intermediate-2, and high-risk. Risk is defined using the International Prognosis Scoring System (IPSS). Patients with low- and intermediate-1 risk ('lower-risk MDS') generally have a lower risk of progression to acute myeloid leukemia (AML) and an overall better prognosis.
- Approximately 40% of lower risk MDS patients develop transfusion-dependent (TD)-anemia. Anemia-related fatigue can be severe and is among the most bothersome symptoms to patients. The need for regular transfusions also increases the clinical burden on this population and can lead to risks associated with iron overload.

Clinical Efficacy *[1,3,4]*

- The efficacy of Rytelo (imetelstat) is based on a randomized, double-blind, placebo-controlled study [IMerge] that evaluated 8-week RBC transfusion independence as the primary endpoint in patients with transfusion-dependent anemia associated with MDS.
    * The study enrolled adults with low- to intermediate-1-risk MDS. Patients had transfusion-dependent anemia defined as requiring four or more units of RBCs over an 8-week period in the 16 weeks leading up to randomization.
    * Patients were relapsed or refractory to ESAs (92%) or were ineligible for ESA therapy because they had endogenous erythropoietin levels >500 mU/mL. Six percent of the patients had prior therapy with Reblozyl (luspatercept).
    * Prior therapy with lenalidomide or hypomethylating agents was not allowed. Additionally, patients with MDS with del(5q) were excluded from enrollment.
    * Sixty-two percent of patients were positive for ring sideroblasts.
    * The rate of RBC transfusion independence was 39.8% and 15.0% at 8 weeks, and 28.0% and 3.3% at 24 weeks in the Rytelo (imetelstat) and placebo groups, respectively. The differences were statistically significant. Based on subgroup analyses, benefit extended to MDS both with and without ring sideroblasts.

Treatment effect was marginal for those with a lower transfusion burden at baseline.

- There is no data directly comparing Rytelo (imetelstat) with any other therapy used for transfusion-dependent MDS.
- Rytelo (imetelstat) has not been shown to alter the disease course or to improve survival or quality of life in patients with MDS.

Guidelines [2]

- The National Comprehensive Cancer Network (NCCN) MDS guideline recommendations for patients with lower-risk MDS with symptomatic anemia and no del(5q) cytogenetic abnormality include (Reblozyl) luspatercept, (Rytelo) imetelstat, and erythropoietin-stimulating agents (ESAs). The guideline generally recommends Reblozyl (luspatercept) prior to Rytelo (imetelstat).

Investigational and Other Uses [5]

- Rytelo (imetelstat) is being evaluated in high-risk MDS and several other conditions including myelofibrosis and solid tumors. However, these studies are ongoing and there are no published data so use in these settings is considered investigational.
- Use of Rytelo (imetelstat) in any setting other than that/those listed under coverage criteria in Section II. is considered investigational.

Safety [3]

- Use of Rytelo (imetelstat) is associated with thrombocytopenia and neutropenia which may require supportive therapies such as growth factors, antimicrobial therapy, and platelet transfusions. Infusion-related reactions are also common.
- Other adverse reactions may include elevated liver enzymes, prolonged partial thromboplastin time, arthralgias, and headache.
- Dose interruptions and reductions due to adverse effects are necessary in the majority of patients.

Dosing [3]

- Rytelo (imetelstat) is given via intravenous infusion over 2 hours at a dose of 7.1 mg/kg every 4 weeks. Premedication with antihistamines and corticosteroids is recommended prior to each infusion to decrease the risk of infusion reactions.
- Rytelo (imetelstat) should be discontinued at week 24 (after 6 doses) if treatment does not result in a decrease in RBC transfusion burden.

Revision History

Revision Date	Revision Summary
12/12/2024	New policy (effective 3/1/2025). - Coverage of Rytelo (imetelstat) will be limited to patients with low- to intermediate-1-risk myelodysplastic syndrome who require at least 8 units of packed RBCs in the preceding 16 weeks when prior erythropoiesis-stimulating agents (ESAs) have not been effective for ring sideroblast-negative disease, and ESAs plus Reblozyl (luspatercept) have not been effective for ring sideroblast-positive disease. - Use in MDS with a del(5q) cytogenetic abnormality is considered investigational as well as all other uses not specifically described in the coverage criteria.

Drug names identified in this policy are the trademarks of their respective owner.

Medication Policy Manual | **Policy No:** dru800

Topic: Tecelra, afamitresgene autoleucel | **Date of Origin:** March 1, 2024

Committee Approval Date: December 12, 2024 | **Next Review Date:** 2026

Effective Date: March 1, 2025

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Tecelra (afamitresgene autoleucel; afami-cel) is a cellular therapy that uses a patient's own genetically modified T cells to kill synovial sarcoma cells that express melanoma-associated antigen A4 (MAGE-A4).

Policy/Criteria

Most contracts require pre-authorization approval of Tecelra (afamitresgene autoleucel) prior to coverage.

I. Continuation of therapy (COT): Tecelra (afamitresgene autoleucel) may be considered medically necessary when full policy criteria below are met, including quantity limit. However, Tecelra (afamitresgene autoleucel) is not coverable for repeated doses and is not coverable if a patient has previously received prior Tecelra (afamitresgene autoleucel).

***Please note**: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Tecelra (afamitresgene autoleucel) may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) that criteria A through F below are met:

A. A diagnosis of **synovial sarcoma, unresectable locally advanced or metastatic.**

AND

B. The patient tests positive for one of the following HLA-A subtypes:

1. HLA-A*02:01P

2. HLA-A*02:02P

3. HLA-A*02:03P

4. HLA-A*02:06P

AND

C. The tumor expresses melanoma-associated antigen A4 (MAGE-A4).

AND

D. Disease progression after at least two prior systemic therapies, one of which must have included an anthracycline- or ifosfamide-based chemotherapy regimen.

AND

E. No prior gene or cellular therapy, including Tecelra (afamitresgene autoleucel).

AND

F. Patient is a suitable candidate for Tecelra (afamitresgene autoleucel) and meets all of the following criteria 1 through 3 below:

1. The patient has an ECOG performance status of 0 or 1 [or Karnofsky Performance score (KPS) of at least 80; the patient is ambulatory and able to carry out work of a light or sedentary nature].

AND

2. The patient has adequate and stable kidney, liver, and cardiac function (provider attestation).

AND

3. The patient has no active systemic infections (including, but not limited to HCV, HBV, and HIV infection) (provider attestation).

PLEASE NOTE: Suitability for Tecelra (afamitresgene autoleucel) must be documented in recent clinical documentation (such as in chart notes, laboratory reports).

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers Tecelra (afamitresgene autoleucel) coverable only under the medical benefit (as a provider-administered medication).

B. When pre-authorization is approved, Tecelra (afamitresgene autoleucel) will be authorized in quantities of one treatment course per lifetime.

IV. Tecelra (afamitresgene autoleucel) is considered investigational for patients who are heterozygous or homozygous for HLA-A*02:05P, and when used for all other conditions.

Position Statement

Summary

- Tecelra (afamitresgene autoleucel) is an intravenously infused melanoma-associated antigen A4 (MAGE-A4)-directed genetically modified (using lentiviral vector) autologous T cell immunotherapy. It is indicated as a one-time infusion for the treatment of unresectable or metastatic synovial sarcoma in patients who have received prior chemotherapy. Patients eligible for this therapy must be HLA-A*02:01P, -A*02:02P, -A*02:03P, or -A*02:06P positive and their tumors must express MAGE-A4 antigen.
- The intent of this policy is to allow for coverage of Tecelra (afamitresgene autoleucel) for unresectable or metastatic synovial sarcoma after progression of disease on at least two prior therapies, including standard front-line chemotherapy, when patients are positive for one of the HLA subtypes listed above, their tumors express MAGE-A4, and they are found to be fit to receive this intensive therapy.
- Tecelra (afamitresgene autoleucel) received FDA accelerated approval in synovial sarcoma based on a small, single-arm, observational study that evaluated tumor response [objective response rate (ORR)] as a surrogate endpoint. There is currently no evidence that it provides any clinically meaningful benefit, and there is no comparative evidence.
- Tecelra (afamitresgene autoleucel) is associated with serious side effects including cytokine release syndrome (CRS) and neurological toxicity. Other potential side effects include gastrointestinal effects (nausea and vomiting), infections, cardiovascular effects, fatigue, and edema.
- The National Comprehensive Cancer Network (NCCN) guideline lists anthracycline- or ifosfamide-based chemotherapy as standard front-line options for unresectable or metastatic synovial sarcoma. Subsequent-line therapy may include Votrient (pazopanib), Yondelis (trabectedin), or additional chemotherapy. The guideline dose not yet include Tecelra (afamitresgene autoleucel) among these recommendations.

- Tecelra (afamitresgene autoleucel) was studied and FDA approved in the doses listed in the product prescribing information. Use of doses or frequencies exceeding these quantities are considered investigational.
- The safety and effectiveness of Tecelra (afamitresgene autoleucel) have not been adequately studied in other disease settings. Therefore, use in settings other than that which is described above are considered investigational.

Regence Pharmacy Services performs independent analyses of oncology medication evidence, to establish coverability per the contracts with the health plan.

- Most contracts define coverability based on established clinical benefit in published, peer-reviewed literature, along with consideration of regulatory status.
- FDA approval does not in itself establish medical necessity, as unpublished, low-quality evidence, including exploratory analyses and unvalidated surrogate endpoints, may be used as the basis of approval. Regulatory approval may or may not reflect clinical benefit relative to standard of care and the recommendations of expert clinical advisors such as the Oncologic Drugs Advisory Committee (ODAC). FDA approvals generally do not consider cost compared to established therapies, or value to members.
- Likewise, NCCN clinical practice guidelines assignment of a recommendation (category 1, 2a, or 2b) does not necessarily establish medically necessity. NCCN recommendations are inconsistently supported by published, peer-reviewed literature and do not uniformly consider value of new therapies relative to existing potentially higher-value treatment options, considering effectiveness, safety, and cost.
- Medication coverage criteria are developed based on the 'medical necessity' assessment, as described above.

Regence Pharmacy Services analysis and coverage policy may differ from FDA labeled indication and/or NCCN clinical practice guidelines.

Background *[1,2]*

- Synovial sarcoma is a rare type of soft tissue sarcoma (STS) making up approximately 5% of STS cases.
- Approximately 50% of synovial sarcoma cases recur or become metastatic. The overall prognosis is poor.
- It is estimated that about 67% of HLA-A*02-positive patients have MAGE-A4-expressing tumors.

Clinical Efficacy *[1,3]*

- The efficacy of Tecelra (afamitresgene autoleucel) as a therapy for locally advanced unresectable or metastatic synovial sarcoma was evaluated in a small (N=44), observational study [SPEARHEAD-1] that evaluated tumor response [objective response rate (ORR)] as a surrogate endpoint.
    * All patients were positive for HLA-A*02:01, -A*02:02, -A*02:03, -A*02:06, or other HLA-A*02 alleles with the same protein sequence as those in the peptide-biding

domain. Patients positive for HLA-A*02:05 were excluded from the study.

  * Tumors were required to have MAGE-A4 staining intensity of 2 or higher on at least 30% of tumor cells and a MAGE-A4 P score ≥30.
  * Subjects in the trial had a median of three prior therapies. All patients had prior therapy with either an anthracycline- or ifosfamide-based chemotherapy regimen.
  * Patients were required to be fit to receive Tecelra (afamitresgene autoleucel) and the intensive lymphodepleting chemotherapy required prior to its infusion. This included having good performance status, adequate organ function, and no ongoing infections.
  * The reported ORR was 43% with 2 complete responses (4.5%). The median duration of response was 6 months. Based on an FDA subgroup analysis there was no decline in response rate in patients who had received >2 prior lines of therapy versus those who had received ≤2 prior lines of therapy.
  * Tecelra (afamitresgene autoleucel) has not been compared with any other therapy.

- Tecelra (afamitresgene autoleucel) was approved via the FDA accelerated pathway. Clinically meaningful benefit from this therapy has not been established.

Guidelines *[2]*

- The National Comprehensive Cancer Network (NCCN) soft tissue sarcoma guideline lists chemotherapy (anthracycline- or ifosfamide-based regimens) as the standard front-line approach for unresectable advanced or metastatic synovial sarcoma. After progression on front-line therapies Votrient (pazopanib), Yondelis (trabectedin), and gemcitabine/ docetaxel are listed as potential options. Tecelra (afamitresgene autoleucel) is not yet part of the guideline recommendations.

Investigational and Other Uses

- Use of Tecelra (afamitresgene autoleucel) in any setting other than that/those listed under coverage criteria in Section II. is considered investigational.

Safety *[4]*

- Current safety experience is limited to the 44 patients with advanced synovial sarcoma who received a single dose of Tecelra (afamitresgene autoleucel) in the pivotal trial.
- Tecelra (afamitresgene autoleucel) labeling carries a Boxed warning describing the potential for cytokine release syndrome (CRS). Other Warnings and Precautions include immune effector cell-associated neurotoxicity syndrome (ICANS), prolonged severe cytopenia, infections, secondary malignancies and hypersensitivity reactions. Close monitoring of patients is warranted.

Dosing *[4]*

- Tecelra (afamitresgene autoleucel) is given via intravenous infusion as a single dose.
- Prior to infusion of Tecelra (afamitresgene autoleucel), four consecutive days of lymphodepleting is given.
- The safety and efficacy of repeat doses of Tecelra (afamitresgene autoleucel) has not been evaluated.

Revision History

Revision Date	Revision Summary
12/12/2024	New policy (effective 3/1/2025). - Coverage of Tecelra (afamitresgene autoleucel) will be limited to the subsequent-line treatment (after progression on front-line chemotherapy and at least one additional therapy) of unresectable or metastatic synovial sarcoma in patients with the HLA subtypes listed in the policy when their tumors express MAGE-A4. Patients should be naïve to prior treatment with cellular therapy, including Tecelra (afamitresgene autoleucel), and must be fit to receive this intensive regimen. - Coverage is limited to one treatment course per lifetime. - Use in patients who are positive for HLA-A*02:05P is considered investigational, as is use in any other condition.

Medication Policy Manual | **Policy No:** dru802

Topic: Niktimvo, axatilimab-csfr | **Date of Origin:** March 1, 2025

Committee Approval Date: March 6, 2025 | **Next Review Date:** 2026

Effective Date: May 1, 2025

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Niktimvo (axatilimab) is an intravenously infused colony stimulating factor-1 receptor (CSF-1R)-blocking antibody for the treatment of chronic graft-versus-host disease (cGVHD) that is refractory to standard front-line therapies.

Policy/Criteria

Most contracts require pre-authorization approval of Niktimvo (axatilimab) prior to coverage.

I. Continuation of therapy (COT): Niktimvo (axatilimab) may be considered medically necessary for COT when criterion A, B, or C below is met.

A. For diagnoses NOT listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND there is documentation that the medication was covered by another health plan. Examples of documentation include the coverage approval letter from the previous health plan or paid claim.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

B. For diagnoses listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

C. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

Please note*: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Niktimvo (axatilimab) may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) that criteria A through C below are met:

A. A diagnosis of **chronic graft-versus-host disease (cGVHD)** after allogeneic hematopoietic stem cell transplant (HSCT)**.**

AND

B. The cGVHD is refractory to corticosteroids.

AND

C. At least two additional prior systemic therapies (in addition to corticosteroids with or without calcineurin inhibitors) were not effective or not tolerated.

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy services considers Niktimvo (axatilimab) coverable only under the medical benefit (as a provider-administered medication).

B. When pre-authorization is approved, Niktimvo (axatilimab) will be authorized in doses up to 35 mg every two weeks until disease progression.

C. Authorization **may** be reviewed at least annually. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, such as disease stability or improvement.

IV. Niktimvo (axatilimab) is considered investigational when used in combination with other unique cGVHD medications [e.g., Jakafi (ruxolitinib), Imbruvica (ibrutinib), Rezurock (belumosudil)], and for all other conditions.

Position Statement

Summary

- Niktimvo (axatilimab) is an intravenously administered colony stimulating factor-1 receptor (CSF-1R)-blocking antibody. It is indicated for chronic graft-versus-host disease (cGVHD) that is relapsed or refractory after at least two prior therapies.
- cGVHD occurs in 30% to 50% of patients after an allogeneic hematopoietic stem cell transplant (HSCT). It is a multisystem disorder that can lead to chronic inflammation, fibrosis, and death. The goals of treatment are to reduce symptom burden, control objective manifestations of disease activity, and to prevent damage and disability. This must all be balanced with potential toxicity related to treatments.
- The intent of this policy is to allow for coverage of Niktimvo (axatilimab) for steroid-refractory cGVHD (defined as disease progression on corticosteroids +/- calcineurin inhibitors) when at least two prior therapies have been ineffective or are not tolerated.
- The approval of Niktimvo (axatilimab) is based on a small, single-arm, observational study that reported a disease response rate of 75% after six months of treatment. There were no complete responses. Additional evidence is needed to determine if Niktimvo (axatilimab) improves or preserves organ function, improves disease symptoms, or prevents disability.
- Niktimvo (axatilimab) has not been compared with any other cGVHD therapy including Imbruvica (ibrutinib), Jakafi (ruxolitinib), and Rezurock (belumosudil) which are also FDA-approved for use in relapsed or refractory cGVHD.
- Like other antibody therapies, Niktimvo (axatilimab) carries a warning for infusion-related reactions. Common adverse effects include infections, gastrointestinal symptoms, fatigue, musculoskeletal pain, and dyspnea.
- The National Comprehensive Cancer Network (NCCN) guideline lists Niktimvo (axatilimab) among recommendations for steroid-refractory cGVHD after two or more prior lines of therapy.

- Niktimvo (axatilimab) was studied and is FDA approved in the doses listed in the product prescribing information. Use of doses or frequencies exceeding these quantities are considered investigational.
- The safety and effectiveness of Niktimvo (axatilimab) have not been adequately studied in other disease settings. Therefore, use in settings other than that which is described above are considered investigational.

Regence Pharmacy Services performs independent analyses of oncology medication evidence, to establish coverability per the contracts with the health plan.

- Most contracts define coverability based on established clinical benefit in published, peer-reviewed literature, along with consideration of regulatory status.
- FDA approval does not in itself establish medical necessity, as unpublished, low-quality evidence, including exploratory analyses and unvalidated surrogate endpoints, may be used as the basis of approval. Regulatory approval may or may not reflect clinical benefit relative to standard of care and the recommendations of expert clinical advisors such as the Oncologic Drugs Advisory Committee (ODAC). FDA approvals generally do not consider cost compared to established therapies, or value to members.
- Likewise, NCCN clinical practice guidelines assignment of a recommendation (category 1, 2a, or 2b) does not necessarily establish medically necessity. NCCN recommendations are inconsistently supported by published, peer-reviewed literature and do not uniformly consider value of new therapies relative to existing potentially higher-value treatment options, considering effectiveness, safety, and cost.
- Medication coverage criteria are developed based on the 'medical necessity' assessment, as described above.

Regence Pharmacy Services analysis and coverage policy may differ from FDA labeled indication and/or NCCN clinical practice guidelines.

Background *[1,2]*

- Chronic graft-versus-host disease (cGVHD) occurs in 30% to 50% of patients after an allogeneic hematopoietic stem cell transplant (HSCT). It is a multisystem disorder that can lead to chronic inflammation, fibrosis, and death.
- Per the National Institutes of Health (NIH) consensus criteria, systemic therapy is indicated for patients with involvement of three or more organs, moderate- to severe involvement in any organ, or any lung involvement.
- The goals of treatment are to reduce symptom burden, control objective manifestations of disease activity, and to prevent damage and disability. This must all be balanced with potential toxicity related to treatments.

Clinical Efficacy *[3,4]*

- The efficacy of Niktimvo (axatilimab) for the management of relapsed or refractory cGVHD is based on a small (N=79), single-arm, observational study [AGAVE-201] that reported a partial response rate of 75% after six months of treatment.

    * Patients enrolled in the study had a diagnosis of steroid-refractory relapsed or refractory cGVHD after an allogeneic HSCT. Fifty-seven percent of patients had involvement of four or more organs and 80% had disease considered to be severe.
    * Patients were allowed to continue their standard of care systemic cGVHD therapies (e.g., corticosteroids, calcineurin inhibitors) if they were on a stable dose for at least two weeks prior to entering the study.
    * Disease was no longer responsive to at least two prior therapies (median of four with a range of 2 to 12). Forty-seven percent were refractory to their last therapy.
    * Prior therapies included: Corticosteroids (100%), ibrutinib (34%), ruxolitinib (72%), belumosudil (20%).
    * A partial response was demonstrated in 75% of the patients in the study. There were no complete responses reported.
- Additional evidence is needed to determine if it improves or preserves organ function, improves disease symptoms, or prevents disability.
- There is no evidence directly comparing any of the FDA-approved agents for recurrent or refractory cGVHD which includes Niktimvo (axatilimab), Imbruvica (ibrutinib), Jakafi (ruxolitinib), and Rezurock (belumosudil).
- Jakafi (ruxolitinib) has the best evidence among these agents where it was shown to demonstrate higher response rates than best available therapy (e.g., steroids and calcineurin inhibitors) in a steroid-refractory population with cGVHD. The evidence for Imbruvica (ibrutinib) and Rezurock (belumosudil) is of similar type and quality (small, single-arm studies) as Niktimvo (axatilimab).

Guidelines [2]

- The National Comprehensive Cancer Network (NCCN) hematopoietic cell transplantation guideline lists the following recommendations for the management of cGVHD:
    * *Steroid-refractory cGVHD:* Jakafi (ruxolitinib) [category 1]
    * *After one or more prior lines of therapy:* Imbruvica (ibrutinib) [category 2A]
    * *After two or more prior lines of therapy:* Rezurock (belumosudil), and Niktimvo (axatilimab) [category 2A]

Investigational and Other Uses [4]

- The use of Niktimvo (axatilimab) in combination with other unique cGVHD medications [e.g., Jakafi (ruxolitinib), Imbruvica (ibrutinib), and Rezurock (belumosudil)] has not been studied and is considered investigational.
- Use of Niktimvo (axatilimab) in any setting other than what is listed under coverage criteria in Section II. is considered investigational.

Safety [3]

- Grade 3 and 4 adverse reactions reported in the pivotal trial include infections, gastrointestinal effects, fatigue, and dyspnea.
- Package labeling warns of the potential for infusion-related reactions.

Dosing *[3]*

- Niktimvo (axatilimab) is administered intravenously every two weeks at a dose of 0.3 mg/kg (maximum of 35 mg) and is given until disease progression.
- Niktimvo (axatilimab) is indicated for adult and pediatric patients with a weight >40 kg.

Revision History

Revision Date	**Revision Summary**
3/6/2025	No changes to coverage criteria with this annual review.
12/12/2024	New policy (effective 3/1/2025). - Coverage of Niktimvo (axatilimab) will be limited to patients with steroid-refractory (i.e., disease progression on corticosteroids with or without calcineurin inhibitors) cGVHD after at least two additional lines of therapy. - All other uses are considered investigational.

Drug names identified in this policy are the trademarks of their respective owner.

Medication Policy Manual | **Policy No:** dru803

Topic: Vyloy, zolbetuximab | **Date of Origin:** May 1, 2025

Committee Approval Date: March 6, 2025 | **Next Review Date:** 2025

Effective Date: May 1, 2025

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Vyloy (zolbetuximab) is an intravenously administered claudin 18.2 (CLDN18.2)-directed cytolytic antibody used in the treatment of specific types of cancer [advanced gastric or gastroesophageal junction cancer (GEJ)].

Policy/Criteria

Most contracts require pre-authorization approval of Vyloy (zolbetuximab) prior to coverage.

I. Continuation of therapy (COT):

Vyloy (zolbetuximab) may be considered medically necessary for COT when criterion A, B, or C below is met.

A. For diagnoses NOT listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND there is documentation that the medication was covered by another health plan. Examples of documentation include the coverage approval letter from the previous health plan or paid claim.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

B. For diagnoses listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

C. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

Please note*: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients):

Vyloy (zolbetuximab) may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) that criteria A through E below are met:

A. A diagnosis of **gastric or gastroesophageal junction (GEJ) adenocarcinoma, locally advanced unresectable or metastatic.**

AND

B. The tumor is human epidermal growth factor receptor 2 (HER2)-negative.

AND

C. The tumor is claudin (CLDN) 18.2-positive, defined as ≥75% of tumor cells demonstrating moderate to strong membranous CLDN18 staining determined by immunohistochemistry (IHC).

AND

D. There has been no prior systemic therapy in the locally advanced unresectable or metastatic setting.

AND

E. Vyloy (zolbetuximab) will be used in combination with fluoropyrimidine (e.g. fluorouracil or capecitabine)- plus platinum (e.g. cisplatin or oxaliplatin)-containing chemotherapy.

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy services considers Vyloy (zolbetuximab) coverable only under the medical benefit (as a provider-administered medication).

B. When pre-authorization is approved, Vyloy (zolbetuximab) will be authorized in the following doses until disease progression:

1. **Initial dose:** 800 mg/m^2 once.
2. **Subsequent doses:** 600 mg/m^2 every 3 weeks, or 400 mg/m^2 every 2 weeks.

C. Reauthorization: Authorization **shall** be reviewed at least every 24 weeks for documented benefit. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met. Specifically, documentation that the medication is providing clinical benefit, including disease stability or improvement, and lack of disease progression, based on an assessment of change in tumor burden. If there is documentation of potential disease progression, a shortened authorization (up to three months) may be approved to allow time for clarification of response to Vyloy (zolbetuximab), including clinical re-evaluation of the patient and reimaging.

PLEASE NOTE: Additional doses of Vyloy (zolbetuximab) will not be authorized without a documented recent assessment by the treating provider (such as oncologist) with objective evidence of response to therapy, such as by re-imaging and use of the RECIST 1.1 and/or iRECIST criteria.

IV. Investigational Uses:

Vyloy (zolbetuximab) is considered investigational when used in combination with programmed death receptor-1 (PD-1) or programmed death-ligand 1 (PD-L1) inhibitor medications, other anticancer monoclonal antibodies [such as Cyramza (ramucirumab) or Erbitux (cetuximab)], and for all other conditions not addressed in the coverage criteria above.

Position Statement

Summary

- Vyloy (zolbetuximab) is an intravenously administered claudin 18.2 (CLDN18.2)-directed cytolytic antibody. It is indicated in combination with fluoropyrimidine- and platinum-containing chemotherapy for the first-line treatment of human epidermal growth factor receptor 2 (HER2)-negative, unresectable (locally advanced) or metastatic gastric or gastroesophageal junction (GEJ) adenocarcinoma when tumors are CLDN18.2-positive.
- *CLDN18.2 testing*: is required for coverage There is currently no FDA-approved companion diagnostic for evaluating tumor CLDN18.2 expression. The current standard for determining CLDN18.2-postive tumors, and that which was used in the pivotal trial evaluating Vyloy (zolbetuximab), is defined as ≥75% of tumor cells demonstrating moderate to strong (2+ or 3+) membranous CLDN18.2 immunohistochemical staining.
- The intent of this policy is to allow coverage of Vyloy (zolbetuximab) when used in the population for which it is indicated as described above.
- The approval of Vyloy (zolbetuximab) in CLDN18.2-positive, HER2-negative, unresectable locally advanced or metastatic gastric or GEJ adenocarcinoma is based on one trial where it demonstrated a significant improvement in median overall survival (OS) when used in combination with fluoropyrimidine- and platinum-containing chemotherapy relative to chemotherapy alone.
- Use in subsequent-line settings or in combination with programmed death receptor-1 (PD-1) or programmed death-ligand 1 (PD-L1) inhibitors or other anti-cancer monoclonal antibodies is considered investigational as Vyloy (zolbetuximab) has not been formally evaluated in these settings.
- Vyloy (zolbetuximab) is associated with significant adverse (AEs) effects which may impact its tolerability. These AEs include nausea and vomiting, other gastrointestinal effects, fatigue, and hypersensitivity reactions. AEs leading to dose interruption were greater in the Vyloy (zolbetuximab) plus chemotherapy arm than in the chemotherapy alone arm (75% versus 40%, respectively).
- The National Comprehensive Cancer Network (NCCN) gastric cancer guideline lists Vyloy (zolbetuximab) in combination with a fluoropyrimidine plus oxaliplatin as a treatment option for CLDN18.2-positive, HER2-negative, unresectable locally advanced or metastatic gastric or GEJ adenocarcinoma.
- Vyloy (zolbetuximab) was studied and FDA approved in the doses listed in the product prescribing information. It is administered until disease progression or unacceptable toxicity. Use of doses or frequencies exceeding these quantities is considered investigational.
- The safety and effectiveness of Vyloy (zolbetuximab) have not been adequately studied in other disease settings. Therefore, use in settings other than that which is described above is considered investigational.
- *Reauthorization Criteria*: When coverage criteria are met, Vyloy (zolbetuximab) is authorized for up to six months (up to 24 weeks) of therapy, after which time documentation must be provided to establish that the medication is effective. Specifically,

there must be documentation of clinical benefit, including disease stability or improvement and there is a lack of disease progression, based on an assessment of change in tumor burden. Documentation of benefit must include an assessment of the most recent imaging ("restaging scans") and/or re-biopsy by the treating oncologist.

Regence Pharmacy Services performs independent analyses of oncology medication evidence, to establish coverability per the contracts with the health plan.

- Most contracts define coverability based on established clinical benefit in published, peer-reviewed literature, along with consideration of regulatory status.
- FDA approval does not in itself establish medical necessity, as unpublished, low-quality evidence, including exploratory analyses and unvalidated surrogate endpoints, may be used as the basis of approval. Regulatory approval may or may not reflect clinical benefit relative to standard of care and the recommendations of expert clinical advisors such as the Oncologic Drugs Advisory Committee (ODAC). FDA approvals generally do not consider cost compared to established therapies, or value to members.
- Likewise, NCCN clinical practice guidelines assignment of a recommendation (category 1, 2a, or 2b) does not necessarily establish medically necessity. NCCN recommendations are inconsistently supported by published, peer-reviewed literature and do not uniformly consider value of new therapies relative to existing potentially higher-value treatment options, considering effectiveness, safety, and cost.
- Medication coverage criteria are developed based on the 'medical necessity' assessment, as described above.

Regence Pharmacy Services analysis and coverage policy may differ from FDA labeled indication and/or NCCN clinical practice guidelines.

Background [1]

- Over 95% of gastric cancers are adenocarcinomas. Gastric cancer tends to have a poor prognosis in Western countries where it is less common because it is more often diagnosed in advanced stages.
- Selecting a therapy for gastric or GEJ cancer involves screening for several different biomarkers. This includes determining human epidermal growth factor receptor 2 (HER2) status, microsatellite instability (MSI) status, programmed death-ligand 1 (PD-L1) expression, neurotrophic tropomyosin-related kinase (NTRK) gene fusion status, and claudin (CLDN) 18.2 expression.
    * Approximately 15% of gastric cancers are HER2-positive.
    * Between 27% to 52% of gastric cancers are estimated to be CLDN18.2-postive.
    * Some tumors may be positive for both PD-L1 and CLDN18.2; however, the proportion of tumors with this characteristic is not yet known.

Clinical Efficacy [2 3]

- The efficacy of Vyloy (zolbetuximab) as an add on to a fluoropyrimidine plus oxaliplatin chemotherapy (FOLFOX6 regimen) for advanced, HER2-negative, CLDN18.2-positive

gastric or gastroesophageal junction (GEJ) cancer is based on a randomized, double-blind trial [SPOTLIGHT] that demonstrated an overall survival (OS) advantage relative to chemotherapy alone (placebo group).

* The trial enrolled adults with HER2-negative unresectable locally advanced or metastatic gastric or gastroesophageal junction (GEJ) adenocarcinoma. About 30% of the population had a previous gastrectomy.
* The tumors were required to be CLDN18.2-positive which was defined as ≥75% of tumor cells with moderate- to strong (2+ or 3+) membranous CLDN18.2 staining (There is no FDA-approved companion diagnostic to date).
* Patients had no prior systemic therapy for advanced disease; however, neoadjuvant or adjuvant chemotherapy or immunotherapy was allowed if it was completed at least six months prior to randomization.
* The median OS was 18.2 months and 15.5 months in the Vyloy (zolbetuximab) and placebo arms, respectively (HR 0.75 [95% CI: 0.60, 0.94]; p=0.0053).

- Only 10% of the study population was enrolled in the U.S. which may impact generalizability due to varying treatment standards and disease characteristics across populations.

Reauthorization Criteria

- When coverage criteria are met, Vyloy (zolbetuximab) is authorized for six months (24 weeks) of therapy, after which time documentation must be provided to establish that the medication is effective. Specifically, there must be documentation of clinical benefit, including disease stability or improvement and there is a lack of disease progression, based on an assessment of change in tumor burden.
  * The standard of care for evaluation of response to immunotherapy, including anticancer monoclonal antibody therapies such as Vyloy (zolbetuximab), is use of the iRECIST criteria for assessment of tumor burden.[4]
  * The iRECIST criteria include use of quantitative and qualitative criteria for assessment of change in tumor burden for target lesions and non-target lesions. [5]
    - Quantitative measurements for target lesions (tumor size and % change)
    - Qualitative evaluation for non-target lesions (present/disappeared/ unequivocal progression)
  * The pivotal trial for Vyloy (zolbetuximab) used the RECIST 1.1 criteria [6] for assessment of tumor burden, a standardized framework for tumor response to therapy. However, RECIST 1.1 was designed for response to cytotoxic chemotherapy and may not accurately reflect response to immunotherapy, such as Vyloy (zolbetuximab), given the cytolytic mechanism as well as antibody properties. Therefore, both the RECIST 1.1 and iRECIST criteria are used for guidance of reauthorization review for response to immunotherapy, including anticancer monoclonal antibody therapies such as Vyloy (zolbetuximab).
  * Documentation of benefit must include an assessment of the most recent imaging ("restaging scans") by the treating oncologist. Given the complexity of the evaluation, including use of the RECIST 1.1 and/or iRECIST criteria, anticancer

monoclonal antibody therapies, such as Vyloy (zolbetuximab), will not be reauthorized without an assessment of response to therapy, such a partial response (PR), complete response (CR), or stable disease (iSD).

* Use of some immunotherapies may result in pseudoprogression, due to immune and T-cell activation, which can appear similar to tumor flare. If there is documentation of potential disease progression ["unconfirmed progressive disease (iUPD)"], a shortened authorization (up to three months) may be approved to allow time for clarification of response to immunotherapy, including clinical re-evaluation of the patient and reimaging. Guidelines recommend reimaging for iUPD after 4-8 weeks.
* If a patient has confirmed, unequivocal new lesions (progression of disease, iPD), additional doses of immunotherapy, including anticancer monoclonal antibody therapies such as Vyloy (zolbetuximab), is not coverable. If a new lesion is equivocal, iUPD reassessment by the treating oncologist with repeat imaging would apply (as noted above).

Guidelines [1]

- The National Comprehensive Cancer Network (NCCN) gastric cancer guideline lists Vyloy (zolbetuximab) plus a fluoropyrimidine and oxaliplatin as a preferred treatment option for HER2-negative, CLDN18.2-positive, unresectable locally advanced or metastatic gastric or GEJ cancer.

Investigational and Other Uses [7]

- *Pancreatic cancer*: There is interest in combining Vyloy (zolbetuximab) in CLDN18.2-positive pancreatic cancer. However, there is currently no published data supporting use in this setting.
- *Combination therapy:*
  * Programmed death receptor-1 (PD-1) inhibitors are used to treat HER2-negative gastric and GEJ tumors that express programmed death-ligand 1 (PD-L1); however, use of Vyloy (zolbetuximab) in combination with these therapies has not been studied to date. The pivotal Vyloy (zolbetuximab) study did not allow concomitant use of PD-1 inhibitors.
  * In addition, there is no published data supporting use in combination with other anticancer monoclonal antibodies, such as Cyramza (ramucirumab) or Erbitux (cetuximab).
- Use of Vyloy (zolbetuximab) in any disease setting other than those listed under coverage criteria above is considered investigational.

Safety [2 8]

- Hypersensitivity reactions and severe nausea and vomiting are among the Warnings and Precautions listed for Vyloy (zolbetuximab).
- The most common adverse effects (AEs) associated with use of Vyloy (zolbetuximab) include gastrointestinal effects (e.g., nausea, vomiting, diarrhea), fatigue, peripheral sensory neuropathy, hypersensitivity, and pyrexia.

- AEs leading to dose interruption were greater in the Vyloy (zolbetuximab) plus chemotherapy arm than in the chemotherapy alone arm (75% versus 40%, respectively)

Dosing *[8]*

- Vyloy (zolbetuximab) is administered intravenously in combination with fluoropyrimidine- and platinum-containing chemotherapy in the following doses:
  * **Initial dose:** 800 mg/m^2 once.
  * **Subsequent doses:** 600 mg/m^2 every 3 weeks or 400 mg/m^2 every 2 weeks.
- Premedication with a combination of antiemetics is required prior to each infusion.

Medication Policy Manual

Policy No: dru806

Topic: Non-Factor Hemophilia A and B Prophylactic Products

- Alhemo, concizumab-mtci
- Hympavzi, marstacimab-hncq

Date of Origin: April 15, 2025

Committee Approval Date: March 6, 2025

Next Review Date: 2025

Effective Date: April 15, 2025

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Non-factor hemophilia A and B prophylactic products are used for routine prophylaxis to prevent or decrease the frequency of bleeding episodes in patients with either hemophilia A or B.

Policy/Criteria

Most contracts require pre-authorization approval of non-factor hemophilia A and B prophylactic products (including all drugs as listed in *Table 1*) prior to coverage.

I. Continuation of therapy (COT):

Non-factor hemophilia A and B prophylactic products may be considered medically necessary for COT when criterion A **AND** B below are met.

A. One of the following (1, 2 or 3):

1. For diagnoses NOT listed in the coverage criteria below, full policy criteria must be met for coverage.

OR

2. For diagnoses listed in the coverage criteria below, criteria a through d must be met:

a. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

b. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

NOTE: Please include baseline annualize bleeding rate (prior to use of non-factor hemophilia A and B prophylactic products), as well as current symptoms, for establishing documentation of clinical benefit.

OR

3. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

AND

B. "Administration, Quantity Limitations, and Authorization Period" below applies, as well as "Not Medically Necessary" for combination therapy and "Investigational Uses."
NOTE: For doses above those listed in Initial Quantities, documentation of need for higher dosing must be met, as detailed in the table.

Please note: *Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients):

Non-factor hemophilia A and B prophylactic products may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) confirming that criterion A or B below are met.

A. Hemophilia A or B with inhibitors (also referred to 'high titer factor inhibitors"), when criteria 1, 2, and 3 below are met:

1. Drug: Request is for Alhemo (concizumab).

2. Diagnosis: Both criteria a. AND b. below are met:

a. One of the following diagnoses, established by or in consultation with a hematologist (a. or b.):

i. Hemophilia A (congenital FVIII deficiency)

OR

ii. Hemophilia B (congenital FIX deficiency)

AND

b. High titer factor inhibitors: Documentation of a history of high anti-FVIII or anti-FIX titer (≥6 Bethesda units).

3. Step therapy: For hemophilia A only: Hemlibra (emicizumab) has been ineffective, not tolerated, or is medically contraindicated.

OR

B. Hemophilia A or B without inhibitors (also referred to "with low or no titer factor inhibitors"), when criteria 1, 2, and 3 below are met:

1. Drug: Request is for Hympavzi (marstacimab):

2. Diagnosis One of the following diagnoses, established by or in consultation with a hematologist (a. or b.):

a. Severe hemophilia A (congenital FVIII deficiency; FVIII activity <1)

OR

b. Moderate to severe hemophilia B (congenital FIX deficiency; FIX activity ≤2).

3. Step therapy: Both criteria a. AND b. below are met:

a. For all patients: Factor replacement product therapy is not a sufficient treatment option, defined as ONE of the following (i. or ii.):

i. Use is medically contraindicated: there is a documented objective clinical reason (as listed in *Appendix 1*) that all available extended half-life (EHL) factor products are not appropriate (as listed in *Appendix 2 and 3*).

OR

ii. Use is ineffective: Prophylactically administered EHL factor product(s) (as listed in *Appendices 2 & 3*) have been

ineffective, as defined by the patient continuing to have documented clinically significant bleeding events despite adherence to optimized EHL factor products (dose and dose frequency, as listed in *Appendices 2 and 3*), such as target joint bleeds or other end-organ damage, documented in a bleed diary or detailed provider notes.

PLEASE NOTE: On-demand ("PRN") use of a factor products (short half-life or extended half-life) will not meet the intent of this efficacy criteria.

AND

b. For hemophilia A only: Hemlibra (emicizumab) has been ineffective, not tolerated, or is medically contraindicated.

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers non-factor hemophilia A and B prophylactic products coverable under the medical benefit or pharmacy benefit. Determination of coverage under the pharmacy or medical benefit is based on group-specific benefits, as defined in the group and member contract (as determined by the member contract with the health plan, regardless of self- or provider-administration).

B. When pre-authorization is approved, non-factor hemophilia A and B prophylactic products will be authorized in quantities as follows in *Table 1* below:

TABLE 1. Non-factor Hemophilia A and B Prophylactic Products

Product	Quantity Limit
Alhemo (concizumab)	Initial: up to 1 mg/kg once (loading dose) followed by 0.2 mg/kg daily for up to 1 month, then up to 0.25 mg/kg daily for 5- months (6-months total for initial authorization) Maintenance: up to 0.25 mg/kg daily for 12-months.
Hympavzi (marstacimab)	Initial: up to **53** (150 mg) **pens** in a **12- month period**, based on a one-time 300 mg loading dose followed by weekly 150 mg SC injections. Maintenance: up to **52** (150 mg) **pens** in **a 12- month period**, based on once weekly 150 mg SC injections. Dose escalation: For patients ≥50 kg, up to **104** (150 mg) **pens** in a **12-month period,** based on once weekly 300 mg SC injections, may may be considered medically necessary when there is clinical documentation that current treatment with Hympavzi 150 mg weekly has had an inadequate response (defined as two or more breakthrough bleeds requiring treatment) after at least a 6-month treatment course.

C. Doses authorized will be based on the closest available pen size.

D. Doses greater than listed above (Table 1) are considered investigational.

E. **Continued Authorization:** Authorization **shall** be reviewed at least annually to confirm that the medication continues to be effective. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, such as improvement in annualized bleed rate (ABR).

IV. Not Medically Necessary Uses

Non-factor hemophilia A and B prophylactic product are considered not medically necessary when used in combination with prophylactic extended half-life (EHL) FVIII or FIX products (such as those *Appendix 2 & 3*).

V. Investigational Uses

Non-factor hemophilia A and B prophylactic products are considered investigational when used for all other conditions, including but not limited to:

A. Use in combination with other non-factor hemophilia A or B prophylactic products, including but not limited to products listed in Table 1 or Hemlibra (emicizumab).

Position Statement

Summary

- Non-factor hemophilia A and B prophylactic products (as listed in Table 1) are indicated for routine prophylaxis to prevent or reduce the frequency of bleeding episodes in patients with hemophilia A (congenital factor VIII deficiency) or hemophilia B (congenital factor IX deficiency).
- The intent of this policy is to allow for coverage of non-factor hemophilia A and B prophylactic products for up to FDA-approved doses for patients with moderate to severe disease and standard of care is not effective, not tolerated, or not a treatment option.
- *Hemophilia A or B with inhibitors*:
    * Alhemo (concizumab) was studied in a phase 3 trial in patients with hemophilia A or B *with* inhibitors (defined as six or more Bethesda units), where it was shown to reduce bleeding when used in doses up to the coverable amount.
    * For patients with hemophilia A only, step with Hemlibra (emicizumab): There is no head-to-head evidence that non-factor hemophilia A and B prophylactic products prophylaxis (such as Alhemo) are safer or more effective than prophylactic Hemlibra (emicizumab), but they are more costly. Therefore, non-factor hemophilia A and B prophylactic products are coverable only when Hemlibra (emicizumab) is ineffective, or use is medically contraindicated.
- *Hemophilia A or B without inhibitors*:
    * Hympavzi (marstacimab) was studied in a phase 3 trial in patients with severe hemophilia A or moderate to severe hemophilia B as defined in coverage criteria, in patients without inhibitors. Patients on Hympavzi (marstacimab) had less

bleeds than “on-demand” factor product dosing; Hympavzi (marstacimab) was non-inferior to factor routine prophylaxis.

* In patients without inhibitors, there is no head-to-head evidence that non-factor hemophilia A and B prophylactic products prophylaxis are safer or more effective than prophylactic factor replacement regimens (FVIII or FIX) or Hemlibra (emicizumab; for hemophilia A only), but they are more costly. Therefore, non-factor hemophilia A and B prophylactic products are coverable only when EHL factor replacement products and Hemlibra (emicizumab; for hemophilia A only) are ineffective, or all are medically contraindicated.

- The National Hemophilia Foundation's Medical and Scientific Advisory Council (MASAC) recommends that bleeding prophylaxis be the standard treatment approach for individuals with severe hemophilia A or B.
    * Hemophilia A or B **without** inhibitors: Patients with hemophilia A without inhibitors typically receive prophylaxis with factor VIII replacement products or Hemlibra (emicizumab). Patients with hemophilia B without inhibitors typically receive prophylaxis with factor IX replacement products. There are numerous treatment options in this population and no distinction is made between different factor products.
    * Hemophilia A **with** inhibitors: MASAC consider Hemlibra (emicizumab) first-line for patients with hemophilia A with inhibitors. The World Federation of Hemophilia (WFH) recommends Hemlibra (emicizumab) prophylaxis over bypassing agents for patients with hemophilia A and persistent inhibitors.
- Non-factor hemophilia A and B prophylactic products may be covered for up to doses/intervals stated in the coverage criteria; the dose studied in clinical trials. The safety and effectiveness of higher doses have not been established.
- The safety and effectiveness of non-factor hemophilia A and B prophylactic products in conditions other than listed in the coverage criteria have not been established.
- *Combination use*:
    * Non-factor hemophilia A and B prophylactic products are used for “baseline” prophylaxis of bleeding and may be used in combination with on-demand (PRN) short half-life (SHL) factor products in patients without high-titer factor inhibitors. However, the use of non-factor hemophilia A and B prophylactic products (as listed in Table 1) in combination with prophylactic extended half-life (EHL) factor product (as listed in Appendix 2 & 3) is considered “not medically necessary.” There is no evidence to support the use of EHL factor products as safer or more effective than lower-cost SHL factor products when used in combination with non-factor hemophilia A and B prophylactic products.
    * There is no data for use of non-factor hemophilia A and B prophylactic products (as listed in Table 1) in combination with Hemlibra (emicizumab), another non-factor prophylactic product for hemophilia A. Therefore, use in combination with Hemlibra (emicizumab) is investigational.

- *Other Investigational Uses*: The safety and efficacy of non-factor hemophilia A and B prophylactic products (as listed in Table 1) in conditions other than Hemophilia A or B with inhibitors (as detailed in the coverage criteria), or use combination with one another or with other non-factor prophylactic therapies, including but not limited to Hemlibra (emicizumab) have not been established.

Clinical Efficacy

Hemophilia A or B **with** inhibitors

- The evidence for efficacy for Alhemo (concizumab) was based primarily on the open-label, phase III Explorer-7 trial, in which 52 patients with hemophilia A and B with inhibitors continued an on-demand bypassing agent or received Alhemo (concizumab).[1 2]
    * Patients enrolled in the trial had congenital hemophilia A or B (any severity)
    * All patients had a history of high anti-factor titers (also known as inhibitors, defined as 0.6 or higher Bethesda units).
    * Patients initially received concizumab at 1 mg/kg on Day 1, followed by a daily dose of 0.25 mg/kg starting on Day 2. However, due to thromboembolic events, the study was paused in March 2020. When the study resumed in August 2020, the dosing regimen was modified to:
        - 1 mg/kg loading dose on Day 1
        - 0.2 mg/kg daily maintenance dose starting on Day 2
    * Patients' plasma concizumab concentrations were measured at Week 4, and the dose was adjusted as follows:
        - Patients with concentrations between 200-4000 ng/mL remained on the 0.2 mg/kg daily dose
        - Patients with concentrations <200 ng/mL were increased to 0.25 mg/kg daily
        - Patients with concentrations >4000 ng/mL were decreased to 0.15 mg/kg daily
    * The annualized bleed rate (ABR) of treated bleeds was 1.7 with Alhemo (concizumab) compared to 11.8 with on-demand bypassing agent therapy (86% reduction; P<0.001); 64% of patients on Alhemo (concizumab) had no bleeds.
    * The pivotal trial for Alhemo (concizumab) was temporarily paused due to nonfatal thromboembolic events but was resumed after implementation of risk-mitigation measures including individualized dosing based on concizumab plasma concentrations. No thromboembolic events were reported after Alhemo (concizumab) was restarted.

Hemophilia A or B **without** inhibitors

- The pivotal trial for efficacy of Hympavzi (marstacimab) was the open-label, phase III BASIS trial (n=116) in which patients with severe hemophilia A or moderate to severe hemophilia B without inhibitors were observed for 24-weeks (while continuing factor products) then given Hympavzi (marstacimab) for 32 weeks.[3-5]

    * Patients in this trial had either severe hemophilia A (defined as factor VIII <1%) or moderately severe to severe hemophilia B (defined as FIX <2%).
    * Patients did not have inhibitors (also known as high anti-factor titers).
    * Patients on Hympavzi (marstacimab) experienced a 92% reduction in annualized bleeding rate (ABR) of treated bleeds compared to on-demand treatment with factor products (superiority; ABR 3.2 vs 38, respectively) and a 35% reduction in ABR of treated bleeds compared to routine prophylaxis with factor products (non-inferiority; ABR 5.1 vs 7.9, respectively). However, the ABR for routine prophylaxis with factor products was higher than expected based on results from other trials and may be due to inadequate optimization in baseline therapy; therefore, it is not possible to make a valid comparison to optimized prophylactic factor therapy.
    * A year-long, open-label trial demonstrated that patients maintained a mean annualized bleeding rate (ABR) consistent with the results seen at 32 weeks.[6]
- Non-factor hemophilia A and B prophylactic products are used for "baseline" prophylaxis of bleeding and may be used in combination with on-demand (PRN) short half-life (SHL) factor products in patients without high-titer factor inhibitors. However, the use of non-factor hemophilia A and B prophylactic products (as listed in Table 1) in combination with prophylactic extended half-life (EHL) factor product (as listed in Appendix 2 & 3) is considered "not medically necessary." There is no evidence to support the use of EHL factor products as safer or more effective than lower-cost SHL factor products when used in combination with non-factor hemophilia A and B prophylactic products.

Clinical Guidelines/Standard of Care Treatment [7-10]

- Prophylaxis is recommended as the optimal treatment modality for individuals with severe hemophilia by the National Hemophilia Foundation's Medical and Scientific Advisory Council (MASAC). The concept was conceived from the observation that moderate hemophiliacs (clotting factor level >1 IU/dL) seldom experience spontaneous bleeding and have much better preservation of joint function. Goals of therapy include trough factor levels of at least 1% (>3%-5% or higher if feasible) and minimal to no spontaneous bleeding.
- Clinical practice guidelines from MASAC consider use of factor replacement products to be the standard of care for the treatment of hemophilia A or B without inhibitors. Hemlibra (emicizumab) is also recommended as first-line in patients with severe hemophilia A with or without inhibitors.
- Factor concentrate products (factor replacement products) are effective for the prevention and control of bleeding versus no treatment based on years of significant clinical experience, systematic reviews, and are endorsed by clinical practice guidelines. There is insufficient evidence that any factor replacement products (also known as "factor concentrate") or bypassing agent is superior to another due to a lack of comparative trial data.

* There are numerous factor replacement products available for hemophilia A or B in patients without inhibitors.
* For patients with inhibitors, there are only a limited number of therapeutic options, including emicizumab (for hemophilia A only), immune tolerance induction (ITI), and bypassing agents, such as rFVIIa (NovoSeven and SevenFact) and activated prothrombin complex concentrate (aPCC, FEIBA).

Investigational Uses

- The use of non-factor hemophilia A and B prophylactic products (as listed in Table 1) for indications other than those listed in the coverage criteria above are considered investigational. Trials in various settings are ongoing.
- There are no published clinical trials evaluating the safety or efficacy of non-factor hemophilia A and B prophylactic products (as listed in Table 1) being used in combination with one another or with emicizumab (Hemlibra).

Appendices

Appendix 1: Clinical Reasons Extended Half-Life (EHL) Factor Products Are Not Appropriate

Severe life-threatening hypersensitivity reaction, including anaphylaxis to factor proteins.
Inadequate venous access for prophylactic IV therapy due to comorbidities or age.
Unable to self-administer IV therapy.

Appendix 2: Extended Half-life (EHL) Factor VIII Products

Hemophilia A – Factor VIII Products		
Medication	**Recombinant or Plasma-Derived**	**FDA-recommended Prophylactic Dosing**
Adynovate[31]	Recombinant	>12 years old: Up to 50 IU/kg two times per week. <12 years old: Initially up to 55 IU/kg two times per week with a maximum of 70 IU/kg.
Afstyla*[24]	Recombinant	>12 years old: Up to 50 IU/kg 2 to 3 times per week. <12 years old: Up to 50 IU/kg every other day.
Altuviiio	Recombinant	Up to 50 IU/kg once weekly.
Eloctate[32]	Recombinant	>6 years old: Up to 65 IU/kg every 3 to 5 days. <6 years old: Up to 65 IU/kg every 3 to 5 days. More frequent or higher doses (up to 80 IU/kg) may be required.
Jivi[33]	Recombinant	>12 years old: Up to 40 IU/kg twice weekly. <12 years old: Not approved for use in this age group.
Esperoct[34]	Recombinant	>12 years old: Up to 50 IU/kg every 4 days. <12 years old: Up to 65 IU/kg twice weekly.

* denotes lower cost factor product

Appendix 3: Extended Half-life (EHL) Factor IX Products

Hemophilia B- Factor IX Products		
Medication	**Recombinant or Plasma-Derived**	**FDA- recommended Prophylactic Dosing**
Alprolix[35]	Recombinant	>12 years old: Up to 50 IU/kg once weekly or 100 IU/kg once every 10 days. <12 years old: Up to 60 IU/kg once weekly.
Idelvion[36]	Recombinant	>12 years old: Up to 40 IU/kg once weekly. <12 years old: Up to 55 IU/kg once weekly.
Rebinyn[37]	Recombinant	Not indicated for prophylaxis.

UMP Medication Policy Manual

Policy No: dru900

Topic: Provider-administered drugs for chronic inflammatory diseases (for UMP plans)

Date of Origin: January 1, 2020

- Cimzia (certolizumab lyophilized powder vial)
- Cosentyx (secukinumab intravenous)
- Entyvio (vedolizumab)
- Ilumya (tildrakizumab-asmn)
- Omvoh (mirkizumab)
- Orencia (abatacept intravenous)
- Simponi Aria (golimumab intravenous)
- Skyrizi (risankizumab)
- Spevigo (spesolimab)
- Tocilizumab (Actemra; biosimilars Tofidence, Tyenne)
- Tremfya (guselkumab)
- Ustekinumab (Stelara; biosimilars Pyzchiva, Selarsdi, Wezlana)

Committee Approval Date: December 16, 2024

Next Review Date: 2025

Effective Date: January 1, 2025

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of medication policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Therapies included in this policy are used to treat a group of diseases that may be caused or worsened by an overactive immune system such as rheumatoid arthritis, psoriasis, and ulcerative colitis.

This policy applies to the Washington State Health Care Authority (HCA) Uniform Medical Plan (UMP) only. The UMP is a self-funded health plan offered through the Washington State HCA's Public Employees Benefits Board (PEBB) Program and School Employees Benefits Board (SEBB) Program and administered by Regence BlueShield.

Table of Contents

Disease Modifying Antirheumatic Drug (DMARD)			
Targeted DMARD			Conventional synthetic DMARDs
Tumor necrosis factor inhibitor (TNF) biologics	Non-tumor necrosis factor inhibitor (non-TNF inhibitor) biologics	Targeted synthetic DMARD (tsDMARD)	
	IL-6 Inhibitors IL-17 Inhibitors IL 12/23 and IL-23 Inhibitors Integrin inhibitors Other mechanisms of action: IL-I rituximab, abatacept	JAK Inhibitors PDE-4 Inhibitors	

Drug List:		
TNF inhibitors		- Adalimumab (Humira; biosimilars Abrilada, Amjevita, Cyltezo, Hadlima, Hulio, Hyrimoz, Idacio, Simlandi, Yuflyma, Yusimry; unbranded: adalimumab-adaz, adalimumab-adbm, adalimumab-ryvk) - Cimzia (certolizumab pre-filled syringes for self-administration or vials for provider-administration) - Enbrel (etanercept) - Etanercept biosimilars (Erelzi, Eticovo) - Simponi/Simponi Aria (golimumab) IV or SC - Remicade (infliximab) - Infliximab products (Inflectra, Ixifi, Renflexis, Avsola, unbranded product, Zymfentra)
IL-6 inhibitors		- Kevzara (sarilumab) - Tocilizumab biosimilars (Tofidence, Tyenne) IV or SC
IL-17 Inhibitors		- Siliq (brodalumab) - Taltz (ixekizumab) - Cosentyx (secukinumab) IV or SC - Bimzelx (bimekizumab-bkzx) IL-17A, IL-17F inhibitor
IL-23 inhibitors		- Tremfya (guselkumab) - Skyrizi (risankizumab) - Ilumya (tildrakizumab-asmn) - Omvoh (mirikizumab-mrkz)
IL-12, IL-23 inhibitors		- Ustekinumab (Stelara; biosimilars Pyzchiva, Selarsdi, Wezlana)
IL-36 inhibitors		- Spevigo (spesolimab)
Integrin Inhibitors		- Tysabri (natalizumab) - Entyvio (vedolizumab)
Other non-TNF inhibitor biologics	T-lymphocyte inhibitor	- Orencia (abatacept) IV or SC
	B-lymphocyte depleter	- Rituximab (Rituxan Hycela, Rituxan; biosimilars Riabni, Ruxience, Truxima) [a]
	IL-1	- Kineret (anakinra) - Ilaris (canakinumab)
JAK Inhibitors		- Olumiant (baricitinib) - Tofacitinib (Xeljanz/Xeljanz XR) - Rinvoq (upadacitinib) - Sotyktu (deucravacitinib)
PDE-4 Inhibitor		- Otezla (apremilast)
S1P receptor modulator		- Velsipity (etrasimod)
Conventional immunomodulators (also referred to as conventional synthetic DMARDs) (see appendix 2, for complete		- Azathioprine (generic, Imuran) - 6-mercaptopurine (generic, 6-MP) - Methotrexate (generic, MTX)

list)	- Hydroxychloroquine (HCQ; generic, Plaquenil) - Leflunomide (generic, Arava) - Mycophenolate (MMF; generic, CellCept, Myfortic) - Cyclosporine (CSA; Gengraf, Neoral, Sandimmune) - Tacrolimus (generic, Prograf) - 5 ASAs [sulfasalazine (generic, SSZ), mesalamine, balsalazide] - Acitretin (generic, Accutane)

Policy/Criteria

Most contracts require pre-authorization approval of drugs for chronic inflammatory diseases prior to coverage.

I. **For self-administered therapies**, please refer to coverage policies administered by ArrayRx.

II. Continuation of therapy (COT): Provider-administered therapies in this policy may be considered medically necessary for COT when criteria A and B below are met.

A. One of the following (1, 2, or 3):

1. For diagnoses NOT listed in the coverage criteria below, full policy criteria must be met for coverage.

OR

2. For diagnoses listed in the coverage criteria below, criteria a and b must be met:

a. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

b. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

3. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

AND

B. Site of care administration requirements are met [refer to Medication Policy Manual, Site of Care Review, dru408].

***Please note**: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

III. New starts (treatment-naïve patients): Provider-administered therapies in the policy may be considered medically necessary when the criteria below are met.

A. Acute Graft Versus Host Disease, Prophylaxis

1. Provider-administered therapies may be considered medically necessary when criteria a through c below are met.

FOR UMP MEMBERS:	
Preferred Self-Administered Options Refer to ArrayRx.	Refer to coverage policies administered by ArrayRx.
Non-Preferred Self-Administered Options Refer to ArrayRx.	Refer to coverage policies administered by ArrayRx.
Provider-Administered Options	Orencia (abatacept) IV

a. Abatacept will be used for **prophylaxis** of **acute graft versus host disease** (aGVHD).

AND

b. Patient will undergo a hematopoietic cell transplant (HCT) from an unrelated donor (either 8/8 HLA matched or 7/8 HLA mismatch).

AND

c. Abatacept will be used in combination with methotrexate and a calcineurin inhibitor (cyclosporine or tacrolimus).

B. Ankylosing Spondylitis (AS)

1. For provider-administered therapies, site of care administration requirements must be met [refer to Medication Policy Manual, Site of Care Review, dru408].
2. For infliximab products: Refer to Medication Policy Manual, Products with Therapeutically Equivalent Biosimilars/Reference Products, dru620.
3. Other provider-administered therapies may be considered medically necessary when criteria a and b below are met.

FOR UMP MEMBERS:	
Preferred Self-Administered Options Refer to ArrayRx.	Refer to coverage policies administered by ArrayRx.
Non-Preferred Self-Administered Options Refer to ArrayRx.	Refer to coverage policies administered by ArrayRx.
Infliximab Products	Refer to Medication Policy Manual, Products with Therapeutically Equivalent Biosimilars/Reference Products, dru620. Preferred: • Avsola • Inflectra (infliximab) Non-preferred: • Remicade (infliximab) • Other infliximab biosimilars (Ixifi, Renflexis) • Unbranded Janssen infliximab product
Other Provider-Administered Options	• Cimzia (certolizumab) vial • Simponi Aria (golimumab) IV • Cosentyx (secukinumab) IV

a. A diagnosis of **axial spondyloarthritis (axSpA)**, including **ankylosing spondylitis** (AS), is established by or in consultation with a specialist in rheumatology.

AND

b. There is clinical documentation that treatment with **at least TWO** preferred self-administered therapies were not effective after at least a 12-week treatment course unless each were not tolerated or are contraindicated (including, but not limited to, contraindications listed in *Appendix 6*).

C. Antibody Mediated Rejection (AMR) of Transplant (Solid Organ)

1. Preferred provider-administered therapies may be considered medically necessary when criteria a and b below are met.

2. Other provider-administered therapies may be considered medically necessary when criteria a through c below are met.

FOR UMP MEMBERS:	
Preferred Self-Administered Options Refer to ArrayRx.	Refer to coverage policies administered by ArrayRx.
Non-Preferred Self-Administered Options Refer to ArrayRx.	Refer to coverage policies administered by ArrayRx.
Preferred Provider-Administered Options	• Tyenne (tocilizumab-aazg) IV
Other Provider-Administered Options	• Actemra (tocilizumab) IV • Tofidence (tocilizumab-bavi) IV

a. Medication will be used for **prevention of antibody (Ab)-mediated rejection**: Prior to solid organ transplant and in the peri-operative period, for patients at high risk for Ab-mediated rejection, including highly sensitized patients, and those receiving an ABO-incompatible organ **OR Treatment of antibody-mediated rejection** (a.k.a. vascular rejection, humoral rejection): following solid organ transplant and confirmed by either biopsy or presence of panel reactive antibodies (PRAs).

AND

b. Treatment with immunoglobulin (IVIG), plasma exchange/pheresis (PLEX), and rituximab has been ineffective or is contraindicated.

AND

c. There is clinical documentation that treatment with all preferred provider-administered therapies were not effective unless each were not tolerated or are contraindicated.

D. Non-Radiographic Axial Spondyloarthritis (NR-axSpA)

1. For provider-administered therapies, site of care administration requirements must be met [refer to Medication Policy Manual, Site of Care Review, dru408].

2. Provider-administered therapies may be considered medically necessary when criteria a and b below are met.

3. Provider-administered biosimilar reference products may be considered medically necessary when criteria a and b below are met.

FOR UMP MEMBERS:	
Preferred Self-Administered Options Refer to ArrayRx.	Refer to coverage policies administered by ArrayRx.
Non-Preferred Self-Administered Options Refer to ArrayRx.	Refer to coverage policies administered by ArrayRx.
Provider-Administered Options	• Cimzia (certolizumab) vial • Cosentyx (secukinumab) IV
a. A diagnosis of **non-radiographic axial SpA** (NR-axSpA) is established by or in consultation with a specialist in rheumatology. **AND** **b.** Treatment with **at least ONE** preferred self-administered therapy was not effective after at least a 12-week treatment course unless each were not tolerated or are contraindicated (including, but not limited to, contraindications listed in *Appendix 6*).	

E. Chronic Plaque Psoriasis (PsO)

1. For provider-administered therapies, site of care administration requirements must be met [refer to Medication Policy Manual, Site of Care Review, dru408].

2. For infliximab products: Refer to Medication Policy Manual, Products with Therapeutically Equivalent Biosimilars/Reference Products, dru620.

3. Preferred provider-administered therapies may be considered medically necessary when criteria a and b below are met.

4. Other provider-administered therapies may be considered medically necessary when criteria a through c below are met.

FOR UMP MEMBERS:	
Preferred Self-Administered Options Refer to ArrayRx.	Refer to coverage policies administered by ArrayRx.
Non-Preferred Self-Administered Options Refer to ArrayRx.	Refer to coverage policies administered by ArrayRx.
Infliximab Products	Refer to Medication Policy Manual, Products with Therapeutically Equivalent Biosimilars/Reference Products, dru620. Preferred: • Avsola (infliximab) • Inflectra (infliximab) Non-preferred: • Remicade (infliximab) • Other infliximab biosimilars (Ixifi, Renflexis) • Unbranded Janssen infliximab product
Preferred Provider-Administered Options	• Stelara (ustekinumab)
Other Provider-Administered Options	• Cimzia (certolizumab) vial • Ilumya (tildrakizumab-asmn) • Ustekinumab biosimilars (Pyzchiva, Selarsdi, Wezlana)

a. A diagnosis of **chronic plaque psoriasis** (PsO) is established by or in consultation with a specialist in dermatology or rheumatology.

AND

b. One of the following criterion i, ii, or iii below is met.

i. There is involvement of ≥ 10% of the body surface area (BSA) OR there is significant functional disability due to PsO.

OR

ii. Treatment with phototherapy (for example, UVB) or photochemotherapy was not effective, not tolerated, or is contraindicated (such as lesions on the face, scalp, hands, feet, nailbeds, or groin area; see *Appendix 1*).

OR

iii. Treatment with at least one conventional agent was not effective after at least 6 to 12 weeks of treatment, or not tolerated, unless all are contraindicated. Conventional agents for the treatment of PsO include: acitretin, anthralin, calcipotriene, calcitriol, coal tar products, cyclosporine, methotrexate, pimecrolimus, tacrolimus, tazarotene, or a topical corticosteroid.

AND

c. There is clinical documentation that treatment with **at least TWO** preferred self-administered therapies were not effective after at least a 12-week treatment course unless each were not tolerated or are contraindicated (including, but not limited to, contraindications listed in *Appendix 6*).

F. Crohn's Disease (CD)

1. **Site of Care Requirements:** For provider-administered therapies, site of care administration requirements must be met [refer to Medication Policy Manual, Site of Care Review, dru408 [Stelara (ustekinumab) and Skyrizi (risankizumab) do not require Site of Care Review].

2. **Diagnostic Criteria:** A diagnosis of **Crohn's disease** (CD) established by or in consultation with a specialist in gastroenterology.

3. **Severity Criteria:** Either criterion a or b below is met.

a. At least one of the following criteria 1 through 6 below are met.

1. Fistulizing Crohn's disease.

2. Previous hospitalization for Crohn's disease.

3. Extensive anatomic involvement.

4. Deep ulcers.

5. Prior surgical resection.

6. Stricturing and/or penetrating behavior.

OR

b. Acute treatment of an exacerbation when at least one of criterion 1, 2, or 3 below, is met.

1. Treatment with an adequate course of corticosteroids (for example, prednisone 40 to 60 mg/day, oral budesonide 9 mg/day, or budesonide rectal for 7 to 14 days) has been ineffective or is contraindicated.

OR

2. The patient has been unable to taper an adequate course of corticosteroids without experiencing worsening of disease.

OR

3. The patient is experiencing breakthrough disease (e.g., active disease flares) while stabilized for at least 8 weeks on a conventional immunomodulator. Conventional immunomodulators for CD include azathioprine, mercaptopurine, methotrexate, balsalazide, mesalamine, cyclosporine, and sulfasalazine.

FOR UMP MEMBERS:		
Product Group	**Products**	**Criteria Requirements**
Preferred Self-Administered Options	Refer to ArrayRx.	Refer to coverage policies administered by ArrayRx.
Non-Preferred Self-Administered Options	Refer to ArrayRx.	Refer to coverage policies administered by ArrayRx.
Preferred Provider-Administered Options	• Entyvio (vedolizumab) • Skyrizi (risankizumab) • Stelara (ustekinumab)	**1.** Site of Care Requirements *(Entyvio only)* **2.** Diagnostic Criteria **3.** Severity Criteria
	• Avsola (infliximab) • Inflectra (infliximab)	Refer to Medication Policy Manual, Products with Therapeutically Equivalent Biosimilars/Reference Products, dru620.
Non-Preferred Provider-Administered Options	• Cimzia (certolizumab) vial • Ustekinumab biosimilars (Pyzchiva, Selarsdi, Wezlana)	**1.** Site of Care Requirements *(Cimzia only)* **2.** Diagnostic Criteria **3.** Severity Criteria **4.** Treatment with **at least TWO** preferred self-administered therapies has been not effective after at least a 12-week treatment course unless each were not tolerated or are contraindicated (including, but not limited to, contraindications listed in *Appendix 6*).
Non-preferred infliximab Products	• Infliximab biosimilars (Ixifi, Renflexis) • Remicade (infliximab) • Unbranded Janssen infliximab product	Refer to Medication Policy Manual, Products with Therapeutically Equivalent Biosimilars/Reference Products, dru620.

G. Cryopyrin-Associated Periodic Syndrome (CAPS)

1. For self-administered therapies, please refer to coverage policies administered by ArrayRx.

FOR UMP MEMBERS:	
Preferred Self-Administered Options Refer to ArrayRx.	Refer to coverage policies administered by ArrayRx.
Non-Preferred Self-Administered Options Refer to ArrayRx.	Refer to coverage policies administered by ArrayRx.
Provider-Administered Options	Refer to Interleukin-1 Antagonists, Medication Policy Manual, Policy No. dru677

H. Cytokine Release Syndrome (CRS)

1. Preferred provider-administered therapies may be considered medically necessary when criterion a below is met.

2. Other provider-administered therapies may be considered medically necessary when criteria a and b below are met.

FOR UMP MEMBERS:	
Preferred Self-Administered Options Refer to ArrayRx.	Refer to coverage policies administered by ArrayRx.
Non-Preferred Self-Administered Options Refer to ArrayRx.	Refer to coverage policies administered by ArrayRx.
Preferred Provider-Administered Options	• Tyenne (tocilizumab-aazg) IV
Other Provider-Administered Options	• Actemra (tocilizumab) IV • Tofidence (tocilizumab-bavi) IV
a. Medication will be used for **cytokine release syndrome** (CRS). **AND** **b.** There is clinical documentation that treatment with all preferred provider-administered therapies were not effective unless each were not tolerated or are contraindicated.	

I. Enthesitis-related Arthritis (ERA)

1. For provider-administered therapies, site of care administration requirements must be met [refer to Medication Policy Manual, Site of Care Review, dru408].

2. Provider-administered therapies may be considered medically necessary when criterion a below is met.

FOR UMP MEMBERS:	
Preferred Self-Administered Options Refer to ArrayRx.	Refer to coverage policies administered by ArrayRx.
Non-Preferred Self-Administered Options Refer to ArrayRx.	Refer to coverage policies administered by ArrayRx.
Provider-Administered Options	
a. A diagnosis of **enthesitis-related arthritis** (ERA) is established by or in consultation with a specialist in rheumatology.	

J. Generalized Pustular Psoriasis (GPP)

1. For infliximab products: Refer to Medication Policy Manual, Products with Therapeutically Equivalent Biosimilars/ Reference Products, dru620.

2. Other provider-administered therapies may be considered medically necessary when criteria a and b below are met.

FOR UMP MEMBERS:	
Preferred Self-Administered Options Refer to ArrayRx.	Refer to coverage policies administered by ArrayRx.
Non-Preferred Self-Administered Options Refer to ArrayRx.	Refer to coverage policies administered by ArrayRx.
Infliximab Products	Refer to Medication Policy Manual, Products with Therapeutically Equivalent Biosimilars/Reference Products, dru620. Preferred: • Avsola • Inflectra (infliximab) Non-preferred: • Remicade (infliximab) • Other infliximab biosimilars (Ixifi, Renflexis) • Unbranded Janssen infliximab product
Other Provider-Administered Options	Spevigo (spesolimab)

a. A diagnosis of **generalized pustular psoriasis (GPP)** established by or in consultation with a specialist in dermatology.

AND

b. One of the following criterion i or ii below is met.

i. **Treatment of GPP flare (IV formulation only)** when all of the following are met:

1. Documentation of disease progression despite usual treatment with cyclosporine OR infliximab unless not tolerated, or both are contraindicated.
2. There is involvement of ≥ 5% of body surface area (BSA) with erythema and the presence of pustules.

OR

ii. **Maintenance treatment for GPP (SC loading dose only)** when all of the following are met:

1. History of at least two moderate-to-severe flares, with at least one associated with fever, elevated C-reactive protein level, elevated white blood cell count, asthenia, or myalgia.
2. Currently not experiencing a flare.
3. Treatment with acitretin and methotrexate for at least eight weeks has been ineffective or not tolerated, unless both are contraindicated.

K. Giant Cell Arteritis (GCA)

1. For provider-administered therapies, site of care administration requirements must be met [refer to Medication Policy Manual, Site of Care Review, dru408].
2. Preferred provider-administered therapies may be considered medically necessary when criteria a and b below are met.
3. Other provider-administered therapies may be considered medically necessary when criteria a through c below are met.

FOR UMP MEMBERS:	
Preferred Self-Administered Options Refer to ArrayRx.	Refer to coverage policies administered by ArrayRx.
Non-Preferred Self-Administered Options Refer to ArrayRx.	Refer to coverage policies administered by ArrayRx.
Preferred Provider-Administered Options	• Tyenne (tocilizumab-aazg) IV
Other Provider-Administered Options	• Actemra (tocilizumab) IV • Tofidence (tocilizumab-bavi) IV

a. A diagnosis of **giant cell arteritis** (GCA) when established by or in consultation with a specialist in rheumatology.

AND

b. Requested medication will be given in combination with high-dose corticosteroids (prednisone 20 to 60 mg per day or equivalent) unless contraindicated or not tolerated.

AND

c. There is clinical documentation that treatment with all preferred provider administered options were not effective unless each were not tolerated or are contraindicated.

L. Hidradenitis Suppurativa (HS)

1. For provider-administered therapies, site of care administration requirements must be met [refer to Medication Policy Manual, Site of Care Review, dru408].

2. Provider-administered therapies may be considered medically necessary when criteria a and b below are met.

3. For infliximab products: Refer to Medication Policy Manual, Products with Therapeutically Equivalent Biosimilars/Reference Products, dru620.

FOR UMP MEMBERS:	
Preferred Self-Administered Options Refer to ArrayRx.	Refer to coverage policies administered by ArrayRx.
Non-Preferred Self-Administered Options Refer to ArrayRx.	Refer to coverage policies administered by ArrayRx.
Infliximab Products	Refer to Medication Policy Manual, Products with Therapeutically Equivalent Biosimilars/Reference Products, dru620. Preferred: • Avsola • Inflectra (infliximab) Non-preferred: • Remicade (infliximab) • Other infliximab biosimilars (Ixifi, Renflexis) • Unbranded Janssen infliximab product

a. A diagnosis of **hidradenitis suppurativa** (HS) is established by or in consultation with a specialist in dermatology.

AND

b. Treatment with at least one conventional agent was not effective after 12 weeks, not tolerated, or all are contraindicated. Conventional agents for the treatment of HS include topical antibiotics, systemic antibiotics (e.g., oral tetracyclines, clindamycin, rifampin, moxifloxacin, metronidazole), intralesional corticosteroids (e.g., triamcinolone), hormonal therapies (e.g., oral contraceptives, spironolactone), cyclosporine, finasteride, metformin, or oral retinoids.

M. Immune-Mediated Colitis

1. Provider-administered therapies may be considered medically necessary when criteria a and b below are met.

2. For infliximab products: Refer to Medication Policy Manual, Products with Therapeutically Equivalent Biosimilars/Reference Products, dru620.

FOR UMP MEMBERS:	
Preferred Self-Administered Options Refer to ArrayRx.	Refer to coverage policies administered by ArrayRx.
Non-Preferred Self-Administered Options Refer to ArrayRx.	Refer to coverage policies administered by ArrayRx.
Infliximab Products	Refer to Medication Policy Manual, Products with Therapeutically Equivalent Biosimilars/Reference Products, dru620. Preferred: • Avsola (infliximab) • Inflectra (infliximab) Non-preferred: • Remicade (infliximab) • Other infliximab biosimilars (Ixifi, Renflexis) • Unbranded Janssen infliximab product
Provider-Administered Options	Entyvio (vedolizumab)

a. A diagnosis of **colitis** due to Yervoy (ipilimumab) or an anti-PD1/PD-L1 agent [e.g., Tecentriq (atezolizumab), Bavencio (avelumab), Libtayo (cemiplimab), Jemperli (dostarlimab), Imfinzi (durvalumab), Opdivo (nivolumab), or Keytruda (pembrolizumab) or Zynyz (retifanlimab)].[a]

AND

b. Treatment with an adequate course of corticosteroids (for example, prednisone 40 to 60 mg/day, oral budesonide 9 mg/day, or budesonide rectal for 7 days) has been ineffective or is contraindicated.

[a] Or as listed on the FDA.gov website.

N. Polyarticular Juvenile Idiopathic Arthritis (PJIA)

1. For provider-administered therapies, site of care administration requirements must be met [refer to Medication Policy Manual, Site of Care Review, dru408].

2. For infliximab products: Refer to Medication Policy Manual, Products with Therapeutically Equivalent Biosimilars/Reference Products, dru620.

3. Preferred provider-administered therapies may be considered medically necessary when criteria a through c below are met.

4. Other provider-administered therapies may be considered medically necessary when criteria a through d below are met.

FOR UMP MEMBERS:	
Preferred Self-Administered Options Refer to ArrayRx.	Refer to coverage policies administered by ArrayRx.
Non-Preferred Self-Administered Options Refer to ArrayRx.	Refer to coverage policies administered by ArrayRx.
Infliximab Products	Refer to Medication Policy Manual, Products with Therapeutically Equivalent Biosimilars/Reference Products, dru620. Preferred: • Avsola (infliximab) • Inflectra (infliximab) Non-preferred: • Remicade (infliximab) • Other infliximab biosimilars (Ixifi, Renflexis) • Unbranded Janssen infliximab product
Preferred Provider-Administered Options	• Orencia (abatacept) IV • Simponi Aria (golimumab IV) • Tyenne (tocilizumab-aazg) IV
Other Provider-Administered Options	• Actemra (tocilizumab) IV • Tofidence (tocilizumab-bavi) IV

a. A diagnosis of **polyarticular juvenile idiopathic arthritis** (PJIA) is established by or in consultation with a specialist in rheumatology.

AND

b. Treatment with a conventional immunomodulator (such as leflunomide, methotrexate, or sulfasalazine) was not effective after at least 6 weeks, or that a conventional immunomodulator was not tolerated, or all conventional immunomodulators are contraindicated.

AND

c. There is clinical documentation that treatment with **at least TWO** preferred self-administered therapies was not effective after at least a 12-week treatment course unless each were not tolerated or are contraindicated (including, but not limited to, contraindications listed in *Appendix 6*).

AND

d. There is clinical documentation that treatment with all preferred provider-administered **tocilizumab options** was not effective after at least a 12-week treatment course unless each were not tolerated or are contraindicated.

O. Psoriatic Arthritis (PsA)

1. For provider-administered therapies, site of care administration requirements must be met [refer to Medication Policy Manual, Site of Care Review, dru408].
2. For infliximab products: Refer to Medication Policy Manual, Products with Therapeutically Equivalent Biosimilars/Reference Products, dru620.
3. Preferred provider-administered therapies may be considered medically necessary when criterion a below is met.
4. Other provider-administered therapies may be considered medically necessary when criteria a and b below are met.

FOR UMP MEMBERS:	
Preferred Self-Administered Options Refer to ArrayRx.	Refer to coverage policies administered by ArrayRx.
Non-Preferred Self-Administered Options Refer to ArrayRx.	Refer to coverage policies administered by ArrayRx.
Infliximab Products	Refer to Medication Policy Manual, Products with Therapeutically Equivalent Biosimilars/Reference Products, dru620. Preferred: • Avsola (infliximab) • Inflectra (infliximab) Non-preferred: • Remicade (infliximab) • Other infliximab biosimilars (Ixifi, Renflexis) • Unbranded Janssen infliximab product
Preferred Provider-Administered Options	• Stelara (ustekinumab)
Other Provider-Administered Options	• Orencia (abatacept) IV • Cimzia (certolizumab) vial • Simponi Aria (golimumab) IV • Cosentyx (secukinumab) IV • Ustekinumab biosimilars (Pyzchiva, Selarsdi, Wezlana)
a. A diagnosis of **psoriatic arthritis** (PsA) when established by or in consultation with a specialist in dermatology or rheumatology. **AND** **b.** There is clinical documentation that treatment with **at least TWO** preferred self-administered therapies were not effective after at least a 12-week treatment course unless each were not tolerated or are contraindicated (including, but not limited to, contraindications listed in *Appendix 6*).	

P. Rheumatoid Arthritis (RA)

1. For provider-administered therapies, site of care administration requirements must be met [refer to Medication Policy Manual, Site of Care Review, dru408].

2. For infliximab products: Refer to Medication Policy Manual, Products with Therapeutically Equivalent Biosimilars/Reference Products, dru620.

3. Preferred provider-administered therapies may be considered medically necessary when criteria a through c below are met.

4. Other provider-administered therapies may be considered medically necessary when criteria a through d below are met.

FOR UMP MEMBERS:	
Preferred Self-Administered Options Refer to ArrayRx.	Refer to coverage policies administered by ArrayRx.
Non-Preferred Self-Administered Options Refer to ArrayRx.	Refer to coverage policies administered by ArrayRx.
Infliximab Products	Refer to Medication Policy Manual, Products with Therapeutically Equivalent Biosimilars/Reference Products, dru620. Preferred: • Avsola (infliximab) • Inflectra (infliximab) Non-preferred: • Remicade (infliximab) • Other infliximab biosimilars (Ixifi, Renflexis) • Unbranded Janssen infliximab product
Preferred Provider-Administered Options	• Orencia (abatacept) IV • Cimzia (certolizumab) vial • Simponi Aria (golimumab IV) • Tyenne (tocilizumab-aazg) IV
Other Provider-Administered Options	• Actemra (tocilizumab) IV • Tofidence (tocilizumab-bavi) IV

a. A diagnosis of **rheumatoid arthritis** (RA) is established by or in consultation with a specialist in rheumatology (see *Appendix 3*).

AND

b. Treatment with a conventional synthetic DMARD (csDMARD) was not effective after at least a 6 to 12-week treatment course based on one or more of the assessment components listed in *Appendix 4*, or that a csDMARD was not tolerated or all csDMARDs are contraindicated. csDMARDs for RA include hydroxychloroquine, leflunomide, methotrexate, and sulfasalazine.

AND

c. There is clinical documentation that treatment with **at least TWO** preferred self-administered therapies were not effective after at least a 12-week treatment course unless each were not tolerated or are contraindicated (including, but not limited to, contraindications listed in *Appendix 6*).

AND

d. There is clinical documentation that treatment with all preferred provider-administered **tocilizumab options** were not effective after at least a 12-week treatment course unless each were not tolerated or are contraindicated.

Q. Takayasu Arteritis

1. For provider-administered therapies, site of care administration requirements must be met [refer to Medication Policy Manual, Site of Care Review, dru408].
2. For infliximab products: Refer to Medication Policy Manual, Products with Therapeutically Equivalent Biosimilars/Reference Products, dru620.
3. Preferred provider-administered options may be considered medically necessary when criteria a and b below are met.
4. Other provider-administered options may be considered medically necessary when criteria a through c below are met.

FOR UMP MEMBERS:	
Preferred Self-Administered Options Refer to ArrayRx.	Refer to coverage policies administered by ArrayRx.
Non-Preferred Self-Administered Options Refer to ArrayRx.	Refer to coverage policies administered by ArrayRx.
Infliximab Products	Refer to Medication Policy Manual, Products with Therapeutically Equivalent Biosimilars/Reference Products, dru620. Preferred: • Avsola (infliximab) • Inflectra (infliximab) Non-preferred: • Remicade (infliximab) • Other infliximab biosimilars (Ixifi, Renflexis) • Unbranded Janssen infliximab product
Preferred Provider-Administered Options	• Tyenne (tocilizumab-aazg) IV
Other Provider-Administered Options	• Actemra (tocilizumab) IV • Tofidence (tocilizumab-bavi) IV

a. A diagnosis of **Takayasu Arteritis** is established by or in consultation with a specialist in rheumatology or immunology.

AND

b. One of the following i or ii below are met.

i. The patient has been unable to taper corticosteroids without experiencing worsening of disease (e.g., unable to achieve doses of 15-20 mg per day or less of prednisone or equivalent after 8 weeks).

OR

ii. The patient is experiencing breakthrough disease (for example, relapses or active disease flares) while stabilized on a conventional immunomodulators, for at least 8 weeks.

AND

c. There is clinical documentation that treatment with all preferred provider-administered therapies were not effective unless each were not tolerated or are contraindicated.

R. Systemic Juvenile Idiopathic Arthritis (SJIA; Still's disease)

1. For provider-administered therapies, site of care administration requirements must be met [refer to Medication Policy Manual, Site of Care Review, dru408].
2. Preferred provider-administered therapies may be considered medically necessary when criteria a through d below are met.
3. Other provider-administered therapies may be considered medically necessary when criteria a through e below are met.

FOR UMP MEMBERS:	
Preferred Self-Administered Options Refer to ArrayRx.	Refer to coverage policies administered by ArrayRx.
Non-Preferred Self-Administered Options Refer to ArrayRx.	Refer to coverage policies administered by ArrayRx.
Preferred Provider-Administered Options	• Tyenne (tocilizumab-aazg) IV
Other Provider-Administered Options	• Actemra (tocilizumab) IV • Tofidence (tocilizumab-bavi) IV

a. A diagnosis of **systemic juvenile idiopathic arthritis** (SJIA; Still's disease) is established by or in consultation with a specialist in rheumatology.

AND

b. There is disease activity greater than 6 weeks.

AND

c. One of the following i or ii below is met.

i. Treatment with at least one oral conventional agent was not effective after 12 weeks, not tolerated, or is contraindicated. Conventional agents for the treatment of SJIA include azathioprine, cyclosporine, leflunomide, methotrexate, systemic corticosteroids, or tacrolimus.

OR

ii. Treatment with at least one NSAID (e.g., ibuprofen, celecoxib) was not effective after 4 weeks, not tolerated, or all are contraindicated.

AND

d. There is clinical documentation that treatment with **at least ONE** preferred self-administered therapy was not effective after at least a 12-week treatment course unless each were not tolerated or are contraindicated (including, but not limited to, contraindications listed in *Appendix 6*).

AND

e. There is clinical documentation that treatment with all preferred provider-administered therapies were not effective after at least a 12-week treatment course unless each were not tolerated or are contraindicated.

S. Ulcerative Colitis (UC)

1. **Site of Care Requirements**: For provider-administered therapies, site of care administration requirements are met [refer to Medication Policy Manual, Site of Care Review, dru408].
2. **Diagnostic Criteria**: A diagnosis of ulcerative colitis (UC) when established by or in consultation with a specialist in gastroenterology.
3. **Severity Criteria**: At least one of the following criterion (a, b, or c) below is met.
   - **a.** Treatment with an adequate course of corticosteroids (for example, prednisone 40 to 60 mg/day, oral budesonide 9 mg/day, or budesonide rectal for 7 to 14 days) was ineffective or is contraindicated; **OR**
   - **b.** The patient has been unable to taper an adequate course of corticosteroids without experiencing worsening of disease; **OR**
   - **c.** The patient is experiencing breakthrough disease (for example, active disease flares) while stabilized on a conventional immunomodulators, for at least two months. Conventional immunomodulators for UC include azathioprine, balsalazide, cyclosporine, mercaptopurine, mesalamine, and sulfasalazine.

FOR UMP MEMBERS:		
Product Group	**Products**	**Criteria Requirements**
Preferred Self-Administered Options	Refer to ArrayRx.	Refer to coverage policies administered by ArrayRx.
Non-Preferred Self-Administered Options	Refer to ArrayRx.	Refer to coverage policies administered by ArrayRx.
Preferred Provider-Administered Options	• Entyvio (vedolizumab) • Skyrizi (risankizumab) • Stelara (ustekinumab) • Tremfya (guselkumab)	**1.** Site of Care Requirements **2.** Diagnostic Criteria **3.** Severity Criteria
	• Avsola (infliximab) • Inflectra (infliximab)	Refer to Medication Policy Manual, Products with Therapeutically Equivalent Biosimilars/Reference Products, dru620.
Non-Preferred Provider-Administered Options	• Omvoh (mirikizumab) • Ustekinumab biosimilars (Pyzchiva, Selarsdi, Wezlana)	**1.** Diagnostic Criteria **2.** Severity Criteria **3.** Treatment with **ALL** preferred self-administered therapies has been not effective after at least a 12-week treatment course unless each were not tolerated or are contraindicated (including, but not limited to, contraindications listed in *Appendix 6*).
Non-preferred infliximab Products	• Infliximab biosimilars (Ixifi, Renflexis) • Remicade (infliximab) • Unbranded Janssen infliximab product	Refer to Medication Policy Manual, Products with Therapeutically Equivalent Biosimilars/Reference Products, dru620.

T. Uveitis

1. For provider-administered therapies, site of care administration requirements must be met [refer to Medication Policy Manual, Site of Care Review, dru408].

2. Provider-administered therapies may be considered medically necessary when criteria a through c below are met.

3. For infliximab products: Refer to Medication Policy Manual, Products with Therapeutically Equivalent Biosimilars/Reference Products, dru620.

FOR UMP MEMBERS:	
Preferred Self-Administered Options Refer to ArrayRx.	Refer to coverage policies administered by ArrayRx.
Non-Preferred Self-Administered Options Refer to ArrayRx.	Refer to coverage policies administered by ArrayRx.
Infliximab Products	Refer to Medication Policy Manual, Products with Therapeutically Equivalent Biosimilars/Reference Products, dru620. Preferred: • Avsola (infliximab) • Inflectra (infliximab) Non-preferred: • Remicade (infliximab) • Other infliximab biosimilars (Ixifi, Renflexis) • Unbranded Janssen infliximab product

a. A diagnosis of **uveitis** is established by or in consultation with a specialist in ophthalmology.

AND

b. Treatment with corticosteroids (oral, periocular, or intravitreal injections) have been:

i. Ineffective after two weeks of therapy (for example, prednisone 40 to 60 mg/day).

OR

ii. Unable to be tapered following an adequate course without worsening of disease.

OR

iii. Not tolerated or is contraindicated.

AND

c. Treatment with at least one conventional agent was not effective after a 6-week treatment course, not tolerated, or all are contraindicated. Conventional agents for treatment of uveitis include azathioprine, cyclosporine, methotrexate, mycophenolate, or tacrolimus.

U. Other Immunologic Conditions: Pyoderma Gangrenosum, Sarcoidosis

1. For provider-administered therapies, site of care administration requirements must be met [refer to Medication Policy Manual, Site of Care Review, dru408].

2. Provider-administered therapies may be considered medically necessary when criteria a and b below are met.

3. For infliximab products: Refer to Medication Policy Manual, Products with Therapeutically Equivalent Biosimilars/Reference Products, dru620.

FOR UMP MEMBERS:	
Preferred Self-Administered Options Refer to ArrayRx.	Refer to coverage policies administered by ArrayRx.
Non-Preferred Self-Administered Options Refer to ArrayRx.	Refer to coverage policies administered by ArrayRx.
Infliximab Products	Refer to Medication Policy Manual, Products with Therapeutically Equivalent Biosimilars/Reference Products, dru620. Preferred: • Avsola (infliximab) • Inflectra (infliximab) Non-preferred: • Remicade (infliximab) • Other infliximab biosimilars (Ixifi, Renflexis) • Unbranded Janssen infliximab product

a. A diagnosis of **pyoderma gangrenosum** or **sarcoidosis** has been established by or in consultation with a specialist in pulmonology, rheumatology, immunology, or other specialist for the disease state.

AND

b. Treatment with a conventional immunomodulator (e.g., methotrexate, azathioprine, cyclosporine, hydroxychloroquine, leflunomide, or mycophenolate) was ineffective, or not tolerated. (See *Appendix 2* for additional conventional agents.)

IV. Administration, Quantity Limitations, and Authorization Periods

A. Pharmacy Services considers intravenously administered drugs in this policy coverable only under the medical benefit (as a provider-administered medication) (see *Table 1*).

B. Pharmacy Services considers Ilumya (tildrakizumab-asmn) coverable only under the medical benefit (as a provider-administered medication).

C. Pharmacy Services considers ustekinumab (Stelara; biosimilars Pyzchiva, Selarsdi, Wezlana) and Skyrizi (risankizumab) coverable under the pharmacy benefit (as self-administered medications) OR coverable under the medical benefit (as provider-administered medications).

D. Pharmacy Services considers the lyophilized powder formulation of Cimzia (certolizumab) coverable only under the medical benefit (as a provider-administered medication). Cimzia (certolizumab) prefilled syringes are coverable only under the pharmacy benefit (as a self-administered medication).

E. When pre-authorization is approved, each drug may be covered in the following quantities and for the following authorization periods outlined in *Table 1*.

TABLE 1. Authorization Limits

Product	Route	Authorization Limit
Cimzia (certolizumab)	SC (vial only)	**CD, RA, PsA, AS, NR-axSpA:** Up to 3 doses (six 200 mg vials) in the first month based on an initial dose of 400 mg SC at weeks 0, 2, and 4 followed by 200 mg every two weeks or 400 mg every four weeks for maintenance. (27 doses in the first 12-month period followed by up to 26 doses per 12-month period, thereafter). **PsO:** - Up to 400 mg (two 200 mg vials) every other week (up to 26 doses per 12-month period). - Authorization **may** be reviewed at least annually to confirm that current medical necessity criteria are met and that the medication is effective. Note: Certolizumab is available in pre-filled syringes and as a lyophilized powder vial (for SC injection). Both forms are given subcutaneously; however only the vials are considered provider-administered.
Cosentyx (secukinumab)	IV	**AS, NR-axSpA, and PsA:** Up to 13 infusions (with loading dose: 6 mg/kg at week 0, followed by 1.75 mg/kg every 4 weeks thereafter; without loading dose: 1.75 mg/kg every 4 weeks; both dosing regimens with a maximum maintenance dose 300 mg per infusion).
Entyvio (vedolizumab)	IV	**CD and UC:** - Initial authorization: Up to 6 doses (six 300 mg infusions) in a 6-month period based on a recommended starting interval of 300 mg infusions at zero, two and six weeks, then every eight weeks thereafter (9 infusions in the first 12-month period followed by up to 7 infusions per 12-month period, thereafter). - Dose escalation: A dosing interval of every 4 weeks (up to 13 infusions per 12-month period) may be considered medically necessary in patients who have had an inadequate response to every 8-week dosing given for at least 24 weeks. Dosing more frequent than every 4 weeks is considered investigational (see Table 4 *Investigational Uses: Dosing or Dose Escalation* for more information). Authorization **may** be reviewed at least annually and clinical documentation indicating that there is disease stability or improvement must be provided.
	IV	**Immune-Mediated Colitis:** Up to 6 doses (six 300 mg infusions) in a 6-month period based on a recommended starting interval of 300 mg infusions at zero, two and six weeks, then every eight weeks thereafter. Authorization **may** be reviewed at least annually and clinical documentation indicating that there is disease stability or improvement must be provided.

Product	Route	Authorization Limit
Ilumya (tildrakizumab -asmn)	SC	**PsO:** Up to two doses (two 100 mg syringes) in the initial four-week period followed by one dose (one 100 mg syringes) every 12 weeks thereafter based on an initial dose of 100 mg at weeks 0 and 4 followed by maintenance dosing of 100 mg every 12 weeks (up to five 100 mg syringes in the first 12-month period followed by four 100 mg syringes per 12-month period thereafter). Authorization **may** be reviewed at least annually to confirm that current medical necessity criteria are met, and that the medication is effective.
Omvoh (mirikizumab)	IV induction	**UC:** Up to 3 doses (three 300 mg infusions) in the first 8-week period based on a recommended starting interval of 300 mg infusions at 0, 4, and 8 weeks.
Orencia (abatacept)	IV	**aGVHD:** Up to 4 infusions (up to 10 mg/kg) in a 4-week period based on a dose of 10 mg/kg/ dose given on days −1, +5, +14, and +28 post-transplant. **RA, PJIA PsA:** Up to 3 infusions (up to 1000 mg) in the first 4-week period, based on weight-based loading doses at weeks 0, 2 and 4, followed by maintenance dosing of up to 13 infusions in a 12-month period, based on a dose of one infusion (up to 1000 mg) every 4 weeks (14 infusions in the first 12-month period followed by up to 13 infusions per 12-month period, thereafter). **RA:** A single IV loading dose (up to 1000 mg) may be authorized, if required prior to administration of self-administered Orencia SC. Authorization **may** be reviewed at least annually, and clinical documentation indicating that there is disease stability or improvement must be provided.
Simponi Aria (golimumab)	IV	**AS, PsA, RA:** Up to 2 infusions (up to 2 mg/kg) in the first 4-week period, based on weight-based loading doses at weeks 0 and 4, followed by maintenance dosing of up to 7 infusions in a 12-month period, based on a dose of one infusion (up to 2 mg/kg) every 8 weeks (8 infusions in the first 12-month period followed by up to 7 infusions per 12-month period, thereafter). **PJIA:** Up to 2 infusions (up to 80 mg/m^2) in the first 4-week period, based on body-surface-area-based loading doses at weeks 0 and 4, followed by maintenance dosing of up to 7 infusions in a 12-month period, based on a dose of one infusion (up to 80 mg/m^2) every 8 weeks (8 infusions in the first 12-month period followed by up to 7 infusions per 12-month period, thereafter). <u>Dose escalation:</u> Dosing interval of up to every 6 weeks may be considered medically necessary in patients who have had an inadequate response to every 8-week dosing given for at least 24 weeks. Authorization **may** be reviewed at least annually to confirm that current medical necessity criteria are met, and the medication is effective. Authorization **may** be reviewed at least annually, and clinical documentation indicating that there is disease stability or improvement must be provided.

<table>
<tr><th>Product</th><th>Route</th><th>Authorization Limit</th></tr>
<tr><td rowspan="2">Spevigo (spesolimab)</td><td>IV</td><td>GPP flare: Up to two 900 mg infusions given within a 4-week approval period, based on a single dose of 900 mg. A second additional 900 mg dose, given one week after the initial dose, may be given once if symptoms persist, within the 4-week approval period. NOTE: no more than two doses are coverable for any one flare.

For consideration of treatment of a <u>new flare</u> (after at least 4 weeks): Authorization shall be reviewed to confirm that current medical necessity criteria are met, including flare criteria, and that the medication was effective for the previously treated flare. Each additional flare authorization is for a maximum of two 900 mg doses over a 4-week approval period.</td></tr>
<tr><td>SC</td><td>GPP maintenance when <u>not</u> experiencing a flare (loading dose only): A single SC loading dose (600 mg dose) may be authorized, if required prior to administration of self-administered Spevigo SC.</td></tr>
<tr><td rowspan="2">Ustekinumab (Stelara; biosimilars Pyzchiva, Selarsdi, Wezlana)</td><td>SC (PsO and PsA)</td><td>PsO and PsA:
- For all patients, regardless of weight, up to five doses (five 45 mg syringes or vials) in a 48-week period based on dosing of 45 mg at week 0 and 4, then 45 mg every 12 weeks thereafter (up to five 45 mg syringes or vials in the first 12-month period followed by four 45 mg syringes or vials per 12-month period thereafter).
- <u>Dose escalation</u>: For patients in whom the 45 mg dose has shown benefit, but who have not achieved clinical remission after at least a 12-week trial, doses of up to 90 mg every 12 weeks may be considered medically necessary. Dosing more frequent than 90 mg every 12 weeks is considered investigational (see <u>Table 4 Investigational Uses: Dosing or Dose Escalation for more information</u>).

Authorization may be reviewed at least annually to confirm that current medical necessity criteria are met, and the medication is effective.</td></tr>
<tr><td>IV Induction (CD and UC Only)</td><td>CD and UC Only: Initial: A single, weight-based IV infusion initially (vials, see chart below for details), then up to 6 doses (six 90 mg syringes or twelve 45 mg vials) based on maintenance dosing of 90 mg SC every 8 weeks. Initial IV dosing is as follows:
<table>
<tr><th>Weight</th><th>Dose</th></tr>
<tr><td>55 kg or less</td><td>260 mg (2 x 130 mg vial)</td></tr>
<tr><td>More than 55 kg to 85 kg</td><td>390 mg (3 x 130 mg vial)</td></tr>
<tr><td>More than 85 kg</td><td>520 mg (4 x 130 mg vial)</td></tr>
</table>
<u>Additional IV induction courses</u> doses may be considered medically necessary in patients who have previously had an inadequate response to every 8-week dosing given for at least 24 weeks or who have had a break in therapy.</td></tr>
</table>

Product	Route	Authorization Limit
	SC Maintenance dosing for CD and UC	**CD:** - Up to 7 doses (seven 90 mg syringes or fourteen 45 mg vials) in a one-year based on maintenance dosing of 90 mg SC every 8 weeks. - Dose escalation/Re-induction: A dosing interval of up to every 4 weeks be or additional IV doses may be considered medically necessary in patients who have had an inadequate response to every 8-week dosing given for at least 24 weeks. Authorization **may** be reviewed at least annually to confirm that current medical necessity criteria are met, and the medication is effective.
Skyrizi (risankizumab)	SC (PsA, PsO)	**PsA, PsO:** Up to 2 doses (four 75 mg syringes or two 150 mg syringes) in the initial four-week period followed by 150 mg (two 75 mg syringes or one 150 mg syringe) every 12 weeks based on dosing of 150 mg SC at weeks 0 and 4 followed by maintenance dosing of 150 mg every 12 weeks (up to twelve 75 mg syringes or six 150 mg syringes in the first 12-month period followed by up to ten 75 mg syringes or five 150 mg syringes per 12-month period, thereafter). Authorization **may** be reviewed at least annually to confirm that current medical necessity criteria are met, and the medication is effective.
	IV Induction (CD, UC)	**CD:** Up to 3 doses (three 600 mg infusions) in the first-8-week period based on a recommended starting interval of 600 mg infusions at zero, four, and 8 weeks, then up to 6 (six 180 mg or 360 mg cartridges) in the first 12-month period based on a maintenance dose of 180 mg or 360 mg given at week 12 and every 8 weeks thereafter. **UC:** Up to 3 doses (1,200 mg infusions) in the first 8-week period based on a recommended starting interval of 1200 mg infusions at zero, four, and 8 weeks, then up to 6 (six 180 mg or 360 mg cartridges) in the first 12-month period based on a maintenance dose of 180 mg or 360 mg given at week 12 and every 8 weeks thereafter).
	SC Maintenance dosing (CD, UC)	**CD, UC:** Up to 7 doses (seven 180 mg or 360 mg cartridges) per 12- month period based on maintenance dosing of 180 mg or 360 mg SC every 8 weeks. Authorization **may** be reviewed at least annually to confirm that current medical necessity criteria are met, and the medication is effective.

Product	Route	Authorization Limit
Tocilizumab (Actemra; biosimilars: Tofidence, Tyenne)	IV	**AMR:** Up to 7 infusions (up to 8 mg/kg with an 800 mg per infusion maximum) in a 6-month period based on a recommended infusion interval of every 4 weeks. Authorization **shall** be reviewed at least every 6 months to confirm that current medical necessity criteria are met, and the medication is effective. **RA and Takayasu Arteritis:** Up to 13 infusions (up to 8 mg/kg) in a 12-month period based on a recommended infusion interval of every 4 weeks. **PJIA:** Up to 13 infusions (up to 10 mg/kg) in a 12-month period based on a recommended infusion interval of every 4 weeks. **GCA:** Up to 13 infusions (up to 6 mg/kg) in a 12-month period based on a recommended infusion interval of every 4 weeks. **SJIA:** Up to 26 infusions (up to 12 mg/kg) in a 12-month period based on a recommended infusion interval of every 2 weeks. **CRS:** Up to 4 infusions (up to 12 mg/kg). No additional doses will be authorized. **For GCA, RA, PJIA, SJIA, and Takayasu Arteritis:** Authorization **may** be reviewed at least annually, and clinical documentation indicating that there is disease stability or improvement must be provided.
Tremfya (guselkumab)	IV Induction	**UC:** Up to 3 doses (200mg infusions) within an 8- week period based on a recommended starting interval of 200mg at week 0, 4, and 8. Induction to be followed by the recommended SC maintenance doses up to FDA-recommended dose, duration, and frequency limits described in its prescribing information.

aGVHD: Acute graft versus host disease; AMR: Antibody mediated rejection; AS: Ankylosing spondyloarthritis, CD: Crohn's disease, CRS: Cytokine release syndrome, ERA: Enthesitis-related arthritis; GCA: Giant cell arteritis; PJIA: Polyarticular juvenile idiopathic arthritis, NR-axSpA: Non-radiographic axial spondyloarthritis, PsA: Psoriatic arthritis, PsO: Plaque psoriasis, RA: Rheumatoid arthritis, SJIA: Systemic juvenile idiopathic arthritis; SpA: Spondyloarthritis, UC: Ulcerative colitis

V. Not Medically Necessary Uses

A. Therapies included in this policy are considered not medically necessary when used according to Table 2.

TABLE 2.

Ilumya (tildrakizumab-asmn) – Doses higher than 100 mg every 12 weeks	Doses > 100 mg every 12 weeks	- Ilumya (tildrakizumab-asmn) is considered not medically necessary when used in doses exceeding 100 mg every 12 weeks. - Ilumya (tildrakizumab-asmn) is FDA approved for PsO at a dose of 100 mg subcutaneously every 12 weeks. While clinical trials of Ilumya (tildrakizumab-asmn) in PsO evaluated doses 100 mg and 200 mg subcutaneously every 12 weeks, both doses appeared to have similar efficacy. Therefore, the use of doses higher than 100 mg every 12 weeks is considered not medically necessary. [1]
Ustekinumab (Stelara; biosimilars Pyzchiva), Selarsdi, Wezlana)	Initial doses of 90 mg for PsO/PsA	- Usteinkinumab (Stelara; biosimilars Pyzchiva, Selarsdi, Wezlana) is considered not medically necessary at initial doses of 90 mg per every 12 weeks regardless of weight. Given that more than half of all patients respond to the 45 mg dose and given the significant cost difference between the 45 mg and 90 mg doses, a trial of 45 mg for all patients regardless of weight represents the best treatment value. - Note: For patients in whom the 45 mg dose has shown benefit, but who have not achieved clinical remission after at least a 12-week trial, doses of up to 90 mg every 12 weeks may be considered medically necessary. - Dosing for ustekinumab was established through a post-hoc analysis of the results of the Phoenix 1 and Phoenix 2 trials. The recommended weight-based dosing scheme was not studied in a prospective manner. [2 3] Patients greater than 100 kg were found to have on average, a better response to treatment when receiving a dose of 90 mg every 12 weeks compared with 45 mg every 12 weeks. * In Phoenix 1, 68.5% and 54.0% of patients greater than 100 kg achieved PASI75 in the 90 mg and 45 mg groups, respectively. * In Phoenix 2, 71.1% and 49.1% of patients greater than 100 kg achieved PASI75 in the 90 mg and 45 mg groups, respectively. * When treatment with 45 mg has resulted in some benefit, but has not achieved clinical remission, a continuation of treatment with 90 mg may be appropriate. - There is no evidence to support the need for re-induction when the dose is escalated from 45 mg to 90 mg is made.

VI. Investigational uses

A. Combination use of targeted DMARDs, such as Otezla (apremilast) and tofacitinib (Xeljanz/Xeljanz XR), is considered investigational.

B. Unless otherwise specified in section I, therapies included in this policy are considered investigational when used for all other conditions, due to lack of published data, lack of high-quality data, or lack of positive data Details of select investigational uses are listed below in tables 3 and 4.

C. Unless specified in Section II (Administration, Quantity Limitations, and Authorization Periods) or Section III (Not Medically Necessary Uses), all dose escalations above the quantity limit are considered investigational (Additional details are in Table 4).

Table 3: Investigational Uses: Indications

Atopic Dermatitis	- Baricitinib is currently being evaluated for the treatment of atopic dermatitis. One preliminary, phase 2 study demonstrated that baricitinib may improve skin clearance compared to placebo. [4] However, longer-term, larger phase 3 studies are needed to confirm the benefit, identify the ideal population, and determine the appropriate dose.
Extraintestinal complications of IBD: Arthritis	- Arthritis is a common extraintestinal complication of IBD (either UC or CD). However, there is no reliable evidence to establish the efficacy or safety of targeted DMARDs in patients with arthritis associated with IBD who do not otherwise require targeted therapy. - The evidence is limited to small, short-term, open-label trials and case studies with infliximab. Given the lack of blinding and lack of control arm, the incremental benefit of infliximab therapy is uncertain. [5] - There are no reliable published clinical trials with any other biologic DMARDs for treatment of arthritis associated with IBD (in the absence of active bowel disease). - Of note: patients with IBD and a confirmed diagnosis of CD or UC with active bowel disease may be covered per Section I for management of IBD symptoms (active bowel disease). However, the isolated arthritis symptoms (in the absence of active bowel disease) is not coverable.
Blau's Syndrome (Familial Juvenile Systemic Granulomatosis)	- There is no reliable evidence to establish the efficacy or safety of targeted DMARDs in the treatment of Blau's syndrome. - No randomized, controlled trials have been published evaluating the use of adalimumab in patients with Blau's syndrome.
Graft Versus Host Disease (GVHD)	- There is no reliable evidence to establish the efficacy or safety of targeted DMARDs in the *treatment* of GVHD. - In one open-label clinical trial (n=62) incidences of GVHD-related mortality, non-relapse mortality, and overall survival were not different between patients treated with infliximab or placebo. [6]

Granuloma Annulare	- There is no reliable evidence to establish the efficacy or safety of targeted DMARDs in the treatment of granuloma annulare. - While case reports have been published describing the treatment of granuloma annulare with etanercept, other reports have been published describing no effect, or an association with the formation of granuloma annulare and treatment with TNF-alfa inhibitors, including etanercept. Additional information is necessary to the benefit of etanercept in this population. [7]
Guttate Psoriasis	- Guttate psoriasis is a type of cutaneous psoriasis. It is characterized by the presence of small, erythematous papules whereas plaque psoriasis is characterized itchy, red, scaly, raised lesions on the skin. Guttate psoriasis is typically managed with topical agents or UV light therapy. - There is no evidence to establish the efficacy or safety of targeted DMARDs in the treatment of guttate psoriasis.
Immune-mediated reactions (other than colitis or CRS with CAR-T cell therapy) due to immunotherapy	- There is no reliable evidence to establish the efficacy of safety of targeted DMARDs in the treatment of immune-mediated reactions, including but not limited to pneumonitis, hepatitis, or arthritis, due to PD-1, PDL-1, or CTLA4 inhibitors. - PD-1, PDL-1, and CTLA4 inhibitors contain warnings for immune-mediated hepatitis. In clinical trials, patients who experienced immune-mediated hepatitis were managed with systemic corticosteroids and mycophenolate. - For immune-mediated hepatitis, NCCN guidelines state that mycophenolate is recommended instead of infliximab due to the concern for hepatotoxicity with infliximab.
Reactive Arthritis/Reiter's Syndrome	- There is no reliable evidence to establish the efficacy or safety of targeted DMARDs in the treatment of reactive arthritis/Reiter's Syndrome.

Sciatica	- There is no reliable evidence to establish the efficacy or safety of targeted DMARDs in the treatment of sciatica. - Evidence for infliximab in the treatment of sciatica is limited to a randomized controlled trial in 40 patients. At 52 weeks, 67% of patients who received infliximab reported no pain compared with 63% of patients who received placebo (p = 0.72). This difference was not statistically significant. [8 9] - There are no randomized controlled trials that evaluate the efficacy and safety of a commercially available formulation of etanercept in the treatment of sciatica. - Evidence for adalimumab in the treatment of sciatica in limited to a small randomized, controlled trial evaluated adalimumab in 61 patients. There was a modest improvement in pain as measured by a 10-point visual analog scale and at three years, the need for back surgery was reduced in adalimumab-treated patients; however, larger clinical trials are needed to confirm the benefit of adalimumab in this population. [10 11]
Scleroderma	- There is insufficient evidence to support the use of tocilizumab for scleroderma. The evidence is limited to one small, placebo-controlled, phase 2 trial using subcutaneous tocilizumab (n=88). The trial found a change in modified Rodan skin score, but no significant difference in skin thickening, disability, fatigue, itching, or patient or clinician global disease severity. Larger Phase 3 trials are needed to establish the safety and efficacy of tocilizumab for scleroderma. [12]
Sjögren's Syndrome	- There is no reliable evidence to establish the efficacy or safety of targeted DMARDs in the treatment of Sjögren's syndrome. - Evidence for etanercept in Sjögren's syndrome is limited a small trial, in which there were no significant differences in the subjective measures of disease severity. [13] - Evidence for anakinra is limited to a placebo-controlled trial in which patients with Sjögren's syndrome failed to find a statistically-significant improvement in fatigue as measured by a visual analog scale in patient receiving anakinra compared with placebo. An ad-hoc analysis found suggestions of a clinically relevant effect, but larger, well-designed trials are needed to establish safety and efficacy for Sjögren's syndrome. [14]

Systemic Lupus Erythematous (SLE)	- There is no reliable evidence to establish the efficacy or safety of targeted DMARDs in the treatment of SLE. - A small uncontrolled clinical trial reported modest efficacy with infliximab in patients with systemic lupus erythematosus, though larger, better designed trials are needed to confirm these results. [15] - A small preliminary study assessing the use of tocilizumab in patients with SLE found promising signs of response, but larger, controlled studies will be needed to establish the efficacy and safety in this population. [16] - One small randomized, placebo-controlled trial evaluated the use of abatacept in patients with non–life-threatening SLE and polyarthritis. The primary endpoint (proportion of patients with a new flare of SLE) was not met but was suggestive of a positive effect in certain exploratory measures. Further study is needed to establish the safety and efficacy of abatacept in SLE. [17] - One 24-week, phase 2 study evaluated the use of baricitinib in patients with SLE. Results demonstrated that baricitinib 4 mg once may reduce SLE disease activity; however, results for the 2 mg dose were not significant. Larger, longer-term studies are needed to clarify the benefit of baricitinib in SLE. [18]
Wegener's Granulomatosis	- There is no reliable evidence to establish the efficacy or safety of targeted DMARDs in the treatment of Wegener's Granulomatosis. - Evidence for infliximab is limited to one small clinical trial in 17 patients. Both infliximab and rituximab appeared to provide benefit in achieving complete or partial response; however, there was a trend favoring rituximab. Additionally, rituximab was better able to maintain remission during the long-term follow-up. [19]

Table 4: Investigational Uses: Dosing or Dose Escalation

Combination use of targeted immunomodulators	- The use of combination (more than one) targeted DMARD therapy, such as Humira (adalimumab), Otezla (apremilast), tofacitinib (Xeljanz/Xeljanz XR), or Entyvio (vedolizumab), is considered investigational (includes all medications included in this policy; see table 5 for a complete list of targeted DMARDs). *Combination use of apremilast and other targeted immunomodulators* - There is no reliable evidence to establish the efficacy or safety of the combined use of apremilast and other targeted DMARDs (such as biologics) in the treatment of PsO or PsA. - There are no randomized, controlled trials evaluating the combined use of apremilast and any other targeted DMARD. The evidence is limited to retrospective studies in small numbers of patients. Additional studies are needed to establish long-term efficacy and the overall risk-benefit profile of combination use.
Secukinumab – Maintenance doses higher than 300 mg every 4 weeks for PsA or PsO	- There is insufficient evidence to support the use of secukinumab at maintenance doses higher than 300 mg every 4 weeks for PsO. - Phase 3 clinical trials of secukinumab for PsA and PsO evaluated maintenance dosing regimens of 150 mg or 300 mg every 4 weeks. Higher or more frequent doses have not been evaluated. It is uncertain if there is any additional benefit with increased dosing and the safety profile has not been evaluated.
Ustekinumab – Doses higher than 90 mg every 12 weeks for PsO or PsA	- There is insufficient evidence to support the use of ustekinumab at maintenance doses higher than 90 mg every 12 weeks for PsO or PsA. - There are no randomized, controlled trials to support doses higher than 90 mg every 12 weeks in PsO or PsA.
Vedolizumab - Doses higher than 300 mg every 4 weeks	- There is insufficient evidence to support the use of vedolizumab at maintenance doses higher than 300 mg every 4 weeks for CD and UC. - In phase 3 clinical studies of vedolizumab in CD and UC the highest dose of vedolizumab used was 300 mg every four weeks. Higher or more frequent doses have not been evaluated.

Position Statement

- ArrayRx's preferred self-administered products can be found at: https://www.hca.wa.gov/assets/pebb/ump-preferred-drug-list-2024.pdf.
- There are many treatments for chronic inflammatory conditions that are effective, have known long-term safety profiles, and are recommended by national treatment guidelines.
- The intent of this policy is to allow coverage of each medication in settings where it has been safe and effective, with coverage after use of lower cost standard of care therapies, including preferred targeted DMARD options.
- Non-medical therapies, such as prescribed exercise therapy, physical therapy, weight loss, and smoking cessation are important treatment plan components for patients suffering from many chronic inflammatory conditions.
- When a systemic medication therapy is needed to manage a chronic inflammatory condition, generic oral therapies usually offer the best value.
- When non-medical therapies and oral medications are inadequate, a targeted DMARD or immunomodulator [conventional synthetic DMARD (csDMARD)] may be appropriate and use is supported by guidelines. Targeted DMARDs, include non-biologics and biologics. Biologics include both anti-TNF and non-anti-TNF options.
- When there is no demonstrated difference in safety or efficacy among the studied targeted DMARDs, the medication with the lowest cost often provides the best value for members.
- Individual responses and tolerability of targeted DMARDs, including biologics, are unpredictable and may vary between patients. If one targeted DMARD provides an inadequate response, another targeted DMARD may yet be effective.
- Due to the potential for development of antibodies with anti-TNF therapies which may result in loss of efficacy, clinical practice guidelines generally recommend a trial with one to two anti-TNF therapies. [20-24] For those who have an inadequate response or intolerance to a TNF inhibitor, it is reasonable to consider a targeted treatment with an alternative mechanism of action and proven efficacy for the patient's diagnosis.
- All DMARDs, conventional and targeted, are immunosuppressants and carry a risk of increased infection. Risk and infection type varies by mechanism of action and medication.
- 2021 JAK inhibitors label updates placed their usage after other systemic therapies for the indications in which they have FDA approval due to safety concerns (which include major cardiovascular events and mortality among other concerns).
- There is significant variation in recommended dosing across indications for individual medications, particularly with targeted agents; therefore, when multiple dosage forms of a targeted agent are available, coverage can be provided for those indications where the dosage form has been evaluated in randomized controlled trials, the dosage form has been proven safe and effective, and for which the dosage form has an established dose. For all other indications, the specific dosage form will be considered investigational.
- Inflectra (infliximab-dyyb) and Avsola (infliximab-axxq) are the preferred infliximab

products. The reference products and other biosimilars such as Renflexis (infliximab-abda) and Ixifi (infliximab-qbtx) are considered non-preferred. While they share most indications with each other, they are not the preferred formulation of infliximab.

- The medications in this policy, including loading doses, are coverable for the lowest effective doses, aligned with how they were studied in clinical trials, including use of loading doses.

Evidence summary:

Rheumatic Conditions – Background

- Treatments for rheumatic conditions may include non-medical therapies, medications for the management of symptoms, medications that modify the disease course such as conventional synthetic or targeted disease modifying anti-rheumatic drugs (DMARDs).
- Medications to control inflammation such as nonsteroidal anti-inflammatory medications (NSAIDs, e.g., ibuprofen, indomethacin, and naproxen) and glucocorticoids (oral or injected into the joint) are effective for the management of symptoms, particularly during the early stages of disease.
- Generic, conventional synthetic DMARDs (csDMARDs), including MTX (methotrexate), hydroxychloroquine, leflunomide, and sulfasalazine are effective for decreasing symptoms and slowing disease progression, and are recommended by current guidelines.
    * MTX is generally the initial csDMARD for rheumatoid arthritis (RA) and juvenile idiopathic arthritis (JIA).
    * csDMARDs have known risks. The management of these risks is well established.
- Targeted DMARDs can also decrease symptoms, help preserve joint functioning, and slow the progression of the disease.
- In JIA, combination therapy with a csDMARD is strongly recommended for infliximab to reduce the risk of anti-drug antibodies against infliximab. [25]

Rheumatic Conditions – Enthesitis-related Arthritis (ERA)

- ERA is a type of juvenile idiopathic arthritis (JIA) that causes swelling or inflammation of the entheses (tendon-to-bone insertion sites).
- 2019 ACR guidelines for JIA recommend NSAIDs as initial therapy for patients with ERA followed by TNF inhibitors. Methotrexate or sulfasalazine may be used if TNF inhibitors are contraindicated. ACR guidelines have not been updated to include secukinumab. [26]
- There is little comparative evidence to distinguish among the biologic options for ERA due to the lack of head-to-head comparisons.
- The evidence for secukinumab in ERA is based on one small placebo-controlled phase III withdrawal trial that demonstrated a reduced time to disease flare for those on secukinumab versus placebo. [27]

Rheumatic Conditions – Axial Spondyloarthritis (SpA)

- Axial spondylarthritis (SpA) is a form of inflammatory arthritis that includes ankylosing spondylitis (AS) and non-radiographic axial spondylarthritis (nr-axSpA).

- Several targeted DMARDs have been shown to be effective in the treatment of AS or nr-axSpA.
- There is moderate quality evidence to support the use of targeted DMARDs, particularly TNF inhibitors, in non-radiographic axial SpA. Clinical trials have consistently shown that treatment with TNF inhibitors reduced disease activity in this population.
- 2019 ACR guidelines do not recommended any one TNF inhibitor over another except in patients who also have inflammatory bowel disease or iritis in which case adalimumab or infliximab would be recommended over etanercept. Cosentyx (secukinumab) and Taltz (ixekizumab) are recommended as second-line options in patients who have active symptoms without response to a previous TNF inhibitor. TNF inhibitors, secukinumab, or ixekizumab are recommended over tofacitinib in patients with AS. [28]
- Because of similar efficacy among the studied targeted DMARDs, non-preferred/non-formulary options are coverable when preferred/formulary options are ineffective, as detailed in the coverage criteria in Section I.

Rheumatic Conditions – Polyarticular Juvenile Idiopathic Arthritis (PJIA); Juvenile Rheumatoid Arthritis (JRA)

- Several targeted DMARDs (as listed in the coverage criteria) have been shown to be effective in the treatment of JIA.
- 2019 ACR guidelines for JIA recommend methotrexate, leflunomide, or sulfasalazine as initial therapy for patients with JIA. Methotrexate is recommended over leflunomide and sulfasalazine due to a larger body of evidence. Biologic agents are recommended in patients who have disease activity despite treatment with methotrexate, sulfasalazine, or leflunomide or in patients with high disease activity or have disease in high-risk joints. [25]
- Combination therapy with a biologic and a csDMARD is recommended to prevent the formation of anti-drug antibodies.
- There is little comparative evidence to distinguish among the targeted options for JIA. Guidelines state that there are mostly equivalent data for safety and efficacy between the biologics and there are lack of head-to-head comparisons between them.
- In patients who have had an inadequate response to a TNF inhibitor, switching to a non-TNF biologic is preferred over a second TNF inhibitor. However, a second TNF inhibitor may be appropriate if patients had a good response to the initial TNF inhibitor. [25]

Rheumatic Conditions – Psoriatic Arthritis (PsA)

- Several targeted DMARDs (as listed in the coverage criteria) have been shown to be effective in the treatment of PsA.
- ACR Guidelines recommend TNF inhibitors as the first-line treatment for PsA. However, other mechanisms can be used in patients with contraindications to TNF inhibitors. The guidelines do not specify the use of any one TNF inhibitor over another. [29]
- In patients who have failed a TNF inhibitor, a second TNF inhibitor is recommend over switching to a different mechanism of action (e.g., an IL-12/23 inhibitor, biologic, IL-17 inhibitors, abatacept, or tofacitinib). However, a different mechanism of action may be

used in cases of primary TNF inhibitor failure (no response) or a serious adverse event due to a TNF inhibitor. [29]

-

- Because of similar efficacy among the studied targeted DMARDs, non-preferred/non-formulary options are coverable when preferred/formulary options are ineffective, as detailed in the coverage criteria.

Rheumatic Conditions – Rheumatoid Arthritis (RA)

- Several targeted DMARDs (as listed in the coverage criteria, as well as rituximab) have been shown to be effective in the treatment of RA.
- The efficacy of these targeted DMARDs in the treatment of RA is similar. Guidelines do not recommend one specific targeted DMARD. The initial choice of therapy includes biologic DMARDs (TNF inhibitors or a non-TNF biologic) or targeted synthetic DMARDs (e.g., JAK inhibitors). However, 2021 ACR guidelines have not accounted for recent drug safety communications regarding the risk of serious heart-related events with JAK inhibitors. [30 31]
- In patients who have had an inadequate response to targeted therapy, guidelines recommend switching to a targeted DMARD of a different class rather a different DMARD of the same class. [30]
- Guidelines have recommendations for specific patient populations including non-TNF inhibitors over TNF inhibitors for patients with New York Heart Association (NYHA) class III or IV heart failure. This recommendation is based on the risk of worsening heart failure observed in RCTs of TNF inhibitors in patients with heart failure. [30]
- Because of similar efficacy among the studied targeted DMARDs, non-preferred/non-formulary options are coverable when preferred/formulary options are ineffective, as detailed in the coverage criteria.

Rheumatic Conditions – Systemic Juvenile Idiopathic Arthritis (SJIA)

- Several targeted agents (as listed in the coverage criteria) have been shown to be effective or are recommended by clinical practice guidelines in the treatment of SJIA. [21]
- Due to lack of high-quality data, the comparative efficacy for these agents in the treatment of SJIA is uncertain.
- The efficacy of these targeted DMARDs (as listed in the coverage criteria) in the treatment of SJIA is similar. However, there is a significant difference in the cost between these treatment options. Therefore, the costlier treatment options are coverable only when the less costly options are ineffective.

Rheumatic Conditions – Giant Cell Arteritis (GCA)

- Data evaluating the use of biologic agents in the treatment of GCA is limited; however, there are few treatment options for this condition, which can result in serious complications.
- Subcutaneous Actemra (tocilizumab) in combination with prednisone has been shown to improve remission rates compared prednisone alone in patients with *newly diagnosed or relapsing* GCA. [32]
- Intravenous Actemra (tocilizumab) is approved for the treatment of GCA; evidence is

based primarily on pharmacokinetic exposure data and extrapolation to the efficacy established for subcutaneous tocilizumab in patients with GCA. [33]

- Evidence for the use of TNF inhibitors is lacking, as several small trials have not shown benefit in the treatment of GCA.

Skin Conditions – Chronic Plaque Psoriasis (PsO)

- There are many treatments for chronic plaque psoriasis (PsO) that are effective, have known long-term safety profiles, and are recommended by national treatment guidelines.
- Light therapy, including UVB and PUVA, is effective and safe, and PUVA may result in long-term remission. When patients are not able to receive office-administered light therapy, light units for home use may be an appropriate alternative (see Appendix 1 for absolute and relative contraindications for phototherapy/photochemotherapy).
- AAD guidelines (2014) recommend phototherapy after failure of first-line treatment (emollients, topical steroids, and topical calcineurin inhibitors). Most patients with mild-to-moderate psoriasis can achieve adequate control with topical medications or phototherapy.
- When systemic therapy is needed to manage psoriasis, csDMARDs often provide the best value. [34]
    * Conventional synthetic DMARDS (csDMARDs), including MTX, cyclosporine, and Soriatane (acitretin), have a proven track record and have been the standard of care for many years.
    * csDMARDs typically take effect with 6 weeks though some patients may require 12 weeks to have full effect. Among these options, cyclosporine is known to work rapidly.
    * Like all immunosuppressants, including targeted DMARDs, the csDMARDs have known risks. The management of these risks is well established.
- Targeted DMARD may be appropriate for patients with moderate to severe psoriasis (e.g., at least 10% BSA and/or significant pain or functional impairment due to the PsO or when conventional topical or oral therapies, or phototherapy have been inadequate.
- Several targeted DMARDs (as listed in the coverage criteria) have been shown to be effective in the treatment of moderate to severe PsO.
- Within each drug class, efficacy of each drug is similar. In general, agents directed against IL-17 (i.e., secukinumab) or IL-23 (i.e., guselkumab) are more effective at producing skin clearance than TNF inhibitors and other mechanisms of action. [34] Because of similar efficacy within each class, non-preferred/non-formulary options are coverable when preferred/formulary options are ineffective, as detailed in the coverage criteria.

Skin conditions – Generalized Pustular Psoriasis [35-37]

- GPP is a rare subtype of psoriasis. Flares are characterized by an abrupt onset of widespread painful pustules which can coalesce into larger, “lakes of pus” overlying painful erythema. Significant flares are often accompanied by systemic symptoms,

notably fever, general malaise, and extracutaneous manifestations such as arthritis, uveitis, and neutrophilic cholangitis, and may be associated with life-threatening complications.

- Acute flares may be idiopathic or may be triggered by infection, withdrawal, or administration of certain medications (including those used in the treatment of GPP such as corticosteroids, methotrexate, or tumor necrosis factor [TNF] inhibitors), pregnancy, or stress.
- Treatment guidelines recommend the identification and management of potential triggers.
- Choice of therapy depends on disease acuity. Acitretin and methotrexate are the preferred initial treatments for adults with relatively stable GPP due to their relatively slow onset of action. They can be used for long-term maintenance treatment.
- Cyclosporine and infliximab are used for more severe, acute GPP. Cyclosporine or infliximab are often considered first line for severe GPP due to their rapid onset of action. Once control of acute disease is achieved, patients may be maintained on fast-acting therapies or transitioned to acitretin or methotrexate for long-term treatment. There is no comparative data regarding relative efficacies of agents used for GPP.

Skin Conditions – Hidradenitis Suppurativa

- High-quality data evaluating the use of targeted DMARDs in the treatment of hidradenitis suppurativa (HS) are limited; however, there are relatively few treatment options for this condition.
- Although adalimumab is FDA approved for the treatment of HS, infliximab also has data to support use in this indication. [38]
    * A high-quality systematic review showed that weekly-dosed adalimumab improved quality of life in HS compared to placebo; although, the effect size was approximately equal to what is considered a minimally clinically important difference.
    * In the same systematic review, infliximab also improved quality of life compared to placebo, with an effect size well above the threshold for a minimally clinically important difference.
- Trials of adalimumab in HS only included patients with more severe disease, defined as Hurley Stage II or III disease and with at least three abscesses or inflammatory nodules.
- Trials showed that adalimumab significantly improved the hidradenitis suppurativa response rate after 12 weeks of treatment; however, efficacy and safety beyond 12 weeks of treatment has not been established. [39 40]
- Additional long-term randomized controlled trials are needed to understand relative efficacy of other treatments, the safety associated with weekly-dosed adalimumab, and role of oral, non-biologic/non-targeted DMARD treatments for HS.
- Evidence-based guidelines for hidradenitis suppurativa are not available, primarily due to lack of data. However, standard of care therapy reviews suggest the following:
    * Patients may benefit from non-pharmacologic interventions such as good personal hygiene, smoking cessation, and weight-loss.
    * For mild to moderate HS, topical clindamycin and tetracyclines have a proven track record of safety and have been the standard of care.

* When systemic therapy is needed to manage refractory hidradenitis suppurativa, oral therapies often provide the best value. Options include systemic antibiotics (e.g., oral tetracyclines, clindamycin, rifampin, moxifloxacin, metronidazole), hormonal therapies (e.g., oral contraceptives, spironolactone), cyclosporine, finasteride, metformin, or oral retinoids.

Gastrointestinal conditions – Background

- There are many treatments for Crohn's disease (CD) and ulcerative colitis (UC) that are effective, have known long-term safety profiles, and are recommended by national treatment guidelines. [41]
- Lifestyle interventions, such as smoking cessation and diet modification, are important components of a comprehensive treatment plan for patients suffering from CD. [41]
- When medication therapy is needed to manage CD and UC, oral and topical (administered rectally) therapies often provide the best value. [41]
  * First-line therapies to induce remission include:
    - Patients with CD: oral corticosteroids, budesonide, aminosalicylates (e.g., sulfasalazine or mesalamine). [41]
    - Patients with UC: oral aminosalicylates (5ASAs, such as sulfasalazine), topical mesalamine or corticosteroids (e.g., budesonide), or oral corticosteroids, depending on the extent and location of disease.
    - Due to the potential for severe adverse effects, the use of conventional corticosteroids such as prednisone is generally reserved for patients with moderate-to-severe disease who failed to respond to first-line therapies. Use is generally limited to one to two weeks. [41]
    - Corticosteroids such as prednisone are effective in patients with both CD UC. Dosages in the range of 40 mg – 60 mg/day or 1 mg/kg/day of prednisone or equivalent are effective for induction of remission. [41]
  * Once maintenance is induced with corticosteroids, maintenance therapy with azathioprine, 6-mercaptopurine, or methotrexate should be initiated. Azathioprine, 6-mercaptopurine, or methotrexate are slow acting and can take 8 to 12 weeks to have full effect.
  * First-line therapies to maintain remission include:
    - Patients with CD: MTX, 6-mercaptopurine, and azathioprine.
    - Patients with UC: oral aminosalicylates (e.g., sulfasalazine), topical mesalamine or corticosteroids, or oral corticosteroids, depending on the extent and location of disease.
- When non-medical therapies and oral/topical therapies (steroids or csDMARDs) are inadequate, a targeted DMARD may be appropriate for induction and/or maintenance of disease remission.

Gastrointestinal conditions –Crohn's Disease (CD) and Ulcerative Colitis (UC)

- There are many treatments for Crohn's disease (CD) and ulcerative colitis (UC) that are effective, have known long-term safety profiles, and are recommended by national treatment guidelines. [41]

- Several targeted DMARDs (as listed in the coverage criteria) have been shown to be effective in the treatment of CD and/or UC, for inducing and maintaining remission compared to placebo.
- Due to a lack of head-to head comparative studies, the overall comparative efficacy for these targeted DMARDs in the treatment of CD is uncertain. There is also a lack of comparative evidence for treatment of UC. Therefore, non-preferred/non-formulary options are coverable when preferred/formulary options are ineffective, as detailed in the coverage criteria.
- Although studied in UC, there are no controlled trials of golimumab in CD. Likewise, although studied in CD, there are no controlled trials of certolizumab or natalizumab in UC.
- Restorative proctocolectomy with ileal pouch–anal anastomosis (IPAA) is routinely performed in patients with UC who undergo colectomy. Idiopathic inflammation of the pouch — referred to as pouchitis — is the most common long-term complication of IPAA. Retrospective, uncontrolled studies suggest that TNF antagonists, vedolizumab, or ustekinumab may be effective in the treatment of pouchitis that is refractory to antibiotics.[42]
- Safety considerations:
    * Due to an increased risk of mortality and thrombosis with tofacitinib 10 mg twice daily or tofacitinib 22 mg daily, tofacitinib is only indicated for patients who have previously had an inadequate response or intolerance to TNF inhibitors.
    * Use of tofacitinib 10 mg twice daily or tofacitinib 22 mg daily should be limited to the shortest duration, with consideration of the benefits and risks for the individual patient. The prescribing information states that the lowest effective dose needed to maintain response should be used.

Guidelines: [41] [44 45]

- Lifestyle interventions, such as smoking cessation and diet modification, are important components of a comprehensive treatment plan for patients suffering from CD.
- When medication therapy is needed to manage CD and UC, oral and topical (administered rectally) therapies often provide the best value.
- First-line therapies to induce remission for CD/UC vary, based on severity and anatomic distribution, but may include:
    * Oral corticosteroids, “topical” steroids (enteric-coated budesonide), oral aminosalicylates (5ASAs, such as sulfasalazine or mesalamine). Steroids are used over csDMARDs for induction of remission in moderate to severe UC. Several product formulations are specific to anatomic location of the disease, such as enteric-coated (EC) budesonide or EC mesalamine, or rectal 5ASAs.
    * In addition, topical mesalamine may be used for UC, depending on the extent and location of disease.
    * The use of conventional corticosteroids, such as prednisone, is generally reserved for patients with moderate-to-severe CD/UC refractory to first-line therapies, given the adverse events. Use is generally limited to one to two weeks.

    * Corticosteroids, such as prednisone, (40 - 60 mg/day or 1 mg/kg/day), are effective for induction of remission for CD and UC.

- Once maintenance is induced with corticosteroids, remission csDMARD therapy should be initiated. Choice of therapy varies between CD and UC, as well as response to induction therapy(s). Antimetabolite csDMARDs [such as MTX (methotrexate), 6-MP (6-mercaptopurine), azathioprine)] are slow acting and can take 8 to 12 weeks to have full effect. They are also used to decrease immunogenicity in combination with targeted DMARDs.
- First-line therapies to maintain remission include:
    * CD: 6-mercaptopurine, azathioprine, and methotrexate.
    * UC: oral 5ASAs (e.g., sulfasalazine), topical mesalamine or corticosteroids, or oral corticosteroids, depending on the extent and location of disease.
- When non-medical therapies and oral/topical medications (steroids or aminosalicylates) are inadequate, a targeted DMARD may be appropriate for induction and/or maintenance of disease remission.
- Guidelines for CD list multiple targeted DMARDs as effective treatment options. [41]
    * TNF inhibitors, including infliximab and adalimumab, are recommended in patients who are resistant to corticosteroids or whose disease is refractory to csDMARDs such as azathioprine or 6-mercaptopurine.
    * Ustekinumab is an option for moderate-to-severe CD patients who failed previous treatment with corticosteroids, thiopurines, methotrexate, or anti-TNF inhibitors or who have had no prior exposure to anti-TNF inhibitors.
    * Vedolizumab is also listed as an effective option for the induction and maintenance of remission in CD.
    * Due to the risk of progressive multifocal leukoencephalopathy (PML), a serious (sometimes fatal) adverse event, natalizumab is only recommended after other treatment options have failed.
    * Patients with fistulizing disease and severely active disease may be candidates for initial targeted DMARD. Definitions for severe disease include the following previous hospitalization for Crohn's disease, extensive anatomic involvement, deep ulcers, prior surgical resection, stricturing and/or penetrating behavior.
- Clinical practice guidelines for the treatment of UC indicate that for patients who initially respond to infliximab but lose response, an increase in dose or shortening of the interval between infusions may improve the likelihood of successful treatment. These guidelines acknowledge that these strategies have not been evaluated in a controlled manner.
- Lack of response and loss of response to TNF inhibitors is common in both CD and UC. The choice of subsequent agent after failure of a TNF inhibitor is typically guided by serum levels. ACG guidelines state that, in patients with adequate serum levels of anti-TNF antibodies switching to another TNF is unlikely to be of benefit.

Gastrointestinal conditions – Immune-mediated Colitis

- Serious or steroid-refractory colitis is a known adverse event associated with checkpoint

inhibitors such as Yervoy (ipilimumab), Opdivo (nivolumab), Keytruda (pembrolizumab), Tecentriq (atezolizumab), Bavencio (avelumab), Libtayo (cemiplimab), and Imfinzi (durvalumab). NCCN guidelines recommend prednisone or methylprednisolone as the first-line treatment for moderate colitis. Infliximab may be considered if there has been no improvement within 2-3 days of initiating glucocorticoids. [46]

- NCCN guidelines state that the duration of therapy with TNF-inhibitors is not clearly defined but is usually a single dose. [46]

Gastrointestinal conditions- collagenous colitis

- The European Guidelines on Microscopic Colitis (including lymphocytic colitis and collagenous colitis) recommend budesonide as front line for both induction as well as maintenance in some cases. Evidence for use of second-line therapies in patients with microscopic colitis is scarce and based primarily on case reports. Guidelines support the use of TNF inhibitors and vedolizumab for refractory microscopic colitis. TNF inhibitors, including infliximab and adalimumab, have been reported to induce remission. Vedolizumab has been associated with clinical remission based on case reports; almost all patients were refractory to prior TNF inhibitors; however, no randomized control trials have been published to date.[47]

Other Immunologic Conditions

Acute Graft Versus Host Disease (aGVHD)[48]

- Graft versus host disease (GVHD) is a common complication of allogeneic hematopoietic cell transplant (HCT) that occurs when the graft (donor) cells identify the transplant recipient cells (host) as foreign and initiates an immune reaction that may lead to organ damage or death.
- The risk for GVHD is higher when receiving a HCT from an unrelated donor.
- There are no standard guidelines for prophylaxis of acute GVHD, protocols vary by transplant center. The choice of therapy may depend on the underlying disease, degree of HLA disparity, conditioning regimen, and patient characteristics. Several regimens include a calcineurin inhibitors (tacrolimus, cyclosporine) given with either methotrexate or mycophenolate mofetil. Post-transplantation with cyclophosphamide or T-cell depletion is also used.
- At 6 months post-transplant, abatacept was shown to increase acute GVHD free survival as well as improve overall survival when used for patients with 8/8 HLA matched or 7/8 HLA mismatched unrelated donor HCT when used in combination with a calcineurin inhibitor plus methotrexate. [49]

Antibody Mediated Rejection of Transplant (solid-organ)[50 51]

- Acute allograft (organ) rejection may be cellular (T-cell mediated) or humoral (antibody-mediated) (AHR, AMR).
- Pre-treatment (desensitization) may reduce the risk of AMR in highly sensitized renal transplant patients.
- Acute humoral rejection (AHR) is also an AMR and can occur outside of the peri-operative period, but most commonly within 6 months after transplant. The diagnosis is confirmed by a renal biopsy.

- The goal of therapy is early antibody elimination with IVIG, pheresis, or a combination of modalities. However, evidence for therapies used in AMR are generally of low quality and protocols vary between transplant centers. PLEX and IVIG are generally regarded as a standard of care for acute active AMR. Rituximab has also been suggested as a treatment option by KDIGO guidelines. [50]
- One study assessed the use of tocilizumab as rescue therapy in 36 kidney transplant patients with chronic AMR who failed standard-of-care treatment with IVIG and rituximab, with or without plasma exchange. Tocilizumab was administered as 8 mg/kg monthly, with a maximal dose of 800 mg for 6 to 25 months. Graft- and patient- survival rates were 80% and 91% at six years post treatment, respectively.
- In a small pilot study (N=10), patients who did not respond to desensitization with IVIG and rituximab (+/- plasma exchange) who were given tocilizumab 8 mg/kg on day 15 then monthly for 6 months with IVIG had a decrease in donor specific antibodies. [52]

Pyoderma Gangrenosum

- Pyoderma gangrenosum (PG) is a rare ulcerative skin condition that is often associated with underlying systemic disease. First-line options for PG typically are systemic corticosteroids, cyclosporine, or tacrolimus. Infliximab is considered a second-line option when there has been an inadequate response. Infliximab or other biologic therapy may use when there is an underlying inflammatory condition, such as ulcerative colitis. [53 54]

Sarcoidosis

- Sarcoidosis is a multisystem granulomatous disorder characterized by the presence of granulomas in involved organs. It most commonly impacts the lungs and lymph nodes but may manifest in other organs. [55]
- Corticosteroid therapy is the primary therapy. Second line agents are considered for patients with corticosteroid-refractory disease. Second-line options include csDMARDs such as azathioprine, methotrexate, and leflunomide. Biologic therapy with infliximab is reserved for patients who have not responded to prior conventional agents. [55 56]

Takayasu arteritis

- Takayasu arteritis is a rare type of vasculitis where inflammation damages the aorta. Takayasu arteritis is complex and requires specialist management to accurately diagnosis and manage the condition. High dose corticosteroids in combination with csDMARDs are recommend as the initial treatment options. Tocilizumab and infliximab are recommended as second line options in patients who are unable to taper off oral corticosteroids or who have a relapse despite treatment with corticosteroids in combination with a csDMARD. [57]
- Actemra (tocilizumab) has been evaluated at doses of 8 mg/kg intravenously every 4 weeks or 162 mg subcutaneously weekly. There is limited information on the efficacy of higher doses. [57-60]

Uveitis

- Corticosteroids are the mainstay of therapy in uveitis. Guidelines recommend a high dose course (prednisone 1 mg/kg/day or up to 60-80 mg per day) for up to one month.

- A csDMARD is recommended if there is no response, or worsening, after two to four weeks of steroids. American Academy of Ophthalmology (AAO) guidelines recommend mycophenolate mofetil, azathioprine, methotrexate, cyclosporine, or tacrolimus. There is insufficient comparative evidence to conclude superiority of one csDMARD over another.
- Targeted DMARDs are recommended in patients who have had an inadequate response to corticosteroids and csDMARDs.
    * Adalimumab is FDA approved for uveitis and recommended as a treatment option in AAO guidelines. Adalimumab has been shown to lower flare rates and loss of visual acuity in two phase 3 RCTs in patients with active uveitis despite high-dose corticosteroids.
    * Infliximab is also a recommended treatment option for uveitis based on evidence from several comparative, open-label trials.

Cryopyrin-Associated Periodic Syndromes (CAPS)/Neonatal-Onset Multisystem Inflammatory Disease (NOMID)

- CAPS are a group of rare genetic diseases affecting approximately 200 to 300 people in the United States and are attributed to a specific genetic mutation. [61]
- Three types of CAPS affect the majority of patients: [61]
    * Neonatal-Onset Multisystem Inflammatory Disease (NOMID) – Urticaria-like rash, CNS involvement [papilledema, cerebrospinal fluid (CSF) pleocytosis, or sensorineural hearing loss], elevated C-reactive protein (CRP), or epiphyseal and/or patellar overgrowth on radiographs.
    * Familial Cold Auto-Inflammatory Syndrome (FCAS) – Recurrent intermittent episodes of fever and rash that primarily followed natural, artificial (e.g., air conditioning), or both types of generalized cold exposure.
    * Muckle-Wells Syndrome (MWS) – Syndrome of chronic fever and rash that may wax and wane in intensity and is sometimes exacerbated by generalized cold exposure. This syndrome may be associated with deafness or amyloidosis.
- Therapies that affect interleukin-1 (IL-1) may be helpful in controlling the symptoms of CAPS. [61]
    * Therapies that affect IL-1 include Kineret (anakinra), Arcalyst (rilonacept), and Ilaris (canakinumab), all of which have FDA marketing approval for one of more forms of CAPS. [62-64]
    * Due to the rarity of these conditions, it is difficult to conduct high-quality scientific studies.
- There have been no head-to-head trials comparing the efficacy of Kineret (anakinra), Arcalyst (rilonacept), or Ilaris (canakinumab) against each other or any other medication in the management of CAPS.
- The efficacy of Kineret (anakinra) was evaluated in a prospective, long-term, open-label and uncontrolled study in 43 patients with NOMID aged 0.7 to 46 years who were treated for up to 60 months. [62 65]

    * Treatment with Kineret (anakinra) resulted in improvements in all individual disease symptoms measured by a disease-specific Diary Symptom Sum Score (DSSS), as well as in the serum markers of inflammation.
    * For 11 patients who went through a withdrawal phase, disease symptoms and serum markers of inflammation worsened after withdrawal and promptly responded to reinstitution of Kineret (anakinra) therapy.

Cytokine Release Syndrome (CRS)

- Tocilizumab IV is FDA-approved for the treatment of cytokine release syndrome associated with the use of chimeric antigen receptor (CAR) T cell therapy, such as Kymriah (tisagenlecleucel) and Yescarta (axicabtagene ciloleucel). It is given as a one-time weight-based dose but up to three additional doses may be administered if there is no clinical improvement.
- Subcutaneous tocilizumab and sarilumab, another IL-6 inhibitor, have not been studied in cytokine release syndrome.

Safety Considerations

- In general, the overall safety profiles of targeted DMARDs for chronic inflammatory diseases is favorable. However, several have warnings related to infection risk and hypersensitivity reactions. [41 66-68] All are immunosuppressants and increase the risk of infection, though some drugs may increase the risk more than others.
- Certain products have unique safety concerns that should be factored into the overall risk-benefit profile.
- Oral JAK inhibitors (tofacitinib, upadacitinib, and baricitinib) contain a boxed warning for increased risk of serious infections, mortality, malignancies, major cardiovascular events, and thrombosis. In a post-marketing safety study, tofacitinib did not meet its primary endpoint of non-inferiority for risk of cardiovascular events and malignancy. Results showed that patients who received tofacitinib at either 5 mg or 10 mg twice daily had a higher rate of cardiovascular events and malignancy compared to patients who received a TNF inhibitor. Though the study only evaluated tofacitinib the warning has been extended to other JAK inhibitors used in the treatment of RA and other inflammatory diseases. [31 43 69-71]
    * The boxed warning is based on a safety study designed to evaluate the safety of tofacitinib relative to TNF inhibitors. The study included patients age 50 or older with at least one CV risk factor and all patients received background MTX. Patients were randomized to one of three groups: tofacitinib 5 mg twice daily, tofacitinib 10 mg twice daily, or a TNF inhibitor.
    * The study failed to meet its pre-specified safety endpoint of non-inferiority to TNF inhibitors for risk of cardiovascular events and malignancy.
    * The prescribing information for each JAK inhibitors has been updated to clarify that each JAK inhibitor is only indicated for to certain patients who have not responded or cannot tolerate one or more TNF blockers. [43]
    * The FDA continues to investigate these safety concerns and will provide updates as additional information becomes is available.

    * The risks and benefits of JAK inhibitors in patients at risk for venous thromboembolism should be carefully considered when choosing treatment strategies.
- Olumiant (baricitinib) has a boxed warning describing an increased risk of venous thromboembolism. Due to this risk, the use of baricitinib is limited to patients who have failed prior treatment options. There are several alternative targeted agents for the treatment of RA that do not carry a risk for VTE and have longer records of safety experience with comparable or better efficacy than baricitinib.
- While newer agents such as IL-23 inhibitors and IL-17 inhibitors, have demonstrated favorable risk-benefit profiles in clinical studies there is limited long-term safety experience. Additionally, there is limited evidence directly comparing to existing standards of care. [41 66-68]
- New or worsening heart failure is listed as a warning and precaution for TNF inhibitors. A clinical trial evaluating etanercept for the treatment of heart failure was terminated early due to lack of efficacy and suggested higher morality in etanercept-treated patients compared to placebo. Post-market, new or worsening heart failure have been reported with TNF inhibitors.

Dose Escalation

- There are no randomized, controlled trials to support dose escalation of ustekinumab from every 8 to 12 weeks to every four-week dosing in any condition. It is uncertain if there is any additional benefit with increased dosing and there is limited long-term safety data.
    * The evidence supporting the use of every four weeks in CD is limited to retrospective, observational studies. [72 73] While some patients experienced disease remission, high-quality, prospective studies are needed to identify the ideal population and clarify the risk-benefit profile. Due to limited evidence supporting use, more frequent dosing of ustekinumab for CD is limited to patients who have had an inadequate response to every 8-week dosing.
    * There are no high-quality studies evaluating the use of every 4-week dosing of ustekinumab in PsO.
    * Additional studies are also needed to clarify the role of dose escalation versus standard dosing or other mechanisms of action.
- Guidelines do not currently support the use of therapeutic drug monitoring of ustekinumab to guide dose escalation.
    * There is very limited evidence on the efficacy of different maintenance troughs for ustekinumab. [74 75]
    * While therapeutic drug monitoring may play a role in the management of TNF inhibitors, the same concepts may not apply to ustekinumab due to its different mechanism of action and pharmacokinetic properties.
- Phase 3 clinical trials of Entyvio (vedolizumab) for UC and CD included maintenance dosing intervals of every 4 weeks and every 8 weeks (with a dose of 300 mg). The results demonstrated that the two maintenance doses produce in similar response rates. In

long-term extension studies some patients who had an inadequate response to every 8-week dosing were able to achieve a response or regain response after increasing to every four-week dosing. Therefore, the use of every four-week dosing is limited to patients who have lost response or have had an inadequate response to every 8-week dosing. [76 77]

- In PsO, there was no statistically significant difference in response for patients who were dose escalated to secukinumab 300 mg every 2 weeks vs every 4 weeks in patients who had suboptimal response to standard dosing at 16 weeks. After 16 weeks, most patients who continued with a 4-week dosing interval were able achieve response. [78]
- Pharmacokinetic and exposure-response modeling suggest shortening the dosing interval for golimumab IV to every 6 weeks may ameliorate waning efficacy toward the end of the standard 8-week dosing interval experienced by a small proportion of patients. [69 79]

Appendix 1: Absolute and Relative Contraindications for Phototherapy/Photochemotherapy

History of melanoma or squamous-cell carcinoma
History of photosensitivity
Increased risk of photosensitivity due to concomitant disease state (e.g., porphyria, systemic lupus erythematosus) or chronic medication use (e.g., tetracycline or sulfonamide antibiotics)
Physical inability to stand for the required exposure time
Presence of premalignant lesions (e.g., actinic keratosis)
Presence of psoriatic arthritis
Treatment of facial or scalp lesions
Treatment of lesions in the groin area
Treatment of lesions on the palms of the hands or soles of the feet, or on nail beds
Type 1 or type 2 skin

Appendix 2: Select List of Conventional Synthetic Disease Modifying Anti-Rheumatic Drugs (csDMARDs)

Conventional Synthetic DMARDS for Rheumatic and Skin Conditions and Uveitis	
Azathioprine (AZA; Imuran)	Methotrexate (oral, injectable)*
Cyclosporine (CSA; Gengraf, Neoral, Sandimmune)*	Mycophenolate (MMF; CellCept, Myfortic)
Hydroxychloroquine (HCQ; Plaquenil)	Sulfasalazine (SSZ; Azulfidine)
Arava (leflunomide)	Soriatane (acitretin)*
Conventional Synthetic DMARDs for Gastrointestinal conditions	
Azathioprine (AZA; Imuran)	Mercaptopurine (6-MP; Purinethol)
Balsalazide (Colazal, Giazo)	Mesalamine (Apriso, Asacol HD, Delzicol, Lialda, Pentasa)
Cyclosporine (CSA; Gengraf, Neoral, Sandimmune)	Sulfasalazine (SSZ; Azulfidine)

*: Therapies used in the treatment of dermatologic conditions

Appendix 3: American College of Rheumatology (ACR) Classification Criteria for Establishing the Diagnosis of Rheumatoid Arthritis (RA) [77 78]

Diagnosis of RA requires the presence of at least 4 of 7 criteria below:
1. Morning stiffness in and around joints lasting more than 1 hour. 2. Arthritis in at least 1 area in a wrist or proximal interphalangeal (PIP) joint (hands or fingers) for > 6 weeks. 3. Simultaneous swelling or fluid accumulation in 3 or more joints for > 6 weeks. 4. Symmetric (bilateral joint) involvement for > 6 weeks. 5. Presence of rheumatoid nodules. 6. Positive serum rheumatoid factor. 7. Radiographic changes typical of RA (erosion or unequivocal bony decalcification in or adjacent to the involved joint) on hand and wrist present.

Appendix 4: American College of Rheumatology (ACR) Assessment Components for Improvement in Rheumatoid Arthritis (RA) [79]

- Tender joint count. - Swollen joint count. - Patient's assessment of pain. - Patient's global assessment of disease activity. - Physician's global assessment of disease activity. - Patient's assessment of physical function. - Acute phase reactant measures (erythrocyte sedimentation rate or C-reactive protein levels).

Appendix 5: American College of Rheumatology (ACR) Classification Criteria for Establishing the Diagnosis of Giant Cell Arteritis (GCA)

Diagnosis of GCA requires the presence of at least 3 of 5 criteria below:
1. Patient age 50 years or older. 2. New onset of localized headache. 3. Temporal artery tenderness or decreased temporal artery pulse. 4. Erythrocyte sedimentation rate of 50 mm per hour or greater. 5. Abnormal temporal artery biopsy.

Appendix 6: Example Contraindications to Self-Administered Therapy

The member is 13 years of age or younger.
Inability to self-inject due to significant behavioral issues and/or cognitive impairment including, but not limited to, those associated with developmental delay, down syndrome, dementia, or excessive anxiety such as needle phobia.
Preferred self-administered therapy/therapies are relatively contraindicated.

Codes	Number	Description
HCPCS	J3262	Injection, tocilizumab (Actemra IV), 1 mg
HCPCS	J0717	Injection, certolizumab pegol (Cimzia lyophilized powder vials), 1 mg
HCPCS	J3380	Injection, vedolizumab (Entyvio), 1 mg
HCPCS	J1602	Injection, golimumab (Simponi Aria), 1 mg, for intravenous use
HCPCS	J3245	Injection, tildrakizumab (Ilumya), 1 mg
HCPCS	J2327	Injection, risankizumab-rzaa (Skyrizi), intravenous, 1 mg
HCPCS	J3358	Ustekinumab (Stelara), for intravenous injection, 1 mg
HCPCS	J3357	Ustekinumab (Stelara), for subcutaneous injection, 1 mg
HCPCS	J0129	Injection, abatacept (Orencia), 10 mg
HCPCS	Q5133	Injection, tocilizumab-bavi (tofidence), 1 mg
HCPCS	Q5135	Injection, tocilizumab-aazg (tyenne), biosimilar, 1 mg
HCPCS	Q5137	Injection, ustekinumab-auub (wezlana), biosimilar, subcutaneous, 1 mg
HCPCS	Q5138	Injection, ustekinumab-auub (wezlana), biosimilar, intravenous, 1 mg

Revision History

Revision Date	Revision Summary
12/16/2024	Effective 1/1/2025 • Policy updated to reflect the name change of Washington State Rx Services to ArrayRx.
9/19/2024	Effective 01/01/2025 • Moved Actemra (tocilizumab) IV to non-preferred for all applicable indications. • Added new Stelara (ustekinumab) biosimilars Pyzchiva, Selarsdi, and Wezlana to policy as non-preferred options.
9/19/2024	Effective 12/1/2024 • Added Tremfya (guselkumab) IV induction as a preferred provider-administered option for ulcerative colitis ahead of anticipated FDA approval. • Added Skyrizi (risankizumab) IV induction as a preferred provider-administered option for ulcerative colitis.
6/20/2024	• Updated authorization limit wording for Simponi Aria in *Table 1* for clarity. No change to intent. • Added new Spevigo (spesolimab) SC formulation to policy criteria and quantity limit for a loading dose in GPP maintenance. • Added Tofidence IV (tocilizumab-bavi) to policy as non-preferred. • Added Tyenne IV (tocilizumab-aazg) to policy as preferred. • Added investigational dose escalation language for Cosentyx (secukinumab).
3/21/2024	Effective 4/1/2024 • Updated Avsola (infliximab) and Stelara (ustekinumab) as preferred products. • Added Omvoh (mirikizumab) as a non-preferred product for ulcerative colitis (UC). • Updated background to include pouchitis and collagenous colitis. • Updated reference to Washington State Rx Services. Product list available at: https://www.hca.wa.gov/assets/pebb/ump-preferred-drug-list-2024.pdf
12/7/2023	• Updated new Cosentyx (secukinumab) IV formulation to policy criteria and QL for AS, nrSpA, and PsA. • Removed discontinued Cosentyx (secukinumab) lyophilized powder vials for subcutaneous administration.
09/14/2023	Updated Actemra (tocilizumab) criteria for use in cytokine release syndrome (CRS). Requirement changed to diagnosis only. CRS no longer need be chimeric antigen receptor (CAR) T-cell induced for coverage approval.

Revision Date	Revision Summary
3/16/2023	Updated reference to Washington State Rx Services. Product list available at: https://www.hca.wa.gov/assets/pebb/ump-preferred-drug-list-2023.pdf
12/9/2022	Effective 1/19/2023: • Updated diagnostic requirements for systemic juvenile idiopathic arthritis (SJIA). Now requires disease activity for at least 6 weeks instead of 6 months. • Skyrizi (risankizumab) quantity limit updated to include new 180 mg maintenance dose for Crohn's Disease (CD). • Updated preferred self-administered products to include Rinvoq (upadacitinib), Xeljanz/Xeljanz XR (tofacitinib), Skyrizi (risankizumab) in their respective indications. • Added Spevigo (spesolimab) to the policy for generalized pustular psoriasis (GPP) as a provider-administered option.
8/29/2022	Effective 10/1/2022: • Added Skyrizi (risankizumab) to policy as a preferred provider administered option for Crohn's disease. • Updated references to Products with Therapeutically Equivalent Biosimilars/Reference Products dru620 (dru905 archived effective 7/15/2022). • Updated cross references and HCPCS codes.
5/23/2022	Effective 7/1/2022: • Updated policy to allow dosing escalation of Simponi Aria (golimumab) to every 6 weeks. • Added Actemra (tocilizumab) IV to policy for Giant Cell Arteritis (GCA). • Updated Entyvio (vedolizumab) for Crohn's Disease (CD) and Ulcerative Colitis (UC) as a preferred provider-administered option. • Added HCPCS codes for provider-administered products.

Revision Date	Revision Summary
2/22/2022	Effective 3/13/2022: • Added coverage criteria for intravenous Actemra (tocilizumab) for solid organ transplant, antibody mediated rejection (AMR). • Added criteria to allow coverage of intravenous Orencia (abatacept) for *prophylaxis* of graft versus host disease (GVHD). • Added coverage criteria for Cosentyx (secukinumab) for enthesitis-related arthritis (ERA). • Wording for intravenous Actemra (tocilizumab) criteria for cytokine release syndrome (CRS) was modified to allow for coverage as part of CAR-T treatment plan. • Updated position statement to clarify that non-TNFs may be an option for New York Heart Association (NYHA) class III/IV heart failure (HF) based on guidelines and post-market reports of new or worsening HF with TNF inhibitors.
10/15/2021	• Revised preferred infliximab products and clarified that they are reviewed under Medication Policy Manual, Products with Therapeutically Equivalent Biosimilars/Reference Products, dru905. • Added unbranded Janssen infliximab product to policy as non-preferred.
7/16/2021	Updated appendix numbers in criteria. No other changes.
4/21/2021	• Added coverage criteria for sarcoidosis and Takayasu Arteritis. • Updated investigational uses.
2/22/2021	Removed requirement for step therapy with two prior self-administered products prior to approval of infliximab products (Remicade and biosimilars).
10/28/2020	• Added Simponi Aria as a provider-administered option for polyarticular juvenile idiopathic arthritis (PJIA), a newly approved FDA indication. • Increased authorization limit for infliximab in immune-mediated colitis to two infusions. • Clarified that Cosentyx (secukinumab) vials are a provider-administered option for non-radiographic axial spondyloarthritis.

Revision Date	Revision Summary
8/25/2020	Effective 10/1/2020: • Revised clinical documentation requirements. • Updated quantity limits for Cimzia (certolizumab) based on newly FDA approved indication. • Removed references to appendix 2 in policy criteria and listed requirements for prior conventional therapies directly in criteria. • **Non-Radiographic Axial Spondyloarthritis:** New diagnosis category in policy. • **Chronic Plaque Psorasis:** - Non-biologic-step-therapy requirements changed from "BSA ≥ 10% AND phototherapy AND conventional DMARD" to "BSA ≥ 10% OR phototherapy OR conventional agent." - Conventional agent list expanded from just DMARDs to also include treatments such as topical corticosteroids. • **Hidradenitis Suppurativa:** - Removed requirement for disease severity. - Removed requirement for functional impairment. - Expanded list of acceptable step therapies from only antibiotics to also include corticosteroids, hormonal therapies, metformin, and retinoids. • **Systemic juvenile idiopathic arthritis:** Expanded list of acceptable step therapies from only conventional DMARDs to also include NSAIDs. • **Uveitits:** Expanded list of acceptable step therapies from only systemic corticosteroids to also include periocular intravitreal corticosteroids.
4/22/2020	• Updated quantity limits for Cosentyx (secukinumab) in axial Spondyloarthritis/ankylosing spondylitis. • Clarified that quantity limits for Cosentyx (secukinumab) in this policy apply to vials. Cosentyx (secukinumab) syringes are considered self-administered. • Updated biosimilar list to include Abrilada (adalimumab-afzb) and Avsola (infliximab-axxq). • Updated dosing for Stelara (ustekinumab) in ulcerative colitis. • Added COT language.
10/23/2019	New UMP-specific policy replacing dru444 for those members. Effective 1/1/2020.

Drug names identified in this policy are the trademarks of their respective owners.

UMP Medication Policy Manual

Policy No: dru901

Topic: Tysabri, natalizumab (UMP plans)

Date of Origin: January 1, 2020

Committee Approval Date: March 16, 2023

Next Review Date: 2023

Effective Date: April 15, 2023

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of medication policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Tysabri (natalizumab) is a medication used to treat multiple sclerosis or Crohn's disease. It is administered intravenously and works on the immune system to relieve symptoms of disease.

This policy applies to the Washington State Health Care Authority (HCA) Uniform Medical Plan (UMP) only. The UMP is a self-funded health plan offered through the Washington State HCA's Public Employees Benefits Board (PEBB) Program and School Employees Benefits Board (SEBB) Program and administered by Regence BlueShield.

Policy/Criteria

I. Continuation of therapy (COT): Tysabri (natalizumab) may be considered medically necessary for COT when criterion A, B, or C below is met.

A. For diagnoses NOT listed in the coverage criteria below, full policy criteria must be met for coverage.

OR

B. For diagnoses listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

C. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

Please note*: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Tysabri (natalizumab) may be considered medically necessary when criterion A below is met.

A. At least one of the following diagnostic criterion 1 or 2 below is met.

1. **Multiple sclerosis:** Initial authorization for Tysabri (natalizumab) may be considered medically necessary when criteria a and b below are met.

a. A definitive diagnosis of a **relapsing form of multiple sclerosis** [clinically isolated syndrome (CIS), relapsing-remitting MS (rrMS), or active secondary progressive MS (SPMS)] that has been established by or in consultation with a specialist in neurology or multiple sclerosis (see *Appendix A* for *American Academy of Neurology* multiple sclerosis definitions).

AND

b. Criteria i or ii below is met.

i. At least two self-administered disease modifying therapies for multiple sclerosis have been documented in clinical notes to be ineffective, not tolerated, or contraindicated (including, but not limited to, those situations in *Appendix C*):

Preferred Self-Administered Therapies (for UMP Members): (Please refer to coverage policies administered by Washington State Rx Services)
Aubagio (teriflunomide)
Avonex (interferon beta-1a)
dimethyl fumarate
fingolimod
glatiramer acetate
Vumerity (diroximel fumarate)

See Appendix B for other MS disease modifying therapies (DMTs)

Ineffectiveness is defined as meeting at least one of the following three criterion (1, 2, or 3) during treatment with one of these medications:

1. The patient continues to have clinical relapses (at least one relapse within the past 12 months).

OR

2. The patient continues to have CNS lesion progression as measured by MRI.

OR

3. The patient continues to have worsening disability. Examples of worsening disability include, but are not limited to, decreased mobility, decreased ability to perform activities of daily living due to disease progression, or an increase in EDSS score.

OR

ii. The patient has had a particularly aggressive initial disease course, as defined by meeting at least one of the following:

1. An EDSS score of ≥ 4 within 5 years of onset.

OR

2. Multiple (two or more) relapses with incomplete resolution in the past year.

OR

3. At least two MRI studies showing new or enlarging T2 lesions or gadolinium-enhancing lesions despite treatment over 6 months.

OR

4. The presence of spinal or brainstem lesions on MRI.

OR

2. Crohn's disease: Initial authorization for Tysabri (natalizumab) may be considered medically necessary for patients meeting all of the following criteria a, b, and c below.

a. Tysabri (natalizumab) is prescribed by, or in consultation with, a specialist in gastroenterology for the indication of Crohn's disease.

AND

b. Humira (adalimumab) is not effective after at least an initial 3-dose induction period, except if not tolerated due to documented clinical side effects.

AND

c. Infliximab is not effective after at least an initial induction period (5 mg/kg on weeks 0, 2 and 6), except if not tolerated due to documented clinical side effects.

III. Administration, Quantity Limitations, and Authorization Period

A. Pharmacy Services considers Tysabri (natalizumab) coverable only under the medical benefit (as a provider-administered medication).

B. When pre-authorization is approved, Tysabri (natalizumab) may be authorized in quantities up to one 300-mg infusion every 4 weeks.

C. Authorization period:

1. Multiple sclerosis: Authorization may be reviewed at least annually. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, such as disease stability or improvement.

2. Crohn's disease: Initial authorization shall be reviewed at 12 weeks. Subsequent authorization shall be reviewed at least every six months. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, such as disease stability or improvement.

IV. Tysabri (natalizumab) is considered not medically necessary when used in the following settings:

A. For the treatment of multiple sclerosis when used concomitantly with other disease-modifying multiple sclerosis therapies (MS DMTs) (see *Appendix B*).

B. For the treatment of Crohn's disease when used concomitantly with any of the following:

1. Adalimumab (Humira or biosimilars).

OR

2. Infliximab.

OR

3. Cimzia (certolizumab pegol).

C. For the treatment of ulcerative colitis.

V. Tysabri (natalizumab) is considered investigational when used for all other conditions, including, but not limited to:

A. Primary progressive multiple sclerosis (PPMS).

B. Rheumatoid arthritis.

Position Statement

Summary

- Tysabri (natalizumab) is a monoclonal antibody used: [1]
  - As monotherapy for the treatment of patients with relapsing forms of multiple sclerosis (MS) to reduce the frequency of clinical exacerbations and delay the accumulation of physical disability.
  - For inducing and maintaining clinical response and remission in adult patients with moderately to severely active Crohn's disease (CD) with evidence of inflammation when there has been inadequate response to, or intolerance of, conventional CD therapies and TNF-α inhibitors.
- The intent of the policy is to allow coverage of Tysabri (natalizumab) in patients who failed two preferred disease modifying therapies for MS or as a first-line option in situations where the benefits outweigh the risks. Tysabri (natalizumab) may also be covered in patients with CD who have previously tried adalimumab or infliximab.
- Tysabri (natalizumab) may be used in patients who failed prior disease modifying therapy or as a first-line option in situations where the benefits outweigh the risks. [1,2]
  - Tysabri (natalizumab) contains a Boxed Warning describing an increased risk of progressive multifocal leukoencephalopathy (PML) with its use.
  - Because of these safety concerns, distribution of Tysabri (natalizumab) is restricted. Only prescribers registered in the CD TOUCH or MS TOUCH programs may prescribe Tysabri (natalizumab) for CD or MS, respectively.

- Tysabri (natalizumab) is considered a disease modifying therapy (DMT) for multiple sclerosis. Other disease modifying multiple sclerosis treatments include interferon beta products (Avonex, Rebif, Betaseron, Extavia, or Plegridy), fingolimod (generic, Gilenya, and Tascenso ODT), glatiramer acetate (Copaxone, Glatopa), Aubagio (teriflunomide), dimethyl fumarate, Ocrevus (ocrelizumab), Briumvi (ublituximab-xiiy), and Lemtrada (alemtuzumab). [2] Rituximab may also be used off label for the treatment of relapsing forms of MS. [1]
- Tysabri (natalizumab) may be used as initial disease modifying therapy in patients with "aggressive" or highly active disease." Definitions for highly active disease are not well established however measures often include relapsing activity, MRI markers, or the location of gadolinium-enhancing lesions. The goal of treatment in patients with aggressive disease is initiate treatment with a highly effective therapy before the patient suffers permanent disability. [2]
- Monitoring for disease activity on MRI is recommended every 6 months.
- Tysabri (natalizumab) is considered a disease modifying Crohn's disease treatment. Other disease modifying Crohn's disease treatments include Humira (adalimumab), infliximab, Cimzia (certolizumab pegol), Entyvio (vedolizumab), and Stelara (ustekinumab).
- No studies have shown that the efficacy of Tysabri (natalizumab) is superior to other disease modifying therapies in the treatment of either multiple sclerosis or Crohn's disease.
- It is not recommended that Tysabri (natalizumab) be administered concomitantly with other disease-modifying MS medications due to the potential for increased risk of serious adverse events.
- Tysabri (natalizumab) is approved at the dose of 300 mg infused intravenously over approximately one hour, every 28 days in the treatment of multiple sclerosis or Crohn's disease. The safety and efficacy of Tysabri (natalizumab) at doses higher than 300 mg every 28 days have not been adequately evaluated.

Clinical Efficacy

MULTIPLE SCLEROSIS

- A 2015 Cochrane network meta-analysis concluded that Lemtrada (alemtuzumab), Tysabri (natalizumab), fingolimod (generic, Gilenya, and Tascenso ODT), and mitoxantrone are more effective than other drugs at preventing relapse than other agents based on moderate to high quality evidence. The authors also concluded that only Tysabri (natalizumab) shows a beneficial effect on disability progression based on moderate quality data. Lemtrada (alemtuzumab) and mitoxantrone were also found to be more effective than other treatments at slowing disability progression but the quality of evidence was lower. [3] Tysabri (natalizumab) has only been shown to be safe and effective in the treatment of relapsing forms of multiple sclerosis. [1] There are no data to support the use of Tysabri (natalizumab) in non-relapsing forms of multiple sclerosis.
- American Academy of Neurology guidelines state disease modifying therapies should be offered to patients with relapsing forms of MS. The choice of initial agent should be individualized to incorporate of safety, route of administration, lifestyle, cost, efficacy,

common adverse effects (AEs), and tolerability. Disease activity, adherence, AE profiles, and mechanism of action should be considered when switching disease modifying therapies. [2]

- AAN guidelines state that Tysabri (natalizumab), fingolimod (generic, Gilenya, Tascenso ODT), or Lemtrada (alemtuzumab) should be used in patients with highly active disease. [2]
- Although no specific guidelines exist, proposed definitions of aggressive or highly active have been developed. It may be defined as at least one of the following: an EDSS score of 4 within 5 years of onset, multiple (two or more) relapses with incomplete resolution over a one-year period, more than two MRI studies showing new or enlarging T2 lesions or gadolinium-enhancing lesions despite treatment, no response to therapy with one or more disease modifying therapies for up to 1 year, or the presence of spinal lesions. Monitoring for treatment efficacy via MRI is recommended every 6 months. [4]
- Tysabri (natalizumab) in combination with any other disease modifying multiple sclerosis treatment medication has not been shown to be more effective than Tysabri (natalizumab) alone in the treatment of multiple sclerosis and may be contraindicated due to safety concerns.

CROHN'S DISEASE

- FDA-approval of Tysabri (natalizumab) in Crohn's Disease (CD) was based on three trials; two in induction of clinical response/remission and one in the maintenance of remission. [1]
    * Patients in the induction trials had moderately to severely active CD (Crohn's Disease Activity Index [CDAI] $\geq$ 220 and $\leq$ 450).
    * In one of the two induction studies, significant differences in response to Tysabri (natalizumab) were only observed in the subgroup of patients with elevated C-reactive protein (CRP) levels. The second induction study used elevated CRP as an entry criterion. However, other medications (e.g., prednisone) may lower CRP levels, making this an insensitive predictor of efficacy.
    * The treatment effect in the induction studies ranged from approximately 13 to 15%.
    * In the trial that looked at maintenance of response of CD over 9 to 15 months, the treatment effect was approximately 33%.
- Concomitant use Tysabri (natalizumab) with immunosuppressives (6-mercaptopurine, azathioprine, cyclosporine, and methotrexate) or inhibitors of TNF-α (e.g., infliximab and adalimumab) is not recommended due to potential safety concerns . [1]
- Tysabri (natalizumab) is generally considered a last-line agent for Crohn's disease due to lack of comparative efficacy with other therapies and its potential for serious safety risks.
    * Steroids, immunosuppressives, and inhibitors of TNF-alpha are recommended prior to prescribing Tysabri (natalizumab).

    * A study demonstrating the efficacy of Humira (adalimumab) in patients in whom infliximab was not effective is the basis for recommending both Humira (adalimumab) and infliximab prior to Tysabri (natalizumab).
        ▪ A randomized, placebo-controlled study comparing Humira (adalimumab) with placebo in 325 patients with Crohn's disease who had lost response to treatment with, or were intolerant to, previous infliximab therapy demonstrated induction of remission in 21% versus 7% of patients who had received adalimumab and placebo, respectively ($p<0.001$, ABI 14%, NNT=8). [5]
- One small trial (n = 79) studied the concomitant use of Tysabri (natalizumab) and infliximab in patients who did not achieve remission of their CD after 12 weeks of infliximab. [6]
    * The trial was not powered to detect differences in efficacy between treatment groups.
    * There were not enough patients in the study to determine whether there were differences in uncommon or rare adverse effects between treatment groups.
    * The Tysabri (natalizumab) prescribing information warns against use of this combination.
- Tysabri (natalizumab) should be discontinued in patients with CD who: [1]
    * Do not achieve therapeutic benefit after 12 weeks of induction therapy.
    * Cannot discontinue chronic concomitant steroids within six months of starting therapy.

Safety

- Several cases of progressive multifocal leukoencephalopathy (PML), a progressive demyelinating disease of the CNS, have been associated with Tysabri (natalizumab) use. PML is an opportunistic viral infection of the brain that usually leads to death or severe disability. [1]
- The Tysabri (natalizumab) prescribing information contains a Boxed Warning describing the increased risk of PML, which may lead to death or severe disability. [1]
- Because of the risk of PML, distribution of Tysabri (natalizumab) is restricted via the TOUCH Prescribing Program.
    * Providers must register to prescribe, distribute, or infuse natalizumab.
    * Only patients who are registered with and who meet all the conditions of either the MS or CD TOUCH programs are eligible to receive natalizumab.
- The most common side effects observed in patients receiving Tysabri (natalizumab) include: infections, acute hypersensitivity reactions, depression, and cholelithiasis (gall stones). [1]
- There are several case reports of patients who developed melanoma after starting treatment with Tysabri (natalizumab). [7] Although cause-effect has not been established, clinicians should be aware of this potential risk, especially when considering therapy for patients with a history of melanoma.

- The Tysabri (natalizumab) prescribing information contains a warning regarding the potential for liver injury. In some patients this occurred as early as six days after an initial dose. [1]

Dosing and administration

- Tysabri (natalizumab) is administered as an intravenous infusion (300 mg) once every 28 days in the treatment of multiple sclerosis and Crohn's disease. The safety and efficacy of Tysabri (natalizumab) at doses higher than 300 mg every 28 days have not been adequately evaluated. [1]

Natalizumab – Use in Other Conditions

- The TOUCH Prescribing Program currently prevents off-label use of Tysabri (natalizumab).
- Authors of a small, open-label study in 10 patients with active ulcerative colitis reported clinical benefit at 4 weeks with administration of Tysabri (natalizumab). Larger, well-designed trials are needed before safety and efficacy are established for this indication.[8]
- There are no data available to support the safety and efficacy of Tysabri (natalizumab) in the treatment of rheumatoid arthritis.

Appendix A: Multiple Sclerosis Forms/Clinical Course Definitions [1,9]	
Clinically Isolated Syndrome (CIS)	The first clinical presentation that shows characteristics of inflammatory demyelination that could be MS.
Relapsing-remitting (RRMS)	Characterized by acute relapses that are followed by some degree of recovery. These attacks develop acutely, evolving over days to weeks. Over the next several weeks to months, most patients experience a recovery of function that is often (but not always) complete. Between attacks the patient is neurologically and symptomatically stable.
Secondary progressive (SPMS)	Defined as sustained progression of physical disability occurring separately from relapses, in patients who previously had RRMS. SPMS may be active or not active. Activity is determined by the presence of ongoing relapses or MRI activity. There are no clinical, imaging, immunologic, or pathologic criteria to determine when a patient transition from RRMS to SPMS, it is usually diagnosed retrospectively.
Primary progressive (PPMS)	Defined as progression of disability from onset without superimposed relapses. The AAN defines PPMS as the third clinical type characterized by a steady decline in function from the beginning without acute attacks.

Appendix B: Disease-Modifying Agents Used in the Treatment of Multiple Sclerosis (MS DMTs)
Aubagio (teriflunomide)
Briumvi (ublituximab-xiiy)
Dimethyl fumarate
Fingolimod (generic, Gilenya, Tascenso ODT)
Glatiramer acetate (Copaxone, Glatopa)
Interferon beta-1a* (Avonex, Rebif)
Interferon beta-1b* (Betaseron, Extavia)
Lemtrada (alemtuzumab)
Mavenclad (cladribine)
Mayzent (siponimod)
Mitoxantrone
Ocrevus (ocrelizumab)
Plegridy (peginterferon beta-1a)
Rituximab [1]
Tysabri (natalizumab)
Vumerity (diroximel fumarate)

[1] Rituximab is not FDA-approved for use in MS, but has evidence for efficacy.

Appendix C: Example Contraindications to Self-Administered Therapy
The member is 13 years of age or younger.
Inability to self-inject due to significant behavioral issues and/or cognitive impairment including, but not limited to, those associated with developmental delay, down syndrome, dementia, or excessive anxiety such as needle phobia.
Preferred self-administered therapy/ therapies are relatively contraindicated.

Revision History

Revision Date	Revision Summary
3/16/2023	Updated Appendix B and Cross References.
12/9/2022	• Updated Preferred Self-Administered Therapies (for UMP Members). • Updated Appendix B.
12/28/2021	Updated Preferred Self-Administered Therapies (for UMP Members).
10/15/2021	Removed Site of Care requirements. Updated document to only reference "infliximab" and not any brand product in particular.
1/20/2021	Updated Preferred Self-Administered Therapies (for UMP Members).
1/22/2020	Added continuation of therapy (COT) criteria (no change to intent of coverage criteria).
10/23/2019	New UMP-specific policy replacing dru111 for those members. Effective 1/1/2020.

Drug names identified in this policy are the trademarks of their respective owners.

UMP Medication Policy Manual

Policy No: dru902

Topic: Ocrevus, ocrelizumab (UMP plans)

Date of Origin: January 1, 2020

Committee Approval Date: March 16, 2023

Next Review Date: 2023

Effective Date: April 15, 2023

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of medication policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Ocrevus (ocrelizumab) is an intravenously administered medication indicated for the treatment of relapsing or primary progressive forms of multiple sclerosis. It works by destroying certain immune cells that are involved in the multiple sclerosis immune response.

This policy applies to the Washington State Health Care Authority (HCA) Uniform Medical Plan (UMP) only. The UMP is a self-funded health plan offered through the Washington State HCA's Public Employees Benefits Board (PEBB) Program and School Employees Benefits Board (SEBB) Program and administered by Regence BlueShield.

Policy/Criteria

I. Continuation of therapy (COT): Ocrevus (ocrelizumab) may be considered medically necessary for COT when criterion A, B, or C **AND** D below is met.

A. For diagnoses NOT listed in the coverage criteria below, full policy criteria must be met for coverage.

OR

B. For diagnoses listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

C. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

AND

D. Site of care administration requirements are met [refer to Medication Policy Manual, *Site of Care Review*, dru408].

***Please note**: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Ocrevus (ocrelizumab) may be considered medically necessary when criteria A and B below are met:

A. Site of care administration requirements are met [refer to Medication Policy Manual, *Site of Care Review*, dru408].

AND

B. Criterion 1 or 2 below are met.

1. A definitive diagnosis of **primary progressive multiple sclerosis** (PPMS) has been established by a specialist in neurology or multiple sclerosis.

OR

2. Criteria a and b below are met.

a. A definitive diagnosis of a relapsing form of multiple sclerosis [clinically isolated syndrome (CIS), relapsing-remitting MS (RRMS), or active secondary progressive MS (SPMS)] has been established by a specialist in neurology or multiple sclerosis.

AND

b. Criteria i or ii below are met.

i. At **least two** self-administered disease modifying therapies for multiple sclerosis have been documented in clinical notes to be ineffective, not tolerated, or contraindicated (including, but not limited to, those situations in *Appendix B*):

Preferred Self-Administered Therapies (for UMP Members): (Please refer to coverage policies administered by Washington State Rx Services)
Aubagio (teriflunomide)
Avonex (interferon beta-1a)
dimethyl fumarate
fingolimod
glatiramer acetate
Vumerity (diroximel fumarate)

See Appendix A for other MS disease modifying therapies (DMTs)

Ineffectiveness is defined as meeting at least **one** of the following three criterion (1, 2, or 3) during treatment with one of these medications:

1. The patient continues to have clinical relapses (at least one relapse within the past 12 months).

OR

2. The patient continues to have CNS lesion progression as measured by MRI.

OR

3. The patient continues to have worsening disability. Examples of worsening disability include, but are not limited to, decreased mobility, decreased ability to perform activities of daily living due to disease progression, or an increase in EDSS score.

OR

ii. The patient has had a particularly aggressive initial disease course, as defined by meeting at least one of the following:

1. An EDSS score of ≥ 4 within 5 years of onset.

OR

2. Multiple (two or more) relapses with incomplete resolution in the past year.

OR

3. At least two MRI studies showing new or enlarging T2 lesions or gadolinium-enhancing lesions despite treatment over 6 months.

OR

4. The presence of spinal or brainstem lesions on MRI.

III. Administration, Quantity Limitations, and Authorization Period

A. Pharmacy Services considers Ocrevus (ocrelizumab) coverable only under the medical benefit (as a provider-administered medication).

B. When pre-authorization is approved, Ocrevus (ocrelizumab) shall be authorized in quantities up to 1200 mg every 12 months (one infusion of 300 mg on day 1 followed by a second infusion on day 15 with subsequent doses of 600 mg infusions every 6 months thereafter).

C. Authorization may be reviewed at least annually to confirm that current medical necessity criteria are met and that the medication is effective. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, such as disease stability or improvement.

IV. Ocrevus (ocrelizumab) is considered investigational when used for all other conditions, including but not limited to:

A. Use in combination with other disease-modifying multiple sclerosis therapies (see *Appendix A*).

B. Any cancer indication, including, but not limited to B-cell chronic lymphocytic leukemia.

C. Maintenance dosing more frequent than every 24 weeks.

D. Neuromyelitis optica spectrum disorders (NMOSD).

E. Rheumatoid arthritis.

Position Statement

Summary

- Ocrevus (ocrelizumab) is a monoclonal antibody used as monotherapy for the treatment of patients with primary progressive multiple sclerosis (PPMS) and relapsing forms of multiple sclerosis (MS).
- Ocrevus (ocrelizumab) is considered a disease modifying multiple sclerosis treatment. Other disease modifying multiple sclerosis treatments for relapsing forms of MS include Lemtrada (alemtuzumab), Briumvi (ublituximab-xiiy), interferon beta products (Avonex, Rebif, Betaseron, Extavia, or Plegridy), fingolimod, glatiramer acetate, Aubagio

(teriflunomide), and dimethyl fumarate. Rituximab may also be used off label for the treatment of relapsing forms of MS.[1]

- The intent of this policy is to allow coverage of Ocrevus (ocrelizumab) in patients with primary progressive MS or in patients with a relapsing form of MS who have tried two preferred disease modifying therapies for MS or who have a particularly aggressive disease course.
- Ocrevus (ocrelizumab) has not been studied in combination with other disease-modifying MS medications and it is therefore not recommended that Ocrevus (ocrelizumab) be administered concomitantly with other disease-modifying MS medications as efficacy and safety have not been established. Concomitant use of Ocrevus (ocrelizumab) with any other disease-modifying therapy for MS is considered investigational.
- Ocrevus (ocrelizumab) is an intravenously infused medication. The starting dose is 300 mg given on day one followed by 300 mg two weeks later. Thereafter, Ocrevus (ocrelizumab) is given every 6 months at a dose of 600 mg.
- The safety and effectiveness of Ocrevus (ocrelizumab) in conditions other than PPMS or relapsing forms of MS have not been established.

Clinical Efficacy in Multiple Sclerosis

- Ocrevus (ocrelizumab) has been shown to reduce elapse rate, slows disability progression, and slows worsening of disease based on MRI outcomes in patients with relapsing forms of MS. [2]
    * Two identical, 96-week studies (OPERA I and OPERA II), evaluated the effects of Ocrevus (ocrelizumab) compared to Rebif (interferon beta-1a) in patients with relapsing forms of MS. Ocrevus (ocrelizumab) was superior to interferon beta-1a in reducing annualized relapse and in slowing confirmed disability progression. On MRI, the patients in the Ocrevus (ocrelizumab) group had fewer new and/or enlarging T2 lesions, less T1 lesions, and a reduced rate of total brain volume loss relative to the Rebif (interferon beta-1a) group.
- Ocrevus (ocrelizumab) has been shown to slow disability progression, and slow the worsening of MRI outcomes in patients with PPMS. [3]
    * One 120-week study (ORATORIO), evaluated the effects of Ocrevus (ocrelizumab) relative to placebo in patients with PPMS. Ocrevus (ocrelizumab) was superior to placebo reducing the proportion of patients who had sustained 12-week confirmed disability progression. The treatment group also showed a significant decrease in T2 volume and showed significantly less brain volume loss on MRI.

Safety [4]

- Ocrevus (ocrelizumab) contains warnings for infusion reactions, infections, and risk of malignancy.
- Common adverse events include upper respiratory tract infections, infusion reactions, skin infections, and lower respiratory tract infections.

Dosing and Administration [4]

- Ocrevus (ocrelizumab) is administered as an intravenous (IV) infusion.
- The starting dose is 300 mg IV followed by 300 mg IV two weeks later. Subsequent doses of Ocrevus (ocrelizumab) are then given every 6 months at a dose of 600 mg IV as a single infusion.

Ocrevus (ocrelizumab) – Use in Other Conditions

- Due to a lack of published data, the use of Ocrevus (ocrelizumab) in conditions other than relapsing forms of MS and PPMS is considered investigational.
- While Ocrevus (ocrelizumab) has a similar mechanism of action to rituximab it has not been studied for the same indications. Thus, due to a lack of data, these conditions are considered investigational.

Neuromyelitis Optica Spectrum Disorders (NMOSD)

- Neuromyelitis optica spectrum disorders (NMOSD; previously known as Devic disease) are characterized by a combination of bilateral optic neuropathy and cervical myelopathy. While both NMOSD and MS are demyelinating diseases they are considered different diseases based on unique immunologic features and differences in imaging features, biomarkers, and neuropathology. [5]
- For acute attacks and relapses of NMOSD, treatment usually consists of intravenous glucocorticoids followed soon by plasmapheresis for refractory or progressive symptoms. For prevention of attacks, systemic immunosuppression with agents including azathioprine, mycophenolate mofetil, rituximab, and mitoxantrone has been used, given the evidence that humoral autoimmunity plays a role in the pathogenesis of NMO. [6,7]
- Rituximab has been shown to the frequency of NMOSD relapses and neurologic disability based on results from one systematic review. However, the optimal treatment regimen and duration have not been determined and additional long-term safety experience is needed to clarify the role of rituximab as a first-line option. [8]
- There is no published evidence to support the use of Ocrevus (ocrelizumab) for NMOSD.

Appendix A: Disease-Modifying Agents Used in the Treatment of Multiple Sclerosis (MS DMTs)
Aubagio (teriflunomide)
Briumvi (ublituximab-xiiy)
Dimethyl fumarate
Fingolimod (generic, Gilenya, Tascenso ODT)
Glatiramer acetate (Copaxone, Glatopa)
Interferon beta-1a* (Avonex, Rebif)
Interferon beta-1b* (Betaseron, Extavia)
Lemtrada (alemtuzumab)
Mavenclad (cladribine)
Mayzent (siponimod)
Mitoxantrone
Ocrevus (ocrelizumab)
Plegridy (peginterferon beta-1a)
Rituximab [1]
Tysabri (natalizumab)
Vumerity (diroximel fumarate)

[1] Rituximab is not FDA-approved for use in MS, but has evidence for efficacy.

Appendix B: Example Contraindications to Self-Administered Therapy
The member is 13 years of age or younger.
Inability to self-inject due to significant behavioral issues and/or cognitive impairment including, but not limited to, those associated with developmental delay, down syndrome, dementia, or excessive anxiety such as needle phobia.
Preferred self-administered therapy/ therapies are relatively contraindicated.

UMP Medication Policy Manual

Policy No: dru903

Topic: Lemtrada, alemtuzumab (UMP plans)

Date of Origin: January 1, 2020

Committee Approval Date: March 16, 2023

Next Review Date: 2023

Effective Date: April 15, 2023

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of medication policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Lemtrada (alemtuzumab) is a medication used in the treatment of relapsing forms of multiple sclerosis (MS). It may help to slow the progression of disability and reduce the number of clinical relapses associated with this condition.

PLEASE NOTE: This policy does NOT apply to alemtuzumab (Campath), which is used primarily in the treatment of cancer (leukemia).

This policy applies to the Washington State Health Care Authority (HCA) Uniform Medical Plan (UMP) only. The UMP is a self-funded health plan offered through the Washington State HCA's Public Employees Benefits Board (PEBB) Program and School Employees Benefits Board (SEBB) Program and administered by Regence BlueShield.

Policy/Criteria

I. Continuation of therapy (COT): Lemtrada (alemtuzumab) may be considered medically necessary for COT when criterion A, B, or C below is met.

A. For diagnoses NOT listed in the coverage criteria below, full policy criteria must be met for coverage.

OR

B. For diagnoses listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

C. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

Please note*: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Lemtrada (alemtuzumab) may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) that criteria A and B below are met.

A. A definitive diagnosis of a **relapsing form of multiple sclerosis** [clinically isolated syndrome (CIS), relapsing-remitting MS (RRMS), or secondary progressive MS (SPMS)] has been established by a specialist in neurology or multiple sclerosis (see *Appendix A* for *American Academy of Neurology* multiple sclerosis definitions).

AND

B. At **least two** self-administered disease modifying therapies for MS have been documented in clinical notes to be ineffective, not tolerated, or contraindicated (including, but not limited to, those in *Appendix B*):

Preferred Self-Administered Therapies (for UMP Members): (Please refer to coverage policies administered by Washington State Rx Services.)
Aubagio (teriflunomide)
Avonex (interferon beta-1a)
dimethyl fumarate
fingolimod
glatiramer acetate
Vumerity (diroximel fumarate)

See Appendix B for other MS disease modifying therapies (DMTs)

Ineffectiveness is defined as meeting at least **one** of the following three criteria (1, 2, or 3) during treatment with one of these medications:

1. The patient continues to have clinical relapses (at least one relapse within the past 12 months).

OR

2. The patient continues to have CNS lesion progression as measured by MRI.

OR

3. The patient continues to have worsening disability. Examples of worsening disability include, but are not limited to, decreased mobility, decreased ability to perform activities of daily living due to disease progression, or an increase in EDSS score.

III. Administration, Quantity Limitations, and Authorization Period

A. Pharmacy Services considers Lemtrada (alemtuzumab) coverable only under the medical benefit (as a provider-administered medication).

B. When pre-authorization is approved, Lemtrada (alemtuzumab) may be covered in the following quantities and for the following authorization periods:

1. Initial authorization (first treatment course; 5 doses): Up to 12 mg/day on five consecutive days in a 12-month period.

2. Second authorization (second treatment course; 3 doses): Following the first treatment course (of five doses), a second treatment course of up to 12 mg/day on three consecutive days in a 12-month period.

3. Additional Authorizations [additional treatment course(s); 3 doses]: Following the second treatment course (of three doses), subsequent treatment courses of 12 mg/day on three consecutive days may be administered in a 12-month period.

4. All subsequent courses must be administered at least 12 months after the last dose of the prior treatment course.

C. Authorization shall be reviewed every 12 months. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, such as disease stability or improvement.

IV. Lemtrada (alemtuzumab) is considered investigational when used:

A. Concomitantly with other DMTs for multiple sclerosis (see *Appendix B*).

B. For non-relapsing forms of MS, such as primary progressive MS (PPMS) or SPMS without active relapses.

V. Lemtrada (alemtuzumab) is considered investigational when used for all other conditions, including but not limited to:

A. Any cancer indication, including, but not limited to B-cell chronic lymphocytic leukemia (CLL).

B. Post-transplant antibody induction therapy.

C. For the treatment of clinically isolated syndrome (CIS).

Position Statement

- Several disease-modifying therapies are used in the treatment of relapsing forms of multiple sclerosis (MS). They help to decrease the number of clinical exacerbations associated with this condition and slow the progression of disability. Relapsing forms of MS include: clinically isolated syndrome (CIS), relapsing-remitting MS (RRMS), and active secondary progressive MS (SPMS).
- The intent of the policy is to allow coverage of Lemtrada (alemtuzumab) in patients who failed two prior preferred disease modifying therapies for MS.
- There are many disease-modifying therapies (DMTs) for the treatment of MS, as listed in Appendix A. Rituximab may also be used off label for the treatment of relapsing forms of MS. [1]
- American Academy of Neurology (AAN) guidelines state:
  * DMTs should be offered to patients with relapsing forms of MS.
  * The choice of initial DMT should be individualized to consider of safety, route of administration, lifestyle, cost, efficacy, adverse effects (AEs), and tolerability.
  * Disease activity, adherence, AE profiles, and mechanism of action should be considered when switching DMTs. [1]
  * Tysabri (natalizumab), fingolimod (generic, Gilenya, and Tascenso ODT), or Lemtrada (alemtuzumab) should be used in patients with highly active disease. [1]
- Individual responses and tolerability of DMTs are unpredictable and may vary between patients. If one DMT provides an inadequate response, another DMT may be effective.

- There is no reliable evidence of increased efficacy or safety of one interferon beta product over another in reducing the signs and symptoms of MS or slowing the progression of disease.
- The safety and effectiveness of combination use of disease modifying therapies for MS medications has not been established.
- Lemtrada (alemtuzumab) is not recommended as a first or second-line option due to serious safety concerns.
    * Lemtrada (alemtuzumab) has boxed warnings describing an increased risk of autoimmunity, infusion reactions, and malignancies with its use. The FDA labeling states that it should generally be reserved for patients who have had an inadequate response to two or more DMTs for MS.
    * Because of these safety concerns, distribution of Lemtrada (alemtuzumab) is restricted with a REMS program for prescribers, health care facilities, and pharmacies.
- Mavenclad (cladribine) is not recommend as a first-line option or for the treatment of CIS due to serious safety concerns of malignancy and teratogenicity. [2]

Clinical Efficacy: Lemtrada (alemtuzumab)

- Two, randomized, open-label, rater-blinded, 2-year, studies compared Lemtrada (alemtuzumab) with interferon beta-1a in patients with relapsing-remitting multiple sclerosis (RRMS). [3,4]
    * The CARE-MS I trial included previously untreated patients while CARE-MS II trial included patients who had at least one relapse while on an interferon beta product or glatiramer acetate.
    * In each trial, there was a statistically significantly lower annualized relapse rate for patients treated with Lemtrada (alemtuzumab) (22%-35%) compared to interferon beta-1a (40%-51%).
    * Treatment-experienced patients treated with Lemtrada (alemtuzumab) experienced a statistically significant reduction in the rate of disease progression compared to those treated with interferon beta 1a (13% vs 20%, p=0.008). The difference in rates of disease progression was not statistically significant among treatment-naïve patients.
- Extension studies for Lemtrada (alemtuzumab) suggest that efficacy is maintained through at least year five but certain patients with disease activity may require additional courses. Among patients who completed CARE-MS II, 58.0% received just no additional courses of Lemtrada (alemtuzumab) while 30.1% received one additional course at some point in the five-year follow-up period. The most common reason for additional courses was relapse. [5]
- Lemtrada (alemtuzumab) has not been directly compared to MS DMTs other than interferon beta-1a, nor has it been studied concomitantly with other DMTs.

Safety

- Lemtrada (alemtuzumab) [10]
  * Lemtrada (alemtuzumab) has boxed warnings for the following:
    - Sometimes fatal autoimmune conditions, such as immune thrombocytopenia and anti-glomerular basement membrane diseases.
    - Serious and life-threatening infusion reactions.
    - An increased risk of malignancies including thyroid cancer, melanoma and lymphoproliferative disorders.
  * Due to its significant safety concerns an FDA Risk Evaluation and Mitigation Strategy (REMS) program limits the availability of Lemtrada (alemtuzumab) to certified prescribers, healthcare facilities, and specialty pharmacies.
  * Regular monitoring is required due to the potential for long-term adverse events. Complete blood count, serum creatinine levels, urinalysis should be collected prior to treatment and at monthly intervals. Thyroid function tests should be conducted prior to treatment and every three months thereafter. Baseline and annual skin exams should be conducted to monitor for melanoma.

Investigational Uses – Lemtrada (alemtuzumab)

The Lemtrada REMS program mitigates off-label use of Lemtrada (alemtuzumab); however, it has been studied in other conditions. Due to a lack of published data, lack of high-quality data, or lack of positive data, these conditions are considered investigational. Details of select investigational uses are reported below.

- B-cell chronic lymphocytic leukemia
  * A high dose formulation of Campath (alemtuzumab) was approved for the treatment of B-cell chronic lymphocytic leukemia (CLL) but was removed from the market in 2012 to prevent off-label use of Campath in MS. Since 2012, Campath has been available for very limited use in CLL through patient access programs. Lemtrada (alemtuzumab) is given at a lower dose when used for MS, lower doses are considered investigational for any other condition, including CLL and other cancers.
  * There have been no controlled clinical trials evaluating the use of low-dose (12 mg) Lemtrada (alemtuzumab) in B-cell chronic lymphocytic leukemia. [11-13]
  * High dose Campath (alemtuzumab) is available for patients with leukemia directly from the manufacturer, free of charge through patient access programs.
- Post-transplant antibody induction therapy
  * There are no controlled clinical trials evaluating the use of low-dose (12 mg) Lemtrada (alemtuzumab) in the post-transplant setting. [14,15]
- The safety and effectiveness of Lemtrada (alemtuzumab) in combination with other disease-modifying MS therapies have not been adequately studied.

Appendix A: Multiple Sclerosis Forms/Clinical Course Definitions [1,9]	
Clinically Isolated Syndrome (CIS)	The first clinical presentation that shows characteristics of inflammatory demyelination that could be MS.
Relapsing-remitting (RRMS)	Characterized by acute relapses that are followed by some degree of recovery. These attacks develop acutely, evolving over days to weeks. Over the next several weeks to months, most patients experience a recovery of function that is often (but not always) complete. Between attacks the patient is neurologically and symptomatically stable.
Secondary progressive (SPMS)	Defined as sustained progression of physical disability occurring separately from relapses, in patients who previously had RRMS. SPMS may be active or not active. Activity is determined by the presence of ongoing relapses or MRI activity. There are no clinical, imaging, immunologic, or pathologic criteria to determine when a patient transition from RRMS to SPMS, it is usually diagnosed retrospectively.
Primary progressive (PPMS)	Defined as progression of disability from onset without superimposed relapses. The AAN defines PPMS as the third clinical type characterized by a steady decline in function from the beginning without acute attacks.

Appendix B: Disease-Modifying Agents Used in the Treatment of Multiple Sclerosis (MS DMTs)
Aubagio (teriflunomide)
Briumvi (ublituximab-xiiy)
Dimethyl fumarate
Fingolimod (generic, Gilenya, and Tascenso ODT)
Glatiramer acetate (Copaxone, Glatopa)
Interferon beta-1a* (Avonex, Rebif)
Interferon beta-1b* (Betaseron, Extavia)
Lemtrada (alemtuzumab)
Mavenclad (cladribine)
Mayzent (siponimod)
Mitoxantrone
Ocrevus (Ocrelizumab)
Plegridy (peginterferon beta-1a)
Rituximab [1]
Tysabri (natalizumab)
Vumerity (diroximel fumarate)

[1] Rituximab is not FDA-approved for use in MS, but has evidence for efficacy

Appendix C: Example Contraindications to Self-Administered Therapy
The member is 13 years of age or younger.
Inability to self-inject due to significant behavioral issues and/or cognitive impairment including, but not limited to, those associated with developmental delay, down syndrome, dementia, or excessive anxiety such as needle phobia.
Preferred self-administered therapy/ therapies are relatively contraindicated.

Revision History

Revision Date	Revision Summary
3/16/2023	Updated Appendix B and Cross References.
12/9/2022	• Updated Preferred Self-Administered Therapies (for UMP Members). • Updated Appendix B.
12/28/2021	Updated Preferred Self-Administered Therapies (for UMP Members)
1/20/2021	• Clarified reauthorization period • Updated Preferred Self-Administered Therapies (for UMP Members)
1/22/2020	Added continuation of therapy (COT) criteria (no change to intent of coverage criteria).
10/23/2019	New UMP-specific policy replacing dru511 for those members. Effective 1/1/2020.

Drug names identified in this policy are the trademarks of their respective owners.

UMP Medication Policy Manual **Policy No:** dru904

Topic: Non-preferred filgrastim products (UMP plans) **Date of Origin:** January 1, 2020

- Neupogen, filgrastim
- Nivestym, filgrastim-aafi
- Nypozi, filgrastim txid
- Releuko, filgrastim-ayow

Committee Approval Date: September 19, 2024 **Next Review Date:** 2025

Effective Date: December 1, 2024

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Filgrastim is a granulocyte-colony stimulating factor (G-CSF) that helps reduce the risk of infections in patients undergoing strong chemotherapy. Filgrastim is available as several different products. This policy applies to the non-preferred products only.

This policy applies to the Washington State Health Care Authority (HCA) Uniform Medical Plan (UMP) only. The UMP is a self-funded health plan offered through the Washington State HCA's Public Employees Benefits Board (PEBB) Program and School Employees Benefits Board (SEBB) Program and administered by Regence BlueShield.

Policy/Criteria

Most contracts require pre-authorization approval of non-preferred filgrastim products (as listed in Table 1) prior to coverage.

I. Continuation of therapy (COT): Continuation of therapy (COT): Non-preferred filgrastim products (as listed in Table 1) may be considered medically necessary for COT when full policy criteria below are met, including quantity limit.

Please note: *Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Non-preferred filgrastim products (as listed in *Table 1*) may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) that criterion A or B below are met.

A. Treatment with **all** preferred products (as listed in *Table 1*) have been ineffective, not tolerated, or contraindicated.

OR

B. Documented emergent clinical indication for filgrastim (see *Appendix 1*) **AND** there is attestation by the providing clinic that **all** preferred products (as listed in *Table 1*), are not available for same-day administration.

Table 1: Reference and Biosimilar Pegfilgrastim Products

	Product name	Formulary status
Reference Product	Neupogen (filgrastim)	Non-preferred/PA required
Biosimilars	Granix (tbo-filgrastim)	Preferred/No PA required [a]
	Zarxio (filgrastim-sndz)	Preferred/No PA required [a]
	Nivestym (filgrastim-aafi)	Non-preferred/PA required
	Releuko (filgrastim-ayow)	Non-preferred/PA required
	Nypozi (filgrastim txid)	Non-preferred/PA required

[a] As a preferred biosimilar, available for coverage without pre-authorization ("no PA required")

III. Administration, Quantity Limitations, and Authorization Period

A. Pharmacy Services considers all non-preferred filgrastim products (as listed in *Table 1*) coverable under the pharmacy benefit (as self-administered medications) OR coverable under the medical benefit (as provider-administered medications).

B. **Non-preferred product approval for unavailability of a preferred product:** Initial authorization will be for three months only. Continued authorization will not be considered solely for unavailability of a preferred product (Zarxio or Granix, as listed in *Table 1*).

C. **All other non-preferred product approvals**: Authorization **may** be reviewed at least annually. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, such as disease stability or improvement.

Position Statement

Summary[1-6]

- The intent of this policy is to promote the use of biosimilar products that are the lowest overall cost. All filgrastim products are considered safe and effective options.
- This policy allows for:
  * Coverage of non-preferred filgrastim products when all of the preferred filgrastim products are ineffective, not tolerated, or contraindicated.
  * Coverage of non-preferred filgrastim products during an emergent clinical situation in which filgrastim is indicated, and the providing clinic does not have any of the preferred filgrastim products available for administration.
- There is no evidence that any one filgrastim product is safer or more effective than another. Among these products, preferred filgrastim provide the best value for members.
- Hospitals and health-systems have medication formularies developed independent of the health plan. The health plan is unable to cover more expensive products for the convenience of the hospital, health-system, provider, or member. Preferred biosimilar products represent the lowest cost to members and the plan; the use of more expensive products without evidence of superior efficacy or safety is not medically necessary per the member's contract.

Appendix 1:

Emergent clinical indications for filgrastim (same-day administration) [a]
Acute radiation syndrome.
Aplastic anemia.
Harvesting of peripheral blood stem cells.
Neutropenia (documented; including but not limited to febrile, chronic, chemotherapy-induced when given outside normal dosing schedule, agranulocytosis).
Patient is being discharged from an inpatient hospital stay and has a documented ongoing indication for filgrastim (filgrastim doses given as part of the inpatient stay is not subject to pre-authorization).

[a] The need for filgrastim in the FUTURE is not considered an "Emergent clinical indication," such as filgrastim for use with scheduled chemotherapy (not yet started).

Codes	**Number**	**Description**
HCPCS	J1442	Injection, filgrastim (Neupogen), excludes biosimilars, 1 microgram
HCPCS	Q5110	Injection, filgrastim-aafi (Nivestym), biosimilar, 1 microgram
HCPCS	Q5125	Injection, filgrastim-ayow, biosimilar, (Releuko), 1 microgram

Revision History

Revision Date	Revision Summary
9/19/2024	Added Nypozi, filgrastim-txid to policy, a new biosimilar.
6/20/2024	No criteria changes with this annual review.
6/15/2023	No criteria changes with this annual update.
6/17/2022	• Added Releuko, filgrastim-ayow to policy, a new biosimilar. • Modify criteria wording, for operational clarity (no change to intent of the criteria with this annual update). • Addition of a product table, to delineate the preferred/non-preferred and reference product/biosimilars.
7/16/2021	No criteria changes with this annual update.
7/22/2020	Added continuation of therapy criteria. No change to intent of policy.
10/23/2019	New UMP-specific policy. Effective 1/1/2020. The intent of the policy is to cover non-preferred filgrastim products when preferred products are not a treatment option (ineffective, not tolerated, or contraindicated) or unavailable for administration for an emergent clinical indication.
