Uniform Medical Plan coverage limits

Updates effective 7/1/2025

The benefit coverage limits listed below apply to these UMP plans:

- Uniform Medical Plan (UMP) Classic (PEBB)
- UMP Select (PEBB)
- UMP Consumer-Directed Health Plan (UMP CDHP) (PEBB)
- UMP Plus–Puget Sound High Value Network (UMP Plus–PSHVN) (PEBB)
- UMP Plus–UW Medicine Accountable Care Network (UMP Plus–UW Medicine ACN) (PEBB)

- UMP Achieve 1 (SEBB)
- UMP Achieve 2 (SEBB)
- UMP High Deductible Plan (SEBB)
- UMP Plus–Puget Sound High Value Network (UMP Plus–PSHVN) (SEBB)
- UMP Plus–UW Medicine Accountable Care Network (UMP Plus–UW Medicine ACN) (SEBB)

Some services listed under these benefits have coverage limits. These limits are either determined by a Health Technology Clinical Committee (HTCC) decision or a Regence BlueShield medical policy. **The table below does not include every limit or exclusion under this benefit. For more details, refer to your plan's Certificate of Coverage.**

Uniform Medical Plan Pre-authorization List

The Uniform Medical Plan (UMP) Pre-authorization List includes services and supplies that require pre-authorization or notification for UMP members.

NOTE: This document includes links to external webpages and documentation. To search inside this document, use CTRL+F for PCs or Command+F for Macs, and type in your search term.

Pharmacy

UMP has a separate vendor – Washington State Rx Services – for the prescription drug benefit. Pre-authorization is necessary for certain injectable drugs that are not normally approved for self-administration when obtained through a retail pharmacy or a network mail-order pharmacy. These drugs are indicated on the UMP Preferred Drug List.

Drugs usually payable under the member's medical benefit will continue with the same Regence process. The Medical Policies associated with these medications are attached to this document. These Medical Policies can also be found by going to https://regence.myprime.com/en/forms/coverage-determination/prior-authorization.html and searching for the specific medication by utilizing CTRL+F.

Medications in blue = HTCC decision followed for UMP members, found at: https://www.hca.wa.gov/assets/program/HA-PRP-final-findings-decision.pdf

Medications in green = HTCC decision followed for UMP members when the diagnosis is chronic migraine as of 01/01/18, found at: https://www.hca.wa.gov/assets/program/chronic-migraine-final-findings-decision-revised-20220520.pdf

Medications in orange do not yet have policies created, but still require prior authorization = Falls under the New to Market policy dru517

Infusion Drug Site of Care

Certain provider administered infusion medications covered on the medical benefit are subject to the Site of Care Program (dru408) medication policy. This policy does not apply to members covered under UMP Plus plans.

Medication Policy Manual

Policy No: dru006

Topic: Botulinum toxin type A injection:

- Botox, onabotulinumtoxinA
- Dysport, abobotulinumtoxinA
- Xeomin, incobotulinumtoxinA
- Daxxify, daxibotulinumtoxinA

Date of Origin: January 1996

Committee Approval Date: December 7, 2023

Next Review Date: 2024

Effective Date: January 15, 2024

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of medication policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Botulinum toxin is a neurotoxin that is injected into a muscle to cause temporary paralysis or relaxation of that muscle. There are four commercial botulinum toxin type A products available: Botox (onabotulinumtoxinA), Dysport (abobotulinumtoxinA),Xeomin (incobotulinumtoxinA), and Daxxify (daxibotulinumtoxinA). Botulinum toxin type B (rimabotulinum, Myobloc) is covered in a separate policy.

Please note: Botulinum toxin for use in gender affirming care is covered in a separate policy, Gender-Affirming Care Products, dru757

Policy/Criteria

Most contracts require pre-authorization approval of botulinum toxin type A prior to coverage.

I. Continuation of therapy (COT): Botulinum toxin type A (Botox, Dysport, Xeomin, Daxxify) may be considered medically necessary for COT when criterion A, B, or C below are met.

A. For potentially cosmetic indications, including **hyperhidrosis**, full policy criteria below must be met for coverage.

OR

B. For all other indications, criteria 1 and 2 below must be met:

1. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

C. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

Please note*: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Botulinum toxin type A (Botox, Dysport, Xeomin, Daxxify) may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) that criterion A or B below are met:

A. **Dystonia or Spastic conditions**, due to one of the following diagnoses:

1. **Cerebral Palsy**

2. **Cervical dystonia with torticollis** with documentation of involuntary contractions of the neck muscles resulting in twisting and repetitive movements, and/or abnormal postures (as documented on physical exam)

3. **Demyelinating diseases of CNS**, including, but not limited to, central demyelinating of corpus callosum, leukodystrophy, multiple sclerosis (MS), neuromyelitis optica (NMO), Schilder's disease

4. **Dysphonia**, including spasmodic dysphonia, laryngeal spasm; laryngeal adductor spastic dysphonia, or stridulus

5. **Facial nerve disorders** (such as blepharospasm, facial/hemifacial spasms, facial nerve VII disorders, facial myokymia, Melkersson syndrome)

6. **Focal upper limb/hand dystonia** (such as Organic writer's cramp)

7. **Lower limb spasticity** (including increased muscle tone in the ankle and toes)

8. **Oromandibular dystonia** (such as orofacial dyskinesia, jaw closure dystonia, Meige syndrome)
9. **Spastic hemiplegia or paraplegia** [including hereditary, related to a stroke (CVA), or related to a spinal cord injury (SCI)]
10. **Thoracic outlet syndrome**, with documentation of functional impairment.
11. **Torticollis, spasmodic or unspecified**, with documentation of involuntary contractions of the neck muscles resulting in twisting and repetitive movements, and/or abnormal postures
12. **Torsion dystonia** [including both symptomatic (acquired) or idiopathic (primary or genetic; a.k.a. Oppenheim's dystonia)]
13. **Upper limb spasticity**

OR

B. **Strabismus**, resulting in vision changes.

III. New starts (treatment-naïve patients): Botulinum toxin A (Botox, Dysport, Xeomin, Daxxify) may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) for the diagnoses listed below, that one of the following criterion A through J below is met:

A. **Anal fissures,** when prior treatment with one or more therapeutic alternatives, such as nitroglycerin ointment or diltiazem cream, has been ineffective, not tolerated, or is contraindicated.

OR

B. **Congenital aganglionic megacolon (Hirschsprung disease),** with documented severe refractory constipation due to increased anal sphincter tone **or** withholding and when prior treatment with bowel regimen for constipation has been ineffective, not tolerated, or is contraindicated.

OR

C. **Endoscopically-administered botulinum,** when criteria 1 and 2 below is met:

1. An upper gastrointestinal diagnosis such as (but not limited to) **dysphagia, gastroparesis, or achalasia/cardiospasm (primary)**.

AND

2. Documented symptoms despite use of standard therapies, such as:
   - **a.** Dysphagia: Diet modification (such as smaller meals, softer foods), and/or occupational therapy.
   - **b.** Gastroparesis: Diet modification, promotility medications, such as metoclopramide, cisapride, erythromycin, or removal/reduction of underlying etiology (such as taper of opioids).
   - **c.** Achalasia/cardiospasm (primary): Dilation therapy, unless the patient is considered a poor surgical candidate.

OR

D. **Hyperhidrosis** (including axillary, palmar and gustatory hyperhidrosis), when criteria 1 through 3 below are met:

1. The hyperhidrosis is documented as persistent and severe.

AND

2. The hyperhidrosis has resulted in a significant medical complication* including a through e:

a. Acrocyanosis of the hands.

OR

b. Recurrent skin maceration with secondary bacterial or fungal infection.

OR

c. Recurrent secondary infections.

OR

d. Persistent eczematous dermatitis.

OR

e. Documentation of inability to perform critical activities of daily living or demands of employment due to hyperhidrosis.

AND

3. Treatment with at least one of the following has been ineffective, not tolerated, or all are contraindicated:

a. Prescription antiperspirants [e.g. aluminum chloride hexahydrate 20% (Drysol)].

OR

b. Oral or topical anticholinergics (e.g. glycopyrrolate or oxybutynin).

***PLEASE NOTE:** Medical treatment of persistent hyperhidrosis is considered not medically necessary in the absence of significant medical complications associated with the condition. Skin irritation, skin maceration without secondary infection, need for frequent changing of clothing, or psychosocial distress alone are not considered to be significant medical complications.

OR

E. **Migraine headache, chronic and severe,** when criteria 1 through 3 below are met:

1. A neurologist or headache specialist has thoroughly evaluated the member and has established and documented a diagnosis of chronic migraine headaches.

AND

2. Documentation of baseline headache days per month, including the number of migraines based on a headache diary OR chart notes, documenting migraine frequency, severity and characteristics.

AND

3. Documentation of an adequate trial of at least ONE prophylactic therapy, as specified in criteria a through d below were either ineffective, not tolerated, or ALL are contraindicated:

a. Topiramate **OR** divalproex sodium (Depakote).

OR

b. A beta blocker (such as propranolol, metoprolol, or atenolol).

OR

c. Venlafaxine OR a tricyclic antidepressant (such as amitriptyline or nortriptyline).

OR

d. Calcitonin gene-related peptide (CGRP) monoclonal antibody or oral CGRP antagonists [such as Aimovig (erenumab), Emgality (galcanezumab), Vyepti (eptinezumab), or Ajovy (fremanezumab), Nurtec (rimegepant), Qulipta (atogepant)] when used for prophylaxis.

PLEASE NOTE: CGRPs used for acute abortive therapy [such as "as needed" rimegepant (Nurtec ODT) or Ubrelvy (ubrogepant)] are not included in this criterion.

OR

F. **Pelvic floor dysfunction** (such as due to levator spasm, pelvic floor spasm), when criteria 1 and 2 below are met:

1. Documented pain and/or functional impairment associated with the pelvic floor dysfunction, such as pelvic pain, vaginismus, and/or dyspareunia.

AND

2. Prior treatment with another treatment option for pelvic floor dysfunction (such as physical therapy, muscle relaxants, trigger point injections, surgery) has been ineffective, not tolerated, or is contraindicated.

OR

G. **Raynaud's syndrome or systemic sclerosis-associated digital ulcers,** when criteria 1 and 2 below is met:

1. Documented pain and/or functional impairment associated with the vasospasm and/or digital ulcers.

AND

2. Prior treatment with a dihydropyridine calcium channel blocker (such as amlodipine, nifedipine) or another vasodilator (such as topical nitroglycerin, a phosphodiesterase type 5 inhibitor, or an angiotensin II receptor blocker) has been ineffective, not tolerated, or is contraindicated.

OR

H. **Sialorrhea** (drooling).

OR

I. **Urinary incontinence,** due to detrusor overactivity [idiopathic or neurogenic (e.g. due to spinal cord injury, multiple sclerosis) or overactive bladder (OAB)], when therapy with anticholinergic agents **or** Myrbetriq (mirabegron) is ineffective or not tolerated.

OR

J. **Refractory postherpetic neuralgia (PHN)** when criteria 1 and 2 below are met:

1. Documented pain and/or functional impairment associated with postherpetic neuralgia, such as a burning, sharp, or stabbing pain that is constant or intermittent.

AND

2. Documentation that adequate trials of BOTH of the following (criteria a and b below) were either ineffective, not tolerated, or are contraindicated.

a. A gabapentinoid [such as gabapentin or pregabalin (Lyrica)].

AND

b. A tricyclic antidepressant (TCA, such as amitriptyline or nortriptyline) OR a serotonin-norepinephrine reuptake inhibitor (SNRI, such as duloxetine or venlafaxine).

IV. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers botulinum toxin type A (Botox, Dysport, Xeomin, Daxxify) coverable only under the medical benefit (as a provider-administered medication).

B. **Initial Authorization**:

1. For hyperhidrosis ONLY: When pre-authorization is approved, botulinum toxin type A shall be authorized in quantities of up to 2 injection treatments within a 24-week period.

2. For all other conditions (except as listed in 1 above): When pre-authorization is approved, botulinum toxin type A may be authorized in quantities up to 4 injection treatments within a 48-week period.

C. **Continued Authorization:**

1. After the initial authorization, up to 4 injection treatments over a 48-week period may be considered medically necessary if objective measures support clinical benefits from treatment.

2. Additional treatments may be authorized on a case-by-case basis if documentation of objective measures supporting the need for more frequent dosing are provided.

3. Coverage may be reviewed at least every 12 months to confirm that current medical necessity criteria are met and that the medication is effective, defined as sustained clinical improvement from reduced symptoms (such as pain and functional impairment).

V. Botulinum toxin type A (Botox, Dysport, Xeomin, Daxxify) is considered not medically necessary for skin wrinkles or other cosmetic indications.

VI. Botulinum toxin type A (Botox, Dysport, Xeomin, Daxxify) is considered investigational for all other indications, including, but not limited to:

- **A.** Allergic rhinitis.
- **B.** Benign prostatic hyperplasia.
- **C.** Congenital talipes equinovarus (clubfoot).
- **D.** Dermatochalasis (excessive eyelid skin, "baggy eyes").
- **E.** Dry eye disease.
- **F.** Headache, non-migraine (e.g. chronic daily, tension, cluster).
- **G.** Interstitial cystitis.
- **H.** Low back pain (LBP).
- **I.** Medication overuse headache (MOH).
- **J.** Motor tic disorder, chronic (including Tics associated with Tourette syndrome).
- **K.** Myofascial pain.
- **L.** Nerve entrapment or compression syndromes, other (those not listed in Section II Above: such as brachial plexus injury, carpal tunnel syndrome Piriformis syndrome).
- **M.** Obesity.
- **N.** Osteoarthritis (OA)-related pain, including of the knee.
- **O.** Plantar fasciitis pain.
- **P.** Temporomandibular dysfunction (TMJ), bruxism, and/or masseter muscle spasm.
- **Q.** Tennis elbow (lateral epicondylitis).
- **R.** Tremors [e.g. essential (benign) tremor, Parkinson's disease-related tremor].

Position Statement

- There are four botulinum toxin type A products available (abobotulinumtoxinA, daxibotulinumtoxinA, incobotulinumtoxinA, and onabotulinumtoxinA) that all work by inhibiting the release of acetylcholine from peripheral cholinergic nerve endings, thereby blocking the cholinergic transmission.
- The intent of this policy is to allow coverage for specific diagnoses where there is demonstrated safety and efficacy from clinical trials to support their use, including spasmodic conditions, and other specific indications. Coverage for hyperhidrosis is allowed when there is documentation the condition is persistent and severe and has resulted in significant medical complications. Coverage for migraine indications is allowed when lower-cost standard of care treatment alternatives are not effective.
- There is insufficient evidence to establish that one botulinum toxin A product is more effective at comparable doses.
- Botulinum toxin type A products are all produced using different methods, so their dosing and potencies are <u>not</u> the same (the number of units of one botulinum toxin type A product cannot be converted to units of another product).

- Conditions for which use of botulinum toxin type A may be considered medically necessary are based on evidence supported by well-designed randomized controlled trials.
- The evidence for use of botulinum toxin type A in chronic migraine headache is inconsistent. Use should be reserved for those who have trialed other treatment options.
- Use of botulinum toxin (all serotypes) for treatment of wrinkles or other cosmetic conditions is considered not medically necessary.
- Botulinum toxins (type A and type B) are being investigated in many different conditions where muscle tension is thought to play a role. The quality of evidence from the majority of these studies is poor because they lack controls, are not randomized or blinded, and only involve small numbers of subjects.

Summary

CLINICAL EFFICACY

Endoscopically-administered botulinum: Achalasia (primary), Gastroparesis, and Dysphagia

- Achalasia is an esophageal motility disorder, also known as cardiospasm, which results in increased lower esophageal sphincter tone, difficulty swallowing, and sometimes regurgitation and chest pain. [1]
- Pneumatic dilation is the preferred medical treatment option for primary achalasia. [2]
- One Cochrane review concluded that pneumatic dilation produces a higher remission rate at 6 and 12 months compared to botulinum toxin. [1]
- Standard therapies for gastroparesis include diet modification (smaller meals, more frequent meals, exacerbating food avoidance), use of promotility medications, (metoclopramide, cisapride, erythromycin), and/or removal/reduction of underlying causes of gastroparesis (such as opioids).
- Approach to treatment of dysphagia (non-achalasia) is dependent on underlying pathology but may include swallowing rehabilitation (such as by a speech or occupational therapist) and/or diet modification. [3]
- Several small, poor-quality trials studied onabotulinumtoxinA in the treatment of gastroparesis. Improvement in gastric emptying time was inconsistent with some trials showing possible benefit [4] and others showing no benefit. [5 6] Despite inconclusive benefit of onabotulinumtoxinA, there is a lack of robust evidence for management of refractory gastroparesis for any one treatment approach. Therefore, botulinum toxin A may be considered medically necessary when standard initial therapies are ineffective. [7]

Anal Fissures

- Nitroglycerin ointment, diltiazem cream, and onabotulinumtoxinA have been studied in the treatment of anal fissures.
    * Nitroglycerin ointment and topical calcium channel blocker (e.g. diltiazem or nifedipine) cream are the least invasive.
    * Several small studies suggest healing rates of up to 70% with onabotulinumtoxinA. [8]
    * Trials comparing nitroglycerin ointment with onabotulinumtoxinA show inconsistent results.

- A comparative trial demonstrated a healing rate of 52% with nitroglycerin compared to 24% with onabotulinumtoxinA after 2 weeks of treatment. [9]
- A second comparative trial demonstrated a healing rate of 60% with nitroglycerin ointment compared to 96% with onabotulinumtoxinA. [10]
- Another study in 73 subjects with anal fissure found there were no advantages of onabotulinumtoxinA over nitroglycerin ointment in fissure healing and fissure-related pain. [11]
- A Cochrane review concluded topical CCBs, nitroglycerin and botulinum toxin to be overall similarly effective non-surgical treatment options. However, surgical sphincterotomy remains the most efficacious therapy; however, it is limited by significant risks. [8]

* A small randomized, double-blind, controlled trial comparing diltiazem cream to onabotulinumtoxinA showed no difference in fissure healing between groups after three months of treatment. [12]

Congenital aganglionic megacolon (Hirschsprung disease)[13-16]

- Congenital aganglionic megacolon (Hirschsprung disease) is a rare gastrointestinal disorder, due to incomplete neuronal development in the distal colon, resulting in abnormal bowel function due to increased/decreased anal sphincter tone or withholding. The condition is generally diagnosed in children and can result in fecal incontinence, constipation, and enterocolitis.
- For constipation symptoms due to increased anal sphincter tone or withholding, treatment options include standard bowel regimen, botulinum toxin, and surgery. There is no standard sequencing of therapies; however, the goal of conservative therapies, including botulinum, includes avoidance of surgical procedures.

Cervical dystonia (spasmodic torticollis)

- Cervical dystonia (or spasmodic torticollis) is characterized by involuntary contractions of the neck muscles resulting in twisting and repetitive movements, and/or abnormal postures. [17]
- A Cochrane review concluded a significant decrease in the cervical dystonia severity scale (CDSS) along with an improved physician's global assessment score and reduction in pain after use of onabotulinumtoxinA injection relative to placebo. The CDSS is an objective measurement used to quantify the severity of abnormal head positioning that results from cervical dystonia. [17]
- OnabotulinumtoxinA has not been shown to be effective in the treatment of in chronic neck pain without torticollis (with or without cervicogenic headache) and mechanical neck disorders and whiplash. [18 19]

Migraine Headache

- The International Headache Society (IHS) Classification of Chronic Migraine Headache's definition of chronic migraine includes that headaches are present on 15 days or more per month, and that at least 8 of these episodes meet the criteria for pain and associated symptoms of migraine (*Appendix 1*).
- The U.S. Headache Consortium endorses headache calendars as the gold standard to track treatment progress. [20]

- Evidence supporting the efficacy of botulinum toxin A in the treatment of migraines has been inconsistent.[21]
- Collective results of seven randomized, controlled episodic migraine trials (totaling more than 1,000 patients) have failed to demonstrate a significant difference between botulinum toxin A and placebo in migraine prevention. Pre-specified primary endpoints and most secondary endpoints were not met. [22-26]
- Two additional trials studying onabotulinumtoxinA in the treatment of chronic migraine were more recently published. [27 28]
    * In the PREEMPT 1 trial, there was no difference between placebo and onabotulinumtoxinA in mean change in headache episodes, the primary endpoint.
    * In the PREEMPT 2 trial, the primary endpoint was changed to mean change in headache days after the PREEMPT 1 trial failed to meet its primary endpoint. A statistical difference favoring onabotulinumtoxinA over placebo was demonstrated. The mean number of headaches decreased from approximately 20 to 11 in the onabotulinumtoxinA group and from approximately 20 to 13 in the placebo group at week 24.
    * Subjects enrolled in the trials had migraine headaches occurring on 15 or more days per 4 weeks, of which each consisted of four or more hours of continuous headache.
- The American Academy of Neurology (AAN) 2016 guideline update supports the use of botulinum toxin type A products in the prevention or treatment of chronic migraine headaches[21]. The AAN Assessment of botulinum toxin A concludes that:
    * They are likely effective in chronic migraine headaches and should be offered as a treatment option to increase the number of headache-free days.
    * They are likely ineffective in treatment of episodic migraine and chronic tension-type headache

    .
- Both the AAN and the American Headache Society recommend limiting the use of abortive therapies for headache. These include over-the-counter (OTC) medications such as NSAIDS and acetaminophen, given the risk of developing medication overuse headache (MOH). Use of OTC abortives should be limited to no more than 14 days per month. In addition, use of butalbital-containing medications and opioids can increase sensitivity to pain. Use of these prescription abortives should be limited to no more than nine days per month (or two days per week). [29]

  Use of Oral Prophylactic Therapies [30 31]
    * Guidelines from the American Academy of Neurology and American Headache Society recommend select antiepileptic medications (divalproex or topiramate) and beta-blockers (propranolol, timolol, or metoprolol) as options that should be offered to patients requiring migraine prophylaxis, with the highest level of evidence to support their use.
    * Other medications that are “probably effective and should be considered” include tricyclic antidepressant (TCA) amitriptyline, selective serotonin-norepinephrine reuptake inhibitor (SNRI) venlafaxine, atenolol and nadolol.

* Use of carbamazepine and a variety of select antihypertensives (candesartan, lisinopril, clonidine, guanfacine, or pindolol) are possibly effective; however, the many other prophylactic alternatives with higher-quality evidence should be used first.
* Many other medications, including but not limited to selective serotonin receptor inhibitors (SSRIs; e.g. fluoxetine, fluvoxamine), other SNRIs (e.g. duloxetine), other AEDs (gabapentin, lamotrigine, and oxcarbazepine), calcium channel blockers (CCBs; e.g. nicardipine, nifedipine, verapamil) and clonazepam, have been studied in migraine prophylaxis, but evidence supporting their efficacy is conflicting, inadequate, or negative (support the therapy is ineffective). [30 31]
* There is insufficient evidence directly comparing botulinum toxin A with other prophylactic therapies such as beta-blockers, antiepileptic medications, tricyclic antidepressants, calcitonin gene-related peptide (CGRP) monoclonal antibodies, or oral CGRP antagonists . [7]

Other Types of Headaches:

* Chronic Daily Headache (CDH): botulinum toxin A has not been shown to be effective in treatment or prevention of CDH.[21 23 32 33]
* Tension Headache: Current evidence is insufficient to permit conclusions regarding botulinum toxin type A products as prophylactic therapy in patients with chronic tension headaches refractory to pharmacologic therapy. [21 22 34-37]
* Current evidence is insufficient to allow the use of botulinum toxin A in the treatment of episodic migraine headaches, tension headaches, or chronic daily headaches [21 34 36-38]

Hyperhidrosis

- Hyperhidrosis can lead to medical complications, including skin maceration with recurrent bacterial or fungal infection requiring treatment or persistent eczematous dermatitis. [39]
- Palmar hyperhidrosis can interfere with ability to function, when grip is impaired due to hyperhidrosis. [39]
- Topical treatments, such as aluminum chloride solution (Drysol) are the primary therapy for axillary and palmar hyperhidrosis, once secondary causes of hyperhidrosis are ruled out. Topical treatments and systemic anticholinergics are primary therapy for persistent eczematous dermatitis. [39]
- There are several double-blind trials that evaluate onabotulinumtoxinA in patients with primary axillary and primary palmar hyperhidrosis. [7 40 41]
  * Treated palms with onabotulinumtoxinA were associated with a 26% reduction in sweating (measured by ninhydrin sweat testing) compared to no reduction with placebo. [40]
  * In two pivotal trials, 81% to 91% of patients treated for primary axillary hyperhidrosis achieved a greater than 50% reduction in axillary sweating at 4 weeks compared with 36% to 41% in the placebo group. [7]
- The median duration of effect in two pivotal trials that evaluated onabotulinumtoxinA in primary axillary hyperhidrosis was 201 days. [7]

- Reduction in sweating is also described in case series reports for both palmar and axillary hyperhidrosis with onabotulinumtoxinA injections lasting up to 5-12 months. [42 43]
- However, despite the reduction in sweating, onabotulinumtoxinA does not affect the unpleasant odor.
- In a small case study, intracutaneous onabotulinumtoxinA was effective in ceasing gustatory sweating up to a mean duration of 17 months. [44]

Muscle Spasms and Dystonias

- A spasm is defined as a sudden involuntary contraction of one or more muscles.
- Muscle spasms are a potential symptom of spasticity, a condition in which specific muscles are continuously contracted. The contraction causes muscles to be stiff or tight and may interfere with movement, speech, and walking.
- Botulinum has been studied and shown to be effective in spasticity due to cerebral palsy,[45 46] spastic hemiplegia or paraplegia,[47] dysphonia,[7 48], blepharospasm,[49] hemifacial spasm,[50] facial nerve disorders, and demyelinating disease of the CNS,[7 51], as well as a variety of dystonias: hand dystonia, [7] oromandibular dystonia,[7] spasmodic torticollis,[7] and torsion dystonia [7].

Pelvic Floor Dysfunction, including levator (pelvic floor) spasm

- Pelvic floor dysfunction is global term used to describe a number of conditions, including chronic pelvic pain. For pelvic floor dysfunction due to levator (pelvic floor) muscle spasm, non-pharmacologic therapy includes physical therapy with pelvic floor training can be used, along with other types of physical therapy. Pharmacologic therapies include various chronic pain medications such as antiepileptics, antidepressants (tricyclic, serotonergic), muscle relaxants, NSAIDs, as well as hormone replacement therapies. Opioids may be used for severe pain, along with trigger point injections. Surgery is reserved for refractory pain. [52]
- The evidence for onabotulinumtoxinA for treatment of pelvic floor muscle spasm is limited to one randomized controlled trial (n=60). The trial reported a decrease in pelvic floor muscle pressure but no significant difference reduction in pain scores.[52] However, there is a lack of robust evidence for management of refractory pelvic floor muscle spasm for any one treatment approach. Therefore, botulinum toxin A may be considered medically necessary when standard initial therapies are ineffective.

Raynaud's Disease

- Raynaud's phenomenon (Raynaud disease) is vasospasm due to cold or stress and can lead to severe constriction of the digits (both fingers and toes). Severe cases may result in digital ischemia, ulcers, and gangrene. [53]
- Non-pharmacologic therapy includes trigger avoidance, including cold, vasoconstricting medications, and smoking. Pharmacologic therapies may be used for refractory RP.
- Dihydropyridine calcium channel blockers (CCBs), such as amlodipine or nifedipine, are the usual first-line pharmacologic treatment options. Other pharmacologic treatment options include various vasodilators: phosphodiesterase (PDE) type 5 inhibitor (e.g. sildenafil, tadalafil), topical nitroglycerin, an angiotensin receptor blocker (e.g. losartan, valsartan), or a serotonin reuptake inhibitor.

- There is limited evidence to guide the management of refractory or progressive ischemia. The goal is prevention of tissue loss, including amputation of digits. Treatment may include aggressive non-pharmacologic, pharmacologic, and surgical therapies. [54]
- The evidence for onabotulinumtoxinA or incobotulinumtoxinA for treatment of Raynaud's syndrome is limited to one pilot trial and one retrospective case series with onabotulinumtoxinA. [88-90] However, given the lack of non-surgical options for refractory ulcers, botulinum toxin A may be covered when standard vasodilator therapy is ineffective, not tolerated, or all options are documented as medically contraindicated.

Sialorrhea (drooling)

- Botulinum toxin A or B can be used for reduction of sialorrhea in patients with a variety of neurological disorders. The goal of therapy is to reduce sialorrhea -associated complications, such as aspiration pneumonia or skin breakdown.
- Anatomically guided injections of rimabotulinumtoxinB into the parotid and submandibular glands appear to effectively improve sialorrhea in patients with a variety of neurologic conditions, including Parkinson's disease and amyotrophic lateral sclerosis (ALS). [7 55 56]

Thoracic Outlet Syndrome

- Thoracic outlet syndrome (TOS) is a form of myofascial pain and may include brachial plexus injury.
    * A Cochrane review concluded that there is insufficient evidence to conclude that botulinum toxin is effective for treatment of TOS. [57] In one small trial, botulinum toxin did not significantly reduce pain or disability scores versus placebo in patients with TOS (of any type). The evidence is complicated by a lack of consensus in the diagnosis of TOS. Additional research is needed to clarify the benefit of TOS treatments.[58]
    * Strengthening exercises, physical therapy and surgery are the standard of care. In patients, in whom these options have been ineffective, botulinum toxin may be a treatment option.

Urinary Incontinence - Neurogenic and idiopathic detrusor overactivity/detrusor hyperreflexia

- Several open-label studies (n=15 to n=200) demonstrated an increase in bladder capacity, a decrease in bladder pressure, and a decrease in incontinence episodes after injection with onabotulinumtoxinA, in both children and adults.[59-61]
- A Cochrane review concluded both botulinum type A and B formulations are effective treatment options for urinary incontinence due to refractory detrusor overactivity due to neurogenic or idiopathic overactive bladder (OAB). [62]

Refractory Postherpetic Neuralgia (PHN) [63]

- Refractory postherpetic neuralgia (PHN) refers to pain that persists after an acute episode of herpes zoster and resolution of the rash. PHN affects nerve fibers and skin and is characterized by constant burning, stabbing sensation or pain triggered by light contact with non-painful stimuli, resulting in decreased quality of life.
- First-line pharmacologic therapies for PHN include topical lidocaine, gabapentinoids (gabapentin, pregabalin), tricyclic antidepressants (TCAs; amitriptyline, nortriptyline), and serotonin-norepinephrine reuptake inhibitors (SNRIs; duloxetine and venlafaxine).

- A systematic review and meta- analysis of seven trials with a total of 752 patients concluded that botulinum toxin A has a greater efficacy than lidocaine for postherpetic neuralgia, based on the visual analog scale (VAS) of these 7 trials. [64]
- For refractory PHN, in which first-line standard of care pharmacologic treatment options have been ineffective, botulinum toxin A may be a treatment option for these patients.

INVESTIGATIONAL USES

Allergic Rhinitis

- One small (n=34) randomized controlled trial of 8-week duration suggests efficacy of onabotulinumtoxinA in relieving rhinorrhea, nasal obstruction and sneezing due to allergic rhinitis. There was no difference between onabotulinumtoxinA and placebo groups for the symptom of itching. [65]
- Well-designed, large-scale trials with repeated injections and comparison to nasal steroids are necessary to validate positive benefits of using onabotulinumtoxinA in this condition.

Benign Prostatic Hyperplasia (BPH)

- A small, poor-quality trial comparing the effects of onabotulinumtoxinA with or without an alpha-adrenergic antagonist suggest possible onabotulinumtoxinA efficacy. The absence of a placebo comparator makes it difficult to determine the true efficacy of onabotulinumtoxinA. [66] The evidence for the use of onabotulinumtoxinA in the treatment of BPH is limited to a variety of Phase II and uncontrolled trials. [7 67] Additional higher-quality studies are needed before onabotulinumtoxinA can be considered safe and effective in this condition.

Congenital talipes equinovarus (clubfoot) [68]

- A Cochrane review concluded that there is insufficient evidence to conclude that botulinum toxin is effective for treatment of clubfoot. The evidence is limited to one small trial, as adjunctive therapy to casting.
- Usual conservative interventions include stretching, casting, and splinting. Surgery is reserved for resistant deformities.

Dermatochalasis

- Dermatochalasis is a condition in which a fold of skin develops in the eyelid, potentially leading to impaired vision, blepharitis, and dermatitis. Surgery is the current standard of care.
- A small, poor-quality study (open-label study without a placebo comparator) suggests that onabotulinumtoxinA may be an effective treatment for upper eyelid dermatochalasis. [69] Additional well-controlled studies are needed before onabotulinumtoxinA can be considered safe and effective in this condition.

Dry Eye Disease

- The evidence for the use of onabotulinumtoxinA for dry eye disease is limited to one small pilot trial (n=20). [70] Larger, well-controlled trials are needed to establish safety and effectiveness of onabotulinumtoxinA for this indication.

Interstitial Cystitis

- Four, poor-quality studies (case series) have assessed onabotulinumtoxinA treatment for pain and improvement of bladder capacity in patients with interstitial cystitis. All

reports suggest efficacy, though results have not been confirmed in larger controlled trials. [7 71]

Low Back Pain

- The evidence for the use of botulinum toxin A in the treatment of lower back pain is limited to several small, poor-quality trials. [72] The studies did not address functional improvement or long-term effects of onabotulinumtoxinA. Large, well-controlled studies are needed before onabotulinumtoxinA can be considered safe and effective in this condition. [7]

Motor Tics

- In one small, poor-quality trial, onabotulinumtoxinA reduced tic frequency and urge in patients with Tourette Syndrome or Chronic Tic Disorder. [73] These reductions were not associated with an overall clinical benefit (measured by the patient's global impression of change).

Myofascial Pain

- OnabotulinumtoxinA has not been shown to provide a consistent benefit over placebo in the treatment of myofascial pain. [7 74]
- One small trial found botulinum toxin A improved pain and quality of life. However, small trial size and use of an enriched protocol design limit generalizability of findings to clinical practice. Only half of patients responded to the initial dose of botulinum toxin A and were enrolled in the randomized phase of the trial. [75]

Obesity

- There is no reliable evidence that onabotulinumtoxinA is useful in reducing body weight in obese patients.
    * Two small, poor-quality trials failed to show a reduction in body weight after administration of onabotulinumtoxinA. [76 77]
    * A small randomized, double-blind study in 24 morbidly obese patients demonstrated significant difference between onabotulinumtoxinA and saline. However, patients were also maintained on a liquid diet for eight weeks. [78]

Orthopedic Pain – Plantar Fasciitis, Lateral epicondylitis (tennis elbow), Osteoarthritis (OA) of the knee

- Four small, exploratory randomized controlled trials reported an improvement in pain scores with onabotulinumtoxinA in patients with plantar fasciitis refractory to other therapies. [79-82]
- Several small, poor-quality trials evaluated onabotulinumtoxinA in patients with lateral epicondylitis (tennis elbow). [83-85] Consistent benefit has not been demonstrated across trials.
- One trial evaluated intra-articular onabotulinumtoxinA for treatment of OA-related knee pain. [86] Despite a reduction in pain with onabotulinumtoxinA versus placebo, additional evidence is needed to establish the clinical benefit versus established standard of care treatments for OA, such as NSAIDs.
- Larger, well-controlled trials are needed to establish safety and effectiveness in these conditions and to establish efficacy relative to conventional therapies. [7]

Nerve Entrapment and Compression Syndromes (such as Brachial Plexus Injury, Carpal Tunnel Syndrome, Piriformis Syndrome)

- Piriformis syndrome is a form of myofascial pain characterized by sciatica and buttock tenderness.
    * Few case reports describe the management of piriformis syndrome. [87] Physical therapy, steroid injections, surgical dissection or resection of the muscle have been reported to relieve symptoms.
    * Well-designed studies using onabotulinumtoxinA for this condition have not been conducted. Available evidence consists of small (fewer than 30 patients) open-label, uncontrolled studies. [7 88]
- There is insufficient evidence to establish efficacy of botulinum toxin for treatment of carpal tunnel syndrome. The evidence is limited to one pilot trial. [89]

Temporomandibular dysfunction (TMJ), Bruxism, and/or Masseter Muscle Spasm and Hypertrophy

- Several small, uncontrolled (case series) studies have studied onabotulinumtoxinA in the treatment of symptoms (headache, jaw dislocation, etc.) arising from TMJ dysfunction. Larger, well-controlled studies are needed to establish benefit in the treatment of this condition. [90-93]
- Several small, poor-quality trials evaluated onabotulinumtoxinA in patients with bruxism, masseter muscle spasm, and/or masseter hypertrophy and one small trial with incobotulinumtoxinA. Consistent benefit has not been demonstrated across trials. Additional larger trials are needed to establish the safety and efficacy of botulinum toxin type A. [94-98]

Tremor

- There is insufficient evidence to support the use of onabotulinumtoxinA in essential hand tremor or MS-related tremor and no evidence in Parkinson's disease-related tremor. [7 99]
- OnabotulinumtoxinA resulted in significant improvement of postural, but not kinetic essential hand tremors. [99] Likewise, one small crossover trial of incobotulinumtoxinA (n=30) improved rest tremor, tremor severity, and postural tremor. [100] However, there is not compelling evidence that either botulinum toxin formulation leads to better functional efficacy for patients.

SAFETY

- The severity and type of adverse effects depends on the location where the botulinum toxin A is injected, the dose used, and the injection technique.
- Commonly reported adverse events observed in clinical trials of onabotulinumtoxinA include dry mouth, dysphagia, asthenia, diplopia, and injection site pain. The prevalence and severity of adverse effects may vary depending on the dose and the site of injection. [51]
- All botulinum toxin products carry a box warning in their labeling describing the potential for toxin to spread from the site of injection and produce symptoms consistent with botulinum toxin effects. Symptoms may include asthenia, generalized muscle weakness, diplopia, blurred vision, ptosis, dysphagia, dysphonia, dysarthria, urinary incontinence and breathing difficulties and may occur hours to weeks after injection.

Swallowing and breathing difficulties can be life threatening. Deaths have been reported.

- The safety, efficacy and dosing of botulinum toxins has not been established for any condition in children less than 12 years of age.

DOSING CONSIDERATIONS

- Botulinum toxin type A products are all produced using different methods, so their dosing and potencies are not the same (the number of units of one botulinum toxin type A product cannot be converted to units of another product).
- Starting doses for botulinum toxin type A products are available in the prescribing information for the specific products. Follow-up doses may be adjusted based on the effectiveness of the initial injections and adverse effects.

Appendix 1: International Headache Society Classification of Chronic Migraine Headache [101]

A. Headache (tension-type and/or migraine) on 15 or more days per month for at least 3 months.*

B. Occurring in a patient who has had at least 5 attacks fulfilling criteria for a migraine without an aura.

C. On 8 or more days per month for at least 3 months headache has fulfilled criteria for pain and associated symptoms of migraine without aura in either or both of criteria 1 head 2 below:

1. At least two of the following criteria a, b, c, and d below are met:

a) Unilateral location.

b) Pulsating quality.

c) Moderate or severe pain intensity.

d) Aggravation by or causing avoidance of routine physical activity (e.g. walking or climbing stairs).

AND at least one of the following criteria e or f below are met:

e) Nausea and/or vomiting.

f) Photophobia and phonophobia.

2. Treated and relieved by triptan(s) or ergot before the expected development of the above symptoms.

D. No medication overuse and not attributed to another causative disorder.

* Characterization of frequently recurring headache generally requires a headache diary to record information on pain and associated symptoms day-by-day for at least one month. Sample diaries are available at http://www.i-h-s.org.

Revision History

Revision Date	Revision Summary
12/7/2023	• Added newly approved Daxxify (daxibotulinumtoxinA) to policy. • Simplified chronic migraine criteria for operational consistency. • Updated step therapy for chronic migraines requiring only one step of prior chronic migraine treatment. • Updated reauthorization to 12 months for migraines. • Added updated AAN 2016 guideline statement.
12/9/2022	• Policy criteria language updated for the following (no change to intent): - Congenital aganglionic megacolon (Hirschsprung disease): clarified symptom severity - Migraine headaches: explicitly added oral CGRP antagonist step therapy. - Urinary incontinence, due to detrusor overactivity: added Myrbetriq (mirabegron) as an acceptable step therapy. • Added coverage criteria for refractory postherpetic neuralgia (PHN) after standard of care treatments.
1/20/2021	• Updated COT language. • Added coverage criteria for thoracic outlet syndrome (TOS) in patients with functional impairment. • Updated criteria for hyperhidrosis: - Clarified that secondary infection or skin maceration are considered separate complications. Added inability to satisfy demands of employment as an example of a complication. - Updated step therapy requirements. - Added a requirement that antiperspirant or anticholinergics (topical or oral) have been tried • Clarified initial and continued authorization periods. Re-authorization criteria were aligned for all indications. Re-authorization requires documentation of clinical benefit and up to 4 doses in a 48-week period may be covered. More frequent doses may be covered on a case-by-case basis.
10/28/2020	Clarified migraine criteria, including removal of duplicative criteria.
4/22/2020	• Clarified CGRP monoclonal antibody step therapy for migraines (when used for prophylaxis). CGRPs used as abortive therapy do not meet this criterion. • Added coverage criteria for refractory Raynaud's and pelvic floor dysfunction. • Policy criteria updated for achalasia: simplified coverage to use as part of an endoscopic procedure for upper GI diagnoses.

Revision Date	Revision Summary
1/22/2020	• Added continuation of therapy (COT) criteria (no change to intent of coverage criteria). • Clarified reauthorization (simplified; no change to intent). • Policy criteria updated for migraine indication to include CGRP monoclonal antibody as step therapy option.
1/31/2019	• Simplified Section I criteria. • Updated investigational uses: - Removed Migraine headache (chronic) in combination with CGRP inhibitors from investigational uses. - Clarified pelvic floor spasm (including pelvic pain, vulvodynia, and vaginismus). • Clarified reauthorization criteria for Section II.
8/17/2018	Added as Investigational uses: Migraine headache (chronic) in combination with CGRP inhibitors.
1/19/2018	• Updated migraine severity criteria to International Headache Society (HIS) standard. • Updated list of Investigational uses (add Dry Eye Disease and OA-related knee pain).
2/17/2017	• The policy criteria were simplified for hyperhidrosis. • Added coverage criteria for congenital aganglionic megacolon (Hirschsprung disease). • Clarified quantity limits to 2 doses per 24-weeks and 4 doses per 48-weeks (versus use of 6 and 12 months, respectively).
2/12/2016	• The policy criteria were updated for hyperhidrosis to clarify the wording regarding medical complications for the definition of medical necessity. • Added coverage criteria for lower limb dystonia, a new FDA-indication. • Added as Investigational uses: dysphagia (non-achalasia), Raynaud's disease, and bruxism/masseter muscle hypertrophy.
1/1/1996	New policy.

Date of Origin: January 1996

Committee Approval Date: September 19, 2024

Next Review Date: 2024

Effective Date: January 1, 2025

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of medication policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Intravenous immune globulin (IVIG) and subcutaneous immune globulin (SCIG) are preparations containing antibodies purified from human blood. They are used in the treatment of many different conditions resulting from immune deficiencies or other immunologic conditions.

Policy/Criteria

Most contracts require pre-authorization approval of immune globulins prior to coverage.

I. Continuation of therapy (COT) **and** new starts (treatment-naïve patients): The use of Higher-Cost Immune Globulin Replacement Products (as listed in *Table 2*) is considered not medically necessary.

II. Continuation of therapy (COT): All other immune globulins (as listed in *Table 1*) may be considered medically necessary for COT when criterion A, B, or C **AND** D below is met.

A. For diagnoses NOT listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND there is documentation that the medication was covered by another health plan. Examples of documentation include the coverage approval letter from the previous health plan or paid claim.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

B. For diagnoses listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

C. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

AND

D. Site of care administration requirements are met [refer to Pharmacy Services Medication Policy Manual, *Site of Care Review*, dru408].

***Please note**: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

III. New starts (treatment-naïve patients): All other immune globulins (as listed in *Table 1*) may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) that criteria A and B below are met.

A. Site of care administration requirements are met [refer to Pharmacy Services Medication Policy Manual, *Site of Care Review*, dru408].

AND

B. At least one of the following diagnostic criteria 1 through 5 below is met:

1. Immunodeficiency (primary or acquired), diagnosed by, or in consultation with an immunologist or hematologist, as defined in criterion a or b:

a. A diagnosis of one of the following and documented **hypogammaglobulinemia** (a low baseline serum IgG level):

i. Primary humoral immunodeficiency diseases (PID) (as defined in *Appendix 1*).

ii. HIV infected children (< 13 years of age) with hypogammaglobulinemia.

iii. Hematologic malignancy-related hypogammaglobulinemia.

iv. Post-allogeneic bone marrow transplant (BMT).

v. B-cell mediated cancer [e.g., chronic lymphocytic leukemia (CLL), B-cell lymphoma].

vi. Hypogammaglobulinemia in neonates, with a low birth weight (less than 1500g) or in a setting with high baseline infection rate or morbidity.

OR

b. A diagnosis of **dysgammaglobulinemia**, primary or due to multiple myeloma in patients with stable disease, and at least one of the following:

i. high risk of recurrent infections despite prophylactic antibiotic therapy.

ii. poor IgG response to the pneumococcal vaccine.

iii. low normal IgG levels during acute sepsis episodes.

OR

2. Hematologic disorders (immune-mediated), not responding to alternative therapies, or at high risk of bleeding:

a. Acquired Factor VIII inhibitor, diagnosed by, or in consultation with an immunologist or hematologist, and when conventional therapy is ineffective or not tolerated. (e.g., immunosuppressive therapy with cyclophosphamide, steroids, or azathioprine).

OR

b. **Autoimmune hemolytic anemia** (AIHA), diagnosed by, or in consultation with an immunologist or hematologist, and not responding to alternative therapies (e.g., steroids, immunosuppressive agents, plasmapheresis, rituximab and/or splenectomy).

OR

c. **Fetal (neonatal) alloimmune thrombocytopenia** (FAIT) diagnosed by, or in consultation with a neonatologist, hematologist, or obstetrician, and with documented diagnosis.

OR

d. **Idiopathic thrombocytopenia purpura**, also known as "immune thrombocytopenia," (acute; ITP), when a rapid increase in platelet count is necessary, such as in an acute bleeding episode or prior an invasive procedure (including surgery, epidural anesthesia, or Cesarean section).

OR

e. **ITP (chronic)**, diagnosed by, or in consultation with an immunologist or hematologist, and when the platelet count is dangerously low, defined as a platelet count less than 30,000 cells/mm3 in children, less than 20,000 cells/mm3 in adults, or less than 30,000 cells/mm3 along with signs/symptoms of bleeding in adults, as a bridge to an alternative chronic therapy (including but not limited to rituximab, a TPO mimetic, or splenectomy) OR when at least one other chronic therapy has been ineffective or all are contraindicated.

OR

f. **ITP in pregnancy**, diagnosed by, or in consultation with a neonatologist, hematologist, or obstetrician, and when at least one of the following criteria are met:

i. Platelet counts less than 20,000/mm3 in the third trimester, despite an adequate course of corticosteroids, unless use of steroids are contraindicated, or not tolerated.

OR

ii. Platelet counts less than 30,000/mm3 associated with bleeding or before vaginal delivery or C-section.

(For IVIG use in preparation for C-section or epidural anesthesia, see criteria 2.d. above)

OR

g. **Post-transfusion purpura** (hemolytic transfusion reaction) in severely affected patients.

OR

h. **Pure red cell aplasia** (PRCA, viral) diagnosed by, or in consultation with an immunologist or hematologist, and with documented parvovirus B19 infection and severe anemia.

OR

3. **Neuromuscular disorders,** diagnosed by, or in consultation with a neurologist, dermatologist or rheumatologist, AND there is clinical documentation (including, but not limited to chart notes) of significant functional impairment:

a. **Guillain-Barré syndrome** (GBS), including **Acute inflammatory demyelinating polyneuropathy** (AIDP), when one of criteria i through iv below are met:

i. Deteriorating pulmonary function tests.

OR

ii. Rapid deterioration with symptoms for less than 2 weeks.

OR

iii. Rapidly deteriorating ability to ambulate.

OR

iv. Inability to walk independently for 10 meters.

OR

b. **Chronic inflammatory demyelinating polyneuropathy** (CIDP) when both criteria i and ii below are met:

i. Significant functional disability.

AND

ii. Documentation of slowing of nerve conduction velocity on electromyogram (EMG)/ nerve conduction study (NCS).

OR

c. **Acute demyelinating encephalomyelitis** (ADEM) or **anti-NMDA receptor encephalitis** when prior therapy with corticosteroids has been ineffective or not tolerated.

OR

d. **Lambert-Eaton myasthenic syndrome** (LEMS**)**.

OR

e. **Multifocal motor neuropathy** (MMN) in patients with conduction block [partial (>30%) or complete block].

OR

f. **Myasthenia gravis (MG)**, when criteria i. and ii. below are met:

i. For the treatment of acute crisis (e.g., respiratory failure, swallowing difficulties) **OR** chronic decompensation

AND

ii. Documentation that at least ONE other standard MG treatment is ineffective or not tolerated [such as plasmapheresis/ plasma exchange (PLEX), pyridostigmine (generic, Mestinon), non-steroidal immunomodulating therapies (such as azathioprine, cyclosporine, mycophenolate, tacrolimus, methotrexate, or cyclophosphamide)].

OR

g. **Paraneoplastic opsoclonus ataxia syndrome** (Opsoclonus-myoclonus ataxia syndrome, OMS) in pediatric neuroblastoma patients with significant functional impairment and not responding to an adequate course of steroids (at least 3 to 7 days).

OR

h. **Pemphigoid, refractory immunobullous disease** (e.g., bullous pemphigoid, pemphigus foliaceus, pemphigus vulgaris) until conventional treatment takes effect (e.g., immunosuppressive agents and plasmapheresis).

OR

i. **Refractory myositis**, including but not limited to autoimmune myositis, **dermatomyositis** (adult), or polymyositis, in patients with severe active illness including muscle weakness and associated severe disability when corticosteroids or other immunosuppressants (e.g., azathioprine, methotrexate, or cyclophosphamide) have been ineffective, are contraindicated or not tolerated.

OR

j. **Juvenile Dermatomyositis** (JDM), with muscle weakness and associated severe disability, with at least ONE of the following documented diagnostic criteria below:

i. Evidence of myositis, demonstrated by abnormality of muscle biopsy, MRI, OR EMG.

OR

ii. Increased muscle enzymes levels (such as CPK, AST, LDH, and/or aldolase)

OR

iii. Cutaneous changes, including heliotrope dermatitis (rash on the upper eyelids) and Gottron's papules (papules over the knuckles), not responding to oral corticosteroids, methotrexate, and/or another oral immunosuppressant.

OR

k. **Stiff-Person Syndrome** when treatment with other agents is ineffective or not tolerated. (e.g., diazepam, baclofen, clonazepam, valproic acid, and clonidine).

OR

l. **Systemic lupus erythematosus,** for severe active disease when other interventions are ineffective or not tolerated (e.g., corticosteroids and immunosuppressive agents, such as cyclophosphamide or azathioprine).

OR

4. **Transplant (solid organ), antibody (Ab)-mediated rejection,** diagnosed by, or in consultation with a transplant specialist or immunologist, and criteria a or b below are met**:**

a. **<u>Prevention</u> of antibody (Ab)-mediated rejection**: Prior to solid organ transplant and in the peri-operative period, for patients at high risk for Ab-mediated rejection, including highly sensitized patients, and those receiving an ABO-incompatible organ.

OR

b. **<u>Treatment</u> of antibody-mediated rejection (a.k.a. vascular rejection, humoral rejection)**: Following solid organ transplant and confirmed by either biopsy or presence of panel reactive antibodies (PRAs).

OR

5. **Other Miscellaneous conditions** when criteria are met:

a. **Kawasaki syndrome**, diagnosed by, or in consultation with a subspecialist (pediatrician, cardiologist, or rheumatologist), and IVIG is used during the first ten days of diagnosis.

OR

b. **Pediatric intractable epilepsy,** diagnosed by, or in consultation with a neurologist, in candidates for surgical resection or when other interventions are ineffective or not tolerated. Examples of other interventions include, but are not limited to, anticonvulsant medications, ketogenic diets, and steroids. [85]

OR

c. **Post-Exposure prophylaxis against varicella-zoster** (VZV) in high-risk populations (immunocompromised individuals who lack evidence of immunity to VZV, pregnant women who lack evidence of VZV immunity, newborns of mothers who develop peri-partum varicella, or infants in the first two weeks of life), diagnosed by, or in consultation with a subspecialist (such as obstetrician, pediatrician, or infectious diseases specialist).

OR

d. **BK Viremia** (BK polyomavirus in solid organ transplantation), diagnosed by, or in consultation with a transplant or infectious diseases specialist, in patients with persistent viremia despite a sufficient reduction of immunosuppressive therapy for at least 4 **weeks.**

['Sufficient reduction' is defined as discontinuation of an antimetabolite (such as mycophenolate mofetil or azathioprine) OR a 50% dose reduction of a calcineurin inhibitor (such as tacrolimus or cyclosporine)].

OR

e. **PANDAS/PANS (Pediatric Autoimmune Neuropsychiatric Disorders Associated with Streptococcal Infections or Pediatric Acute-onset Neuropsychiatric Syndrome),** when the following (i, ii, iii, and iv) are met:

i. The patient is less than 18 years of age.

AND

Pediatric subspecialist assessment: The diagnosis is made by, or in consultation with, ONE of the following pediatric subspecialists (for an adolescent, consultation may be with an adult subspecialist): pediatric neurologist, pediatric psychiatrist, neurodevelopmental pediatrician, pediatric rheumatologist, pediatric allergist/immunologist.

NOTE: IVIG for adults with PANDAS/PANS is not coverable.

AND

ii. If the prescriber is not a pediatric subspecialist (e.g., primary care), clinical documentation must be provided that the pediatric subspecialist agrees with the treatment plan for IVIG [attestation].

AND

iii. Documentation of baseline evaluation, including details of neuropsychiatric symptoms, temporal relationship to the symptoms, and associated functional impairment.

NOTE: This evaluation must include clinical testing with a validated instrument, which must be performed pretreatment and posttreatment to demonstrate clinically meaningful improvement (See Appendix 2).

AND

iv. Step therapy: A clinically appropriate trial of at least **two** of the following (1, 2, 3, and/or 4.) are ineffective, not tolerated, or use of all are contraindicated, and documentation stating the therapies were specifically used

for PANDAS/PANS symptoms.

['Ineffective' is defined as a lack of sustained clinically meaningful improvement on a validated instrument in relation to the primary symptom complex]

1. *Antimicrobial therapy*: Short-course antibiotic therapy (such as amoxicillin, azithromycin, or penicillin) for a confirmed group A beta-hemolytic *Streptococcus* (strep) infection.

OR

2. *Anti-inflammatory therapy* with at least one of the following (criteria a, b, or c):

a. Nonsteroidal anti-inflammatory drugs (NSAIDs) for at least five days

OR

b. Systemic corticosteroids

OR

c. Plasma exchange (PLEX)

OR

3. *Psychoactive therapy* with at least one of the following (criteria a or b):

a. Selective serotonin reuptake inhibitors (SSRIs)

OR

b. Behavioral therapy (such as cognitive behavioral therapy [CBT])

OR

4. Tonsillectomy and/or adenoidectomy

IV. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers immune globulins coverable only under the medical benefit (regardless of self- or provider-administration).

B. When pre-authorization is approved, immune globulins (as listed in *Table 1*) will be covered in the quantities and for the authorization periods outlined in *Table 3*.

C. Although the use of specific high-cost immune globulin products (as listed in *Table 2*) is considered 'not medically necessary,' if pre-authorization is approved, these immune globulins (as listed in *Table 2*) will be covered:

1. In the quantities and for the authorization periods outlined in *Table 3*.

AND

2. Site of care administration requirements are met [refer to Pharmacy Services Medication Policy Manual, Site of Care Review, dru408].

D. Subcutaneous administration of immune globulin (SCIG) is considered an alternative to intravenous administration of immune globulin (IVIG) and may be considered medically necessary when one of the coverage criteria above is met.

E. For dose requests above the policy limits (as listed in *Tables 1, 2,* and *3*):

1. **IVIG:** Higher doses may be coverable for patients who have clear clinical documentation, including but not limited to chart notes, supporting an objective improvement in symptoms or function while treated with IVIG 2 g/kg per four weeks (or equivalent), and who have maximized adjunctive therapy, but continue to have functional impairment or incomplete disease control.

2. **SCIG:** Doses of SCIG in excess of those listed in *Tables 1 and 2* are considered 'not medically necessary.'

F. The concomitant use of maintenance SCIG and IVIG is considered not medically necessary.

Table 1. Coverable Immune Globulin Replacement Products

Product Name		Route of Administration	Coverable Dose
Carimune NF Flebogamma DIF Gammagard S/D	Octagam Privigen	IVIG	2 grams/kg per 4 weeks (or equivalent)
Gammagard Gammaked	Gamunex C	IVIG or SCIG	2 grams/kg per 4 weeks (or equivalent)
Cutaquig Hyqvia	Xembify	SCIG	2 grams/kg per 4 weeks (or equivalent)
Hizentra		SCIG	0.4 gm/kg per week (or equivalent)

Table 2. 'Not Medically Necessary' Higher-Cost Immune Globulin Replacement Products

Product Name		Route of Administration	Coverable Dose
Alyglo Asceniv Bivigam	Gammaplex Panzyga	IVIG	2 grams/kg per 4 weeks (or equivalent)
Cuvitru		SCIG	2 grams/kg per 4 weeks (or equivalent)

Table 3. Quantity Limits and Authorization Period

Indication [a]	Dosing Schedule
	[a] Hizentra may be authorized up to 0.4 gm/kg/week
Replacement Therapy - Immunodeficiency [with documented hypogammaglobulinemia (low IgG levels) or poor immune response (dysgammaglobulinemia)]	
Primary humoral immunodeficiency disease (PID)	- **Initial Authorization and Continued Authorization:** Up to 2 g/kg per four weeks. - Authorization **may** be reviewed at least every 12 months. - **Reauthorization:** Clinical documentation (including, but not limited to chart notes) must be provided to confirm that the medication is effective, defined as decreased occurrence of infections or normalization of IgG levels. - IVIG doses higher than 2 g/kg per four weeks may be considered when there is documentation of continued severe infections despite IVIG doses of 2 g/kg per 4 weeks. Higher doses of SCIG are not coverable.
Hematologic malignancy-related hypogammaglobulinemia (e.g., CLL, post-BMT)	
HIV+ children with hypogammaglobulinemia	
Hypogammaglobulinemia in neonates	
Hematologic disorders (immune-mediated)	
Acquired Factor VIII Inhibitor	- **Initial Authorization and Continued Authorization:** Up to 2 g/kg per four weeks. - Authorization **shall** be reviewed at least every 52 weeks. - **Reauthorization:** Clinical documentation (including, but not limited to chart notes) must be provided to confirm that the medication is effective, defined as initial response, and continued presence of Factor VIII inhibitor.
Autoimmune hemolytic anemia, (AIHA)	- **Initial Authorization and Continued Authorization:** Up to 2 g/kg per four weeks. - Authorization **shall** be reviewed at least every 52 weeks. - **Reauthorization:** Clinical documentation (including, but not limited to chart notes) must be provided to confirm that the medication is effective, defined as initial response, and recurrence of clinically significant, symptomatic anemia.
Fetal (neonatal) alloimmune thrombocytopenia (FAIT)	- **Initial Authorization:** Up to 2 g/kg per **week** until delivery. - **Continued Authorization:** No reauthorization.
ITP (acute)	- **Initial Authorization:** Up to 2 g/kg total (authorization is for up to 28 weeks). - **Continued Authorization:** No reauthorization (please see ITP [chronic] below for ongoing therapy requests).

Indication [a]	Dosing Schedule
	[a] Hizentra may be authorized up to 0.4 gm/kg/week
ITP (chronic)	- **Initial Authorization:** Up to 2 g/kg per four weeks, up to 28 weeks. - **Continued Authorization:** Up to 2 g/kg per four weeks - Authorization **shall** be reviewed at least every 52 weeks. - **Reauthorization:** Clinical documentation (including, but not limited to chart notes) must be provided to confirm that the medication is effective, with a documented initial response to IVIG and: o Continued thrombocytopenia, defined as a platelet count of < 20,000 OR less than 30,000 cells/m^3 and clinically significant bleeding despite therapy with an alternative chronic therapy. **OR** o Documentation that an alternative chronic therapy has been ineffective, or not tolerated.
ITP in pregnancy	- **Initial Authorization:** Up to 2 g/kg per four weeks, up to delivery. - **Continued Authorization:** No reauthorization (please see criteria for ITP [chronic] for ongoing therapy requests).
Post-transfusion purpura (hemolytic transfusion reaction)	- **Initial Authorization:** Up to 4 g/kg total over up to 4 weeks. - **Continued Authorization:** No reauthorization.
Pure red cell aplasia (PRCA), viral	- **Initial Authorization:** Up to 2 g/kg per four weeks, up to 28 weeks. - **Continued Authorization:** Up to 2 g/kg per four weeks - Authorization **shall** be reviewed at least every 52 weeks. - **Reauthorization:** Clinical documentation (including, but not limited to chart notes) must be provided to confirm that the medication is effective, with documentation of initial response, parvovirus, and recurrence of significant anemia.
Neuroimmunologic disorders	
GBS, Acute inflammatory demyelinating polyneuropathy (AIDP)	- **Initial Authorization:** Up to 2 g/kg per four weeks, up to 12 weeks. - **Continued Authorization:** No reauthorization; please see criteria for Chronic inflammatory demyelinating polyneuropathy (CIDP) for ongoing therapy requests.
Pemphigoid, refractory	- **Initial Authorization:** Up to 2 g/kg per four weeks, up to 26 weeks. - **Continued Authorization:** No reauthorization.
Paraneoplastic opsoclonus ataxia syndrome	- **Initial Authorization:** Up to 2 g/kg per four weeks - Authorization **shall** be reviewed at least every 28 weeks. - **Continued Authorization:** Up to 2 g/kg per 4 weeks. - **Reauthorization:** Clinical documentation (including, but not limited to chart notes) must be provided to confirm that the medication is effective, with documented functional improvement.

Indication [a]	Dosing Schedule
	[a] Hizentra may be authorized up to 0.4 gm/kg/week
Acute demyelinating encephalomyelitis (ADEM) or anti-NMDA receptor encephalitis Chronic inflammatory demyelinating polyneuropathy (CIDP) Lambert-Eaton myasthenic syndrome (LEMS) Multifocal motor neuropathy (MMN) Myasthenia gravis (MG. acute and chronic) Stiff-Person syndrome	- **Initial Authorization:** Up to 2 g/kg per four weeks; up to 28 weeks. - **Continued Authorization:** Up to 2 g/kg per four weeks. - Authorization **shall** be reviewed at least every 52 weeks. - **Reauthorization:** Clinical documentation (including, but not limited to chart notes) must be provided to confirm that the medication is effective, with documented functional improvement.
Dermatomyositis Myositis, including polymyositis and autoimmune myositis Systematic lupus erythematosus (SLE)	- **Initial Authorization:** Up to 2 g/kg per four weeks, up to 28 weeks. - **Continued Authorization:** Up to 2 g/kg per four weeks. - Authorization **shall** be reviewed at least every 52 weeks. - **Reauthorization:** Clinical documentation (including, but not limited to chart notes) must be provided to confirm that the medication is effective, with documented improvement in muscle strength and/or decreased CPK levels.
Transplant (solid organ)	
Prevention of acute rejection (pre- and peri-operative)	- **Initial Authorization:** Up to 2 g/kg per four weeks, up to 12 weeks total. - **Continued Authorization:** No reauthorization. Please see Treatment of antibody (Ab)-mediated (humoral) rejection. -
Treatment of antibody (Ab)-mediated (humoral) rejection	- **Initial Authorization:** Up to 2 g/kg per four weeks, up to 12 weeks total. - **Continued Authorization:** Up to 2 g/kg per four weeks - Authorization **shall** be reviewed after each course (see Reauthorization). - **Reauthorization:** Clinical documentation (including, but not limited to chart notes) must be provided to confirm that one of the following is met: • Persistent rejection: Up to 28 weeks total may be authorized if rejection is persistent, and documentation of a treatment plan has been provided that must include a plan for re-transplantation. • New episode of rejection: Up to 12 weeks total when there is documented improvement from a previous course and confirmation of another episode of rejection.

Indication [a]	Dosing Schedule
	[a] Hizentra may be authorized up to 0.4 gm/kg/week
Other Miscellaneous disorders	
Kawasaki syndrome	- **Initial Authorization:** Up to 4 g/kg total, authorized over an eight-week period. - **Continued Authorization:** No reauthorization
Pediatric intractable epilepsy	- **Initial Authorization:** Up to 2 g/kg per four weeks, up to 28 weeks. - **Continued Authorization:** Up to 2 g/kg per four weeks - Authorization **shall** be reviewed at least every 52 weeks. - **Reauthorization:** Clinical documentation (including, but not limited to chart notes) must be provided to confirm that the medication is effective, with documented significantly reduced frequency and/or duration of seizures.
Post-Exposure prophylaxis against varicella-zoster (VZV)	- **Initial Authorization:** 400 mg/kg as a single dose. - **Continued Authorization:** No reauthorization.
BK Viremia (BK polyomavirus in solid organ transplantation)	- **Initial Authorization:** Up to 2 g/kg total, authorized over a twelve-week period. - **Continued Authorization:** No reauthorization.
PANDAS / PANS	- **Initial Authorization:** Up to 2 g/kg per four weeks, up to 12 weeks (up to 3 months). - **Continued Authorization:** Up to 2 g/kg per four weeks - Authorization **shall** be reviewed at least every 12 weeks (3 months). - **Reauthorization:** Clinical documentation (including, but not limited to chart notes) must be provided to confirm that the medication is effective, with documented significantly reduced severity of symptoms and improvement in functioning. This evaluation must include clinical testing with a validated instrument (see *Appendix 2*), which must be performed pretreatment and posttreatment to demonstrate clinically meaningful improvement.

V. Immune globulin (IVIG/SCIG) is considered investigational when used for all other conditions, including, but not limited to:

1. Acute lymphocytic leukemia
2. Acute renal failure
3. Adrenoleukodystrophy
4. Adult HIV infection
5. Alzheimer's disease
6. Aplastic anemia
7. Asthma
8. Atopic dermatitis
9. Autism
10. Cardiomyopathy, recent-onset dilated
11. Chronic fatigue syndrome
12. Clostridium difficile, recurrent

13. Complex Regional Pain Syndrome (CRPS)
14. Cystic fibrosis
15. Diabetes
16. Diamond-Blackfan anemia
17. Encephalitis, not otherwise specified (in the coverage criteria above)
18. Endotoxemia
19. Heart block, congenital
20. Hemolytic anemia (other than autoimmune)
21. Hemophagocytic syndrome
22. Human T-lymphocyte virus-1 myelopathy
23. Hyper IgE syndrome
24. Immune mediated neutropenia
25. Inclusion body myositis
26. Infectious disease in high-risk neonates and adults following surgery or trauma
27. Lumbosacral plexopathy
28. Narcolepsy/cataplexy
29. Neonatal hemochromatosis
30. Nephropathy, membranous
31. Nephrotic syndrome
32. Neuropathy, not otherwise specified (in the coverage criteria above)
33. Ophthalmopathy, euthyroid
34. Paraproteinemic neuropathy
35. Post-polio syndrome
36. Recurrent spontaneous abortion
37. Rheumatoid arthritis
38. Systemic Sclerosis, diffuse cutaneous (dcSS)
39. Stevens-Johnson Syndrome
40. Still's Disease (Systemic Juvenile Immune Arthritis, SJIA)
41. Surgery or trauma
42. Thrombocytopenia, nonimmune
43. Thrombotic Thrombocytopenic Purpura, including Hemolytic Uremic Syndrome (TTP/HUS), neonatal autoimmune and transfusion refractory.
44. Tic disorder (Based on DSM Criteria)
45. Toxic epidermal necrolysis (TEN)
46. Urticaria, delayed pressure
47. Vasculitic syndromes, other systemic (not specified above), such as antineutrophil cytoplasmic antibody- (ANCA) associated vasculitis [microscopic polyangiitis (MPA)], and eosinophilic granulomatosis with polyangiitis (EGPA) [Churg-Strauss Syndrome (CSS)]
48. Von Willebrand's syndrome

Position Statement

Summary

Intravenous immune globulin (IVIG) [1 2]

- All IVIG preparations are generally considered therapeutically interchangeable.
- Minor immunoglobulin A (IgA) and immunoglobulin G (IgG) subclass differences exist. [32-34]
- IVIG preparations with low IgA content are used to minimize reactions in patients with hypogammaglobulinemia and concurrent IgA deficiency or when anti-IgA antibodies are present in a recipient.
- Differences in formulation may guide product selection (e.g., pre-mixed liquid vs. lyophilized powder, 5% vs. 10%, low sucrose, low osmolarity).
- Given that there are several available IVIG preparations that are generally considered therapeutically interchangeable, the use of significantly more expensive formulations of IVIG are considered not medically necessary and not coverable (i.e., higher-cost immune globulin replacement products as listed in *Table 2*).

Subcutaneous immune globulin (SCIG) [1]

- All immune globulin products for subcutaneous (SC) use are approved for patients with primary immune deficiency (PID). They are available as 16.5% or 20% solutions for weekly SC infusion or as a 10% solution (Hyqvia) for monthly SC infusion.
- Some immune globulin products for intravenous (IV) use may also be for SC administration (see *Tables 1 and 2* above).
- Multiple injection sites (three to eight) are necessary for weekly infusion (all SCIG in *Tables 1 and 2*, excepting Hyqvia) for an average patient because of the volume that must be infused. Hyqvia 10% is formulated with hyaluronidase, to allow for larger volume infusion at a single injection site, dosed monthly.
- SCIG has a lower bioavailability than IVIG, so must be given in higher doses to achieve the same serum IgG concentrations. With exception of Hyqvia, all SCIG formulations require a dose increase versus IVIG.
- However, SC delivery may result in higher steady-state IgG levels due to less variation in IgG levels.
- Most of these products have not been approved for SC administration for any indication, other than PID. Because other diagnoses usually require larger doses (based on grams per kilogram) with a high volume per dose, SC administration is generally not feasible. Therefore, use of SCIG in excess of the doses listed in the Quantity Limits (*Tables 1 and 2*) is considered "not medically necessary." Higher doses of immune globulin replacement therapy may be given with intravenous (IVIG) products.
- Injection site swelling, redness, and itching were reported in the majority of patients.
- Given that there are several available SCIG preparations that are generally considered therapeutically interchangeable, the use of significantly more expensive formulations of SCIG are considered not medically necessary and not coverable.

Dosing Considerations and Therapeutic Levels for Replacement Therapy for Treatment of Immunodeficiency with Hypogammaglobulinemia [3]

- Dosing adjustment in replacement therapy is based on clinical response and IgG levels.
    * The trough or steady state IgG level is obtained before scheduled infusions and frequently guides immune globulin replacement therapy (IVIG/SCIG) dose selection.
    * The minimum serum concentration of IgG necessary for protection has not been firmly established. However, maintenance of serum trough IgG levels above 500 mg/dL has been considered a sufficient target to prevent most systemic infections. Some patients may require a higher IgG level for protection.
- Immune globulin replacement therapy is a blood product and by nature, in limited supply and costly to prepare and administer. Long toxicity associated with immune globulin replacement (IVIG/SCIG) therapy includes potential risk of renal toxicity and thrombotic events. As such, use of immune globulin replacement therapy should be limited to specific conditions with proven benefit, when diagnostic criteria are met, and used by, or in consultation with, appropriate subspecialists.
- Dosing of immune globulin replacement therapy for conditions other than hypogammaglobulinemia do NOT require monitoring of IgG levels. Efficacy in conditions other than hypogammaglobulinemia is based on clinical response, including improvement or resolution of disease symptoms, up to the maximum covered dose (per the Quantity Limits above).

Clinical Efficacy

IMMUNODEFICIENCY (Primary or Secondary) - Replacement Therapy for Hypogammaglobulinemia

Primary humoral immunodeficiency diseases [1 3 4]

- All available immune globulin replacement products are FDA-approved for use in primary immunodeficiency (PID).
- X-linked agammaglobulinemia (congenital agammaglobulinemia) occurs in male infants, usually presenting in the first 3 years of life.
- Common variable immunodeficiency (CVID; acquired hypogammaglobulinemia; adult onset hypogammaglobulinemia; dysgammaglobulinemia) is characterized by low to normal IgG levels and inability to produce an antibody response to protein (e.g., tetanus) or carbohydrate antigens (e.g., Pneumovax). Most patients experience severe recurrent and/or chronic infections.
- Combined immunodeficiency syndromes, including Wiskott-Aldrich syndrome, are rare, inherited syndromes.
- Immunoglobulin reference ranges vary depending on the age of the patient and the particular assay method used. The usual immune globulin maintenance dose is 100-800mg/kg/month and therapy is usually life-long.

- Hypogammaglobulinemia in neonates [5]
    * Treatment with IVIG is usually reserved for patients with recurrent severe infections, not responding to antibiotic prophylaxis.
    * The usual IVIG dose is 400 – 600 mg/kg/month, administered as a single dose, or up to several months in duration.

Acquired Deficiencies:

- Hematologic malignancy-related hypogammaglobulinemia (including B-cell cancers, multiple myeloma, and post-bone marrow transplant (BMT). [6 7]
    * Use of immune globulin replacement in hypogammaglobulinemia patients with B-cell cancers (including CLL), multiple myeloma and post-allogeneic bone marrow transplant (BMT) is supported by guidelines.
    * IVIG therapy reduces the incidence of bacterial infections in patients with hematologic malignancies and secondary hypogammaglobulinemia.
    * Previously, use of IVIG prophylaxis post-BMT was common for prevention of graft versus host disease (GVHD); however, with improved immunosuppressant regimens, the use of routine IVIG prophylaxis is no longer supported.
    * Monthly IVIG infusions of 400 mg/kg are recommended to maintain the serum IgG level.
- HIV-infected children < 13 years of age[8]
    * Current guidelines recommend IVIG use among HIV-infected children who have hypogammaglobulinemia (IgG <400 mg/dL), to prevent serious bacterial infections (SBIs).
    * IVIG is no longer recommended for primary prevention of SBIs in children, unless hypogammaglobulinemia is present. During the pre-HAART (highly-active antiretroviral therapy) era, IVIG was shown to decrease the frequency of bacterial infections and hospitalization in children with AIDS, however only in those not receiving daily Pneumocystis carinii pneumoniae (PCP) prophylaxis.

AUTOIMMUNE (IMMUNE-MEDIATED) DISORDERS

- Pooled immune globulin (IVIG) has been studied and found to be useful in a variety of autoimmune disorders, including hematologic, neuromuscular and infectious disease-related diseases. However, given the rarity of many of these disorders, the evidence for safety and efficacy in some diagnoses is insufficient at this time.
- The mechanism of action of IVIG in autoimmune disorders is thought to include acute neutralization of circulating autoantibodies, toxins, and cytokine modulation, as well as long-term reduction of antibody production and suppression of T-cell cytokines.

Hematologic (immune-mediated) Disorders: [6]

Acquired Factor VIII inhibitor [9-14]

- A sufficient treatment course is usually 6-12 weeks before attempting a different immunosuppressive agent. Patients are generally treated until remission (elimination of the inhibitor) occurs, which may take several months.

- Treatment regimens of 1 gm/kg for 2 days or 400 mg/kg for 5 days have been studied. In one study, only 6 of 19 patients responded to IVIG within 40 days of treatment.

Fetal (neonatal) alloimmune thrombocytopenia (FAIT): [15 16]

- ACOG guidelines recommend IVIG as first line treatment for documented fetal thrombocytopenia.
- A trial comparing IVIG treatment with and without dexamethasone in siblings showed that:
  * IVIG treatment was associated with an increase in mean platelet count of 69,000/mm^3.
  * There were no instances of intracranial hemorrhages, although hemorrhage had occurred previously in 10 untreated siblings.
- The recommended dose of IVIG is 1 gm/kg/week, increasing to 2 gm/kg/week in refractory cases.

Idiopathic thrombocytopenia purpura (ITP) [6 17-20]

- Normal platelet count range is 115,000/mm^3 to 440,000/mm^3.
- Acute ITP
  * Acute ITP is usually seen in children and typically resolves spontaneously within 2 months.
  * Approach to management of children with observation, steroids, and/or IVIG is based on severity and type of bleeding (such as mucosal versus non-mucosal).
  * In various studies, a majority of IVIG recipients attained platelet counts greater than 100,000 cells/mm^3 within 7 days.
  * A maximum of 1 gm/kg/day for three or four doses of IVIG on alternate days is recommended.
- Chronic ITP
  * Current evidence does not support that IVIG alters the natural course of chronic ITP, affects long-term morbidity/mortality, or increases the rate of long-term remission.
  * IVIG is not indicated for the maintenance of platelet counts in chronic ITP; however, IVIG maybe be used episodically in patients with chronic ITP, for acutely low platelet levels.
  * Steroids are considered the first-line treatment of choice for chronic ITP. Although the use of IVIG may be considered as a steroid-sparing adjunctive therapy for chronic ITP, other therapies with a more durable response should be considered, such as splenectomy, rituximab, Promacta (eltrombopag) or Nplate (romiplostim).
  * IVIG may be considered in patients with dangerously low platelet counts (less than 10,000 to 20,000 per mm^3 in adults or less than 30,000 per mm^3 in children) or patients undergoing an invasive procedure, and therefore may be at an increased risk for significant bleeding, such as intracranial hemorrhage.

    * Choosing Wisely, an evidence-based initiative to promote wise use of medical resources, states that patients with ITP should not be treated in the absence of bleeding or a very low platelet count. Only rarely should patients be treated when platelet counts are above 30,000, such a preparation of surgery or an invasive procedure. Unnecessary treatment exposes patients to potential adverse events and raises the overall cost of care, with unknown clinical benefit. [20]
    * The usual dose of IVIG is 1 to 2 gm/kg divided into equal amounts and given over 2 to 5 days.

- ITP in pregnancy (a.k.a. Pregnancy-Associated ITP) [6 15 19]
    * The goal of therapy is to minimize the risk of bleeding complications due to thrombocytopenia.
    * Platelet function is typically normal, so it is not necessary to maintain platelet count in the normal range.
    * The first line of treatment is prednisone, usual dose 1-2 mg/kg/day.
    * IVIG is useful in cases that are resistant to steroids and when a rapid rise in platelets is necessary. A response typically occurs within 6 – 72 hours of IVIG treatment.
    * For patients nearing the end of their pregnancy and preparing for use of epidural anesthesia, IVIG coverage will be considered under "ITP, acute" criteria, for use prior to an invasive procedure. Because the evidence is less useful in determining the exact threshold platelet levels needed for prevention of bleeding, the use of IVIG is generally at the discretion of the treating anesthesiologist or surgeon, and pregnant patients are managed like non-pregnant patients.
    * The American College of Obstetrics and Gynecology (ACOG) recognizes the high cost of IVIG therapy and suggests consultation from a physician experienced in the treatment of ITP when considering use of IVIG therapy.
        ▪ Guidelines recommend that, except for the delivery, treatment indications for pregnant women are similar to those currently recommended for any patient.
        ▪ At the time of delivery, management of ITP is based on an assessment of maternal bleeding risks associated with delivery, epidural anesthesia, and the minimum platelet counts recommended to undergo these procedures (80 X 10^9/L for epidural placement and 50 X 10^9/L for cesarean delivery)

<u>Post-transfusion purpura</u> (hemolytic transfusion reaction) [19 21]

- Post-transfusion purpura is a rare condition that can occur in patients undergoing blood transfusions. It typically develops approximately one-week after blood transfusion.
- IVIG may be considered first-line therapy in severely affected patients.
- The recommended dose of IVIG is 500 mg/kg/day for two consecutive days. Rapid platelet recovery has been seen within days of treatment.

Pure Red Cell Aplasia (PRCA), Viral [19 22]

- Parvovirus B19 infects and lyses red cell precursors, which can cause pure red cell aplasia. IVIG therapy is usually reserved for patients with chronic parvovirus infection and chronic anemia.
- Chronic parvovirus infection with anemia usually occurs in immunocompromised patients. If the immunodeficiency improves, the parvovirus and anemia may spontaneously resolve.
- The usual dose of IVIG is 2-4 grams/kg, divided as 400 mg/kg/day for 5 – 10 days, 1 gm/kg/day for 3 days or 0.5 gm/kg weekly for 4 weeks. Initial treatment courses may be indicated with recurrence of anemia and increase in parvovirus B19 DNA.

Neuromuscular Disorders:

Inflammatory demyelinating polyneuropathy (IDP) [23-28]

- Guillain-Barré syndrome (GBS) and Acute IDP[22,23, 90][23-25]
    * Diagnostic criteria for GBS include all of the following:
        - Progressive weakness of the extremities, the trunk, bulbar and facial muscles, and external ophthalmoplegia.
        - Reduction or absence of deep tendon reflexes in weak limbs.
        - Presence of demyelination on electrodiagnostic studies may be present but is not required for the diagnosis of GBS.
    * IVIG appears to be effective in adult patients with Guillain-Barré syndrome when given within 2 weeks of symptom onset.
    * The recommended IVIG dose is 400 mg/kg/day for 5 days. If relapse occurs within 1-2 weeks of initial therapy, an additional treatment course of IVIG may be effective. Further treatment does not improve outcomes and is not recommended.
- Chronic IDP (CIDP)[26-28]
    * Clinical guidelines recognize the use of specific diagnostic criteria for CIDP, to exclude other causes of neuropathy and confirm the presence of peripheral nerve demyelination.
        - Objective criteria include use of electrodiagnostic (EMG) testing, along with additional studies, such as nerve biopsy or lumbar puncture (LP) to confirm elevation of CSF protein.
        - Given the lack of consensus across guidelines and need to exclude neuropathies unlikely to respond to IVIG therapy, use of objective criteria are required to support a clinical diagnosis of CIDP.
    * Treatment options include plasmapheresis, IVIG, and corticosteroids.
    * The usual IVIG dose is 400 mg/kg/day for 5 days, repeated every 6 weeks.

Autoimmune encephalitis: acute demyelinating encephalomyelitis (ADEM) or anti-NMDA receptor encephalitis

- Immune-mediated encephalitis is relatively rare and include ADEM and encephalitis syndromes associated with antibodies against neuronal tissue, such as anti-NMDA receptor encephalitis.

- The differential diagnoses list for autoimmune encephalitis is extensive and may include diagnoses considered investigational in this policy. Therefore, IVIG is considered not coverable, until the diagnosis is clarified.

Acute demyelinating encephalomyelitis (ADEM) [29]

- ADEM can be associated with various neurologic and psychiatric symptoms, including cognitive and speech dysfunction, seizures, dyskinesias, altered consciousness, and autonomic instability.
- High-dose IV corticosteroid therapy is considered the first-line treatment for ADEM, with IVIG or plasma exchange reserved for patients not responding to steroid therapy.
- The usual IVIG dose is 400 mg/kg/day for 5 days.

Anti-NMDA receptor encephalitis (anti-NMDAR)[29 30]

- Anti-NMDA receptor encephalitis is a specific type of autoimmune encephalitis, diagnosed by detection of IgG antibodies against a subunit of NMDA receptors in serum or CSF. It can be associated with various neurologic and psychiatric symptoms, including cognitive and speech dysfunction, seizures, dyskinesias, altered consciousness, and autonomic instability.
- The diagnosis of anti-NMDAR is confirmed by very specific testing, IgG antibodies to the GluN1 (also known as NR1) subunit of the NMDA receptor in CSF. However, given access to testing and delays in results, available standard diagnostic tests can support the diagnosis, including CSF, EEG, and brain MRI.
- Based on large case series and years of experience in clinical practice, use of immunosuppression therapy is the standard of care, with corticosteroids, IVIG, plasma exchange, cyclophosphamide, or rituximab. IVIG (400 mg/kg/day for 5 days) in combination with high-dose methylprednisolone or plasma exchange may be useful in treating patients with anti-NMDA receptor encephalitis in the first-line setting. Rituximab and/or cyclophosphamide may be of benefit in patients not responding to IVIG and steroids within 10 days. Children are generally managed with monotherapy (cyclophosphamide or rituximab).

Dermatomyositis (DM), adult and pediatric (juvenile)[26 31-34]

- High-dose IVIG is a safe and effective treatment for refractory dermatomyositis unresponsive to corticosteroid therapy. [26 31 32]
- For adults, abnormalities on EMG or elevations in CPK are accepted diagnostic criteria.
- Juvenile dermatomyositis (JDM) is characterized by a vasculopathy affecting both the muscle and the skin. For pediatric patients, a number of muscle enzymes, including CPK, LDH, AST or aldolase, may be used to confirm the diagnosis. Myositis may also be confirmed by an abnormal muscle biopsy, EMG or MRI. Children can also have specific skin manifestations associated with the dermatomyositis, including Gottron papules on the dorsal surface of the knuckles and heliotrope rash over the eyelids.[33]
- The recommended IVIG dose is 2 gm/kg per month.

Lambert-Eaton myasthenic syndrome (LEMS)[26 31 35]

- LEMS is a rare acquired autoimmune disorder characterized by proximal weakness of extremities, decreased reflexes, and dryness of mouth and eyes.
- IVIG improved limb, respiratory muscle, and bulbar muscle strength in a small, randomized trials. [34]
- The recommended dose of IVIG is 2 gm/kg administered over 2 – 5 days.

Multifocal motor neuropathy (MMN) [31 36-43]

- MMN is a progressive neuropathy with asymmetric, distal weakness of at least one limb, upper extremities more frequently than lower extremities.
- Small, controlled trials demonstrate significant increase in muscle strength associated with IVIG administration, long-term benefits, and safety (44 patients across four small trials of IVIG induction therapy as compared to placebo). [36-40]
- The recommended IVIG dose is 2 gm/kg/month, administered over 2 – 5 days.[31 42]
- Additionally, patients with anti-GM1 antibodies show an increased chance of response to IVIG. However, anti-GM antibodies are present in only 30-80% of patients with MMN and are not specific to MMN. In addition, patients who lack anti-GM1 antibodies may have a favorable response to IVIG; therefore, the clinical utility of monitoring anti-GM1 antibodies is uncertain. [41]

Myasthenia gravis (MG) [26 44 45]

- IVIG may be useful in treating patients with severe myasthenia gravis acutely, or as maintenance therapy for patients who fail to respond to the maximum tolerated doses of corticosteroids and/or immunosuppressants.
- Randomized trials examining short-term treatment of myasthenia gravis with IVIG have shown no difference between IVIG and plasma exchange or IVIG and methylprednisolone.
- There is no evidence to determine whether IVIG improves function or reduces steroid requirements for moderate to severe myasthenia gravis.
- The recommended dose of IVIG is 1 – 2 gm/kg/month administered over 2 – 5 days.

Opsoclonus-myoclonus ataxia (OMA)

- Opsoclonus-myoclonus ataxia (OMA) is a rare neurological syndrome characterized by an unsteady gait, brief shock-like muscle spasms, and irregular rapid eye movements and can be a paraneoplastic (e.g., with neuroblastoma) or non-paraneoplastic syndrome.
- Evidence supporting the use of IVIG for OMA consists mainly of retrospective chart reviews and case reports in children and adults. [46]
- However, one randomized phase 3 placebo-controlled trial for the use of IVIG for children with opsoclonus-myoclonus associated with neuroblastomas found a reduction in OMA in the IVIG-treated group as compared to placebo (81 versus 41%). All patients received steroids and chemotherapy. IVIG was dosed 1 gm/kg on days 0 and 1 of each 28-day cycle.[48]

Pemphigoid bullous (e.g., pemphigus foliaceus, pemphigus vulgaris) [34 49]

- IVIG is typically given in refractory disease, in combination with conventional treatments, such as immunosuppressive agents and plasmapheresis, and is discontinued once conventional treatment (such as corticosteroids, azathioprine, cyclophosphamide, etc.) takes effect. IVIG is not considered a maintenance therapy for pemphigus foliaceus, pemphigus vulgaris or other autoimmune mucocutaneous blistering diseases.
- The usual dose of IVIG is 1-2 gm/kg administered over 3 days. This regimen may be repeated every 3-4 weeks.

Polymyositis 24, 25, 32[26 31 32]

- Polymyositis is an inflammatory myopathy with no unique clinical features. It is typically a diagnosis of exclusion in patients with slowly progressive muscle weakness.
- Traditional therapies include immunosuppressive medications or steroids.
- IVIG may be considered for patients not responding to first-line immunosuppression.
- The recommended dose of IVIG is 2 gm/kg/month administered over 2 – 5 days.

Stiff Person Syndrome 24, 44 [26 50]

- Sixteen patients were randomized to IVIG or placebo for 3 months, and then crossed over to the alternate treatment after a 1-month washout period. IVIG patients demonstrated decreased stiffness scores, decreased frequency of falls, ability to walk more easily without assistance, and improved ability to perform work-related tasks. Benefits lasted 6 weeks to 1 year without additional treatment.
- The usual dose of IVIG is 400 mg/kg/day for 3 – 5 days.

Systemic Lupus Erythematosus

- Small case series suggest some benefit from treatment with IVIG when compared to cyclophosphamide.
- The usual dose of IVIG is 400 mg/kg/day for 5 days.

Transplant (Solid Organ):

Antibody-mediated rejection (AMR) 45-47 [51-53]

- Acute allograft (organ) rejection may be cellular (T-cell mediated) or humoral (antibody-mediated) (AHR, AMR).
- The standard for diagnosis of rejection is a transplant biopsy. [52]
- Pre-treatment with IVIG (desensitization) may reduce the risk of AMR in “highly sensitized” renal and/or heart transplant patients, also referred to as “with donor specific antibodies (DSAs” [52 53]
- A randomized, double-blind trial comparing IVIG to placebo in 101 highly sensitized renal transplant candidates concluded that IVIG is better than placebo in improving transplantation rates. [51]
- Acute humoral rejection (AHR) is also an AMR and can occur outside of the peri-operative period, but most commonly within 6 months after transplant. The diagnosis is confirmed by a renal biopsy. The goal of therapy is early antibody elimination with IVIG, pheresis, or a combination of modalities.

- A variety of protocols have been developed for the use of IVIG in treating AMR after solid organ transplant. [52 53]

Other Miscellaneous Disorders:

Kawasaki syndrome][54 55]

- IVIG in conjunction with aspirin given within the first 10 days of illness can reduce the incidence of coronary artery abnormalities, compared with treatment with aspirin alone. IVIG is not effective if more than ten days have elapsed from onset of symptoms.
- The usual dose of IVIG is 2 gm/kg as a single dose but may be repeated if the patient fails to defervesce.

BK viremia (BK polyomavirus in solid organ transplantation) [56-59]

- The American Society of Transplantation Infectious Diseases Community of Practice (AST-IDCOP) recommends a stepwise reduction of immunosuppressive therapy until serum BK levels are no longer detectable. Although there are no randomized controlled trials, this approach is supported by a meta-analysis and a number of large prospective observational studies reporting successful clearance BK virus in 80% to 100% of cases.
- Reduction of immunosuppressants is often done in a stepwise fashion:
    * Immunosuppressants for solid organ transplants include calcineurin inhibitors (such as cyclosporine and tacrolimus), antimetabolites (such as azathioprine and mycophenolate), and steroids (prednisone).
    * Immunosuppression reduction may begin with a reduction of either the calcineurin inhibitor or antimetabolite by 50%, eventually leading to a discontinuation of the antimetabolite.
- The highest IVIG dose studied in BK viremia was 2g/kg, given over several days to weeks. The optimum dose, frequency, and duration for IVIG use in BK viremia varies greatly and needs further evaluation. However, there is no evidence to support higher, longer, or repeated doses of IVIG.
- Pediatric Autoimmune Neuropsychiatric Disorders Associated with Streptococcal Infections (PANDAS) / Pediatric Acute-onset Neuropsychiatric Syndrome (PANS) [60-64]
    * PANDAS/PANS are syndromes with an abrupt onset of symptoms and associated temporally with a Group A beta-hemolytic streptococcal infection. The symptoms generally are abnormal behavioral (neurologic and psychiatric in nature) and may include obsessive-compulsive disorder (OCD), tic disorders (verbal or motor), and cognitive issues. Other symptoms may include emotional symptoms (e.g., anxiety, emotional lability, irritability, aggression, oppositional behaviors), reduced performance in school (related to deficits in attention and memory, hyperactivity, and cognitive changes), sensory or motor abnormalities, and somatic symptoms (sleep disturbance, enuresis, or urinary frequency). [64]
    * A recent consensus statement from the PANS Research Consortium indicates that IVIG has been used in clinical practice for PANS/PANDAS; however, this statement also acknowledged the lack of high-quality evidence in this area. [60 62]
    * There is currently insufficient evidence that IVIG is more effective than any other approach for treatment of for PANS/ PANDAS. Case series and case

reports, as well as initial low-quality studies in small numbers of subjects, have suggested that IVIG may be efficacious in PANS/PANDAS. However, good quality, randomized, double-blinded trials have failed to show any significant difference between IVIG and placebo during the blinded study period. [61 63] Any recommendation for treatment is based on very low-quality evidence, including expert opinion and lower-quality observational data. [64]

* Of note, there is a lack of consensus among experts that PANDAS is an autoimmune disorder. As such, use of immunomodulators is not universally recommended and some experts caution against their use. [63]

* Because the safety and efficacy of IVIG remains inconclusive, the use of IVIG is coverable for PANS/PANDAS only when: [64]
  - PANS/PANDAS is diagnosed by a subspecialist (such as a pediatric neurologist, pediatric psychiatrist, neurodevelopmental pediatrician, pediatric rheumatologist, pediatric allergist/immunologist) and
  - IVIG use is endorsed by the primary care provider (such as a family physician or pediatrician) and
  - An appropriate clinical trial of less intensive treatments is ineffective for sustained reduction in symptoms. Less intensive treatments investigated for management of PANDAS/PANS include antimicrobials, anti-inflammatories, and psychoactive therapies:
    * Antimicrobials: short-course antibiotic therapy for confirmed Group A beta-hemolytic strep infection (14-day course, minimum).
    * Anti-inflammatory therapies: initial therapy with nonsteroidal anti-inflammatory drugs (NSAIDs) for 5-7 days. Corticosteroids may be used if suboptimal response to NSAIDs (sufficient course).
    * Psychoactive therapies: selective serotonin reuptake inhibitors (SSRIs) and/or behavioral therapy [such as cognitive behavioral therapy (CBT), or
    * Given lack of clearly recommended specific treatments by guidelines among a large variety of available of less intensive treatment options available, IVIG is coverable only when <u>at least</u> two of these listed above are ineffective, as detailed in the coverage criteria.
    * Plasma exchange (PLEX), tonsillectomy, and adenoidectomy are also treatment options in this setting, which are not required but may be considered valid prior step therapies.
  - A baseline evaluation is completed and includes detailed documentation of neuropsychiatric symptoms and associated functional impairment. Clinical testing with a validated instrument must be performed pretreatment and posttreatment to demonstrate clinically meaningful improvement (see *Appendix 2*). Use of non-validated instruments are not sufficient (see *Appendix 3*).

INVESTIGATIONAL CONDITIONS

- The University Hospital Consortium (UHC), an alliance of 68 academic health centers, performed a critical assessment of off-label IVIG uses.
- The UHC determined published data to be inadequate to support the use of IVIG in various conditions. [65]
- Asthma: Further trials in asthma patients are necessary to delineate patient subsets that would best benefit from IVIG therapy and define optimal dosing in this condition. [66-69]
- HIV (adults): The use of IVIG in HIV-infected adults is not definitive to substantiate a positive benefit on overall long-term health outcomes. [70]
- Multiple sclerosis, progressive: There is not substantial evidence to support IVIG in the treatment of chronic progressive multiple sclerosis. [71 72]
- Multiple sclerosis; relapsing-remitting type (RRMS): IVIG may provide some benefit in reducing the acute exacerbation rate in relapsing-remitting multiple sclerosis.[73]
    * Trials are generally limited to small numbers of patients and have lacked complete data on clinical outcomes.
    * Current evidence suggests little benefit with regard to slowing disease progression.
    * The American Academy of Neurology does not consider IVIG to be a first-line therapy in the treatment of relapsing-remitting multiple sclerosis. Instead, disease modifying therapies (DMTs) should be initiated (see *Medications for Multiple Sclerosis Policy* in *Cross Reference*s for more information).
- Neuropathy, other (not listed in the criteria): Other neuropathies, such as small fiber neuropathy and autonomic autoimmune neuropathy NOS
    * The differential diagnoses list for neuropathy is extensive and may include diagnoses considered investigational in this policy.
    * Therefore, IVIG is not coverable until the diagnosis is clarified, for evaluation versus coverage criteria.
    * *Specific to small fiber neuropathy*: The available literature for the use of IVIG for small fiber neuropathy is limited to case reports/case series,[74] along with two small double-blind, placebo-controlled trials in patients with small fiber neuropathy (SFN), one with painful idiopathic small fiber neuropathy (I-SFN)[75] and a more recent trial with SFN associated with two autoantibodies, trisulfated heparin disaccharide (TS-HDS) and fibroblast growth factor receptor 3 (FGFR-3). [76]
        - Available case reports/ case series reported inconsistent and transient results. [74]
        - The trial in idiopathic SFN reported no significant effect on pain in patients with painful I-SFN with use of IVIG. It would require 10 patients to be treated for a single person to have a 1-point change in an 11-point pain scale. Disease modification effect was not measured. [75]

- The trial in SFN and autoantibodies to TS-HDS and FGFR-3 did not find a benefit with use of IVIG versus placebo.[76]
- Therefore, given that lack of meaningful benefit, the use of IVIG for small fiber neuropathy is considered investigational and not coverable.
- The underlying cause needs to be treated (such as sarcoid, diabetes, Sjogren).
- Pain treatment options include antidepressants [tricyclics (TCAs), serotonergic norepinephrine reuptake inhibitors (SNRIs)], anticonvulsants, corticosteroids, topical pain cream, analgesics, and tramadol.

* *Specific to autoimmune neuropathy* (a.k.a. immune-mediated neuropathy): [77-79]
  - The diagnosis of autoimmune neuropathy, including autoimmune autonomic neuropathy, requires exclusion of other immune-mediated neuropathy causes, such as Guillain-Barre Syndrome (GBS), demyelinating polyneuropathy, and multifocal motor neuropathy (MMN).
  - For autoimmune neuropathy associated with systemic autoimmune disease (such as vasculitis, rheumatoid arthritis, lupus, Sjogren syndrome), the underlying cause needs to be treated.
  - The available literature for the use of IVIG for autoimmune autonomic neuropathy is limited to case reports/case series and one recent small RCT in chronic residual peripheral neuropathy in microscopic polyangiitis (no clear benefit of IVIG).[79] Other reported treatment options include mycophenolate, prednisone, azathioprine, and rituximab alone or in combination. Additional evidence is needed to establish the benefit of IVIG.
* *Paraproteinemic neuropathy:* neuropathies associated with a monoclonal gammopathy or paraprotein, including IgG or IgA paraproteinemic neuropathy. Insufficient evidence is available to establish benefit from IVIG. [80]

- Optic neuritis (ON): There is insufficient evidence for the use of IVIG for optic neuritis.[81 82]
  * Optic neuritis is characterized by acute monocular visual loss. Demyelinating optic neuritis is a frequent condition in patients with a diagnosis of multiple sclerosis. Optic neuropathies due to other conditions are numerous and addressed elsewhere.
  * The use of IVIG for optic neuritis is not supported by available evidence. One small RCT (n=32) failed to demonstrate a statistically significant benefit in improvement of the primary endpoint of logarithm of the minimum angle of resolution (logMAR), a measure of visual acuity as compared to IV methylprednisolone ("steroid pulse") for steroid-resistant ON.[81]
  * At this time, the standard of care treatment for steroid-resistant ON in patients with abnormal brain MRIs is initiation of disease-modifying therapies (DMTs) for clinically isolated syndromes (CIS) suggestive of MS.

- Post-Polio: Trials of IVIG for post-polio syndrome failed to demonstrate a statistically significant benefit in improvement of muscle strength. [83]
- Recurrent pregnancy loss, or recurrent spontaneous abortion (due to anti-phospholipid or anti-cardiolipin antibodies): [84-87]
    * Recurrent pregnancy loss is defined as three or more pregnancies resulting in spontaneous abortion prior to 20 weeks of gestational age. These women often have immunologic abnormalities, particularly antiphospholipid antibodies.
    * IVIG has not been established as a safe or effective therapy to prevent recurrent spontaneous abortion in women with immunologic abnormalities, such as elevated natural killer cells, defective cytokines, or defective growth factors. [84]
    * One randomized controlled trial comparing IVIG to thyroid replacement therapy for the prevention of miscarriages found IVIG to be less effective. There was a statistically significant higher rate of live birth among women treated with thyroid replacement therapy. [85]
    * A small randomized controlled trial in 85 women with a history of three or more spontaneous abortions before 10 weeks of gestation compared low molecular heparin (LMW) plus aspirin with IVIG therapy. The percentage of live births in the LMW plus aspirin versus the IVIG treatment group was 72.5% and 39.5%, respectively. [86]
    * A randomized controlled trial in 82 women with a history of idiopathic secondary miscarriage compared live birth rates in those who received IVIG versus placebo infusion (saline). There was no statistical difference between treatment groups. [[84]
    * ACOG recommendations state:[87]
        - If results are positive for the same antibody on two consecutive tests 6 to 8 weeks apart, initiate heparin and low-dose aspirin with next pregnancy attempt.
        - IVIG is not effective in preventing recurrent pregnancy loss.
- Additional conditions for which published data is determined to be inconclusive or inadequate to support the use of IVIG include Alzheimer's disease, atopic dermatitis, recurrent *C. difficile*, complex regional pain syndrome (CRPS), narcolepsy/cataplexy, neonatal hemochromatosis, chronic sinusitis, tic disorder, delayed pressure urticaria, systemic sclerosis (diffuse cutaneous, dcSS) and toxic epidermal necrolysis[88-98]

Appendix 1: Primary Humoral Immunodeficiencies, as defined by the following diagnostic criteria:
1. X-linked agammaglobulinemia (congenital agammaglobulinemia) diagnosis accompanied by marked deficits or absence of all five immunoglobulin classes (IgG, IgM, IgA, IgE, and IgD), decreased circulating B lymphocytes, and normal numbers of functioning T lymphocytes. **OR** **2.** Hypogammaglobulinemia (a general term describing serum levels of IgG which are below the lower limits of normal). **OR** **3.** Common variable immunodeficiency (CVID; acquired hypogammaglobulinemia; adult onset hypogammaglobulinemia; dysgammaglobulinemia) documented with low to normal IgG levels and the inability to produce an antibody response to protein (e.g., tetanus) or carbohydrate antigens (e.g., Pneumovax). **OR** **4.** Immunoglobulin subclass deficiency (e.g., X-Linked immunodeficiency with hyper-IgM) accompanied by very low serum concentrations of IgG, IgA, and IgE, with normal or, more frequently, greatly elevated polyclonal IgM concentrations. **OR** **5.** Combined immunodeficiency syndromes, including Wiskott-Aldrich syndrome, accompanied by marked deficits in IgG, IgA and IgM, low lymphocyte counts, and absent or below normal levels of both B- and T-lymphocytes.

Appendix 2: Validated Neuropsychological Tests for PANS/PANDAS[64]	
Assessment of:	**Validated Test**
Motor and vocal tics, obsession and compulsion	• Children's Yale–Brown Obsessive Compulsive Scale (CY- BOCS) for presence and severity of motor and vocal tics • Yale Global Tic Severity Scale (YGTSS) for presence and severity of child's obsession and compulsion
Anxiety	Multidimensional Anxiety Scale for Children (MASC) for the presence and types of child's anxiety symptoms for ages 8 to 19 years.
Short-term memory and attention	• Digit Span subtest Wechsler Intelligence Scale for Children for verbal short-term memory for ages 6 to 16 years • Coding subtest Wechsler Intelligence Scale for Children for visual-motor dexterity and nonverbal short-term memory for ages 6 to 16 years; and • Symbol Search subtest Wechsler Intelligence Scale for Children for accuracy, attention and concentration for ages 6 to 16 years.
Processing speed	Processing Speed Index Wechsler Intelligence Scale for Children (WISC III-IV) for speed of cognitive processes and response output on visual-motor tasks for ages 6 to 16 years
General	Global Impairment Score scale to measure impairment in children and adolescents

Appendix 3: Other Neuropsychological Tests (non-validated) [64]	
Assessment of:	**Test**
General	• Achenbach System of Empirically Based Assessment (ASEBA),19 Mini international neuropsychiatric interview (M.I.N.I.- KID) or equivalent - general assessment of psychiatric conditions • Child and Adolescent Trauma Screen (CATS) for trauma screening • Children's Global Assessment Scale (C- GAS) for general functioning • Clinical Global Impression- Severity Scale (CGI- S) for severity of the patient's illness at time of assessment • Pediatric Quality of Life Inventory (PedsQL) for quality of life • Work and Social Adjustment Scale (WSAS) 2 for impaired functioning • KIDSCREEN for subjective health and well- being
Anxiety	The Screen for Child Anxiety Related Disorders (SCARED)
Executive Function	Behavior Rating Inventory of Executive Function (BRIEF)
Screening for psychiatric diagnoses	Kiddie Schedule for Affective Disorders and Schizophrenia (Kiddie- SADS)
Inattention, hyperactivity and impulsivity	ADHD rating scale (ADHD- RS)

Revision History

Revision Date	Revision Summary
9/19/2024	Effective 1/1/2025, moved Hyqvia from Table 2 ('Not Medically Necessary' Higher-Cost Immune Globulin Replacement Products) to Table 1 (Coverable Immune Globulin Replacement Products).
6/20/2024	New IVIG product, Alyglo (immune globulin intravenous, human-stwk), added to policy as medically necessary.
3/21/2024	Effective 3/21/2024: • Clarification of the following criteria: - Multifocal motor neuropathy (MMN) diagnostic criteria, for operational consistency. - Myasthenia gravis (MG) step therapy criteria, to align with other medication policies for MG for administrative consistency (no change to intent of coverage criterion). - PANDAS/PANS step therapy criteria (from three to two step-therapies), as required by Oregon State DFR 11/14/2023 Notice of Coverage Requirement). • Correction of the products considered not medically necessary in the Continuation of Therapy (COT) criteria. Changed criteria I. to refer to the products listed in *Table 2*. • Removed Carimune from the policy (no longer commercially available). • Renamed *Table 2* to specify "High-Cost". • Corrected coverable dose in *Table 1* and *Table 2* to match Dosing Schedule in *Table 3*.
9/14/2023	Effective 1/1/2024: • Added coverage criteria for PANDAS/PANS. • Clarified "diagnosis by, or in consultation with" subspecialist throughout the diagnostic criteria. No change to intent of criteria. • Moved following products to "not medically necessary," for both Continuation of therapy (COT) and New Starts: - IVIG: Bivigam, Gammaplex, Panzyga - SCIG: Cuvitru, Hyqvia
3/16/2023	Clarified Guillain-Barré syndrome (GBS) criteria to include, but not be limited to acute inflammatory demyelinating polyneuropathy (AIDP).
6/17/2022	Moved Asceniv to "not medically necessary," for both Continuation of therapy (COT) and New Starts.
4/21/2021	• Coverage criteria and quantity limit for use in BK viremia added. • Continuation of therapy (COT) language updated (no change to intent).

Revision Date	Revision Summary
10/28/2020	• Clarified policy quantity limits and intent. • Added coverage for postexposure VZV prophylaxis.
4/22/2020	Added continuation of therapy (COT) criteria (no change to intent of coverage criteria).
7/24/2019	• Add Asceniv (IVIG), Xembify (SCIG) and Cutaquig (SCIG) to policy (new products) • Clarified coverage criteria for ADEM and anti-NMDA receptor encephalitis are specific to those two specific diagnoses. ADEM and anti-NMDA receptor encephalitis are types of autoimmune encephalitis. Autoimmune encephalitis (not otherwise specified) is considered a non-specific diagnosis and is not coverable. • Broadened coverage criteria for: - ITP of pregnancy (align platelet count to guidelines; 20,000) - LEMS (remove step therapy) • Investigational Uses: - Added PANDAS/PANS - Removed Behçet's syndrome, Neonatal hemolytic disease, Multiple Sclerosis, Uveitis and Wegener's granulomatosis. • Clarified Quantity Limits (QL): - Added QL per dose (and month) for SCIG and IVIG products. - Modified QL for treatment of immune-mediated rejection to allow up to six months if re-transplant is the treatment plan. • Update HCPCS Codes.
8/17/2018	• Added Panzyga to policy. • Added investigational use: Complex Regional Pain Syndrome • Updates HCPCS Codes
1/18/2018	Add Gammaked to policy.
4/14/2017	• Clarify coverage criteria for CIDP • Add coverage criteria for refractory acute demyelinating encephalomyelitis (ADEM) and anti-NMDA encephalitis • Clarify re-authorization period for Immunodeficiency (Replacement Therapy)
11/11/2016	Removed site of care language from the individual drug policy; however, requirements still apply. Reference to *Site of Care Review*, dru408 is provided as part of criterion IA.
9/15/2016	Add Cuvitru to policy.

Revision Date	Revision Summary
4/8/2016	• Reworded coverage criteria for Polymyositis to Refractory Myositis. Move Dermatomyositis (juvenile) criteria, to follow after Refractory Myositis. • Delete requirement for IgG levels for reauthorization for hypogammaglobulinemia in re-authorization table (typographical error).

Medication Policy Manual

Policy No: dru029

Topic: Synagis, palivizumab, Respiratory syncytial virus (RSV) immune prophylaxis

Date of Origin: January 1997

Committee Approval Date: June 20, 2024

Next Review Date: 2025

Effective Date: November 1, 2024

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of medication policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Synagis (palivizumab) is an antibody used in the prevention of respiratory syncytial virus (RSV) which may cause lower respiratory tract disease in certain high-risk infants and children younger than 24 months.

Policy/Criteria

Most contracts require pre-authorization approval of Synagis (palivizumab) prior to coverage.

I. Continuation of therapy (COT): Synagis (palivizumab) may be considered medically necessary for COT when criterion A, B, or C below is met.

A. For diagnoses NOT listed in the coverage criteria below, full policy criteria must be met for coverage.

OR

B. For diagnoses listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

C. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

***Please note**: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Synagis (palivizumab) may be considered medically necessary for children when there is clinical documentation (including, but not limited to chart notes) that criteria A. **AND** B. are met:

A. **Beyfortus** (nirsevimab-alip) is unavailable due to manufacturer shortage, use is contraindicated, or prior therapy was not tolerated.

AND

B. One of the following criteria (1. through 6.) below is met:

1. Chronic lung disease (CLD) of prematurity [also known as bronchopulmonary dysplasia (BPD)]: Infants or children with CLD of prematurity when criteria a, b, and c below are met.

a. Gestational age less than 32 $^{0/7}$ weeks.

AND

b. A requirement for greater than 21% oxygen for at least 28 days after birth).

AND

c. Chronological age <u>at the start of the current RSV season</u>, as defined by criterion 1. or 2. below:

1. Less than or equal to 12 months chronological age.

OR

2. Greater than 12 months but less than or equal to 24 months chronological age for children who continue to require medical intervention (supplemental oxygen, chronic corticosteroids, or diuretic therapy) during the 6-month period before the start of the second RSV season.

PLEASE NOTE: In the absence of ongoing medical intervention for CLD (medications or oxygen), Synagis (palivizumab) is NOT coverable for children age 12-24 months

OR

2. <u>Congenital heart disease (CHD)</u>: Infants or children with hemodynamically significant congenital heart disease who are less than or equal to 12 months chronological age at the start of the current RSV season when criterion (a., b., or c.) is met.

a. Receive medication to control congestive heart failure or will receive medication as a result of a planned cardiac surgery.

OR

b. Have moderate to severe pulmonary hypertension.

OR

c. Have cyanotic heart disease.

PLEASE NOTE: The use of Synagis (palivizumab) is considered <u>not</u> medically necessary for children with CHD greater than 12 months chronological age at the start of the current RSV season.

OR

3. Infants less than or equal to 12 months chronological age with neuromuscular disease or congenital abnormality that impairs the ability to clear secretions from the upper airway because of ineffective cough.

OR

4. <u>Estimated gestational age less than 29 weeks</u>: Infants less than or equal to 12 months chronological age (post-natal age) at the onset of the current RSV season and born before 29 $^{0/7}$ weeks gestation.

OR

5. Immunocompromised: Infants or children less than 24 months chronological age who will be profoundly immunocompromised during the current RSV season due to one of the following criteria (a. through d.) below.

a. Solid organ transplant.

OR

b. Hematopoietic stem cell transplant.

OR

c. Chemotherapy.

OR

d. Immunocompromised due to other conditions with either lower respiratory tract symptoms (including use of ongoing supplemental oxygen therapy), lymphopenia, or corticosteroid therapy.

OR

6. Cystic fibrosis: Infants or children with cystic fibrosis when criterion a. or b. below is met for the chronological ages indicated at the start of the current RSV season.

a. Less than or equal to 12 months chronological age with clinical evidence of chronic lung disease and/or nutritional compromise.

OR

b. Greater than 12 months but less than or equal to 24 months chronological age when 1 or more of the following are present:

1. Manifestations of severe lung disease (previous hospitalization for pulmonary exacerbation in the first year of life or chest imaging abnormalities that persist when stable).
2. Weight for length less than the 10th percentile.

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers Synagis (palivizumab) coverable only under the medical benefit (as a provider-administered medication).

B. When a member meets the applicable criteria above, coverage is authorized annually during the local RSV season.

C. When a member meets the applicable criteria above, Synagis (palivizumab) will be authorized in quantities of up to 5 doses, up to 15 mg/kg, for monthly dosing until the end of the current RSV season.

IV. RSV immunoprophylaxis with Synagis (palivizumab) is considered not medically necessary for any of the following:

A. Infants who do not meet the criteria above.

B. Infants and children with hemodynamically insignificant heart disease, such as mild cardiomyopathy not requiring medical therapy, secundum atrial septal defect, small ventricular septal defect, pulmonic stenosis, uncomplicated aortic stenosis, mild coarctation of the aorta, and patent ductus arteriosus.

C. Infants with lesions adequately corrected by surgery unless they continue to require medication for congestive heart failure (and criteria IB. above is met).

D. Patients with cystic fibrosis who do not meet the criteria above.

E. Patients with Prader-Willi Syndrome (PWS) who do not meet the criteria above.

F. Patients with recurrent wheeze who do not meet the criteria above.

G. Patients with Down syndrome who do not meet the criteria above.

V. Synagis (palivizumab) is considered investigational when used for any other indication, including:

A. RSV immunoprophylaxis in adults.

B. Treatment of RSV infections (in children or adults).

C. Use after Beyfortus (nirsevimab-alip) in the same RSV season.

Position Statement

Summary

- Synagis (palivizumab) has not been shown to be safer or more effective than other immunoprophylaxis options to prevent complications of respiratory syncytial virus (RSV) infection in infants and children who are at high risk of severe RSV disease, such as Beyfortus (nirsevimab-alip). However, use of Synagis (palivizumab) is significantly more costly. Therefore, Synagis (palivizumab) is only coverable when Beyfortus (nirsevimab-alip) is unavailable or use is contraindicated, and the "high-risk" criteria are met [for specific children who have risk factors or other underlying medical conditions that would predispose them to significant respiratory complications due to RSV infection].
- Synagis (palivizumab) has only been proven to decrease the chance of being hospitalized from RSV in some pediatric patients who are at high risk of severe RSV disease. [1,2] The evidence to support the efficacy of Synagis (palivizumab) is limited and unreliable, and the benefit of RSV immunoprophylaxis with Synagis (palivizumab) may be modest.
- Synagis (palivizumab) has not been shown to prevent mortality from RSV infection.
- This medical policy is consistent with the American Academy of Pediatrics (AAP) Red Book update (February 21, 2024) and the Centers for Disease Control and Prevention (CDC) which recommends Beyfortus (nirsevimab-alip) over Synagis (palivizumab).[3,4]

- When Beyfortus (nirsevimab-alip) is not available or contraindicated, Synagis (palivizumab) is recommended in high-risk infants as outlined in the AAP Redbook (2021) "2021-2024 Report of the Committee on Infectious Disease" and associated guidance issued in 2014. [2-6]).
- There is no evidence to support the use of Synagis (palivizumab) after the use of Beyfortus (nirsevimab-alip). Therefore, the use of Synagis (palivizumab) after the use of Beyfortus (nirsevimab-alip) immunoprophylaxis is considered investigational.

Clinical Efficacy

- Clinical trials have demonstrated efficacy for Synagis (palivizumab) in reducing hospitalization due to RSV infection, and reductions in other measures of severity of RSV infection. [7]
- Impact RSV Study [Synagis (palivizumab) versus placebo] [7]
    * The Impact RSV Study reported a 55% reduction in RSV-related hospitalizations ($p < 0.001$). RSV hospitalization was 4.8% in the Synagis (palivizumab) group compared to 10.6% in the placebo group (number needed to treat = 17).
    * Among secondary endpoints, the incidence of intensive care unit (ICU) admission during hospitalization for RSV infection was lower among patients receiving Synagis (palivizumab) than among those receiving placebo (1.3% and 3.0%, respectively), but there was no difference in the mean duration of ICU care between the two groups.
    * A cohort study showed that Synagis (palivizumab) administered to infants born at 32 to 35 weeks estimated gestational age did not result in direct cost savings related to hospitalization or ambulatory care. [8]
- In the Synagis (palivizumab) CHD Study, Synagis (palivizumab) reduced RSV hospitalizations by 45% ($p < 0.003$) which correlates to a number needed to treat of 23. [9]
- In a double-blind, randomized, placebo-controlled trial of 429 otherwise healthy preterm infants with recurrent wheeze, Synagis (palivizumab) treatment resulted in a relative reduction in the total number of wheezing days during the first year of life. However, Synagis (palivizumab) is considered not medically necessary for this condition as there is no clear correlation to decreased wheezing days and effect on health outcomes. [10]

National Guidelines

<u>American Academy of Pediatrics (AAP)</u> [2-6]

- The AAP and the Advisory Committee on Immunization Practices (ACIP) recommends the use of Beyfortus (nirsevimab-alip) over Synagis (palivizumab) for RSV immunoprophylaxis unless Beyfortus (nirsevimab-alip) is unavailable or contraindicated to administer. However, Synagis (palivizumab) should continue to only be used in high-risk infants as outlined in the Red Book (2021).
- The AAP recognizes the high cost-to-benefit ratio for RSV immunoprophylaxis with Synagis (palivizumab). Therefore, guidelines define the pediatric populations that best benefit from RSV immunoprophylaxis.

- The AAP provides recommendations for RSV immunoprophylaxis in children who have risk factors or other underlying medical conditions that would predispose them to respiratory complications due to RSV infection.
- The AAP guidance also includes detailed lists of the types of patients not at increased risk of RSV infection and therefore should not receive RSV immunoprophylaxis.
- The AAP recommends that parents can reduce the risk of an RSV infection by practicing good handwashing, washing blankets and toys regularly, limiting exposure to environmental pollutants, not smoking around their children, and avoiding crowds during RSV season.
- Regarding exposure to indoor air pollutants, the AAP recommends that infants at high risk for RSV infection should never be exposed to tobacco smoke.
- Breastfeeding should be encouraged for all infants; however, lack of breastfeeding is not a defined risk for RSV. Therefore, RSV immunoprophylaxis is not specifically recommended for infants unable to breastfeed.
- Determination of RSV season: see *Dosing* section below.

Rationale for Changes to National Guidelines

- Guidance for the recommended use of Synagis (palivizumab) was issued in July 2014 and re-affirmed in the most recent Red Book (2021). Significant changes from previous recommendations include the following: [2,5,6]
    - Synagis (palivizumab) is no longer recommended for otherwise healthy infants born at or after 29 $^{0/7}$ weeks. The AAP continues to recommend avoidance of crowds and group childcare during the RSV season for high-risk infants.
        - A study performed by the New Vaccine Surveillance Network (NVSN), sponsored by the Centers for Disease Control and Prevention (CDC) found that some previously reported potential risk factors (e.g., siblings in the household, child-care attendance) were not associated with a significantly increased risk of RSV hospitalization.
        - This same study also found that the RSV hospitalization rate for preterm infants was not significantly different from the rate for term infants (4.6/1000 and 5.3/1000, respectively); although, infants born at less than 30 weeks' gestation had a higher risk of RSV hospitalization than did infants born at 30 to 33 weeks gestation.
        - Additional cohort studies in various states and varying groups of preterm infants also support that the greatest increase in risk of RSV hospitalization is in preterm infants born before 29 weeks gestation.
    - Synagis (palivizumab) is no longer recommended in the second year of life except for some children with chronic lung disease and cystic fibrosis, and for some profoundly immunocompromised children.
    - In a prospective population-based surveillance study of 5,067 children younger than five years, 75% of those hospitalized were younger than 12 months.
        - There is limited safety data and no efficacy data to support the use of Synagis (palivizumab) in the second year of life, RSV hospitalization rates

decline for all children with the second season, regardless of the presence or absence of comorbidities.

* The definition of chronic lung disease and the associated recommendations have been clarified.
* Guidance for use of Synagis (palivizumab) in some infants with hemodynamically significant CHD, immunocompromised children and some children with cystic fibrosis has been provided.

Hemodynamically Significant CHD

- Certain children who are 12 months or younger with hemodynamically significant CHD may benefit from palivizumab prophylaxis. Children with hemodynamically significant CHD who are most likely to benefit from immunoprophylaxis include infants with acyanotic heart disease who are receiving medication to control congestive heart failure and will require cardiac surgical procedures and infants with moderate to severe pulmonary hypertension.

Immunocompromised

- RSV infection in immunocompromised children and adults can progress to respiratory failure and death. In several retrospective analyses of RSV-infected individuals, the majority of deaths that occurred were in those with lower respiratory tract disease. Profound lymphopenia (< 100 cells/mm^3) was associated with progression to lower respiratory tract disease, and, therefore, is a risk factor for poor outcomes due to RSV infection.
- Other risk factors for poor outcomes due to RSV infection include chronological age younger than two years, lower respiratory tract symptoms at presentation, and corticosteroid therapy.

Cystic fibrosis

- While routine use of Synagis (palivizumab) is not recommended in children with cystic fibrosis, it may be considered when other conditions (e.g., chronic lung disease, nutritional compromise) are present.
- Two recent reviews of RSV infection in infants with cystic fibrosis concluded that they may be at a slightly higher risk of hospitalization; however, there is insufficient data to support a universal recommendation for this group.

- When Synagis (palivizumab) is recommended, it may be given for up to 5 monthly doses for qualifying children (see *Dosing* below).

Safety

- Hypersensitivity reactions have been reported on initial exposure or re-exposure to Synagis (palivizumab). [1]
- Rare cases of anaphylaxis (< 1 case per 100,000 patients) have been reported following re-exposure to Synagis (palivizumab). [1]

Dosing

- RSV immunoprophylaxis is initiated at the onset of the annual RSV season and terminated at the end of RSV season.[2]
    * Determination of RSV season: Season onset can be determined in real time by identifying the first week of 2 consecutive weeks that RSV RT-PCR test positivity is 3% or greater or antigen detection positivity is 10% or greater. [2]
        - Per the National Respiratory and Enteric Virus Surveillance System (NREVSS) in 2013, the onset week in an area (national, regional, or state) is defined as the first of 2 consecutive weeks when the weekly mean of the percentages of specimens testing positive for RSV antigen in all reporting laboratories in the area is ≥ 10%. [12]
        - However, since 2014, most laboratories replaced RSV antigen tests with PCR testing (RSV RT-TR). [13]
        - Reporting by individual state and county health departments may vary. Either test result can be used for the purposes of this coverage policy.
    * The offset is the last of 2 consecutive weeks when the mean percent positive drops below this threshold. The season duration is the onset week, the weeks between onset and offset, and the offset week. The peak is the week when the mean percentage of positive RSV antigen tests is the highest. [12]
    * In most areas of the United States, with the exception of Alaska and Florida, the usual time for the beginning of the RSV season is October to December, and termination is March to early April. [2]
    * Regional differences account for a later RSV season experienced in the Pacific Northwest, which is typically from November through April. [11]
    * The onset of the RSV season is variable in different regions of Florida. Despite this variation, a maximum of 5 doses of palivizumab is recommended to provide 6 months of protective serum concentrations of palivizumab. Use of Florida Department of Health data may be helpful to determine start date of palivizumab prophylaxis.
    * Alaska Native populations in southwest Alaska experience a higher risk of hospitalization due to RSV and have a longer RSV season. Given the differences in epidemiology of RSV and the cost of emergency air transportation out of remote locations, eligibility for palivizumab prophylaxis may differ from infants in the continental United States. Use of RSV surveillance data from the state of Alaska may be helpful to determine start and stop date of palivizumab prophylaxis.
    * Data from the past year's surveillance season is used as a predictor for the timing of the next year's outbreak. This information is updated annually. For current RSV trends, refer to: http://www.cdc.gov/surveillance/nrevss/rsv/index.html.
- The recommended treatment course for Synagis (palivizumab) from the prescribing information is up to 5 total doses. Doses should be administered every 30 days starting in early November. [2]

- The AAP confirms the recommendation of a maximum of 5 total doses with the following statement: [5,6]

  > "Results from clinical trials indicate that palivizumab trough serum concentrations more than 30 days after the fifth dose will be well above the protective concentration for most infants. Five monthly doses of palivizumab will provide more than 20 weeks of protective serum antibody concentration. In the continental United States, a total of five monthly doses for infants and young children with congenital heart disease, CLD, or preterm birth before 32 weeks gestation (31 weeks, 6 days and younger) will provide an optimal balance of benefit and cost, even with variation in season onset and end.
  >
  > Children who qualify for palivizumab prophylaxis for the entire RSV season should receive palivizumab only during the 5 months following the onset of RSV season in their region (maximum of 5 doses), which should provide coverage during the peak of the season, when prophylaxis is most effective."

- The AAP Red Book (2021-2024) reaffirms the position in the 2014 guidance: [2]

  > "Because 5 monthly doses of palivizumab at 15 mg/kg/dose will provide more than 6 months of serum palivizumab concentration above the desired serum concentration for most infants, administration of more than 5 monthly doses is not recommended within the continental United States. Children who qualify for palivizumab prophylaxis should receive the first dose at the onset of the RSV season. For qualifying infants born during the RSV season, fewer than 5 doses will be needed to provide protection until the RSV season ends in their region (maximum of 5 doses).
  >
  > A small number of sporadic RSV hospitalizations will occur before or after the main season in many areas of the United States, but the greatest benefit from prophylaxis is derived during the peak of the season and not when the incidence of RSV hospitalization is low."

- Although Synagis (palivizumab) is NOT coverable in infants and children with stable congenital heart disease (CHD), operationally, Synagis (palivizumab) criterion B.1. "Receive medication to control congestive heart failure" would be met on the day of a planned surgery. Therefore, this criterion would be considered "met" two weeks prior to the planned surgical date, to allow for adequate prophylaxis lead-time. However, Synagis (palivizumab) criteria would be met for coverage only if the other criteria are met for CHD, namely age less than or equal to 12 months.

Medication Policy Manual | **Policy No:** dru048

Topic: Myobloc, rimabotulinumtoxinB | **Date of Origin:** December 14, 2001

Committee Approval Date: December 7, 2023 | **Next Review Date:** December 2024

Effective Date: March 1, 2024

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of medication policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Botulinum toxin is a neurotoxin that is injected into a muscle to cause temporary paralysis or relaxation of that muscle. This policy covers the one commercial botulinum toxin type B product, Myobloc (rimabotulinumtoxinB). Botulinum toxin type A products (Botox, Dysport, and Xeomin) are covered in a separate policy.

Please note: Botulinum toxin for use in gender affirming care is covered in a separate policy, Gender-Affirming Care Products, dru757

Policy/Criteria

Most contracts require pre-authorization approval of Myobloc (rimabotulinumtoxinB) prior to coverage.

I. Continuation of therapy (COT): Myobloc (rimabotulinumtoxinB) may be considered medically necessary for COT when criterion A, B, or C below are met.

A. For potentially cosmetic indications, including **hyperhidrosis**, full policy criteria below must be met for coverage.

OR

B. For all other indications, criteria 1 and 2 below must be met:

1. The patients was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

C. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

Please note*: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Myobloc (rimabotulinumtoxinB) may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) showing that criterion A, B, or C is met.

A. **Cervical dystonia** or **spasmodic torticollis,** when criteria 1 and 2 below are met:

1. Documentation of involuntary contractions of the neck muscles resulting in twisting and repetitive movements, and/or abnormal postures.

AND

2. Documented pain or functional impairment originating from the dystonia.

OR

B. **Sialorrhea** (drooling), excessive.

OR

C. **Urinary incontinence** due to detrusor overactivity [idiopathic or neurogenic causes (e.g. due to spinal cord injury, multiple sclerosis), or overactive bladder (OAB)], when therapy with anticholinergic agents or Myrbetriq (mirabegron) is ineffective or not tolerated.

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers Myobloc (rimabotulinumtoxinB) coverable only under the medical benefit (as a provider-administered medication).

B. **Initial Authorization:** When pre-authorization is approved, Myobloc (rimabotulinumtoxinB) may be authorized in quantities up to 4 injection treatments within a 48-week period.

C. **Continued Authorization:**

1. Authorization may be reviewed at least every 12 months. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, such as disease stability or improvement.

2. Additional treatments may be authorized on a case-by-case basis if documentation of objective measures supporting the need for more frequent dosing are provided.

IV. Myobloc (rimabotulinumtoxinB) is considered investigational for all other conditions, including, but not limited to:

A. Carpal tunnel syndrome.

B. Hyperhidrosis (such as axillary or palmar).

C. Spasticity not otherwise specified (other than spasmodic torticollis), such as:

1. Cerebral palsy (CP)-related spasticity.

2. Hemifacial spasm.

3. Spasmodic dysphonia.

4. Spasmodic dystonia.

5. Spastic movement disorders in children.

6. Spastic trismus, including TMJ.

7. Upper limb spasticity following stroke.

Position Statement

Summary

- Myobloc (rimabotulinumtoxinB) is a form of botulinum toxin type B and is approved for the treatment of cervical dystonia or spasmodic torticollis to reduce the severity and pain associated with abnormal neck position.
- Myobloc (rimabotulinumtoxinB) is also used for reduction of sialorrhea in patients with a variety of neurological disorders. The goal of therapy is to reduce sialorrhea-associated complications, such as aspiration pneumonia or skin breakdown. For urinary incontinence due to detrusor overactivity, Myobloc (rimabotulinumtoxinB) may be a treatment option for patients with symptoms not responding to other treatment options.

- The intent of this policy is to allow coverage for specific diagnoses where there is demonstrated safety and efficacy from clinical trials to support their use, including spasmodic conditions, and other specific indications.
- Botulinum toxins (BTX-A and BTX-B) have also been studied in many different conditions where muscle tension is thought to play a role. The quality of evidence from the majority of these studies is poor.
- FDA labeling indicates that units of Myobloc (rimabotulinumtoxinB) cannot be compared to or converted into units of any other botulinum toxin. [24] Therefore, the efficacy, dosing and safety of Myobloc (rimabotulinumtoxinB) cannot be based on extrapolation from other studies using other botulinum toxin serotypes.
- Use of botulinum toxin (all serotypes) for treatment of wrinkles or other cosmetic conditions is considered not medically necessary and frequently excluded by contract.

Clinical Efficacy

Cervical Dystonia or Spasmodic Torticollis

- Cervical dystonia (or spasmodic torticollis) is characterized by involuntary contractions of the neck muscles resulting in twisting and repetitive movements, and/or abnormal postures.
- Results from three clinical studies support the efficacy of rimabotulinumtoxinB in reducing neck pain and the severity of the abnormal head position associated with cervical dystonia or spasmodic torticollis in patients previously responsive to BTX-A [1,2] or those patients who no longer respond to BTX-A. [3]

Sialorrhea

- Anatomically guided injections of Myobloc (rimabotulinumtoxinB) into the parotid and submandibular glands appear to effectively improve sialorrhea in patients with Parkinson's disease. [4-6] and amyotrophic lateral sclerosis (ALS). [7]
- A randomized controlled trial demonstrated a decrease in frequency and severity of sialorrhea in children with cerebral palsy who received rimabotulinumtoxinB injected into the salivary glands. [8]

Urinary Incontinence due to overactive bladder (OAB)

- Injection of Myobloc (rimabotulinumtoxinB) into the bladder appears to improve urinary urgency, frequency and nocturia in patients with refractory detrusor overactivity.
- A Cochrane review concluded both botulinum type A and B formulations are effective treatment options for urinary incontinence due to refractory detrusor overactivity due to neurogenic or idiopathic OAB. [9]

Use of botulinum toxic type B in other conditions

- The evidence for the use of Myobloc (rimabotulinumtoxinB) in a variety of conditions is limited to pilot trials and case reports, including hyperhidrosis (axillary and palmar), [10-13] carpal tunnel syndrome, [14] and myofascial pain due to nerve entrapment (e.g. piriformis syndrome or shoulder impingement). [15,16] The evidence from these trials is of poor quality and the response to therapy was variable. Larger, well-designed trials are necessary to confirm the results, as well as establish benefit relative to standard of care treatments.

- Similarly, small pilot studies, case reports and observational studies have suggested potential benefit of Myobloc (rimabotulinumtoxinB) in the treatment of various spastic disorders (other than spasmodic torticollis), including spasmodic dystonia, [17] upper limb spasticity following stroke, [18,19] spastic movement disorders in children, [20] arm dystonia in children with cerebral palsy, [21] spastic trismus a muscle spasm of the jaw, which may include the temporomandibular joint (TMJ), [22] and hemifacial spasm. [23] The evidence from these trials is of poor quality. Larger, well-designed clinical trials are needed to assess safety and efficacy of rimabotulinumtoxinB in these conditions.

Safety [24]

- The most commonly reported adverse events observed in clinical trials of Myobloc (rimabotulinumtoxinB) include dry mouth, dysphagia, dyspepsia, and injection site pain.
- All botulinum toxin products have a boxed warning and Risk Evaluation and Mitigation Strategy (REMS) program for the potential for toxin to spread from the site of injection and produce symptoms consistent with botulinum toxin effects. Symptoms may include asthenia, generalized muscle weakness, diplopia, blurred vision, ptosis, dysphagia, dysphonia, dysarthria, urinary incontinence and breathing difficulties and may occur hours to weeks after injection. Swallowing and breathing difficulties can be life threatening. Deaths have been reported.
- The safety, efficacy and dosage of botulinum toxins have not been established for any condition in children less than 12 years of age.

Revision History

Revision Date	Revision Summary
12/7/2023	No criteria changes with this annual review.
12/9/2022	Added Myrbetriq (mirabegron) as an acceptable step for Urinary incontinence, due to detrusor overactivity [such as overactive bladder (OAB)]. No change to intent.
1/20/2021	• Revised continuation of therapy (COT) criteria. • Reworded urinary incontinence criteria to align with botulinum toxin A policy. • Clarified initial and continued authorization periods. Clarified that more frequent doses may be covered on a case-by-case basis.
1/22/2020	Added COT criteria (no change to intent of coverage criteria).
1/31/2019	• No coverage criteria changes with this annual update. • Clarified documentation language (No change to intent).
1/19/2018	No coverage criteria changes with this annual update
2/17/2017	• Clarified quantity limits to 4 doses per 48-weeks (versus use of 12 months). • Clarified authorization "may" be reviewed every 12 months.
2/12/2016	No criteria changes.
12/14/2001	New policy.

Drug names identified in this policy are the trademarks of their respective owners.

Medication Policy Manual | **Policy No:** dru135

Topic: Compounded Medications | **Date of Origin:** July 28, 2006

Committee Approval Date: December 9, 2022 | **Next Review Date:** December 2023

Effective Date: March 1, 2023

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of medication policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

The FDA defines drug compounding as the process by which a pharmacist or doctor combines, mixes, or alters ingredients to create a medication tailored to an individual patient's needs.

In order to be covered, a compounded prescription medication must contain at least one federal legend drug in therapeutic amounts. A federal legend drug is defined as a medication product that by Federal law bears the statement "Caution – Federal (U.S.A.) law prohibits dispensing without a prescription" or words of similar meaning (such as "Rx only"). Bulk chemicals, medical food supplements and nutritional additives not approved for dispensing by prescription are not considered federal legend drugs. The policy below defines criteria that must be met in order for compounded prescriptions to be covered.

PLEASE NOTE: If a compounded medication contains only ingredients that are excluded under the member's benefit (including, but not limited to, bulk chemicals and OTC products), it will be excluded from coverage regardless of the criteria below.

Policy/Criteria

I. Continuation of therapy (COT): Compounded medications may be considered medically necessary for COT when all criteria A, B, and C below are met.

A. The patient is established on this therapy AND one of the following situations apply (criterion 1 or 2 below):

1. Prior to current health plan membership AND the medication was covered by another health plan.

OR

2. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission AND there is documented clinical benefit.

AND

B. The active ingredient in the compounded prescription medication contains at least one federal legend drug component.

AND

C. If a compounded prescription medication is similar to a commercially available product, but differs from the commercially available product in dosage, dosage form, and/or omission of dye, sweetener, flavoring, or preservative, then clinical documentation is required from the prescriber supporting the clinical need for compounded medication.

***Please note**: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. A compounded prescription medication may be considered medically necessary when criteria A through D below are met:

A. The active ingredient in the compounded prescription medication contains at least one federal legend drug component.

AND

B. The active ingredient is present in therapeutic amounts, based on scientific literature or national compendia.

AND

C. The safety and effectiveness for the compounded medication and its route of administration (including the delivery system) is supported by scientific literature or national compendia.

AND

D. If a compounded prescription medication is similar to a commercially available product, but differs from the commercially available product in dosage, dosage form, and/or omission of dye, sweetener, flavoring, or preservative, then clinical documentation is required from the prescriber supporting the clinical need for the compounded medication.

III. Authorization may be reviewed annually to confirm that current medical necessity criteria are met and that the medication is effective.

IV. Drug compounding for the sole purpose of convenience is considered not medically necessary.

Position Statement

Summary

- The FDA recognizes the ability of pharmacists or physicians to engage in traditional extemporaneous drug compounding of reasonable quantities of drugs in response to receipt of a valid prescription. [1]
- Drug compounding may be required to fit the medical needs of a patient because a medication is not commercially available in the necessary strength or dosage form. Drug compounding may also be required for:
    * Preparation of a medication that has been withdrawn from the market for economic concerns, NOT safety.
    * Patients who require liquid formulations or rectal suppositories due to difficulty or inability to swallow.
    * Allergies to dyes, preservatives, or fillers in commercial products which require allergy-free medications.
- When the sole purpose of drug compounding is for the sake of convenience to the physician, other health care provider, and/or the patient, the compounded drug is not considered medically necessary.

Federal and State Regulation

- The FDA provides rules and guidance to assure compounding activities performed by pharmacies and/or physician offices are maintained within the realm of traditional pharmacy practice and that activities are not those that would be considered manufacturing and distributing of an unapproved new drug. [1,2]
- The FDA receives guidance from the Pharmacy Compounding Advisory Committee (PCAC), which was established to advise the FDA on scientific, technical, and medical issues related to drug compounding. The FDA will also consult with the PCAC before issuing certain regulations. [2,3]
- Regulation of compounding is generally done at the state level. States may vary in their regulation and definitions of compounding. The FDA has oversight when compounding is considered manufacturing.

Compounded Pellets (implants) – such as naltrexone or testosterone

- There is significant interest in the use of various medications given as pellets (or implants). Commercially available implants include, but are not limited to: [4]
    * Testosterone pellet (available commercially as generic testosterone pellet, or brand Testopel 75 mg)
    * Buprenorphine implant (available commercially as Probuphine)
    * Various contraceptive implants

- However, the use of compounded pellets (or implants) are not coverable, per the coverage criteria. The rationale is as follows:
    * Most compounded pellets (or implants) are made with a bulk powder or chemical and do NOT contain a "federal legend drug," as defined in the coverage criteria. Any compound that does not contain a federal legend drug is contractually excluded from coverage.
    * In addition, like many other compounds, there is insufficient evidence to establish the safety or efficacy of compounded pellets (or implants), the pellet dosage form, nor the amount of active ingredient in the pellet (including its pharmacokinetics).
- Naltrexone subcutaneous (SC) implant:
    * Naltrexone is available as FDA-approved long-acting injectable suspension (Vivitrol), as well as orally as a 50 mg scored tablet. [4]
    * The safety and efficacy of the compounded product (naltrexone SC implant pellet), the pellet dosage form, nor the amount of naltrexone in this dosage form (including its pharmacokinetics) is not well established. While it may be similar to other compounded products studied, consistent dose and release profiles are not supported by the current literature.
- Testosterone compounded pellet:
    * Testosterone is available as an FDA-approved long-acting pellet (Testopel, as 75 mg pellets), as well as several other topical, injectable, and oral dosage forms. [4]
    * The safety and efficacy of compounded testosterone products (including testosterone pellet other than Testopel and any strength other than 75 mg), the pellet dosage form, nor the amount of testosterone in this dosage form (including its pharmacokinetics) is not well established.

Revision History

Revision Date	Revision Summary
12/9/2022	Removed criterion 2E, requiring medical necessity review for any compounded ingredient that requires pre-authorization. This is done to streamline operational efficiencies with our PBM.
10/15/2021	No criteria changes with this annual update. Cross references updated to remove an archived policy (dru548).
10/28/2020	Added continuation of therapy (COT) criteria (no change to intent of coverage criteria).
7/24/2019	Added that compounds made for the purpose of convenience is considered not medically necessary.
03/08/2019	Added clarification of compounded implants and pellets, including naltrexone and hormones (such as testosterone, estradiol, etc).
10/04/2018	Added clarification of excluded coverage for compounds containing only excluded products such as bulk chemicals and OTC drugs.
08/17/2018	Added criterion to clarify that if the active ingredient requires pre-authorization, then medical necessity criteria for that medication must also be met.
08/11/2017	No changes to coverage criteria with this annual update.
03/10/2017	No changes to coverage criteria with this annual update.

Drug names identified in this policy are the trademarks of their respective owners.

Medication Policy Manual | **Policy No:** dru196

Topic: Arzerra, ofatumumab | **Date of Origin:** January 15, 2010

Committee Approval Date: July 16, 2021 | **Next Review Date:** April 2022

Effective Date: October 1, 2021

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of medication policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Ofatumumab (Arzerra) is a B-cell-directed monoclonal antibody used in the treatment of lymphocytic leukemia (CLL). It is given via intravenous infusion.

Policy/Criteria

Most contracts require pre-authorization approval of ofatumumab (Arzerra) prior to coverage.

I. Continuation of therapy (COT): Ofatumumab (Arzerra) may be considered medically necessary for COT when criterion A, B, or C below is met.

A. For diagnoses NOT listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND there is documentation that the medication was covered by another health plan. Examples of documentation include the coverage approval letter from the previous health plan or paid claim.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

B. For diagnoses listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

C. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

***Please note**: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Ofatumumab (Arzerra) may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) that criteria A and B below are met.

A. Diagnosis of **relapsed or refractory chronic lymphocytic leukemia** (CLL).

AND

B. Clinical documentation (including, but not limited to chart notes) confirming that at least two prior therapies for CLL have been ineffective.

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy services does not consider ofatumumab (Arzerra) to be a self-administered medication.

B. When preauthorization is approved, ofatumumab (Arzerra) will be authorized for a single treatment course of up to 12 infusions in a 12-month period. No additional treatment courses will be authorized beyond 12 infusions.

IV. Ofatumumab (Arzerra) is considered not medically necessary for the following conditions:

A. Rheumatoid arthritis (RA).

B. Previously untreated CLL.

V. Use of ofatumumab (Arzerra) beyond a total of 12 infusions is considered investigational. Additionally, ofatumumab (Arzerra) is considered investigational when used for all other conditions, including but not limited to:

A. Non-Hodgkin's follicular lymphoma.

B. Maintenance therapy in CLL.

C. Mucosa-associated lymphoid tissue (MALT) lymphoma.

D. Relapsing-remitting multiple sclerosis (RRMS).

Position Statement

- Ofatumumab (Arzerra) is a monoclonal antibody that is directed against B-lymphocytes. It results in depletion of B-cells by binding to CD20 molecules expressed on the B lymphocytes. Rituximab and obinutuzumab (Gazyva) are also CD20-directed therapies.
- Ofatumumab (Arzerra) is approved for the treatment of chronic lymphocytic leukemia (CLL) when first-line therapies, specifically fludarabine and alemtuzumab, were not effective; as a first-line therapy when given with chlorambucil for patients who are not candidates for fludarabine-based chemotherapy; for relapsed CLL when given with fludarabine and cyclophosphamide; or for maintenance therapy in patients who are in complete or partial response after at least two lines of therapy for recurrent or progressive CLL. (Note: Alemtuzumab is no longer commercially available; however, it is available through the manufacturer at no cost when used for cancer treatment).
- The intent of this policy is to cover ofatumumab (Arzerra) for relapsed or refractory CLL after at least two prior CLL therapies have been ineffective.
- The efficacy of ofatumumab (Arzerra) is based on surrogate endpoints such as tumor response and progression-free survival (PFS). To date, there is no evidence of improved clinical outcomes such as improved survival, quality of life, or symptom control.

- Ofatumumab (Arzerra) has not been directly compared with rituximab or obinutuzumab (Gazyva), two other CD20-directed therapies used in the treatment of CLL. Ofatumumab (Arzerra) has the potential to be the most costly option among these similar treatment options.
- A recent study reported improved PFS with ibrutinib (Imbruvica) relative to ofatumumab (Arzerra) when administered to patients with CLL who had received prior therapy for their disease. The trial was stopped early due to these positive findings for ibrutinib (Imbruvica). Overall survival data from the trial is not mature.
- Although the National Comprehensive Cancer Network (NCCN) Chronic Lymphocytic Leukemia/Small Lymphocytic Lymphoma guideline lists ofatumumab (Arzerra) as one of many category 2A options in the relapsed or refractory CLL setting, there are several preferred therapies in each of these settings with higher level recommendations (category 1).
- A recent study evaluated ofatumumab (Arzerra) in patients with rheumatoid arthritis who had an inadequate response to methotrexate. There are many other medications with longer track records of safety and effectiveness that provide a better value in this population.
- Ofatumumab (Arzerra) is being studied in other conditions were B-cells may play a role in the disease process. Studies evaluating the possible benefit in these other conditions, which includes follicular lymphoma and multiple sclerosis, are currently ongoing.
- Ofatumumab (Arzerra) is administered via intravenous infusion for a total of 12 infusions. There is not sufficient evidence to support use of ofatumumab (Arzerra) beyond a single course of up to 12 infusions.

Regence Pharmacy Services performs independent analyses of oncology medication evidence. NCCN clinical practice guidelines assignment of a category 2a/b recommendation does not necessarily establish medically necessity. The Regence Pharmacy Services analysis and coverage policy may differ from NCCN clinical practice guidelines.

Clinical Efficacy

OFATUMUMAB (ARZERRA) IN CHRONIC LYMPHOCYTIC LEUKEMIA (CLL)

Ofatumumab (Arzerra) has been studied in chronic lymphocytic leukemia (CLL) in the relapsed setting as a single agent, and in the first-line setting in combination with chlorambucil in patients who are not candidates for cytotoxic chemotherapy. To date, there is no evidence that it improves disease-related symptoms or overall survival. Additionally, there is no evidence that it is superior to any other therapy for CLL in any setting.

<u>Relapsed/refractory CLL</u>

- A small, low-quality, single-arm study evaluated tumor response rate as the primary endpoint in 59 patients with relapsed/refractory CLL. [1 2]

    * All patients included in the trial had CLL that was refractory to both fludarabine and alemtuzumab (Campath). The median number of prior therapies was five.
    * The investigator-determined overall response rate (combination of partial and complete responders) was 42%. There were no complete responses.
    * Eighty-eight percent of patients in the clinical trial received at least 8 of the 12 scheduled doses of ofatumumab (Arzerra), while 54% of subjects received all 12 infusions.
    * The evidence from this trial is of low-quality because there was no comparator, the subjects were not blinded or randomized, and the endpoint (tumor response) has not been validated to correlate with clinically relevant outcomes (e.g., overall survival, symptom control, or quality of life).
    * Note: Alemtuzumab (Campath) is no longer commercially available because the manufacturer is now marketing it as a new therapy for multiple sclerosis. However, it is available at no charge through the manufacturer when used for the treatment of cancer. Visit http://www.campath.com/ for details on the Campath Distribution Program.
- A large, randomized, open-label trial compared ibrutinib (Imbruvica) with ofatumumab (Arzerra) in previously treated patients with CLL or small lymphocytic lymphoma (SLL), a related condition. [3]
    * The trial evaluated patients who had received at least one prior therapy (median of 2 to 3) and were not candidates for treatment with a purine analog (e.g., fludarabine) because they had a short progression-free interval after prior chemotherapy, they were of advanced age (≥ 70 years), had a coexisting illness, or had a chromosome 17p13.1 deletion.
    * Patients (N = 391) were randomized in a 1:1 fashion to receive either ibrutinib (Imbruvica) 420 mg orally daily, or a standard course (12 infusions) of ofatumumab (Arzerra). A majority of patients had high-risk features, including del(17p) or del(11p).
    * The median duration of progression-free survival was 8.1 months with ofatumumab (Arzerra) and had not yet been reached in the ibrutinib (Imbruvica) arm (median follow up of 9.4 months). This difference was statistically significant.
    * Survival at 12 months was 90% and 81% in the ibrutinib (Imbruvica) and ofatumumab (Arzerra) treatment arms, respectively. Median overall survival has not been reached in either group.
    * There is low confidence in the comparative evidence from this trial because it was an open-label design and there were differences in baseline characteristics between the two populations [patients in the ibrutinib (Imbruvica) treatment arm were more heavily pretreated and there was a greater proportion of patients with bulky disease in this arm]. Bias due to lack of blinding and poor randomization cannot be ruled out. Additionally, future reports of overall survival will be confounded by crossover from ofatumumab (Arzerra) to ibrutinib (Imbruvica).

- The NCCN CLL/SLL guideline lists ofatumumab (Arzerra) as a category 2A recommendation among 'Other recommended regimens' when used in the relapsed and refractory CLL/SLL setting. There are several alternative regimens (both category 1 and category 2A recommendations) which are listed as preferred regimens. [4]

Not Medically Necessary and Investigational Uses

Previously untreated CLL

- A large, randomized, open-label trial evaluated ofatumumab (Arzerra) plus chlorambucil in patients with CLL who had no previous treatment for their disease. [1 5]
  - The trial evaluated patients who were not candidates for fludarabine-based chemotherapy due to advanced age (≥ 70 years) or presence of comorbidities (e.g., coexisting illness, poor renal function).
  - Patients (N=447) were randomized to ofatumumab (Arzerra) plus chlorambucil or chlorambucil alone. Treatment was given in 28-day cycles for up to 12 cycles.
  - Progression-free survival (PFS), the primary endpoint, was 22.4 months and 13.1 months in the ofatumumab (Arzerra) plus chlorambucil and chlorambucil alone arm, respectively.
  - There were inadequate details available to assess the quality of evidence in this trial; however, the lack of blinding is considered a major flaw.
- The efficacy of ofatumumab (Arzerra) has not been studied beyond a single treatment course which consists of 12 infusions. [1-3]
- Ofatumumab (Arzerra) has not been directly compared with rituximab or obinutuzumab (Gazyva), two additional CD20-directed therapies used in the treatment of CLL.
- The National Comprehensive Cancer Network (NCCN) Chronic Lymphocytic Leukemia/Small Lymphocytic Lymphoma guideline does not recommend ofatumumab (Arzerra) as first-line therapy for CLL in patients with or without a del(17p)/TP53 mutation. [4]

Maintenance therapy for CLL

- A low-quality, open-label, multicenter, Phase III trial compared ofatumumab (Arzerra) maintenance therapy (1000 mg every 8 weeks for up to 2 years) with observation for patients in remission after reinduction for relapsed CLL. Treatment continued until disease progression or the patient withdrew from the study. [6]
  - At the planned interim analysis, PFS was significantly improved in the ofatumumab (Arzerra) arm (29.4 months) compared to the observation arm (15.2 months).
  - However, there was no significant difference between the treatment arms in OS (HR=0.85; 95% CI, 0.52 to 1.37; p=0.49).
  - No clinically relevant differences in HRQOL were observed.
- The NCCN CLL/SLL guidelines gives ofatumumab (Arzerra) a lower than standard recommendation (category 2B) for CLL maintenance therapy. [4]

Other conditions

- Ofatumumab (Arzerra), an anti-CD20 antibody, has been studied in several other B-cell-mediated conditions.
    * *Follicular lymphoma*: Several trials have evaluated ofatumumab (Arzerra) in follicular lymphoma. [7-9] To date, none of the trials have evaluated a clinical endpoint or compared ofatumumab (Arzerra) to either placebo or any established therapy. Additional studies are needed to establish the safety and effectiveness of ofatumumab (Arzerra) in this condition.
    * *Mucosa-associated lymphoid tissue (MALT) lymphoma:* A preliminary trial in 16 patients suggests that ofatumumab (Arzerra) may have activity in this disease based on objective tumor response rates. A larger, well-designed study is needed to establish safety and effectiveness in this condition. [10]
    * *Rheumatoid arthritis*: One small phase I/II trial and a larger phase III trial evaluated ofatumumab (Arzerra) in patients with rheumatoid arthritis. [11 12] The larger of the two trials compared ofatumumab (Arzerra) with placebo in patients who had an inadequate response to methotrexate. [12] There are many established treatment options with long track records of safety and effectiveness that provide a better value in this population.
    * *Relapsing-remitting multiple sclerosis (RRMS)*: A small, published, phase II, dose-finding, cross-over trial evaluated MRI lesions and B-cell counts in patients receiving ofatumumab (Arzerra) for RRMS for 24 weeks. Standard trial design to establish safety and efficacy of medications in RRMS includes evaluation of MS attack rate in hundreds of patients over a minimum of 2 years. Larger, well-controlled trials evaluating a clinical endpoint are needed to establish ofatumumab (Arzerra) as a safe and effective therapy for RRMS. [13]
    * *Waldenström's macroglobulinemia (WM)*: There is interest in using ofatumumab (Arzerra) in WM by virtue of its mechanism of action which is similar to other therapies used in the treatment of this condition; however, to date, no clinical trials have been published to support this use.
- The NCCN compendium lists ofatumumab (Arzerra) among many category 2A recommendations for Waldenström's macroglobulinemia. Its use is recommended only in rituximab -intolerant individuals. [14] No clinical trials were identified that evaluated ofatumumab (Arzerra) in this condition.

Safety [1]

- Infections, neutropenia, and fever are the most common serious adverse reactions observed with ofatumumab (Arzerra).
- Ofatumumab (Arzerra) may cause serious infusion reactions leading to symptoms that include bronchospasm, dyspnea, laryngeal edema, cardiac infarction, and angioedema. Premedication with intravenous corticosteroids, an oral analgesic, and on oral or intravenous antihistamine are recommended before infusing.
- Ofatumumab (Arzerra) has a boxed warning to highlight the potential risk of progressive multifocal leukoencephalopathy (PML) and reactivation of hepatitis B.

Dosing [1]

- Relapsed CLL: Ofatumumab (Arzerra) is administered for up to 6 cycles as follows:
  - 300 mg on Day 1, followed by 1,000 mg on Day 8 (Cycle 1)
  - 1,000 mg on Day 1 of subsequent 28-day cycles for a maximum of 6 cycles.
- Refractory CLL: Ofatumumab (Arzerra) is administered in 12 doses as follows:
  - An initial dose of 300 mg (Dose 1), followed one week later by
  - 2,000 mg weekly for 7 doses (Doses 2 through 8), followed 4 weeks later by
  - 2,000 mg every four weeks for 4 doses (Doses 9 through 12).
- Premedicate before each dose with acetaminophen, an oral or intravenous antihistamine, and an intravenous corticosteroid (prednisolone 100 mg or equivalent).
- The safety and effectiveness of ofatumumab (Arzerra) have only been formally evaluated based on the administration of a single, 12-dose course of therapy. Although there is a published case series of a small subset of subjects from the pivotal trial who went on to receive a second course of ofatumumab (Arzerra) when their CLL progressed after an initial 12-dose course, this low-level evidence is not sufficient to support the benefit of this practice versus changing to an alternative therapy. [15]

Revision History

Revision Date	Revision Summary
7/16/2021	No criteria changes with this annual update.
06/15/2020	Removed references to brand Rituxan from policy, to account for upcoming changes in biosimilars policy (dru620).
4/22/2020	Added continuation of therapy (COT) criteria (no change to intent of coverage criteria).
4/25/2019	Mucosa-associated lymphoid tissue (MALT) lymphoma was added to the list of investigational conditions.
3/19/2018	No changes to coverage criteria with this annual update.
1/13/2017	Revised coverage criteria to specify relapsed or refractory CLL. Added maintenance therapy as an investigational use.
1/8/2016	No changes with this annual update.
1/15/2010	New policy

Medication Policy Manual

Policy No: dru198

Topic: Istodax, romidepsin

Date of Origin: January 15, 2010

Committee Approval Date: July 16, 2021

Next Review Date: April 2022

Effective Date: October 1, 2021

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Romidepsin (Istodax), a histone deacetylase (HDAC) inhibitor, is a cancer medication used in the treatment of certain T-cell lymphomas. It is given via intravenous infusion.

Policy/Criteria

Most contracts require pre-authorization approval of romidepsin (Istodax) prior to coverage.

I. Continuation of therapy (COT): Romidepsin (Istodax) may be considered medically necessary for COT when criterion A, B, or C below is met.

A. For diagnoses NOT listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND there is documentation that the medication was covered by another health plan. Examples of documentation include the coverage approval letter from the previous health plan or paid claim.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

B. For diagnoses listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

C. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

Please note*: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Romidepsin (Istodax) may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) confirming that criterion A or B below is met.

A. A diagnosis of **peripheral T-cell lymphoma** (PTCL) when at least two prior systemic therapies have been ineffective or not tolerated (see *Appendix 1* for therapy options).

OR

B. A diagnosis of **cutaneous T-cell lymphoma** (CTCL) [e.g. Mycosis Fungoides and Sézary Syndrome] when at least two prior systemic therapies have been ineffective or not tolerated (see *Appendix 2* for therapy options).

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services does not consider romidepsin (Istodax) to be a self-administered medication.

B. When pre-authorization is approved, romidepsin (Istodax) will be authorized for up to three infusions every four weeks until disease progression.

C. Authorization may be reviewed at least annually. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, such as disease stability or improvement.

IV. Romidepsin (Istodax) is considered investigational when used in patients who have had prior treatment with belinostat (Beleodaq) and when used in combination with other chemotherapy medications.

V. Romidepsin (Istodax) is considered investigational when used for all other conditions, including but not limited to:

A. Prostate cancer.

B. Squamous cell cancer of the head and neck (SCCHN).

C. Solid tumors.

Position Statement

- Romidepsin (Istodax), a histone deacetylase (HDAC) inhibitor, is among several systemic medications (see *Appendices 1 and 2*) that may be used to treat cutaneous T-cell lymphoma (CTCL) [e.g. Mycosis Fungoides (MF), Sézary Syndrome (SS)] and peripheral T-cell lymphoma (PTCL).
  - The intent of this policy is to cover romidepsin (Istodax) for the indications and dose for which it has been shown to be safe and effective, as detailed in the coverage criteria.
- The effectiveness of romidepsin (Istodax) is based on low-quality, single-arm studies that evaluated tumor response rates, a surrogate marker, as the primary endpoint.
- The effect of these therapies on overall survival has not been evaluated.
- Romidepsin (Istodax) has not been studied in the first-line setting nor has it been compared to any other therapy options.
- Romidepsin (Istodax) is administered via intravenous infusion over 4 hours and is given until disease progression or unacceptable toxicity.

Regence Pharmacy Services performs independent analyses of oncology medication evidence. NCCN clinical practice guidelines assignment of a category 2a/b recommendation does not necessarily establish medically necessity. The Regence Pharmacy Services analysis and coverage policy may differ from NCCN clinical practice guidelines.

Clinical Efficacy

Cutaneous T-cell Lymphoma (CTCL)

- The effectiveness of romidepsin (Istodax) has been evaluated in 167 subjects with cutaneous T-cell lymphoma (CTCL) in two, uncontrolled clinical trials with poor quality evidence. [1-3]
  - There was no comparator in either of the studies.
  - The studies evaluated a subgroup of subjects with CTCL for overall response (partial response plus complete response) to therapy.
  - Approximately 34% of subjects had either a partial response (28%) or a complete response (6%).
- All subjects evaluated in the studies had been on one or more prior systemic therapies.
- There is currently no evidence that romidepsin (Istodax) improves clinical outcomes (e.g. overall survival, quality of life) in patients with CTCL.

Peripheral T-cell Lymphoma (PTCL)

- Romidepsin (Istodax) was evaluated in 130 patients with PTCL who had failed at least one prior therapy. The evidence is of poor quality as the trial was not controlled. [4] A second trial in a mixed group of patients with PTCL or CTCL was used as supportive information. [5]
  - Romidepsin (Istodax) was not compared with placebo or an active comparator in either study.
  - The primary endpoint evaluated was disease response rate which is based on disease markers. Clinical outcomes, such as survival, have not been evaluated.
  - The overall response rate (complete response rate plus partial response rate) was 25% with 15% of patients achieving a complete response. [4]
- All subjects evaluated in the studies had been on one or more prior systemic therapies. [4,5]
- There is currently no evidence that romidepsin (Istodax) improves clinical outcomes (e.g. overall survival, quality of life) in patients with PTCL.

National Guidelines

- The National Comprehensive Cancer Network (NCCN) T-cell lymphomas and Primary Cutaneous Lymphomas guidelines lists romidepsin (Istodax) among several recommended systemic treatment options for the treatment of both CTCL and PTCL. [6,7] [refer to *Appendix 1* and *Appendix 2*].

Use in Other Conditions

- Romidepsin (Istodax) is being evaluated for use in several other conditions:
  - Preliminary studies failed to demonstrate a benefit in advanced colorectal cancer, metastatic renal cell carcinoma, prostate cancer, and lung cancer. [8-12]
  - A phase 2 study evaluated the combination of romidepsin (Istodax) and gemcitabine in patients with relapsed or refractory PTCL. There was no additional benefit shown over the use of romidepsin (Istodax) alone. [13]
  - In small number of patients with relapsed multiple myeloma, poor response rates were achieved. [14]

* No results are available for studies in several other conditions including squamous cell cancer of the head and neck (SCCHN), breast cancer, solid tumors, and acute myelogenous leukemia. [15]

Safety [1]

- The most common adverse experiences reported with romidepsin (Istodax) include: nausea, fatigue, infections, vomiting, anorexia, bone marrow depression, low serum magnesium, diarrhea, fever, and hypotension.
- Prolongation of the QT interval and increased risk of serious infections have been reported with romidepsin.
- There is the potential for clinically significant drug-drug interactions when romidepsin (Istodax) is co-administered with strong CYP 3A4 inhibitors (e.g. ketoconazole, clarithromycin) and inducers (e.g. rifampin), as well as with drugs that inhibit the P-glycoprotein pathway (e.g. cyclosporine).
- Caution is urged when co-administering romidepsin (Istodax) with warfarin, as elevations in INR may occur.

Dosing considerations [1]

- Romidepsin (Istodax) is administered intravenously on days 1, 8, and 15 of every 28-day cycle until disease progression or unacceptable toxicity. [1]
- Dose adjustment may be necessary for hematologic as well as nonhematologic toxicities. [1]

Appendix 1: Systemic Treatment Options for PTCL [6] a,b,c

First-line Therapy

- Brentuximab vedotin + CHP (cyclophosphamide, doxorubicin, prednisone) for CD30+ histologies
- CHOEP (cyclophosphamide, doxorubicin, vincristine, etoposide, prednisone)
- CHOP (cyclophosphamide, doxorubicin, vincristine, prednisone)
- CHOP followed by IVE (ifosfamide, etoposide, epirubicin) alternating with methotrexate
- EPOCH (etoposide, prednisone, vincristine, cyclophosphamide, doxorubicin)
-

Second-line Therapy

Transplant candidates	*Non-transplant candidates*
• *Preferred single agents:* o Belinostat (Beleodaq) o Brentuximab vedotin (Adcetris) for CD30+ PTCL o Pralatrexate (Folotyn) o Romidepsin (Istodax) • *Preferred combination regimens:* o DHAP (dexamethasone, cisplatin, cytarabine) o DHAX (dexamethasone, oxaliplatin, cytarabine) o ESHAP (etoposide, methylprednisolone, cytarabine, cisplatin) o GDP (gemcitabine, dexamethasone, cisplatin) o GemOx (gemcitabine, oxaliplatin) o ICE (ifosfamide, carboplatin, etoposide) • *Other recommended therapies:* o Bendamustine o Gemcitabine o Lenalidomide o GVD (gemcitabine, vinorelbine, liposomal doxorubicin)	• *Preferred Single agents:* o Belinostat (Beleodaq) o Brentuximab vedotin (Adcetris) for CD30+ PTCL o Pralatrexate (Folotyn) o Romidepsin (Istodax) • *Other single agents:* o Alemtuzumab (Campath) o Bendamustine o Cyclophosphamide and or etoposide (IV or PO) o Gemcitabine o Lenalidomide (Revlimid) o Radiation therapy

[a] PTCL subtypes included: PTCL not otherwise specified (NOS), angioimmunoblastic T-cell lymphoma (AITL), anaplastic large cell lymphoma (ALCL), and enteropathy-associated T-cell lymphoma (EATL)

[b] All therapies listed above are NCCN category 2A recommendations (lower quality evidence but uniform consensus among panel) unless otherwise indicated.

[c] AITL and ALCL have slight variations in the regimens used in the second line and subsequent therapy setting

Appendix 2: Systemic Treatment Options* for CTCL (i.e. Mycosis Fungoides/Sezary syndrome) [7]	
acitretin (Soriatane)	interferon gamma (Actimmune)
alemtuzumab (Campath)	isotretinoin
all-trans retinoic acid (Vesanoid)	methotrexate
bexarotene (Targretin)	mogamulizumab (Poteligeo)
brentuximab vedotin (Adcetris)	pembrolizumab (Keytruda) [category 2B]
chlorambucil (Leukeran)	pentostatin
cyclophosphamide	pralatrexate (Folotyn)
doxorubicin, liposomal (Doxil)	romidepsin (Istodax)
etoposide	temozolomide (CNS involvement)
gemcitabine	vorinostat (Zolinza)
interferon alfa (Intron A)	

* All therapies listed above are NCCN category 2A recommendations (lower quality evidence but uniform consensus among panel), unless otherwise noted.

Medication Policy Manual

Policy No: dru216

Topic: Provenge, sipuleucel-T

Date of Origin: August 11, 2010

Committee Approval: June 20, 2024

Next Review Date: 2025

Effective Date: September 1, 2024

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Provenge (sipuleucel-T) is indicated for the treatment of asymptomatic or minimally symptomatic metastatic, castration-resistant prostate cancer. It is an immunotherapy derived from a patient's own immune cells and is designed to stimulate an immune response against the prostate cancer.

Policy/Criteria

Most contracts require pre-authorization approval of Provenge (sipuleucel-T) prior to coverage.

I. Continuation of therapy (COT): Provenge (sipuleucel-T) may be considered medically necessary for COT when criterion A, B, or C below is met.

A. For diagnoses NOT listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND there is documentation that the medication was covered by another health plan. Examples of documentation include the coverage approval letter from the previous health plan or paid claim.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

B. For diagnoses listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

C. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

***Please note**: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Provenge (sipuleucel-T) may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) that criteria A through F below are met.

A. Diagnosis of **metastatic adenocarcinoma of the prostate**.

AND

B. Radiographic evidence of metastases beyond the primary tumor, (such as bone and soft tissue) except visceral metastases; specifically, liver, lung, or brain metastases. [1]

AND

C. Hormone refractory (also known as castration-resistant, castration-recurrent, or androgen-independent) disease when both criteria 1 and 2 below are met:

1. Disease progression or metastasis despite removal of testes OR despite treatment with anti-androgen medications such as Lupron (leuprolide).

AND

2. Current testosterone level is < 50 ng/dL.

AND

D. Asymptomatic or minimally symptomatic disease [e.g., no narcotic (opioid) use for prostate cancer-related pain].

AND

E. If cytotoxic chemotherapy [e.g., docetaxel, cabazitaxel] has been previously administered, it must have been stopped for at least 3 months prior to initiation of leukapheresis for Provenge (sipuleucel-T) therapy.

AND

F. If immunosuppressants such as systemic corticosteroids at doses > 5 mg prednisone or equivalent) and/or radiation have been administered, it must have been stopped for at least 28 days prior to initiation of leukapheresis for Provenge (sipuleucel-T) therapy.

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers Provenge (sipuleucel-T) coverable only under the medical benefit (as a provider-administered medication).

B. When pre-authorization is approved, Provenge (sipuleucel-T) may be authorized one-time for a maximum of three infusions, each of which includes harvest and re-infusion of activated leucocytes. When criteria for coverage are met, up to 3 completed infusions (one course of therapy) may be authorized per lifetime.

C. Additional courses of therapy are considered investigational.

IV. Provenge (sipuleucel-T) is considered investigational when used for all other conditions, including but not limited to:

A. Localized (non-metastatic) prostate cancer.

B. Treatment of patients with moderate to severe prostate cancer-related pain that requires treatment with opioid analgesics.

C. Treatment of metastatic prostate cancer when there is metastasis to the liver, lung, or brain with or without additional metastases.

D. Concomitant use with of either chemotherapy or immunosuppressive agents (such as systemic corticosteroids) with the leukapheresis procedure or Provenge (sipuleucel-T).

Position Statement

- Provenge (sipuleucel-T) may improve overall survival as a first-line therapy in men with metastatic castration-resistant (mCRPC). However, there is uncertainty as to the magnitude of its benefit and its effectiveness relative to docetaxel. [1,2]
- Medical or surgical castration (hormonal intervention) is considered first-line therapy for patients with metastatic prostate cancer. Approximately 15% of patients do not respond to or eventually become refractory to hormonal intervention. [3]
- Docetaxel plus prednisone is considered first-line salvage therapy in patients with mCRPC based on its overall survival advantage over mitoxantrone plus prednisone, a chemotherapy regimen used for palliative treatment. [3]
- In the Provenge (sipuleucel-T) clinical trials, the population studied had radiologically confirmed mCRPC which was asymptomatic or minimally symptomatic. No data exists for its use in moderately or severely symptomatic patients, and it has not been studied in patients with visceral metastases. [1]
- Patients in the clinical trials had castration levels of serum testosterone below 50 ng/dL and a serum PSA of at least 5.0 ng/mL. Disease progression was based on imaging studies or PSA measurements, despite surgical or medical castration. [1,2]
- Pain related to prostate cancer is considered a prognostic factor in metastatic prostate cancer and people with pain tend to have higher tumor burden. [4]
- The use of either chemotherapy or immunosuppressive agents (such as systemic corticosteroids) given at the same time with the leukapheresis procedure for Provenge (sipuleucel-T) has not been studied. Provenge (sipuleucel-T) is designed to stimulate the immune system so simultaneous use of immunosuppressive agents may alter the effectiveness and/or safety of Provenge (sipuleucel-T). [2,5]

Regence Pharmacy Services performs independent analyses of oncology medication evidence, to establish coverability per the contracts with the health plan.

- Most contracts define coverability based on established clinical benefit in published, peer-reviewed literature, along with consideration of regulatory status.
- FDA approval does not in itself establish medical necessity, as unpublished, low-quality evidence, including exploratory analyses and unvalidated surrogate endpoints, may be used as the basis of approval. Regulatory approval may or may not reflect clinical benefit relative to standard of care and the recommendations of expert clinical advisors such as the Oncologic Drugs Advisory Committee (ODAC). FDA approvals generally do not consider cost compared to established therapies, or value to members.
- Likewise, NCCN clinical practice guidelines assignment of a recommendation (category 1, 2a, or 2b) does not necessarily establish medically necessity. NCCN recommendations are inconsistently supported by published, peer-reviewed literature and do not uniformly consider value of new therapies relative to existing potentially higher-value treatment options, considering effectiveness, safety, and cost.
- Medication coverage criteria are developed based on the 'medical necessity' assessment, as described above.

Regence Pharmacy Services analysis and coverage policy may differ from FDA labeled indication and/or NCCN clinical practice guidelines.

Clinical Efficacy

- The evidence for Provenge (sipuleucel-T) in the first-line salvage treatment of mCRPC is unreliable. The magnitude of survival benefit relative to placebo is uncertain. [1,2]
- The efficacy of Provenge (sipuleucel-T) relative to docetaxel, another potential first-line therapy in this setting, has not been studied. [2] There are three studies that compared Provenge (sipuleucel-T) with "placebo" (Note: a large proportion of subjects initially randomized to placebo crossed over to a product similar to Provenge (sipuleucel-T) after progression of disease). [1,6,7]
- The evidence from one pivotal published randomized controlled published trial comparing Provenge (sipuleucel-T) with placebo in men with mCRPC disease. At a median follow-up of 34 months, patients who received Provenge (sipuleucel-T) had a statistically significant improvement in overall survival. This trial was appraised as unreliable for reasons that included: [1]
    * Unblinding, which was allowed after disease progression was confirmed.
    * Crossover to alternative therapies after disease progression was allowed at the discretion of the investigator. (This occurred in a large proportion of subjects).
- Both of these flaws may impact the overall survival endpoint. The follow up use of a product similar to Provenge (sipuleucel-T) in the placebo treatment arm has the potential to improve survival in these patients, while follow up use of docetaxel in the Provenge (sipuleucel-T) treatment arm has the potential to improve survival in these patients. This crossover allows for confounding variables and makes it difficult to assess whether the reported overall survival benefit is valid and, if the benefit is real, to quantify the benefit.
- The evidence from two smaller published trials comparing Provenge (sipuleucel-T) with placebo in men with mCRPC disease were appraised as not reliable for reasons that included: [6,7]
    * Use of time to progression (TTP) of disease as a primary endpoint. TTP does not predict overall survival, a clinically relevant endpoint, in men with mCRPC.
    * Crossover to other therapies was allowed after progression of disease.
    * Post hoc analysis of overall survival (did not define statistical methods in advance).
    * One study was stopped before it met its enrollment goal.
- Provenge (sipuleucel-T) is recognized in the National Comprehensive Cancer Network (NCCN) prostate cancer guidelines as a category 1 recommendation ("Useful in certain circumstances") for men with mCRPC with asymptomatic or minimally symptomatic disease with ECOG scores of 0 to 1, and is not recommended for patients with visceral metastases and a life expectancy of less than 6 months. It is also recommended as category 2A in patients who have failed first-line therapy for metastatic disease. [3]

Safety [4]

- The most common adverse reactions include: chills, fatigue, fever, back pain, nausea, joint ache, and headache. There are no published head-to-head clinical trials to support the claim that Provenge (sipuleucel-T) has less toxicity than docetaxel.
- There were more cerebrovascular events (CVEs), including hemorrhagic and ischemic strokes, reported in patients receiving Provenge (sipuleucel-T) than placebo (3.5% vs. 2.6%). The difference was not statistically significant. Nevertheless, the Food and Drug Administration listed it as a safety concern in their review of the safety of this medication.

Medication Policy Manual | **Policy No:** dru223

Topic: Prolia, denosumab | **Date of Origin:** August 11, 2010

Committee Approval Date: September 19, 2024 | **Next Review Date:** 2025

Effective Date: December 1, 2024

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Prolia (denosumab) is a medication used to treat osteoporosis (bone loss). It works by preventing bone resorption (breakdown). Reducing bone resorption leads to a favorable increase in bone mass and reduction in fracture risk.

PLEASE NOTE: Denosumab is also marketed as Xgeva and is used to prevent skeletal complications of bone metastases from solid tumor cancers. In addition, Xgeva (denosumab) is used for the treatment of giant cell tumor of the bone and hypercalcemia of malignancy. There is a separate medication policy for Xgeva (denosumab) for these indications, specifically.

Policy/Criteria

Most contracts require pre-authorization approval of Prolia (denosumab) prior to coverage.

I. Continuation of therapy (COT): Prolia (denosumab) may be considered medically necessary for COT when criterion A, B, or C below is met.

A. For diagnoses NOT listed in the coverage criteria below, full policy criteria must be met for coverage.

OR

B. For diagnoses listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

C. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

Please note*: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New Starts (Treatment-naïve patients): Prolia (denosumab) may be considered medically necessary when there is clinical documentation (including, but not limited to, chart notes) that criteria A and B below are met.

A. Patients at high risk for fracture defined by meeting any one of criterion 1 through 6:

1. Have a bone mineral density that is 2.5 or more standard deviations below that of a "young normal" adult (T-score at or below –2.5).

OR

2. Have osteopenia (T-score between -1 and -2.5) and glucocorticoid use for at least 3 months at a dose of 5 mg per day or greater, of prednisone (or equivalent).

OR

3. History of osteoporotic (fragility) fracture.

OR

4. Men receiving androgen deprivation therapy (ADT) for nonmetastatic prostate cancer.

OR

5. Women receiving adjuvant aromatase inhibitor therapy for breast cancer.

OR

6. The probability is ≥ 20% for an occurrence of a major osteoporotic fracture or ≥ 3% for hip fracture, based on the US-adapted WHO algorithm Fracture Risk Assessment Tool (FRAX tool).

AND

B. One of the following criterion (1 or 2) below is met:

1. The patient is at very high risk of fracture, defined as meeting one of the following criterion (a through d) below:

a. A history of multiple fragility fractures.

OR

b. A bone mineral density that is 3 or more standard deviations below that of a "young normal" adult (T score at or below - 3.0) with or without fracture history.

OR

c. A bone mineral density that is 2.5 or more standard deviations below that of a "young normal" adult (T score at or below -2.5) **and** a history of at least one fragility fracture.

OR

d. A bone mineral density that is 2.5 or more standard deviations below that of a "young normal" adult (T score at or below -2.5) after completion of a full course of an anabolic bone medication (as listed in *Appendix 1*).

OR

2. Step therapy with lower-cost alternatives has been ineffective, not tolerated or contraindicated as defined by at least one of the following (a through e):

a. The patient has received at least three years of bisphosphonate therapy and remains at high risk for fracture (e.g., T-score at or below –2.5).

OR

b. A bisphosphonate has been ineffective (e.g., a loss of BMD after at least 12 months of treatment or fracture while on treatment).

OR

c. Raloxifene has not been effective after at least a 24-month treatment period based on objective documentation.

OR

d. Bisphosphonates (both oral and IV) are not tolerated due to documented clinical side effects.

OR

e. Bisphosphonates (both oral and IV) are contraindicated based on current medical literature and objective documentation describing the contraindication is provided (including, but not limited to, creatinine clearance of less than 35 ml/min).

PLEASE NOTE: In patients with underlying GI issues, use of oral bisphosphonates may be contraindicated or not tolerated. However, use of an IV bisphosphonate must be trialed for above criterion to be met.

IV bisphosphonates, such as zoledronic acid (generic Reclast), are available for coverage without pre-authorization.

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers Prolia (denosumab) coverable under the pharmacy benefit (as a self-administered medication) OR coverable under the medical benefit (as a provider-administered medication).

B. When pre-authorization is approved Prolia (denosumab) will be authorized in quantities of two 60 mg injections per year.

C. Authorization **may** be reviewed at least annually. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, such as disease stability or improvement.

IV. Prolia (denosumab) is considered not medically necessary for the prevention of skeletal complications of bone metastases from solid tumor cancers, treatment of giant cell tumor of the bone, and hypercalcemia of malignancy.

V. Prolia (denosumab) is considered investigational when used for all other conditions, including but not limited to:

A. Prevention of postmenopausal osteoporosis

B. Use in combination with anabolic bone medications, including but not limited to, Tymlos (abaloparatide), teriparatide (Forteo), or Evenity (romosozumab).

Position Statement

Summary

- Prolia (denosumab) is a monoclonal antibody used for the treatment of osteoporosis in men and postmenopausal women at high risk for fracture (e.g., T-score at or below -2.5, osteopenia and glucocorticoid use for > 3 months, probability ≥ 20% for an occurrence of a major osteoporotic fracture or ≥ 3% for hip fracture based on FRAX tool). In addition, it is used to increase bone mass in patients at high risk for fracture as a result of receiving androgen deprivation therapy for prostate cancer or aromatase inhibitor therapy for breast cancer.

- Bisphosphonate treatment for prevention of bone loss, regardless of cause, is the standard of care due to the body of evidence supporting efficacy and track record of safety. There are both oral and injectable bisphosphonates available as low-cost generics.
- Osteoporosis guidelines consider either oral or injectable bisphosphonates (including alendronate, risedronate, and zoledronic acid), along with Prolia (denosumab), as first-line therapy options for most patients who are candidates for treatment. All of these options have "broad spectrum" anti-fracture activity, with proven efficacy to reduce hip, non-vertebral, and spine fractures. Because raloxifene, a selective estrogen receptor modifier (SERM), has not been shown to reduce hip or non-vertebral fracture, it is considered an alternate to the bisphosphonates and Prolia (denosumab). [1]
- American Association of Clinical Endocrinologists (AACE) guidelines recommend that Tymlos (abaloparatide), Prolia (denosumab), Evenity (romosozumab), teriparatide (Forteo), and zoledronate as initial therapy for patients at very high fracture risk. The definition for very high risk differs in in Endocrine Society and AACE guidelines but both include patients with a T-score at or below -2.5 and a history of fracture, or a history of multiple fractures. [1 2] An additional definition of very high risk in the AACE guidelines includes patients with a T-score at or below -3.0, regardless of fracture history.
- There is consistent evidence that Prolia (denosumab) is a potent antiresorptive therapy. The effect is consistent across the placebo-controlled trials and comparative, non-inferiority trials. Prolia (denosumab) has demonstrated the potential to decrease the risk of fractures in patients with osteoporosis to a similar degree as other established treatment options (e.g., bisphosphonates); however, it is unknown if Prolia (denosumab) is a superior treatment option.
- Comparative evidence evaluating Prolia (denosumab) and bisphosphonates for osteoporosis assessed bone mineral density (BMD) as the primary endpoint, which is not as clinically relevant as the ability to prevent fracture.
- There is no comparative evidence evaluating Prolia (denosumab) and bisphosphonates for the prevention of osteoporosis associated with hormone suppression treatment in breast or prostate cancer.
- Generic treatments, such as bisphosphonates (oral and injectable), provide the best value for the prevention or treatment of bone loss in high-risk patients. Prolia (denosumab) has not been proven to be safer or more effective than generic bisphosphonates but is more costly. For patients unable to use oral bisphosphonates due to gastrointestinal (GI) issues, IV bisphosphonates are a treatment option as they do not have direct GI irritant effects.
- Denosumab is also marketed as Xgeva and is indicated for the treatment of skeletal complications of bone metastases from solid tumor cancers, treatment of giant cell tumor of the bone, or hypercalcemia of malignancy. Use of Prolia for these indications is considered not medically necessary as dosage and frequency of administration differ between indications and products.
- The use of Prolia (denosumab) for the prevention of postmenopausal osteoporosis is considered investigational as there is no evidence supporting its safety and efficacy in

this population. A number of other therapies (e.g., lifestyle modifications, calcium and vitamin D, bisphosphonates) may be appropriate in select patients.

- In addition, there is insufficient evidence to establish that the use of Prolia (denosumab) in combination with anabolic agents, such as teriparatide (Forteo) or Tymlos (abaloparatide), is more effective than monotherapy with either agent.
- Although the risk for osteonecrosis of the jaw (ONJ) and atypical femoral fracture (AFF) may be increased with long-term bisphosphonate use, the absolute risk reduction of clinical fractures with these medications are far greater than the absolute risk of AFF and ONJ. [3]
- The 2019 Endocrine Society Osteoporosis guideline and American Society for Bone and Mineral Research (ASBMR) recommend post-menopausal women be evaluated for fracture risk after 3-5 years of bisphosphonates. Patients with low-moderate fracture risk may consider a drug holiday, which is defined as a period of time when no osteoporosis medications are given. For patients with high risk (which include multiple spine fractures or hip/spine BMT $\leq$-2.5) osteoporosis treatment should be continued, as the benefits likely outweigh potential harms. [4]
- The 2019 Endocrine Society guidelines also recommend dual-energy X-ray absorptiometry (DEXA) at the spine and hip every 1 to 3 years to assess the response to treatment. While there is uncertainty regarding what is considered an adequate response, guidelines state the stable or increasing BMD may indicate a good response. Switching treatments may also be considered in patients who experience a fracture. [4]
- There have not been adequate studies to evaluate the efficacy of switching to alternative therapies and the optimal duration of bisphosphonate therapy is unclear.

Clinical Efficacy

Osteoporosis

- Prolia (denosumab) has not been proven in reliable clinical studies to be more effective than generic options.
- There are several randomized controlled trials (RCTs) assessing the efficacy of Prolia (denosumab) relative to placebo or alendronate. [5-8] However, only one trial studied the clinically meaningful endpoint of fracture prevention. [7] The other efficacy trials used percent change in bone mineral density (BMD) or geometric parameters as the primary endpoint. [5 6 8 9] BMD is a surrogate marker and change in BMD is poorly correlated to fracture prevention. Furthermore, geometric parameters remain a research method versus a clinical technique.
    - ***** A single trial established the efficacy of Prolia (denosumab) with regard to decreased fracture risk in postmenopausal osteoporosis compared to placebo. [7]
    - ***** Prolia (denosumab) reduces the risk of vertebral, hip and non-vertebral fractures in post-menopausal women with osteoporosis over 36 months when compared to placebo.
    - ***** Data from the long-term extension are available. Reduction in bone turnover and increases in BMD were maintained over time with Prolia (denosumab); however,

due to the cross-over design of the trial, the benefit for reducing fracture risk beyond 36 months of treatment cannot be determined. [10 11]

- There are trials comparing Prolia (denosumab) to weekly alendronate for the treatment of osteoporosis in post-menopausal women; however, there are limitations to these data.
  * The primary endpoint of many of these trials is BMD changes at 12 months, which is not as clinically relevant as fracture data. [5 6]
  * Another study performed a post-hoc analysis of a subset of patients (n = 116) enrolled in a phase 2 dose-ranging study. The primary endpoint of this study was geometric strength parameters. Although the effects of Prolia (denosumab) were greater than alendronate in select bone sites, the results are only suggestive of a correlation to improved fracture data and do not definitively prove that Prolia (denosumab) is superior to alendronate for preventing osteoporosis-related fractures. [9]
- The FRAX tool (www.shef.ac.uk/FRAX) was developed by the World Health Organization (WHO) to evaluate fracture risk of patients. It integrates clinical risk factors with BMD at the femoral neck. The FRAX tool provides the 10-year probability of fracture. The output is a 10-year probability of hip fracture and the 10-year probability of a major osteoporotic fracture (forearm, shoulder, or clinical vertebral fracture).
- Treatment should be considered if the 10-year risk is 3% or more for hip fracture or 20% or more for "major" osteoporosis-related fracture based on the US-adapted WHO algorithm (FRAX tool). [12]
- 2019 Endocrine Society Osteoporosis guideline recommend initial treatment with bisphosphonates (alendronate, risedronate, zoledronic acid, and ibandronate). They are available at low cost and have a long history of use. Prolia (denosumab) is considered an alternative initial treatment for patients who are not candidates for a bisphosphonate or who have not had an adequate response to bisphosphonates[4]
- An injectable option [e.g., zoledronic acid, Prolia (denosumab), Evenity (romosozumab), Tymlos (abaloparatide), or teriparatide (Forteo)] is recommended for those with a prior fragility fracture or indicators of higher fracture risk (e.g., advanced age, frailty, glucocorticoids, very low T-scores, or increased fall risk); however, no one specific injectable option is preferred over another. [12] Of the treatment options, generic zoledronic acid is the lowest cost treatment choice.
- The evidence for combination use of Prolia (denosumab) and teriparatide (Forteo) is limited to one small trial in post-menopausal women (n = 94). Although the combination resulted in a larger increase in BMD than either agent alone, there are no fracture data available. [13] Combination therapy substantially raises the cost and probably increases the potential for side effects. Until the effect of combination therapy on fracture is better understood, the AACE/ACE does not recommend concomitant use of these agents. [1 2]

Prevention of Osteoporosis due to Hormone Suppression

- For prostate cancer and breast cancer patients on hormone suppression therapy, hormone suppression increases bone turnover and decreases bone mineral density.
- There is a limited body of evidence for fracture prevention during hormone suppression therapy for prostate cancer and breast cancer. Trials were designed to demonstrate an

increase in BMD or time to first fracture, rather than a reduction in fracture risk. BMD is a surrogate for fracture risk, a more clinically meaningful measure of efficacy. The effect of Prolia (denosumab) on overall survival remains unknown.

Prostate Cancer

* For the treatment of bone loss in men with prostate cancer receiving androgen deprivation therapy (ADT), the evidence for efficacy for Prolia (denosumab) comes from a randomized, placebo-controlled trial in men with nonmetastatic prostate cancer. [14]
* Following two years of treatment, the lumbar spine BMD was higher in Prolia (denosumab)-treated patients compared to placebo-treated patients. Prolia (denosumab) also significantly reduced the incidence of new vertebral fractures (a secondary endpoint) at three years.
* In addition to Prolia (denosumab), there is evidence that pamidronate, zoledronic acid, and alendronate increase BMD during ADT for prostate cancer.
* There is no comparative evidence between bisphosphonates or Prolia (denosumab) for prevention of osteoporosis due to hormone suppression in patients with prostate cancer.
* The National Comprehensive Cancer Network (NCCN) Prostate Cancer guideline recognizes both Prolia (denosumab) and bisphosphonates (zoledronic acid or alendronate) to increase bone density, a surrogate for fracture risk in men without metastases receiving ADT. Treatment with any of these agents is recommended when the absolute fracture risk warrants drug therapy, with no preference for one agent over another.[15]

Breast Cancer

* For the treatment of bone loss in women with breast cancer receiving adjuvant aromatase inhibitor therapy, the evidence for efficacy for Prolia (denosumab) comes from a randomized, placebo-controlled trial. [16] Following one year of treatment, the lumbar spine BMD was higher in Prolia (denosumab)-treated patients compared to placebo-treated patients.
* Another study (ABCSG-18) evaluated the effects of Prolia (denosumab) relative to placebo on time to first clinical fracture in postmenopausal, aromatase inhibitor-treated patients with early-stage hormone receptor-positive breast cancer. [17] Compared to placebo, patients treated with Prolia (denosumab) had a significantly delayed time to first clinical fracture.
* There is no evidence that that Prolia (denosumab) is superior to intravenous bisphosphonates in the early breast cancer setting.
    - Prolia (denosumab) has not been directly compared to any active treatment, such as intravenous bisphosphonates, for the prevention of skeletal fractures, delay of disease recurrence, or overall survival in patients with early breast cancer.
    - The ABCSG-18 study [17] evaluated the impact of Prolia (denosumab) on disease-free survival (DFS) as a secondary endpoint in women with breast cancer. These results were not reported with the original study publication.

- The intent-to-treat analysis of DFS showed an absolute difference of 1.2% favoring Prolia (denosumab) compared to placebo, and barely met the statistical significance threshold (p = 0.051). [18]
- Subsequently, the 5-year DFS was published, with an absolute difference of 1.9% favoring Prolia (denosumab) compared to placebo, and a DFS of 3.1% at 8 years. As noted in the publication, despite statistical significance, the clinical utility of such a small change in DFS is unknown.[19]
- In the final protocol-defined analysis, at 8 years follow up, the observed difference (1%) in overall survival (OS) between treatment with Prolia (denosumab) compared to placebo was not statistically significant (90.9% vs. 89.9%; HR 0.8; 95% CI 0.64-1.01). [20]

* The NCCN Breast Cancer guideline recommends that women on adjuvant aromatase inhibitor therapy should have monitoring of bone health with a BMD determination at baseline and periodically thereafter. The use of a bisphosphonate is generally the preferred intervention to improve BMD. [21]

Safety

- The most common side effects reported with Prolia (denosumab) include urinary tract infection, upper respiratory tract infection, cataract, constipation, rash, sciatica, and pain in the extremities. [17]
- Both bisphosphonates and Prolia (denosumab) have labeled warnings for risk of osteonecrosis of the jaw (ONJ).
  * ONJ was first reported in patients with advanced cancer receiving high-dose (monthly) bisphosphonate therapy. The incidence of ONJ is much lower with bisphosphonate therapy for osteoporosis (usually annual dosing). [22]
  * When compared to cancer patients receiving antiresorptive treatment, the risk of ONJ for patients with osteoporosis exposed to antiresorptive medications is about 100 times smaller. [23]
  * Based on the current data, the risk of developing ONJ among osteoporotic patients exposed to bisphosphonates or Prolia (denosumab) is real but remains very low. The risk for ONJ among patients treated with either zoledronic acid or Prolia (denosumab) approximates the risk for ONJ of patients enrolled in placebo groups. [23] There is no evidence to establish that Prolia (denosumab) has a lower risk of ONJ, as compared to bisphosphonates (oral or injectable).
  * The risk versus benefit profile should be carefully considered for use of bone resorptive agents [bisphosphonates or Prolia (denosumab)]. Poor baseline health or dental procedures during treatment are known risk factors for ONJ. Thus, patients should be referred for dental evaluation before starting either agent.
- Because of potential safety concerns with long-term use of Prolia (denosumab), it appears to have a less favorable risk versus benefit profile than bisphosphonates for the prevention of osteoporosis.
- Prolia (denosumab) has a new black box warning for an increased risk of severe hypocalcemia in patients with advanced kidney disease. Prolia (denosumab) has a risk

evaluation and mitigation strategy (REMS) in place to ensure that this potential risk is considered before use. [24]

- Prolia (denosumab) contains a warning for an increased risk of fracture following discontinuation of Prolia (denosumab) treatment. Patients who discontinue Prolia (denosumab) should be transitioned to an alternative antiresorptive therapy. Please note that bisphosphonates (including intravenous zoledronic acid) and raloxifene are available without pre-authorization and may be used to transition patients.

Appendix 1: Anabolic Bone medications

Medication	Treatment course
teriparatide (Forteo)	24 months
Evenity (romosozumab)	12 months
Tymlos (abaloparatide)	24 months

Revision History

Revision Date	Revision Summary
9/19/2024	• Added additional criterion to define "very high risk" patients (T score ≤ - 3.0). • Removed Bonsity brand name from criteria V.B. (teriparatide is not marketed under this brand name any longer).
9/14/2023	• No criteria changes with this annual review.
9/23/2022	• Reworded criteria for operational clarity (no change to intent). • Added criteria for coverage of "very-high risk of fracture," despite completion of a full course of an anabolic bone medication. • Changed Bonsity to Bonsity/Teriparatide. • Updated benefit coverage to either medical or pharmacy depending on administration status.
10/15/2021	Updated criteria to bypass step therapy requirements for patients at very high risk of fracture (T-score at or below -2.5 and a history of fragility fracture, or multiple fragility fractures).
7/16/2021	Removed Site of Care Program requirement.
10/28/2020	• Added COT criteria. • Revised definition of ineffectiveness for bisphosphonates.
10/23/2019	• No changes to criteria. • Drug holidays addressed in supporting statement.
10/19/2018	Clarified investigational uses.
07/20/2018	• Clarified intent of raloxifene step therapy (ineffective). • Updated criteria with standard policy language (no changes to intent).
8/11/2017	Added raloxifene as an option for step therapy.
3/10/2017	Clarified use in combination with Forteo (teriparatide) is considered investigational.
11/11/2016	Removed site of care language from the individual drug policy; however, requirements still apply. Reference to Site of Care Review, dru408 is provided as part of criterion IA.
10/21/2016	Clarified that both IV and oral bisphosphonates are contraindicated in criterion B.2.c; however, the intent of this criterion has not changed.
3/11/2016	No criteria change.

Drug names identified in this policy are the trademarks of their respective owners.

Medication Policy Manual | **Policy No:** dru238

Topic: Yervoy, ipilimumab | **Date of Origin:** May 13, 2011

Committee Approval Date: March 6, 2025 | **Next Review Date:** 2025

Effective Date: May 1, 2025

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of medication policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Yervoy (ipilimumab) is an intravenous immune therapy medication used as a monotherapy or in combination with Opdivo (nivolumab) to treat certain types of cancers.

Policy/Criteria

Most contracts require pre-authorization approval of Yervoy (ipilimumab) prior to coverage.

I. Continuation of therapy (COT):

Yervoy (ipilimumab) may be considered medically necessary for COT when criterion A, B, or C below is met.

A. For diagnoses NOT listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND there is documentation that the medication was covered by another health plan. Examples of documentation include the coverage approval letter from the previous health plan or paid claim.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

B. For diagnoses listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

C. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

Please note*: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients):

Yervoy (ipilimumab) may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) confirming that one of the following criterion A through H below is met.

A. A diagnosis of **melanoma**, **unresectable (stage III) or metastatic (stage IV)**, when Yervoy (ipilimumab) will be given in one of the following two treatment settings (1 or 2):

1. Yervoy (ipilimumab) will be used as monotherapy.

OR

2. For use as combination therapy, both criteria below (a and b) are met:

a. Yervoy (ipilimumab) will be given in combination with Opdivo (nivolumab).

AND

b. No prior therapy with any of the following:
i. Yervoy (ipilimumab).
ii. PD-1/PD-L1 blocking antibody therapy *(see Appendix 1)*.

OR

B. A diagnosis of **melanoma**, **resectable** when criteria 1, 2, and 3 below are met:

1. Documentation of pathologic involvement of regional lymph nodes (stage III).

AND

2. Yervoy (ipilimumab) is used as adjuvant treatment (after complete surgical resection).

AND

3. Yervoy (ipilimumab) will be used as monotherapy.

OR

C. A diagnosis of **colorectal cancer** (CRC), locally advanced or metastatic, when criteria 1 through 4 below are met:

1. The tumor is microsatellite instability-high (MSI-H) or mismatch repair deficient (dMMR) by immunohistochemistry (IHC) or polymerase chain reaction (PCR) testing.

AND

2. There has been disease progression during or after prior therapy with a fluoropyrimidine (e.g., fluorouracil, capecitabine), oxaliplatin, and irinotecan, unless all are not tolerated or there is a documented medical contraindication to each of the three options.

AND

3. No prior therapy with any of the following:
a. Yervoy (ipilimumab).
b. PD-1/PD-L1 blocking antibody therapy *(see Appendix 1)*.

AND

4. Yervoy (ipilimumab) will be used in combination with Opdivo (nivolumab) for a maximum of four doses.

OR

D. A diagnosis of **renal cell carcinoma** (RCC), unresectable locally advanced or metastatic, when criteria 1 through 4 below are met:

1. The disease is considered intermediate- or poor risk (see *Appendix 2*).

AND

2. There has been no prior systemic therapy in the advanced disease setting.

AND

3. No prior therapy with any of the following:
a. Yervoy (ipilimumab).
b. PD-1/PD-L1 blocking antibody therapy *(see Appendix 1)*.

AND

4. Yervoy (ipilimumab) will be used in combination with Opdivo (nivolumab) for a maximum of four doses.

OR

E. A diagnosis of **non-small cell lung cancer** (NSCLC), advanced or metastatic, when criteria 1, 2, and 3 below are met:

1. Yervoy (ipilimumab) is used in combination with Opdivo (nivolumab) AND one of the following applies (a or b):

a. The tumor expresses PD-L1 (≥ 1%).

OR

b. Given in combination with two cycles of platinum-doublet chemotherapy (regardless of PD-L1 status).

AND

2. No prior use of systemic anti-cancer therapy for advanced or metastatic disease (used in the first-line setting).

AND

3. No prior therapy with any of the following:

a. Yervoy (ipilimumab).

b. PD-1/PD-L1 blocking antibody therapy *(see Appendix 1)*.

OR

F. A diagnosis of **hepatocellular carcinoma** (HCC) when criteria 1 through 4 below are met:

1. Confirmation of one of the following (a or b): [provider attestation]

a. Child-Pugh score of 5 to 6 (class A).

OR

b. Child-Pugh Class B AND good performance status (ECOG 0-1)

AND

2. There has been disease progression on, or intolerance to an HCC-active oral tyrosine kinase inhibitor (TKI) [such as sorafenib (generic, Nexavar), or Lenvima (lenvatinib)].

AND

3. Yervoy (ipilimumab) will be used in combination with Opdivo (nivolumab) for a maximum of four doses.

AND

4. No prior therapy with any of the following:

a. Yervoy (ipilimumab).

b. PD-1/PD-L1 blocking antibody therapy *(see Appendix 1)*.

OR

G. A diagnosis of **malignant pleural mesothelioma** (MPM), **unresectable**, when criteria 1, 2, and 3 below are met:

1. No prior use of systemic therapy for advanced disease.

AND

2. Yervoy (ipilimumab) is used in <u>combination</u> with Opdivo (nivolumab).

AND

3. No prior therapy with any of the following:
- **a.** Yervoy (ipilimumab).
- **b.** PD-1/PD-L1 blocking antibody therapy *(see Appendix 1)*.

OR

H. A diagnosis of **esophageal squamous cell carcinoma** (ESCC), unresectable advanced or metastatic, when criteria 1 through 5 below are met:

1. The patient is not a candidate for surgical resection or definitive chemoradiotherapy (CRT).

AND

2. Yervoy (ipilimumab) will be used in combination with Opdivo (nivolumab).

AND

3. The tumor expresses PD-L1 (≥ 1%).

AND

4. Use in the first-line setting, with no prior systemic therapy in the advanced disease setting.

AND

5. No prior therapy with any of the following:
- **a.** Yervoy (ipilimumab).
- **b.** PD-1/PD-L1 blocking antibody therapy *(see Appendix 1)*.

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers Yervoy (ipilimumab) coverable only under the medical benefit (as a provider-administered medication).

B. When preauthorization is approved, Yervoy (ipilimumab) will be authorized as follows:

1. As monotherapy (melanoma):

Diagnosis	Dosing, as a monotherapy	Duration
Melanoma, resectable (adjuvant)	Up to 10 mg/kg every 3 weeks for four doses, then up to 10 mg/kg every twelve weeks.	Until disease recurrence or for a maximum of 3 years.
Unresectable or metastatic melanoma	Up to 3 mg/kg/dose [up to 600 billing units per claim (600 mg)], for four doses.	***Initial Authorization:*** Up to four infusions (one treatment course), or until disease progression. ***Reauthorization:*** Up to four additional infusions (maximum of one additional treatment course) may be authorized if there is documented disease progression after an initial response to Yervoy followed by at least 3 months of disease stability.

2. Combination therapy with Opdivo (nivolumab) or other medications:

Diagnosis	Dosing, in combination with Opdivo (nivolumab)	Duration
CRC, RCC	Up to 1 mg/kg/dose for four doses with nivolumab (then nivolumab monotherapy).	One-time for a maximum of four infusions (one treatment course), or until disease progression.
HCC, Unresectable or metastatic melanoma	Up to 3 mg/kg/dose for four doses with nivolumab (then nivolumab monotherapy).	
ESCC, NSCLC*, MPM	Up to 1 mg/kg/dose every 6 weeks with nivolumab.	Until disease progression or for a maximum of 2 years (or 24 months).

*In NSCLC Yervoy (ipilimumab) is approved either in combination with Opdivo (nivolumab) alone, or in combination with Opdivo (nivolumab) plus two cycles of chemotherapy. The Yervoy (ipilimumab) dose is the same in either setting.

C. Authorization **may** be reviewed at least annually. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, such as disease stability or improvement.

IV. Yervoy (ipilimumab) is considered investigational when:

A. Infused for more than the dose-maximum listed above (including more than 4 doses for unresectable or metastatic melanoma, CRC, HCC, and RCC).

B. Used in combination with other anticancer medications other than those specifically listed above, including but not limited to other immunotherapies and targeted therapies.

C. Used as a neoadjuvant therapy (prior to surgical excision) for resectable melanoma.

D. Used as adjuvant therapy (after surgical tumor excision) for resectable renal cell carcinoma (RCC).

E. Used for all other conditions, including but not limited to:

1. Breast cancer.

2. Cervical cancer.

3. Leukemia.

4. Non-Hodgkin's lymphoma.

5. Ovarian cancer.

6. Pancreatic cancer.

7. Prostate cancer.

8. Sarcoma.

9. Small cell lung cancer.

10. Urothelial cancer.

Position Statement

- Yervoy (ipilimumab) is a human cytotoxic T-lymphocyte antigen 4 (CTLA-4) blocking antibody which is used in the treatment of melanoma, either alone or in combination with Opdivo (nivolumab) for specific cancers.
- The intent of this policy is to cover Yervoy (ipilimumab) in settings where it has been shown to be safe and effective, as detailed in the coverage criteria, with consideration for other available treatment options.
    - * Where there is lack of proven additional benefit and/or lack of demonstrated health outcome (such as overall survival or improved quality of life) relative to alternative therapies, use of Yervoy (ipilimumab) alone or in combination with other therapies is not coverable ("not medically necessary" or "investigational").
    - * It is important to note that the fact that a medication is FDA approved for a specific indication does not, in itself, make the treatment medically reasonable and necessary.
- Many of the clinical indications for immunotherapies (such as CTLA-4, PD-1, PD-L1, and others) have been approved by the FDA and endorsed by clinical guidelines based on surrogate measures such as overall tumor response rate (ORR) and progression-free survival (PFS) which are not proven to accurately predict clinically important outcomes such as improved overall survival or improved quality of life.
- National Comprehensive Cancer Network (NCCN) guidelines recommend Yervoy (ipilimumab) as a potential option in each of the treatment settings listed in the coverage criteria. In general, NCCN recommendations parallel the FDA approved indications.
- Yervoy (ipilimumab) is associated with severe and life-threatening immune-mediated adverse reactions.
- Yervoy (ipilimumab) is given as an intravenous infusion over 30 to 90 minutes. It is covered up to the maximum doses and durations listed in package labeling for the various disease settings for which it is approved, as specified in the coverage criteria.
- Optimal sequencing of chemotherapy and immunotherapy in many cancers is unknown or the data is evolving. At this time, sequential use of immunotherapies is not supported by current evidence. Specifically, there is no evidence to support the sequential use of different CTLA-4, PD-1/PD-L1 inhibitors once there is disease progression on prior CTLA-4 therapy. Therefore, the use of sequential courses of CTLA-4 immunotherapy is not coverable.
- There are ongoing studies using Yervoy (ipilimumab) in a variety of other cancers. However, although initial evidence may be promising, the potential for clinical benefit in these conditions is still being investigated.

Regence Pharmacy Services performs independent analyses of oncology medication evidence, to establish coverability per the contracts with the health plan.

- Most contracts define coverability based on established clinical benefit in published, peer-reviewed literature, along with consideration of regulatory status.

- FDA approval does not in itself establish medical necessity, as unpublished, low-quality evidence, including exploratory analyses and unvalidated surrogate endpoints, may be used as the basis of approval. Regulatory approval may or may not reflect clinical benefit relative to standard of care and the recommendations of expert clinical advisors such as the Oncologic Drugs Advisory Committee (ODAC). FDA approvals generally do not consider cost compared to established therapies, or value to members.
- Likewise, NCCN clinical practice guidelines assignment of a recommendation (category 1, 2a, or 2b) does not necessarily establish medically necessity. NCCN recommendations are inconsistently supported by published, peer-reviewed literature and do not uniformly consider value of new therapies relative to existing potentially higher-value treatment options, considering effectiveness, safety, and cost.
- Medication coverage criteria are developed based on the 'medical necessity' assessment, as described above.

Regence Pharmacy Services analysis and coverage policy may differ from FDA labeled indication and/or NCCN clinical practice guidelines.

Clinical Efficacy

Cutaneous Melanoma

- Yervoy (ipilimumab) may be covered for treatment of **advanced malignant cutaneous melanoma** that is unresectable or has metastasized to other areas, a setting where it has been shown to improve overall survival relative to supportive care.

As monotherapy for advanced melanoma

- A large study evaluated the effects of Yervoy (ipilimumab) on overall survival (OS) in patients with previously treated, unresectable, or metastatic melanoma. [1]
    * The triple-arm study included 676 patients with unresectable or metastatic melanoma who had received one or more prior treatments.
    * The study compared Yervoy (ipilimumab) with a gp100 peptide vaccine (an experimental immunotherapy used in the treatment of melanoma). gp100 peptide vaccine has not been shown to impact OS in this population.
    * Yervoy (ipilimumab) was administered in a dose of 3 mg/kg intravenously (IV) every three weeks for a total of 4 doses (one treatment course).
    * Patients in the study who received Yervoy (ipilimumab) had a median OS of approximately 10 months, compared with a reported median OS of 6.4 months in the vaccine-only arm. This is considered a clinically relevant improvement in OS.
    * Limitations to the study included uncertain blinding and concealment of allocation, and uncertainty as to whether the comparator (peptide vaccine) had any positive or negative impact on study patients.
- Yervoy (ipilimumab) has not been compared with any other therapy for unresectable or metastatic melanoma in patients who have had prior medication therapy for melanoma. [2]
- A second study compared Yervoy (ipilimumab) plus dacarbazine versus dacarbazine alone in patients with unresectable or metastatic melanoma who had no prior medication therapy. [3]

* The study reported a median OS advantage of approximately 2 months in the Yervoy (ipilimumab) treatment arm.
* There is low confidence in the results from the trial because of a very high proportion of missing data (~35%) and the potential for confounding due to additional therapies that were used after disease progression.

Combination with Opdivo (nivolumab) for advanced melanoma

- The use of Yervoy (ipilimumab) in combination with Opdivo (nivolumab) was studied in one randomized, double-blind, triple-arm study included 945 patients with unresectable or metastatic melanoma. [4]
  * Patients had not received prior systemic therapy for advanced disease, such as Yervoy (ipilimumab) or a programmed death-1 (PD-1) inhibitor [Opdivo (nivolumab), or Keytruda (pembrolizumab)].
  * Patients were treated with Yervoy (ipilimumab) 3 mg/kg IV along with Opdivo (nivolumab) 1 mg/kg IV every three weeks for four doses, followed by Opdivo (nivolumab) 3 mg/kg IV every two weeks, until disease progression.
  * Combination therapy improved median PFS by approximately 8.5 months relative to monotherapy with either Yervoy (ipilimumab) or Opdivo (nivolumab) [11.5 months versus 2.9 months or 6.9 months, respectively]. The OS data was not yet mature at the time this trial was published.
- There is interest in the use of Yervoy with other PD-1 inhibitors, such as pembrolizumab (Keytruda). however, at this time, there is insufficient evidence to support the use of Yervoy except as noted in the coverage criteria, as either a monotherapy, or in combination with nivolumab (Opdivo). Use in combination with any other PD-1 inhibitor is considered investigational. Yervoy (ipilimumab) has not been studied in combination with Keytruda (pembrolizumab), another PD-1 inhibitor.

Adjuvant therapy for advanced melanoma

- The risk versus the potential benefit of high-dose Yervoy (ipilimumab) as an adjuvant therapy for **resectable cutaneous melanoma** with pathologic involvement of regional lymph nodes (stage III) is unclear. This regimen is poorly tolerated, and it is not known if the toxicities of this therapy outweigh potential clinical benefit.
- A large, randomized, double-blind, trial evaluated Yervoy (ipilimumab) as an adjuvant therapy in subjects with stage III, resectable cutaneous melanoma. [5,6]
  * Subjects were diagnosed with histologically confirmed cutaneous melanoma that was metastatic to the lymph nodes only and had complete excision of the cutaneous lesion with good margins and a complete regional lymphadenectomy. Yervoy (ipilimumab) 10 mg/kg (high-dose) was compared with placebo, each given IV every three weeks for four doses, then every three months for a maximum of three years.
  * At a medium follow-up of 2.7 years, recurrence-free survival (RFS), the primary endpoint, was improved in the Yervoy (ipilimumab) therapy arm relative to placebo (26 months versus 17 months, respectively).

    * In an updated analysis, at a medium follow-up of 5.3 years, the rate of OS was 65.4% in the Yervoy (ipilimumab) group, as compared to 54.4% in the placebo group (hazard ratio for death, 0.72; 95.1% CI, 0.58 to 0.88; P = 0.001).
    * More than half of the subjects withdrew from the Yervoy (ipilimumab) treatment arm due to adverse events versus only 4% in the placebo arm. Immune-related adverse events of any grade occurred in 90% of patients in the Yervoy (ipilimumab) group and 40% of patients in the placebo group. Immune-related adverse events of grade 3 to 5 occurred in 43% of patients in the Yervoy (ipilimumab) treatment group and in 3% of patients in the placebo group. Additionally, five patients in the Yervoy (ipilimumab) arm died due to immune-mediated adverse events attributed to treatment.
- Despite FDA approval, the small change in OS, high toxicity, and poor tolerability of high-dose Yervoy (ipilimumab) observed in this study, it is unclear if the harms of this therapy outweigh any potential clinical benefit when it is used as an adjuvant therapy after complete resection of cutaneous melanoma and regional lymphadenectomy due to pathologic involvement of regional lymph nodes. In addition, there are no studies demonstrating the efficacy of Yervoy (ipilimumab) when used at a lower dose in the adjuvant setting, or whether a potential clinical benefit at a lower dose will outweigh toxicities.

Renal cell carcinoma (RCC)

- Yervoy (ipilimumab) initiated in combination with Opdivo (nivolumab) was approved in **untreated, intermediate- to high-risk, advanced RCC** based on preliminary evidence where it demonstrated a modest improvement in survival at 18 months relative to Sutent (sunitinib). A large, randomized, open-label trial compared the combination of Yervoy (ipilimumab) plus Opdivo (nivolumab) with Sutent (sunitinib) as initial therapy for patients with intermediate- to poor risk, unresectable or metastatic RCC. [7]
    * Yervoy (ipilimumab) was initiated with Opdivo (nivolumab) and was administered for four doses total. Opdivo (nivolumab) was then continued as monotherapy until disease progression.
    * The population included patients of favorable-, intermediate-, or poor-risk disease based on the International Metastatic RCC Database Consortium (IMDC) prognostic model; however, only patients with intermediate- or poor risk disease were evaluated for efficacy.
    * There was no statistical difference in progression-free survival (PFS) between the two treatment groups.
    * There was no difference in radiographic disease progression detected between the two treatment groups. It is too soon to know if the absolute survival difference is clinically relevant as median survival has not been met in either treatment group. An interim analysis at 18 months demonstrated a survival benefit in the Yervoy (ipilimumab) plus Opdivo (nivolumab) treatment arm relative to Sutent (sunitinib) [HR 0.63 (99.8% CI: 0.44, 0.89)]. Median OS has not been reached in either group.

    - Potential areas of bias which may erode the reported survival difference between the therapies include lack of blinding, and a high proportion of subjects who stopped taking study medication who then crossed over to other therapies.
- It is not known how Yervoy (ipilimumab) plus Opdivo (nivolumab) compares with other front-line therapy options. To date this combination has only been compared with Sutent (sunitinib).
- It is too early to determine the overall net health benefit of Yervoy (ipilimumab) plus Opdivo (nivolumab) in advanced RCC.

Hepatocellular carcinoma (HCC)

- Yervoy (ipilimumab) was approved in combination with Opdivo (nivolumab) for advanced HCC after progression of disease on sorafenib based on a small, low-quality study where it was found to shrink the size of tumors in about one out of three patients. A small cohort of patients with advanced HCC who had progressed during or after sorafenib therapy was evaluated in this low-quality, single-arm, open-label, observational trial. [2]
    - Yervoy (ipilimumab) was initiated with Opdivo (nivolumab) and was administered for four doses total. Opdivo (nivolumab) was then continued as monotherapy until disease progression.
    - All patients in the trial had a Child-Pugh class of A5 or A6. Eighty percent had extrahepatic spread of their disease. All enrolled patients had good performance status (ECOG 0-1).
- Sixteen of 49 patients (33%) demonstrated a tumor response during the trial. Only 4 patients (8%) had a complete response. To date there is no evidence that it improves any relevant clinical outcome (e.g., overall survival, quality of life, function, symptom control) in this disease setting.
- The evidence for use of systemic anticancer therapy in Child-Pugh class B HCC is limited to small numbers of patients across pivotal trials. All included patients had good performance status (ECOG 0-1). Additionally, patients with Child-Pugh class C were not included due to their poor performance status. Therefore, coverage of systemic therapies for HCC is limited to patients with good performance status (ECOG 0-1).

Colorectal cancer (CRC)

- Yervoy (ipilimumab) was approved in combination with Opdivo (nivolumab) for patients with mismatch repair deficient (dMMR) or microsatellite stability-high (MSI-H) metastatic CRC based on a small, low-quality, single-arm cohort observational study where it was found to shrink the size of tumors in about one out of two patients. [2]
    - All of the patients enrolled in the trial had disease progression during or after prior treatment with fluoropyrimidine-, oxaliplatin-, or irinotecan-based chemotherapy.
    - Yervoy (ipilimumab) was initiated with Opdivo (nivolumab) and was administered for four doses total. Opdivo (nivolumab) was then continued as monotherapy until disease progression.
    - All patients had microsatellite instability-high (MSI-H) or mismatch repair deficient (dMMR) metastatic disease.

    * Thirty-eight (46%) of 82 patients in the cohort had a tumor response during the trial. Only three patients (3.7%) had a complete response.

- To date there is no evidence that it improves any relevant clinical outcome (e.g., overall survival, quality of life, function, symptom control) in this disease setting.

Non-small cell lung cancer (NSCLC)

- Yervoy (ipilimumab) was approved in combination with Opdivo (nivolumab) as a front-line therapy for patients with recurrent or metastatic NSCLC two different settings, based on improved overall survival relative to platin-doublet chemotherapy:
    * In patients with no known EGFR mutations or ALK translocations, regardless of PD-L1 status when given with two cycles of platin-doublet chemotherapy.
    * In patients with no known EGFR mutations or ALK translocations, but whose tumors expressed PD-L1 (≥ 1%).
- Approval of Yervoy (ipilimumab) in combination with Opdivo (nivolumab) as a front-line therapy in patients with metastatic NSCLC expressing PD-L1 (≥ 1%) is based on an open-label trial that compared this immunotherapy regimen with platin-doublet chemotherapy. [2,8]
    * Patients had no known EGFR mutations or ALK translocations.
    * Patients were given Yervoy (ipilimumab) every 6 weeks plus Opdivo (nivolumab) every 2 weeks until disease progression, or up to two years in patients without disease progression.
    * The median OS was 17.1 months [95% CI: 15.0, 20.1] and 14.9 months [95% CI: 12.7, 16.7] in the Yervoy (ipilimumab) plus Opdivo (nivolumab) and platinum-doublet chemotherapy treatment arms, respectively.
- Approval of Yervoy (ipilimumab) in combination with Opdivo (nivolumab) as a front-line therapy in patients with metastatic NSCLC regardless of PD-L1 status is based on an open-label trial that compared this immunotherapy regimen plus two cycles of platin-based chemotherapy with standard platin-doublet chemotherapy. [2]
    * To be enrolled in the trial, patients could have no known EGFR mutations or ALK translocations.
    * Patients were given Yervoy (ipilimumab) every 6 weeks plus Opdivo (nivolumab) every 3 weeks in combination with two cycles of a platinum-doublet until disease progression, or up to two years in patients without disease progression.
    * The median OS was 14.1 months [95% CI: 13.2, 16.2] and 10.7 months [95% CI: 9.5, 12.5] in the Yervoy (ipilimumab) plus Opdivo (nivolumab) plus platin-doublet chemotherapy, and platinum-doublet chemotherapy treatment arms, respectively.

Malignant pleural mesothelioma (MPM)

- Yervoy (ipilimumab) was approved in combination with Opdivo (nivolumab) as a front-line therapy for patients with unresectable MPM based on a large, open-label randomized controlled trial (RCT) that demonstrated a four-month improvement in median OS relative to platinum-based chemotherapy, the standard of care. [9]
    * Patients were given Yervoy (ipilimumab) every 6 weeks [in combination with Opdivo (nivolumab)] until disease progression, or up to two years in patients without disease

progression.

* The median OS was 18.1 months and 14.1 months in the Yervoy (ipilimumab)/ Opdivo (nivolumab) and chemotherapy treatment arms, respectively [HR 0.74 (95% CI 0.61, 0.89); p = 0.002].

Esophageal Squamous Cell Carcinoma (ESCC)

- Yervoy (ipilimumab) was approved in combination with Opdivo (nivolumab) as a potential front-line therapy for unresectable advanced or metastatic ESCC based on a large randomized, open-label trial that demonstrated a 2-month improvement in median OS relative to standard front-line chemotherapy. [10] This is likely an overestimate of expected survival benefit in the general population due to the following:
  * The trial was enriched with patients whose tumors overexpressed PD-L1 (PD-L1 ≥ 1%) and were therefore more likely to respond to this immunotherapy combination. Subgroup analyses support this analysis as there was a 4.5-month improvement in median OS relative to standard chemotherapy in the PD-L1 ≥ 1% population; however, there was no survival benefit relative to chemotherapy in the PD-L1 < 1% population. *(Note: Forty-nine percent of the study population had PD-L1 expression ≥ 1%)*
  * Only 16% of patients in the chemotherapy arm received a PD-(L)1 inhibitor after disease progression. Follow-on therapy with a PD-(L)1 inhibitor is standard of care in the US based on current guidelines. There are currently two PD-1 inhibitors approved as monotherapy in the US for ESCC in the second-line setting (after progression on chemotherapy).
- Optimal sequencing of therapies in ESCC has not yet been determined.

CLINICAL GUIDELINES

- The National Comprehensive Cancer Network (NCCN) melanoma guideline lists Yervoy (ipilimumab), and Yervoy (ipilimumab) plus Opdivo (nivolumab) as a category 2A recommendation as a second-line or subsequent therapy in patients with or without BRAF V600 mutation positive melanoma. The use of Yervoy (ipilimumab) in combination with Opdivo (nivolumab) is a category 1 recommendation in the first-line metastatic setting.
- The NCCN gives high-dose Yervoy (ipilimumab) a category 2A recommendation in the adjuvant treatment of stage III cutaneous melanoma where it may have use when there has been prior exposure to anti-PD-1 therapy. [11]
- The NCCN melanoma guideline includes a footnote indicating that re-induction with Yervoy (ipilimumab) may be considered for select patients who experienced no significant systemic toxicity during prior therapy and who relapse after initial clinical response or progress after stable disease. [11,12]

For other cancers, the NCCN guideline lists the following: [11]

- The combination of Yervoy (ipilimumab) plus Opdivo (nivolumab) among preferred treatment options for first-line intermediate- to poor-risk, unresectable or metastatic RCC. It is a category 2A recommendation for low-risk disease.
- Yervoy (ipilimumab) in combination with Opdivo (nivolumab) as a treatment option for microsatellite instability-high (MSI-H) or mismatch repair deficient (dMMR) metastatic

CRC when disease has progressed after FOLFOX or CAPEOX.

- Yervoy (ipilimumab) in combination with Opdivo (nivolumab) as a treatment option as a subsequent-line therapy for HCC.
- The combination of Yervoy (ipilimumab) and Opdivo (nivolumab) among preferred, front-line regimens for MPM.
- Yervoy (ipilimumab) in combination with Opdivo (nivolumab) as a treatment option 'useful in certain circumstances' when the tumor expresses PD-L1. It is also listed as a category 2A 'other' recommendation as an initial therapy for metastatic NSCLC that does not express PD-L1.
- Yervoy (ipilimumab) plus Opdivo (nivolumab) is listed as a category 2A recommendation among many potential front-line regimens for advanced ESCC. The guideline notes that use should be limited to cases where there has been no tumor progression with prior checkpoint inhibitor therapy.

INVESTIGATIONAL USES

- Data to support the use of combination treatment with Yervoy (ipilimumab) and Opdivo (nivolumab) for the treatment of small cell lung cancer (SCLC) is limited to a single phase I/II trial. Response rates were reported with the combination treatment in SCLC after primary therapy, but not overall survival. Combination treatment with Yervoy (ipilimumab) and Opdivo (nivolumab) have not been shown to be superior to many available alternative therapies in patients with SCLC. Larger, well-designed, randomized, controlled trials are needed to confirm preliminary results. [13]
- Yervoy (ipilimumab) demonstrated some antitumor activity in small trials in patients with non-Hodgkin Lymphoma, and sarcoma. Larger, well-controlled clinical trials in these settings are needed to confirm clinical benefit. [14-16]
- Yervoy (ipilimumab) failed to demonstrate any clinical benefit in castration-resistant prostate cancer (as monotherapy) and small cell lung cancer (in combination with cytotoxic chemotherapy) in two large, phase 3 trials. [17,18]
- There is interest in using Yervoy (ipilimumab) in the neoadjuvant melanoma setting; however, evidence to date is preliminary and hypothesis generating. A phase 3 randomized, comparative trial is needed to determine if neoadjuvant therapy confers any additional benefit over standard current therapies (e.g., adjuvant immunotherapies).
- A randomized, double-blind, placebo-controlled trial (CheckMate 914) evaluated the combination of Opdivo (nivolumab) and Yervoy (ipilimumab) as an adjuvant therapy for patients with resectable renal cell carcinoma (RCC) who were at high risk of relapse. No difference in relapse-free survival (RFS) was detected between the treatment and placebo groups. The number of deaths was similar in each treatment arm; however, OS data is not yet mature. [19]

Safety

- The most common adverse effects (AEs) reported with Yervoy (ipilimumab) include fatigue, diarrhea, pruritus, rash, and colitis. Additional common AEs observed at the higher, 10 mg/kg dose, include nausea, vomiting, headache, weight loss, pyrexia, decreased appetite, and insomnia. Yervoy (ipilimumab) carries a boxed warning for severe immune-

mediated adverse reactions including immune-mediated hepatitis and endocrinopathies. For severe reactions, the prescribing information recommends Yervoy (ipilimumab) be permanently discontinued. For moderate reactions, the prescribing information states the dose of Yervoy (ipilimumab) should not be given and systemic corticosteroids are recommended. [2]

Dosing Considerations

- Dosing and administration vary based on the setting in which Yervoy (ipilimumab) is used. Consult package labeling for details. [2]
- High-dose (10 mg/kg IV every three weeks) Yervoy (ipilimumab), which is approved for adjuvant use in patients with stage 3 melanoma, is poorly tolerated. [12]
- The evidence for retreatment with ipilimumab when there is disease progression after initial response in patients with advanced melanoma is based on low-quality evidence. [12,20,21]
    * Patients in these observational studies were retreated with up to an additional four doses (one treatment course) of ipilimumab after disease progression.
    * Approximately half were able to achieve a temporary response to the additional treatment course. Most of the responders achieved stable disease; however, some patients had a partial response, and a few had a complete response.
    * It is not known if retreatment improves any clinical outcome such as improved survival or quality of life.

Appendices

Appendix 1:

FDA- approved PD-1 and PD-L1 blocking monoclonal antibody therapies [a]
Programmed death receptor-1 (PD-1) inhibitors
Jemperli (dostarlimab)
Keytruda (pembrolizumab)
Libtayo (cemiplimab-rwlc)
Loqtorzi (toripalimab)
Opdivo (nivolumab), Opdivo Qvantig (nivolumab-hyaluronidase-nvhy)
Tevimbra (tislelizumab)
Zynyz (retifanlimab)
Programmed death-ligand 1 (PD-L1) inhibitor
Bavencio (avelumab)
Imfinzi (durvalumab)
Tecentriq (atezolizumab), Tecentriq Hybreza (atezolizumab- hyaluronidase-tqjs)

[a] Or as listed on the FDA.gov website. Several PD-1s are in the drug development pipeline. This is a list of the PD-1 inhibitors FDA-approved in the US at the time this policy was approved.

Appendix 2:

International Metastatic Renal Cell Carcinoma Database Consortium (IMDC) Prognostic Model [7]

Number of Risk Factors	Expected Outcome
0	Low risk, with good prognosis
1 or 2	Intermediate risk
3 or more	Poor risk

Risk factors: *(predicators of shortened survival)*

- Serum hemoglobin < lower limit of normal
- Corrected serum calcium > upper limit of normal
- Karnofsky performance status score < 80% (not capable of caring for self, or normal activity or work)
- Time from initial diagnosis to initiation of treatment of < 1 year
- Absolute neutrophil count > upper limit of normal
- Platelets > upper limit of normal

Revision History

Revision Date	Revision Summary
3/6/2025	Updated coverage criteria for hepatocellular carcinoma to include Child-Pugh B with good performance status (ECOG 0-1).
6/20/2024	No changes to coverage criteria with this annual review.
12/7/2023	Fixed typo in criterion E1. No change to intent of policy.
9/14/2023	• Clarification of criteria wording to align with associated policies. Specifically, indications in which Yervoy (ipilimumab) is used in combination with Opdivo (nivolumab), no change to intent. • Adjuvant use of Yervoy (ipilimumab) in resectable renal cell carcinoma (RCC) was added as investigational based on a failed phase 3 study in this setting.
9/23/2022	• Added coverage criteria for Yervoy (ipilimumab) as a combination therapy with Opdivo (nivolumab) for first-line treatment of ESCC based on new evidence and a new FDA indication. • Added quantity limits for Yervoy (ipilimumab) when used in ESCC. • Added neoadjuvant (prior to surgical resection) use of Yervoy (ipilimumab), either alone or in combination with other medications, as investigational. There is insufficient evidence to support this use currently.
10/15/2021	No changes to coverage criteria with this annual update.
7/16/2021	Updated criteria and quantity limits for advanced melanoma to allow for one additional treatment course (up to four additional ipilimumab infusions) in cases where disease has advanced three or more months after response to initial treatment.
4/21/2021	• Added coverage criteria for malignant pleural mesothelioma. • Clarification of criteria wording to align with associated policies (no change to intent). • Updated the QLL language to include HCC and MPM. • Updated 'Investigational uses' (added HCC to the indications list for more than 4 doses as being investigational. This was an oversight from a previous update).
10/28/2020	No changes to coverage criteria with this annual update.
7/22/2020	• Added coverage criteria for use in advanced hepatocellular carcinoma. • Added coverage criteria for use in front-line metastatic NSCLC. • Updated quantity limitations for new indications. • Updated 'Investigational uses' (removed NSCLC).
10/23/2019	Kidney cancer (renal cell carcinoma) was removed from the list of 'Investigational' conditions (oversight from prior update). No other changes to criteria or intent.

Revision Date	Revision Summary
8/17/2018	• Added coverage criteria for use in advanced RCC and metastatic CRC. • Updated the list of 'investigational uses' (added SCLC). • Updated the 'Administration, Quantity Limitations, and Authorization Period' section to include the new indications and clarified duration of coverage for use in adjuvant melanoma.
10/13/2017	Added coverage criteria for adjuvant use in resectable cutaneous melanoma when there is pathologic involvement of regional lymph nodes (stage III).
5/13/2016	• Added adjuvant use of high-dose (10 mg/kg) Yervoy (ipilimumab) for resectable cutaneous melanoma when there is pathologic regional lymph node involvement as not medically necessary. This is a newly approved FDA-labeled use. • Updated guideline recommendations, added newly published evidence, and updated Appendices.
12/11/2015	• Added policy coverage criteria for the use in combination with Opdivo. • Clarified that dose is 3 mg/kg. • Add Appendix 1, with a list of available PD1s. • Add Appendix 3, with a list of other targeted therapies for melanoma.

Medication Policy Manual | **Policy No:** dru264

Topic: Adcetris, brentuximab vedotin | **Date of Origin:** November 11, 2011

Committee Approval Date: March 6, 2025 | **Next Review Date:** 2026

Effective Date: May 1, 2025

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Adcetris (brentuximab vedotin) is an intravenously administered medication used in the treatment of certain lymphomas (Hodgkin lymphoma and several types of rare non-Hodgkin lymphomas).

Policy/Criteria

Most contracts require pre-authorization approval of Adcetris (brentuximab vedotin) prior to coverage.

I. Continuation of therapy (COT): Adcetris (brentuximab vedotin) may be considered medically necessary for COT when criterion A, B, or C below is met.

A. For diagnoses NOT listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND there is documentation that the medication was covered by another health plan. Examples of documentation include the coverage approval letter from the previous health plan or paid claim.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

B. For diagnoses listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

C. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

Please note*: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Adcetris (brentuximab vedotin) may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) that one of the following criterion A, B, C, or D below is met:

A. A diagnosis of **classical Hodgkin lymphoma** (cHL) when at least one of the criteria 1, 2, or 3 below are met:

1. A diagnosis of previously untreated cHL and both criteria below (a and b) are met:

a. One of the following criteria (i or ii) below are met:

i. Advanced stage cHL (stage III or IV)

OR

ii. High-risk cHL, defined as stage IIB with bulk disease, stage IIIB, stage IVA, or stage IVB.

AND

b. Both of the following criteria (i and ii) below are met:

i. The patient has not received prior chemotherapy or radiotherapy.

AND

ii. Adcetris (brentuximab vedotin) will be administered with cytotoxic chemotherapy, such as AVD (doxorubicin, vinblastine, and dacarbazine) or AVE-PC (doxorubicin, vincristine, etoposide, prednisone, and cyclophosphamide).

OR

2. A diagnosis of relapsed/refractory cHL, as defined by one of the following criterion (a or b) below:

a. An autologous stem cell transplant (ASCT) for cHL has not been successful.

OR

b. A minimum of two prior multi-agent chemotherapy regimens for cHL were not effective or were not tolerated.

OR

3. Adcetris (brentuximab vedotin) will be used as post-ASCT consolidation therapy for cHL AND the patient is at high risk of relapse or progression as defined by one of the following three high-risk categories (a, b, or c):

a. Primary refractory cHL (i.e., failure to achieve complete remission following initial frontline therapy).

OR

b. Relapsed cHL with an initial remission duration of less than 12 months.

OR

c. Presence of extranodal involvement (e.g., chest wall, bone, lung, liver).

OR

B. A diagnosis of one of the following subtypes of **CD30-expressing peripheral T-cell lymphoma** (PTCL):

1. Systemic anaplastic large cell lymphoma (sALCL).

2. Peripheral T-cell lymphoma (PTCL), not otherwise specified (NOS).

3. Angioimmunoblastic T-cell lymphoma (AITL).

OR

C. A diagnosis of **primary cutaneous anaplastic large cell lymphoma** (pcALCL) with multifocal lesions.

OR

D. A diagnosis of **CD30-expressing mycosis fungoides (MF)** when at least one prior systemic therapy has not been effective or was not tolerated.

III. Administration, Quantity Limitations, and Authorization Period:

A. Regence Pharmacy Services considers Adcetris (brentuximab vedotin) coverable only under the medical benefit (as a provider-administered medication).

B. When pre-authorization is approved, Adcetris (brentuximab vedotin) will be authorized in the following quantities:

1. Classical Hodgkin lymphoma (cHL):

a. ***Previously untreated high-risk or advanced stage:***

i. Adult: Doses up to 120 mg every two weeks for a treatment course of up to 12 infusions.

ii. Pediatric: Doses up to 180 mg every three weeks for a treatment course of up to 5 infusions.

b. ***Consolidation (post ASCT):*** Doses up to 180 mg every three weeks for a treatment course of up to 16 infusions

c. ***Relapsed/refractory disease:*** Doses up to 180 mg every three weeks until disease progression.

2. For the following subtypes of CD30-expressing peripheral T-cell lymphoma: sALCL, PTCL NOS, and AITL:

a. ***Previously untreated disease:*** Doses up to a maximum of 180 mg every three weeks for a treatment course of up to 8 infusions.

b. ***Relapsed disease:*** Doses up to 180 mg every three weeks until disease progression.

3. Primary cutaneous anaplastic large cell lymphoma (pcALCL): Doses up to 180 mg every three weeks for a treatment course of up to 16 infusions.

4. CD30-expressing mycoses fungoides (MF): Doses up to 180 mg every three weeks for a treatment course of up to 16 infusions.

C. Authorization period:

1. Classical Hodgkin lymphoma (cHL):

a. ***Previously untreated stage III or IV, and consolidation (post ASCT):*** No additional doses beyond the maximum number of doses stated above will be authorized.

b. ***Relapsed/refractory disease:*** Authorization **may** be reviewed at least annually. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, such as disease stability or improvement.

2. **For the following subtypes of CD30-expressing peripheral T-cell lymphoma: sALCL, PTCL NOS, and AITL:**
   a. ***Previously untreated disease:*** No additional doses beyond the maximum number of doses stated above will be authorized.
   b. ***Relapsed disease:*** Authorization **may** be reviewed at least annually. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, such as disease stability or improvement.
3. **Primary cutaneous anaplastic large cell lymphoma (pcALCL):** No additional doses beyond the maximum number of doses stated above will be authorized.
4. **CD30-expressing mycoses fungoides (MF):** No additional doses beyond the maximum number of doses stated above will be authorized.

IV. Use of Adcetris (brentuximab vedotin) beyond one treatment course, as defined above is considered investigational. Additionally, Adcetris (brentuximab vedotin) is considered investigational when used for all other conditions.

Position Statement

- Adcetris (brentuximab vedotin) is a medication that combines the action of an antibody with chemotherapy (an antibody-drug conjugate). It is directed against CD30, a cell membrane protein associated with certain types of lymphoma.
- Adcetris (brentuximab vedotin) is approved for use in several classical Hodgkin lymphoma (cHL) settings, relapsed systemic anaplastic large cell lymphoma (sALCL), and relapsed primary cutaneous anaplastic large cell lymphoma (pcALCL) or CD30-expressing mycosis fungoides (MF). It is given via intravenous infusion over 30 minutes.
- In cHL, Adcetris (brentuximab vedotin) has been studied in the following populations:
  * In patients with advanced or high-risk (stage IIB, III, or IV) disease as an initial therapy when given as a component of a chemotherapy regimen.
  * As consolidation therapy following autologous stem cell transplant (ASCT) in the following high-risk patient populations: those with primary refractory Hodgkin's lymphoma (failure to achieve complete remission), relapsed Hodgkin's lymphoma with an initial remission duration of less than 12 months, or extranodal involvement at the start of pre-transplantation salvage chemotherapy.
  * In patients with relapsed or refractory cHL who received a median of five prior therapies including ASCT.
- Several clinical trials have also evaluated Adcetris (brentuximab vedotin) in rare subtypes of CD30-expressing non-Hodgkin lymphomas, including systemic anaplastic large cell lymphoma (sALCL), primary cutaneous anaplastic large cell lymphoma (pcALCL), angioimmunoblastic T-cell lymphoma (AITL), peripheral T-cell lymphoma not otherwise specified (PTCL-NOS), and relapsed mycoses fungoides (MF).

- The evidence for Adcetris (brentuximab vedotin) is generally of low quality. Efficacy is based on response rates and progression-free survival. These surrogate endpoints have not been shown to correlate with improved survival or quality of life.
- The NCCN ***Hodgkin lymphoma*** guideline lists Adcetris (brentuximab vedotin) as a potential therapy for most of its labeled indications.
- The NCCN ***T-cell lymphomas*** guideline lists Adcetris (brentuximab vedotin) as the sole preferred, category 1 recommendation for primary treatment of pcALCL with multifocal lesions. It is listed among recommended options for other rare, CD30-expressing non-Hodgkin lymphomas including PTCL-NOS, AITL, relapsed ALCL, and relapsed MF.
- The most common adverse effects reported with Adcetris (brentuximab vedotin) include bone marrow depression, severe peripheral sensory neuropathy, infusion reactions, and risk of infection were reported in clinical trials. Peripheral neuropathy may persist after Adcetris (brentuximab vedotin) is discontinued.
- There is no evidence to support more than one treatment course of Adcetris (brentuximab vedotin), or continuation of therapy after disease progression. In addition, use of Adcetris (brentuximab vedotin) multiple disease settings within the same patient has not been studied. For example, if a patient receives a treatment course in the front-line setting, its use in a subsequent treatment setting (e.g., after relapse) has not been studied.
- There is interest in using Adcetris (brentuximab vedotin) in other types of cancers where CD30 may be expressed as well as in additional cHL settings; however, there is currently not sufficient evidence to support coverage outside of the clinical settings listed above.

Regence Pharmacy Services performs independent analyses of oncology medication evidence, to establish coverability per the contracts with the health plan.

- Most contracts define coverability based on established clinical benefit in published, peer-reviewed literature, along with consideration of regulatory status.
- FDA approval does not in itself establish medical necessity, as unpublished, low-quality evidence, including exploratory analyses and unvalidated surrogate endpoints, may be used as the basis of approval. Regulatory approval may or may not reflect clinical benefit relative to standard of care and the recommendations of expert clinical advisors such as the Oncologic Drugs Advisory Committee (ODAC). FDA approvals generally do not consider cost compared to established therapies, or value to members.
- Likewise, NCCN clinical practice guidelines assignment of a recommendation (category 1, 2a, or 2b) does not necessarily establish medically necessity. NCCN recommendations are inconsistently supported by published, peer-reviewed literature and do not uniformly consider value of new therapies relative to existing potentially higher-value treatment options, considering effectiveness, safety, and cost.
- Medication coverage criteria are developed based on the 'medical necessity' assessment, as described above.

Regence Pharmacy Services analysis and coverage policy may differ from FDA labeled indication and/or NCCN clinical practice guidelines.

Clinical Efficacy

CLASSICAL HODGKIN LYMPHOMA (cHL)

Relapsed/refractory cHL after ASCT:

- A phase 2, single-arm trial evaluated the efficacy of Adcetris (brentuximab vedotin) in 102 subjects with Hodgkin lymphoma that was refractory to or relapsed following autologous stem cell transplantation (ASCT). [1]
    * The study reported overall response rates of 75% in this population.
    * Overall response rates have not been correlated with clinically meaningful outcomes (e.g., overall survival, quality of life) in this condition.
- It is not known how Adcetris (brentuximab vedotin) compares with cytotoxic chemotherapy in the treatment of relapsed/refractory Hodgkin Lymphoma. There is no evidence that compares Adcetris (brentuximab vedotin) with any other therapy in this setting, including best supportive care.
- The National Comprehensive Cancer Network (NCCN) guideline for Hodgkin lymphoma lists Adcetris (brentuximab vedotin) as an option for patients with relapsed or refractory disease (after a failed ASCT or when at least two prior multi-agent chemo-therapy regimens have not been effective). Several multi-agent chemotherapy regimens are also listed as recommended treatment options (see *Appendix 1*). [2]

As consolidation therapy after ASCT:

- A published, phase 3 randomized controlled trial in 329 patients evaluated the efficacy of Adcetris (brentuximab vedotin) versus placebo as a consolidation therapy following ASCT in patients with Hodgkin lymphoma at high risk for relapse or progression. [3]
    * Patients considered being at high risk for relapse or progression included patients with primary refractory primary refractory Hodgkin's lymphoma (failure to achieve complete remission), relapsed Hodgkin's lymphoma with initial remission duration of less than 12 months, or extranodal involvement at the start of pre-transplantation salvage chemotherapy.
    * The primary endpoint was progression-free survival (PFS), with secondary endpoints focused on overall survival (OS) and safety.
    * The majority (60%) of patients in the trial were refractory to frontline therapy and all patients were required to have obtained a complete remission (CR), partial remission (PR), or stable disease (SD) to salvage therapy prior to ASCT.
    * The median PFS with Adcetris (brentuximab vedotin) was 42.9 months compared to 24.1 months for placebo.
    * At the time of the interim analysis, there was no statistically significant difference in OS between groups. This endpoint was potentially confounded by crossover, as 85% of patients in the placebo arm received Adcetris (brentuximab vedotin) when the trial was unblinded.
    * PFS has not been correlated with clinically meaningful outcomes (e.g., overall survival, quality of life) in this condition.
- NCCN lists Adcetris (brentuximab vedotin) as an option for consolidation therapy following ASCT in patients at high risk for relapse or progression. Several multi-agent chemotherapy regimens are also listed as recommended treatment options (see *Appendix 1*). [2]

Previously untreated cHL (first-line):

- A large, open-label RCT (ECHELON-1) compared standard chemotherapy (ABVD; doxorubicin, bleomycin, vinblastine, and dacarbazine) with Adcetris (brentuximab vedotin) plus chemotherapy (A-AVD; as above minus bleomycin) in adult patients with previously untreated, advanced stage (stage III or IV) cHL. [4]
    * In an initial assessment, the 2-year PFS (independent assessors) was reported as 77.2% and 82.1%, respectively. There was no statistically significant OS difference noted (2-year OS of 94.9% vs 96.6%, respectively; p = NS).
    * Subsequently, a 6-year follow-up reported overall survival estimates of 93.9% with A-AVD and 89.4% with ABVD [HR 0.59; (95% CI: 0.40, 0.88); p=0.009]. [5]
    * The relative survival advantage for A-AVD is not robust as there may have been confounding factors that impacted the results such as differences in follow-on therapies. Median OS data is not yet mature.
    * A significant increase in fever and neutropenia, some cases of which were fatal, was reported in the Adcetris (brentuximab vedotin) treatment arm.
    * Approximately 1.5% of subjects in the ABVD arm died of pulmonary toxicity; the ECHELON-1 trial did not utilize PET-adjusted chemotherapy nor did the protocol specify regular monitoring of study subjects for pulmonary toxicity. The magnitude of the benefit associated with Adcetris (brentuximab vedotin) compared to current standards of care in the US is not clear.
    * Subgroup analyses showed inconsistent benefit. There was no OS benefit in subjects with lower risk (Stage III or IPS 0-1) disease; it is unclear if Adcetris (brentuximab vedotin) is potentially inferior to PET-adjusted ABVD in these patients.
- NCCN guidelines for adult Hodgkin lymphoma recommend PET-adjusted ABVD or A-AVD (if neuropathy not present) as potential treatment options in the first line setting. Adcetris (brentuximab vedotin) has not been compared to PET-adjusted chemotherapy such as ABVD followed by AVD for patients with Deauville 1-3 or eBEACOPP for patients with Deauville 4-5. The comparative efficacy of Adcetris (brentuximab vedotin) + AVD to PET-adjusted chemotherapy with ABVD is not known.[2]
- Subsequently, a large, open-label, active-control RCT (AHOD1331) compared standard chemotherapy (ABVE-PC; doxorubicin, bleomycin, vinblastine, etoposide, prednisone, and cyclophosphamide) with Adcetris (brentuximab vedotin) plus chemotherapy (Bv-AVEPC; as above minus bleomycin) in pediatric patients with previously untreated, high-risk cHL (n=600). [6]
    * High-risk was defined as Ann Arbor Stage IIB with bulk disease, Stage IIIB, Stage IVA, and Stage IVB.
    * The primary endpoint of event free survival (EFS) was 92.1% with Bv-AVEPC vs. 82.5% ABVE-PC (p<0.001).
    * Secondary safety and overall survival (OS) endpoints were not statistically significantly different between the groups. Subjects had similar use of radiation therapy, and same frequency of toxicities. OS at 3 years was 99.3% (95% CI, 97.3 to 99.8) with Bv-AVEPC vs 98.5% (95% CI, 96.0 to 99.4) with ABVE-PC.

- NCCN guidelines for pediatric Hodgkin lymphoma list PET-adjusted regimens of Bv-AVEPC and OEPA (vinblastine, etoposide, prednisone, and doxorubicin) as preferred (category 1) treatment options in the first line setting for high-risk disease. Both regimens have FDG-PET response-based use of ISRT, modified based on response to initial cycles of chemotherapy. The comparative efficacy of Adcetris (brentuximab vedotin) + AVEPC to OEPA is not known.[2]

OTHER cHL TREATMENT SETTINGS

- There is interest in using Adcetris (brentuximab vedotin) as a front-line option in older patients (> 60 years of age) with Hodgkin lymphoma who may be unable to tolerate conventional combination chemotherapy. Although initial findings appear promising, larger, well-controlled trials are needed to confirm the results. [7]
- The NCCN Hodgkin lymphoma guideline lists Adcetris (brentuximab vedotin) among a list of several potential second-line therapies for relapsed or refractory cHL. The evidence for use earlier in therapy is based on small, non-comparative (single-arm) trials that report overall response rates (ORR) as a surrogate endpoint.
    * A small, single-arm study conducted by Younis, et al. evaluated ORR in patients who received Adcetris (brentuximab vedotin) monotherapy for confirmed CD30-positive cHL who had relapsed or refractory disease after an autologous stem cell transplant (auto-SCT). The number of prior therapies (excluding the auto-SCT) ranged from one to thirteen, with a median of 3.5. Forty-two percent of patients had disease that was refractory to the most recent cHL therapy. The ORR in this study was reported as 75%. [8]
    * A second, small, single-arm, phase 1/2, multi-cohort study conducted by O'Connor, et al. evaluated safety (primary endpoint) and ORR (secondary endpoint) in patients with CD30-positive relapsed or refractory cHL. Thirty-seven patients entered the phase 2 (efficacy) portion of the study and received a combination of Adcetris (brentuximab vedotin) and bendamustine. Patients had at least one prior cHL therapy, with no upper limit for the total number of prior therapies. The median number of prior therapies was not reported; however, the population was described as being heavily pretreated and 78% of the population was reported to have received prior platinum-based therapy in the second- or subsequent-line setting. The ORR in this study was reported as 78%. [9]
- There is also interest in using Adcetris (brentuximab vedotin) for cHL in combination with Opdivo (nivolumab). Available published evidence is based on two, small, single-arm, observational trials.
    * Preliminary results from a study of 60 patients with relapsed or refractory cHL suggest complete remission rates that are similar to complete remission rates reported with second-line salvage chemotherapy. The durability of effect with this combination is not yet known. [10]
    * A second study in 46 previously untreated patients with cHL with a mean age of 71.5 years and who were considered unsuitable for standard chemotherapy (ABVD) was closed early because it did not meet predefined efficacy parameters. [11]

CD30-EXPRESSING PERIPHERAL T-CELL LYMPHOMAS (PTCL)

- A multicenter, double-blind RCT [ECHELON-2 study] evaluated Adcetris (brentuximab vedotin) in patients with several subtypes of CD30-expressing peripheral T-cell lymphomas (PTCLs). [12,13]
  * The trial compared the addition of Adcetris (brentuximab vedotin) to a backbone regimen of CHOP chemotherapy, to CHOP chemotherapy plus placebo.
  * Subjects enrolled in the trial had CD30-expresssion of at least 10% per immuno-histochemistry.
  * The trial included the following subtypes of PTCL:
    - Systemic anaplastic large cell lymphoma (sALCL) [70%]
    - PTCL, not otherwise specified [16%]
    - Angioimmunoblastic T-cell lymphoma [12%]
    - Adult T-cell leukemia/lymphoma [2%]
    - Enteropathy-associated T-cell lymphoma [< 1%]
  * The efficacy was driven by the population with sALCL. There were too few subjects with adult T-cell leukemia/lymphoma and enteropathy-associated T-cell lymphoma to draw any conclusions regarding potential efficacy.
  * This trial excluded subjects with primary cutaneous ALCL (pcALCL).
  * Median PFS, the primary endpoint, was significantly longer in the brentuximab vedotin (Adcetris) versus the placebo arm of the trial. Median OS has not been reached in either treatment arm.
- A phase 2, single-arm trial evaluated the efficacy of Adcetris (brentuximab vedotin) in 58 subjects with systemic ALCL that was refractory to or relapsed following at least one multi-agent chemotherapy regimen. [14]
  * The study reported overall response rates of 86% in this population.
  * Overall response rates have not been correlated with clinically meaningful outcomes (e.g., overall survival, quality of life) in this condition.
- The NCCN ***T-cell lymphomas*** guideline lists Adcetris (brentuximab vedotin) among several recommended treatment options for certain rare, CD30-expressing non-Hodgkin lymphomas including PTCL-NOS, AITL, and relapsed ALCL. [2]

PRIMARY CUTANEOUS ALCL AND CD30-EXPRESSING MYCOSIS FUNGOIDES

- A small, open-label RCT compared Adcetris (brentuximab vedotin) with physician's choice of methotrexate or Targretin (bexarotene) in patients with either primary cutaneous anaplastic large cell lymphoma (pcALCL) or CD30-expressing mycosis fungoides (MF). [12]
  * Patients enrolled in the trial had relapsed or refractory disease with a median of two prior systemic therapies.
  * The therapies were evaluated based on their ability to achieve an objective response that lasted at least 4 months (ORR4). Patients in the Adcetris (brentuximab vedotin) and physician's choice of therapy arms had on ORR4 of 56.3% and 12.5%, respectively.

    * ORR4 is a surrogate endpoint and has not been shown to predict improvement in survival in clinically relevant outcomes, such as OS and quality of life.
- The NCCN T-cell lymphomas guideline lists Adcetris (brentuximab vedotin) as a preferred regimen (category 1) for pcALCL when multifocal lesions are present. [2] It is listed among potential recommended treatment options for CD30-expressing MF. [2]

USE IN OTHER CONDITIONS

- A small, phase 1/2, observational trial evaluated tumor response rates in a mixed population of 29 subjects with various CD30-positive B-cell lymphomas. [15]
    * Patients in the trial were given six cycles of Adcetris (brentuximab vedotin) in combination with rituximab, cyclophosphamide, doxorubicin, and prednisone.
    * The population included 22 subjects with primary mediastinal B-cell lymphoma (PMBCL), 5 subjects with diffuse large B-cell lymphoma (DLBCL), and 2 subjects with gray zone lymphoma (GZL).
    * Consolidative radiation was used in 52% of the subjects.
    * The trial is of low quality due to the small number of subjects, the heterogeneous population, and the lack of control (no comparator, randomization, or blinding).
- The net health benefit of Adcetris (brentuximab vedotin) outside of the clinical settings described in the coverage criteria has not been confirmed.

Safety [1,12]

- The most commonly reported adverse events with Adcetris (brentuximab vedotin) in clinical trials included neutropenia, peripheral sensory neuropathy, fatigue, nausea, anemia, upper respiratory tract infection, diarrhea, pyrexia, rash, thrombocytopenia, cough, and vomiting.
- Severe peripheral sensory neuropathy and neutropenia were responsible for the majority of dose reductions and interruptions during the Adcetris (brentuximab vedotin) clinical trials. Fatal and serious cases of fever and neutropenia have been reported with Adcetris (brentuximab vedotin) when given with AVD. Primary prophylaxis with filgrastim is recommended by the manufacturer.
- Infusion reactions, Stevens-Johnson syndrome, and progressive multifocal leukoencephalopathy (PML) have also been reported with Adcetris (brentuximab vedotin).
- A boxed warning was added to the prescribing information for Adcetris (brentuximab vedotin) in January 2012 stating that JC virus infection resulting in PML and death can occur in patients treated with Adcetris (brentuximab vedotin).
- Coadministration of Adcetris (brentuximab vedotin) with strong CYP3A4 inhibitors (e.g., clarithromycin, itraconazole) may result in increased exposure to Adcetris (brentuximab vedotin), so close monitoring for adverse reactions is necessary.

Dosing Considerations [12]

- Adcetris (brentuximab vedotin) is given via intravenous infusion over 30 minutes.
- Dose delays and reductions are indicated for peripheral neuropathy and neutropenia.
- Adcetris (brentuximab vedotin) is contraindicated for concomitant use with bleomycin.
- FDA-labeled dosing by indication:

Indication	Recommended dose	Frequency and Duration
Previously untreated Stage III or IV cHL (adult)	1.2 mg/kg up to a max of 120 mg in combination with chemotherapy	Q2 weeks until a maximum of 12 doses (stop earlier if disease progression)
Previously untreated high-risk cHL (pediatric)	1.8 mg/kg up to a max of 180 mg in combination with chemotherapy	Q3 weeks until a maximum of 5 doses (stop earlier if disease progression)
cHL consolidation	1.8 mg/kg up to a max of 180 mg	Q3 weeks until a maximum of 16 doses (stop earlier if disease progression)
Relapsed cHL	1.8 mg/kg up to a max of 180 mg	Q3 weeks until disease progression
Previously untreated sALCL or other CD30-expressing PTCLs	1.8 mg/kg up to a max of 180 mg in combination with chemotherapy	Q3 weeks with each cycle of chemotherapy for 6 to 8 doses
Relapsed sALCL	1.8 mg/kg up to a max of 180 mg	Q3 weeks until disease progression
Relapsed pcALCL or CD30-expressing MF	1.8 mg/kg up to a max of 180 mg	Q3 weeks until a maximum of 16 doses (stop earlier if disease progression)

cHL = classical Hodgkin lymphoma; sALCL = systematic anaplastic large cell lymphoma; MF = mycoses fungoides; pcALCL = primary cutaneous anaplastic large cell lymphoma; PTCL = peripheral T-cell lymphoma

Appendix 1: International Prognostic Score (IPS) for Determining Risk Level in cHL [2]
Patients with High-Risk cHL have at least FOUR of the following risk factors:
• Male sex • Age ≥ 45 years • Stage IV disease • Hemoglobin < 10.5 g/dL • Lymphocyte count < 0.6 x 10^9/L, or < 8% of WBC • Leukocytosis (WBC ≥ 15,000/mm^3) • Serum albumin < 4 g/dL

Revision History

Revision Date	Revision Summary
3/6/2025	No changes to coverage criteria with this annual review.
12/12/2024	No criteria changes with this annual review.
12/7/2023	No criteria changes with this annual review.
6/15/2023	Effective 7/15/2023: • Modified first-line cHL criteria to allow coverage in high-risk disease in combination with cytotoxic chemotherapy, based on new indication in pediatric patients. • Updated quantity and duration limits.
12/9/2022	Effective 1/15/2023: • Updated cHL criteria to allow coverage in the first-line setting when used with in combination with AVD chemotherapy for stage 3 and 4 disease. • Updated standard policy template language.
6/17/2022	Clarified intent of coverage for cHL in the first-line setting. No updates to criteria.
1/20/2021	Updated continuation of therapy (COT) language. No changes to coverage criteria.
1/22/2020	• Added continuation of therapy (COT) criteria (no change to intent of coverage criteria). • The quantity limitations were rearranged by disease state rather than by dosing so they would parallel the order of the coverage criteria. Additionally, the authorization period section was also rearranged to better coincide with the quantity limitations. These changes were made to improve the efficiency of application of this policy. The overall intent of coverage was preserved.
1/31/2019	• The condition for at least one prior therapy for primary cutaneous ALCL (pcALCL) was removed (coverage is now allowed in the front-line setting). • Coverage was added for specific subtypes of CD30-expressing PTCLs based on a new FDA indication: sALCL, PTCL NOS, and AITL. • Quantity limits and authorization periods were added for the new indications for which coverage will be provided.
6/15/2018	• Added coverage criteria for front-line use in patients with high-risk, stage III or VI cHL when bleomycin is contraindicated. • Added coverage for primary cutaneous ALCL or CD30-expressing mycoses fungoides (new indications, rare diseases) and removed these conditions from the list of investigational uses. • Updated quantity and duration limits.
7/14/2017	Updated list of 'investigational' conditions (added AITL).
9/9/2016	No changes to coverage criteria with this annual update.
11/11/2011	New policy.

Medication Policy Manual | **Policy No:** dru278

Topic: Marqibo, vincristine sulfate liposome injection | **Date of Origin:** September 24, 2012

Committee Approval Date: January 20, 2021 | **Next Review Date:** January 2022

Effective Date: April 1, 2021

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of medication policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Liposomal vincristine (Marqibo) is a liposomal form of generic vincristine sulfate. It is an intravenous chemotherapy used to treat a specific type of leukemia.

PLEASE NOTE: This policy and the coverage criteria below do not apply to generic vincristine sulfate. Generic vincristine sulfate does not require pre-authorization.

Policy/Criteria

Most contracts require pre-authorization approval of liposomal vincristine (Marqibo) prior to coverage.

I. Continuation of therapy (COT): Liposomal vincristine (Marqibo) may be considered medically necessary for COT when criterion A, B, or C below is met.

A. For diagnoses NOT listed in the coverage criteria below, criteria 1 and 2 below must be met:

1. The patient was established on therapy prior to current health plan membership AND there is documentation that the medication was covered by another health plan. Examples of documentation include the coverage approval letter from the previous health plan or paid claim.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

B. For diagnoses listed in the coverage criteria below, criteria 1 and 2 below must be met:

1. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

C. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

Please note*: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Liposomal vincristine (Marqibo) may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) that criteria A and B below are met.

A. A diagnosis of **Philadelphia chromosome negative (Ph-negative) acute lymphoblastic leukemia (ALL)**.

AND

B. Disease has progressed after at least two prior regimens including at least one induction/maintenance and one relapsed/refractory regimen. (see *Appendix 1*)

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services does not consider liposomal vincristine (Marqibo) to be a self-administered medication.

B. Authorization may be reviewed at least annually. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, such as disease stability or improvement.

IV. Liposomal vincristine (Marqibo) is considered investigational when used for all other conditions, including but not limited to:

A. Treatment-naïve acute lymphoblastic leukemia

B. Non-Hodgkin lymphomas (NHLs)**,** including diffuse large B-cell lymphoma (DLBCL) and mantle cell lymphoma (MCL)

C. Hodgkin lymphoma

D. Metastatic melanoma

E. Pediatric cancers

F. Retinoblastoma

G. Ependymoma

H. Wilms' Tumor

I. Sarcoma, including rhabdomyosarcoma

Position Statement

- Liposomal vincristine (Marqibo) is generic vincristine sulfate, a vinca alkaloid chemotherapy agent, encapsulated in a fatty vehicle.
- Because liposomal vincristine (Marqibo) is a unique formulation of generic vincristine sulfate, there may be interest in using liposomal vincristine (Marqibo) in indications where generic vincristine sulfate has been shown to be effective. To date, there is a lack of evidence to determine the relative clinical benefit of liposomal vincristine (Marqibo) compared to generic vincristine sulfate.
- Like generic vincristine sulfate, liposomal vincristine (Marqibo) is contraindicated for intrathecal administration and in patients with demyelinating conditions. They are also both associated with serious adverse effects including neuropathy, myelosuppression, severe constipation and/or paralytic ileus, and tissue injury due to extravasation.

Regence Pharmacy Services performs independent analyses of oncology medication evidence. NCCN clinical practice guidelines assignment of a category 2a/b recommendation does not necessarily establish medically necessity. The Regence Pharmacy Services analysis and coverage policy may differ from NCCN clinical practice guidelines.

Clinical Efficacy

Acute Lymphoblastic Leukemia

- Liposomal vincristine (Marqibo) has not been shown to provide additional clinical benefit compared to currently existing therapies used in the treatment of ALL.
- Liposomal vincristine (Marqibo) was approved based on one unpublished phase II, single-arm study in 65 patients with Ph-negative ALL that had progressed following two or more anti-leukemia therapies. [1]
    * The primary endpoint evaluated in this study was complete response plus complete response without full platelet recovery.
    * Ten (15.4%) subjects achieved the combined primary endpoint. Three (4.6%) subjects achieved complete response, while seven (10.8%) achieved complete response without full platelet recovery.
- One additional published phase II study evaluated overall response rate in 16 patients with refractory ALL. [2]
    * Treatment with liposomal vincristine (Marqibo) was the first salvage attempt in 11 patients, the second salvage attempt in 3 patients, and the third salvage attempt in 2 patients.
    * The overall response rate in the fourteen evaluable patients was 14% (1 complete responder; 1 partial responder).
- Liposomal vincristine (Marqibo) was studied in twenty adult patients with newly-diagnosed, B-cell ALL given as part of a hyper-CMAD regimen. This regimen was found to have good activity based on complete molecular response rates; however, the study only had a single arm (non-comparative) so it is not known if it offers any improvement in efficacy or safety over generic vincristine sulfate. [3]
- The National Comprehensive Cancer Network (NCCN) ALL guideline lists liposomal vincristine (Marqibo) among several category 2A recommendations for relapsed or refractory Ph-negative ALL. [4]

Non-Hodgkin Lymphoma (NHL)

- Liposomal vincristine (Marqibo) has not been shown to provide additional clinical benefit compared to currently existing therapies used in the treatment of NHLs.
- Two preliminary, early-phase studies were identified that evaluate liposomal vincristine (Marqibo) in refractory NHL, including large B-cell lymphoma and mantle cell lymphoma. The studies are small, uncontrolled, and evaluated tumor response. No clinical benefit has been demonstrated to date in these populations. [5,6]
- The NCCN does <u>not</u> list liposomal vincristine (Marqibo) among the treatment options for relapsed/refractory NHLs. [7]

Other Uses

- Liposomal vincristine (Marqibo) is currently being studied in a variety of other cancers including Hodgkin lymphoma, metastatic melanoma, non-Hodgkin's lymphomas (including diffuse large B-cell lymphoma and mantle cell lymphoma), acute myeloid leukemia (AML), and several pediatric cancers. [8]

- Liposomal vincristine (Marqibo) is considered investigational in the abovementioned cancers due to the low level of available evidence in these settings.

Safety [1]

- The safety profile for liposomal vincristine (Marqibo) appears similar to generic vincristine sulfate.
- Boxed warnings for liposomal vincristine (Marqibo) include potential death with intrathecal use and potential overdose if confused with generic vincristine as the dosing recommendations are different.
- Additional warnings include neuropathy, myelosuppression, tumor lysis syndrome, severe constipation and/or paralytic ileus, severe fatigue, hepatotoxicity, embryofetal toxicity, and tissue injury due to extravasation.
- Liposomal vincristine (Marqibo) is contraindicated in patients with demyelinating conditions including Charcot-Marie-Tooth syndrome.
- The most commonly reported adverse reactions (incidence ≥ 30%) in clinical studies include constipation, nausea, pyrexia, fatigue, peripheral neuropathy, febrile neutropenia, diarrhea, anemia, decreased appetite, and insomnia.

Dosing and Administration [1]

- Liposomal vincristine (Marqibo) is administered at a dose of 2.25 mg/m^2 intravenously over 1 hour once every 7 days.
- Liposomal vincristine (Marqibo) may be fatal if administered intrathecally.
- Dosing recommendations for liposomal vincristine (Marqibo) are different from those for generic vincristine; therefore, the drug name and dose should be verified prior to preparation and administration.
- Liposomal vincristine (Marqibo) requires approximately 60 to 90 minutes of preparation time and must be done according to aseptic technique in a biological safety cabinet.
- Dosing modification is recommended for patients who experience liposomal vincristine (Marqibo)-related peripheral neuropathy.

Medication Policy Manual

Policy No: dru279

Topic: Zaltrap, ziv-aflibercept

Date of Origin: September 24, 2012

Committee Approval Date: June 20, 2024

Next Review Date: 2025

Effective Date: September 1, 2024

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of medication policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Zaltrap (ziv-aflibercept) is an intravenous (IV) medication, a Vascular Endothelial Growth Factor (VEGF) inhibitor, used in the treatment of colon cancer.

Policy/Criteria

Most contracts require pre-authorization approval of Zaltrap (ziv-aflibercept) prior to coverage.

I. Continuation of therapy (COT): Zaltrap (ziv-aflibercept) may be considered medically necessary for COT when criterion A, B, or C below is met.

A. For diagnoses NOT listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND there is documentation that the medication was covered by another health plan. Examples of documentation include the coverage approval letter from the previous health plan or paid claim.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

B. For diagnoses listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

C. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

Please note*: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Zaltrap (ziv-aflibercept) may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) confirming that criteria A, B, and C below are met:

A. A diagnosis of **metastatic colorectal cancer**.

AND

B. Prior treatment with an Eloxatin (oxaliplatin)-containing regimen has been ineffective or not tolerated.

AND

C. Prior treatment with bevacizumab has been ineffective, contraindicated, or not tolerated.

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers Zaltrap (ziv-aflibercept) coverable only under the medical benefit (as a provider-administered medication).

B. Authorization **may** be reviewed at least annually. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, including disease stability or improvement relative to baseline symptoms.

IV. Zaltrap (ziv-aflibercept) is considered investigational when used for all other conditions, including but not limited to:

A. Gastroesophageal cancers.

B. Kidney cancer.

C. Leukemia.

D. Lung cancer [small cell (SCLC), and non-small cell lung cancers (NSCLC)].

E. Lymphoma.

F. Ovarian cancer.

G. Pancreatic cancer.

H. Prostate cancer.

I. Thyroid cancer.

Position Statement

- Zaltrap (ziv-aflibercept) is an intravenously infused medication that inhibits Vascular Endothelial Growth Factor (VEGF) thereby preventing the formation of new blood vessels and halting cell growth.
- The intent of this policy is to cover Zaltrap (ziv-aflibercept) for the indications, regimen, and dose for which it has been shown to be safe and effective, as detailed in the coverage criteria.
- Zaltrap (ziv-aflibercept) demonstrated an improvement in overall survival in metastatic colorectal cancer that was previously treated with an oxaliplatin-containing regimen.
- Zaltrap (ziv-aflibercept) was studied in combination with 5-fluorouracil, leucovorin and irinotecan (FOLFIRI).
- Bevacizumab (Avastin, biosimilars) is another VEGF inhibitor approved for the treatment of metastatic colorectal cancer in combination with 5-fluorouracil based chemotherapy.
- There is insufficient evidence to establish the comparative efficacy and safety of bevacizumab (Avastin, biosimilars) and Zaltrap (ziv-aflibercept).
- For our health plan members, bevacizumab (Avastin, biosimilars) is the preferred medication among the VEGF inhibitors used to treat metastatic colorectal cancer.

- The safety and effectiveness of Zaltrap (ziv-aflibercept) have not been established in conditions other than metastatic colorectal cancer.

Regence Pharmacy Services performs independent analyses of oncology medication evidence, to establish coverability per the contracts with the health plan.

- Most contracts define coverability based on established clinical benefit in published, peer-reviewed literature, along with consideration of regulatory status.
- FDA approval does not in itself establish medical necessity, as unpublished, low-quality evidence, including exploratory analyses and unvalidated surrogate endpoints, may be used as the basis of approval. Regulatory approval may or may not reflect clinical benefit relative to standard of care and the recommendations of expert clinical advisors such as the Oncologic Drugs Advisory Committee (ODAC). FDA approvals generally do not consider cost compared to established therapies, or value to members.
- Likewise, NCCN clinical practice guidelines assignment of a recommendation (category 1, 2a, or 2b) does not necessarily establish medically necessity. NCCN recommendations are inconsistently supported by published, peer-reviewed literature and do not uniformly consider value of new therapies relative to existing potentially higher-value treatment options, considering effectiveness, safety, and cost.
- Medication coverage criteria are developed based on the 'medical necessity' assessment, as described above.

Regence Pharmacy Services analysis and coverage policy may differ from FDA labeled indication and/or NCCN clinical practice guidelines.

Clinical Efficacy

Zaltrap (ziv-aflibercept) demonstrated improved overall survival in patients with metastatic colorectal cancer (CRC) previously treated with an oxaliplatin-containing regimen.

- A single, randomized controlled trial compared Zaltrap (ziv-aflibercept) in combination with 5-fluorouracil, leucovorin, and irinotecan (FOLFIRI) to FOLFIRI alone in the treatment of patients with metastatic colorectal cancer that was resistant to, or had progressed following, and oxaliplatin-containing regimen. [1,2]
    * The primary endpoint of the study was overall survival (OS). The addition of Zaltrap (ziv-aflibercept) to FOLFIRI improved OS by 1.44 months compared to FOLFIRI alone (12.06 versus 13.5 months, respectively; p = 0.0032).
    * Approximately 30% of randomized patients had received prior treatment with bevacizumab.
- The National Comprehensive Cancer Network (NCCN) Colon and Rectal Cancer treatment guidelines list Zaltrap (ziv-aflibercept) as an option after the first progression of metastatic colon or rectal cancer. NCCN recommends that Zaltrap (ziv-aflibercept) be used in combination with FOLFIRI or irinotecan. Bevacizumab is recommended as a preferred recommendation in this treatment setting. Additionally, bevacizumab has a recommendation for initial treatment of advanced or metastatic colorectal cancer in combination with FOLFOX or CapeOX. [3]

Use in Other Conditions [4]

Zaltrap (ziv-aflibercept) is currently being studied for treatment of a variety of cancers including: leukemia, lung cancer (small cell and non-small cell), lymphoma, ovarian cancer, pancreatic cancer, prostate cancer and thyroid cancer. There are currently no published studies supporting the safety or efficacy of Zaltrap (ziv-aflibercept) in these cancers. Preliminary results reported on clinicaltrials.gov show a lack of benefit with Zaltrap (ziv-aflibercept) in non-small cell lung cancer, ovarian cancer, and prostate cancer.

Safety [1]

- Zaltrap (ziv-aflibercept) has Boxed Warnings for risk of hemorrhage, gastrointestinal perforation, and compromised wound healing.
- Other serious adverse effects reported with Zaltrap (ziv-aflibercept) include fistula formation, hypertension, arterial thromboembolic events, proteinuria, neutropenia, diarrhea and dehydration, and reversible posterior leukoencephalopathy syndrome.

Dosing [1]

- The usual dose of Zaltrap (ziv-aflibercept) is 4 mg/kg given by intravenous infusion over 1 hour every 2 weeks.
- Zaltrap (ziv-aflibercept) is indicated for use in combination with 5-fluorouracil, leucovorin and irinotecan (FOLFIRI).

Medication Policy Manual **Policy No:** dru281

Topic: pertuzumab-containing medications:

- Perjeta, pertuzumab
- Phesgo, pertuzumab/trastuzumab/hyaluronidase

Date of Origin: September 24, 2012

Committee Approval Date: June 20, 2024 **Next Review Date:** 2025

Effective Date: July 15, 2024

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of medication policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Perjeta (pertuzumab) is a monoclonal antibody used in the treatment of HER2-positive breast cancer. It is given via intravenous infusion in combination with trastuzumab plus chemotherapy. Phesgo (pertuzumab/trastuzumab/hyaluronidase) is a combination of monoclonal antibodies used in the treatment of HER2-positive breast cancer that can be given subcutaneously under the skin.

Policy/Criteria

Most contracts require pre-authorization approval of pertuzumab-containing medications prior to coverage.

I. Continuation of therapy (COT): Pertuzumab-containing medications may be considered medically necessary for COT when criterion A, B, or C below is met.

A. For diagnoses NOT listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND there is documentation that the medication was covered by another health plan. Examples of documentation include the coverage approval letter from the previous health plan or paid claim.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

B. For diagnoses listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

C. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

Please note*: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Pertuzumab-containing medications may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) confirming that one of the following criterion A, B, or C below is met:

A. **Metastatic Breast Cancer:** A diagnosis of HER2-positive metastatic breast cancer when criteria 1 and 2 below are met:

1. Pertuzumab-containing medications are used in one of the two treatment settings described below:

a. Patient has had no prior therapy for HER2-positive metastatic breast cancer.

OR

b. Patient has received one prior therapy for metastatic breast cancer that included trastuzumab plus chemotherapy in the absence of Perjeta (pertuzumab).

AND

2. **Perjeta Only:** Perjeta (pertuzumab) is used concomitantly with trastuzumab and chemotherapy (e.g., docetaxel).

OR

B. **Neoadjuvant (pre-operative) Use in Breast Cancer:** A diagnosis of HER2-positive locally advanced, inflammatory, or early-stage breast cancer when criteria 1, 2, and 3 below are met:

1. Pertuzumab-containing medications are used preoperatively prior to resection of the breast tumor (neoadjuvant setting).

AND

2. Pertuzumab-containing medications are used concomitantly with chemotherapy (e.g., docetaxel).

AND

3. **Perjeta Only:** Perjeta (pertuzumab) is also used concomitantly with trastuzumab.

OR

C. **Adjuvant (post-operative) Use in Breast Cancer:** A diagnosis of HER2-positive locally advanced, inflammatory, or early-stage breast cancer when criteria 1 through 6 below are met:

1. Pertuzumab-containing medications are used post-operatively after resection of the breast tumor (adjuvant setting).

AND

2. One of the two following settings (a or b):

a. The patient is node-positive (based on surgical pathology report or attestation) and all of the following (i through iv):

i. The patient did **not** receive neoadjuvant chemotherapy.

AND

ii. The patient has had no prior HER2-directed chemotherapy [such as trastuzumab, Perjeta (pertuzumab), or Kadcyla (ado-trastuzumab emtansine)].

AND

iii. Pertuzumab-containing medications are used concomitantly with chemotherapy (e.g., docetaxel).

AND

iv. **Perjeta Only:** Perjeta (pertuzumab) is also used concomitantly with trastuzumab.

OR

b. The patient was on adjuvant Kadcyla (ado-trastuzumab emtansine) for residual disease and both of the following (i and ii)

i. Adjuvant Kadcyla (ado-trastuzumab emtansine) was not tolerated.

AND

ii. **Perjeta Only:** Perjeta (pertuzumab) is used concomitantly with trastuzumab.

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers pertuzumab-containing medications coverable only under the medical benefit (as a provider-administered medication).

B. When preauthorization is approved, pertuzumab-containing medications will be approved as follows:

1. Metastatic setting:

a. Perjeta (pertuzumab): Initial dose of 840 mg, followed by subsequent doses of 420 mg every 3 weeks until disease progression. Perjeta (pertuzumab) should be discontinued if trastuzumab is discontinued.

b. Phesgo (pertuzumab/trastuzumab/hyaluronidase): Initial dose of 1,200 mg pertuzumab, 600 mg trastuzumab, and 30,000 units hyaluronidase followed every 3 weeks by subsequent doses of 600 mg pertuzumab, 600 mg trastuzumab, and 20,000 units hyaluronidase until disease progression.

2. Neoadjuvant setting:

a. Perjeta (pertuzumab): Initial dose of 840 mg, followed by 420 mg every 3 weeks for up to six doses prior to surgery. Perjeta (pertuzumab) should be discontinued if trastuzumab is discontinued.

b. Phesgo (pertuzumab/trastuzumab/hyaluronidase): Initial dose of 1,200 mg pertuzumab, 600 mg trastuzumab, and 30,000 units hyaluronidase followed every 3 weeks by subsequent doses of 600 mg pertuzumab, 600 mg trastuzumab, and 20,000 units hyaluronidase preoperatively for 3 to 6 cycles.

3. Adjuvant setting:

a. Perjeta (pertuzumab): Initial dose of 840 mg, followed by 420 mg every 3 weeks for up to 18 doses (one year of combined neoadjuvant and adjuvant therapy total) or until disease progression.

b. Phesgo (pertuzumab/trastuzumab/hyaluronidase): Initial dose of 1,200 mg pertuzumab, 600 mg trastuzumab, and 30,000 units

hyaluronidase followed every 3 weeks by subsequent doses of 600 mg pertuzumab, 600 mg trastuzumab, and 20,000 units hyaluronidase postoperatively for a total of 1 year (up to 18 cycles) or until disease progression.

C. Authorization **may** be reviewed at least annually. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, such as disease stability or improvement.

IV. Pertuzumab-containing medications are considered not medically necessary when used for node-negative HER2-positive breast cancer treatment in the adjuvant (after surgical resection) setting.

V. Pertuzumab-containing medications are considered investigational when:

A. Perjeta (pertuzumab) is not administered in conjunction with trastuzumab.

B. Used beyond the second-line treatment setting for metastatic breast cancer.

C. Used in the adjuvant setting, after the patient has received neoadjuvant therapy.

D. Gastric cancer.

E. HER2-negative breast cancer.

F. Ovarian cancer.

G. Colorectal cancer.

H. Non-small cell lung cancer.

Position Statement

- Perjeta (pertuzumab), a monoclonal antibody that prevents growth of cancer cells via its blockade of HER2 receptors, is approved for the treatment of HER2-positive metastatic breast cancer (mBC); as a neoadjuvant therapy (used prior to surgical resection of a tumor) for locally advanced, inflammatory, or early-stage HER2-positive breast cancer; and as an adjuvant therapy (used after surgical resection of a tumor) for non-metastatic, invasive, HER2-positive breast cancer at high risk of recurrence.
- Perjeta (pertuzumab) binds to a different area on HER2 receptors than trastuzumab. In some breast cancer settings, the two medications used in combination may provide greater antitumor activity than trastuzumab alone.
- Phesgo (pertuzumab/trastuzumab/hyaluronidase) is a fixed dose combination of pertuzumab and trastuzumab with hyaluronidase, an endoglycosidase, combined in a formulation that can be given subcutaneously.
- The intent of this policy is to cover pertuzumab-containing medications (Perjeta, Phesgo) for the indications, regimen, and dose for which it has been shown to be safe and effective, as detailed in the coverage criteria, with consideration for other available treatment options.

    * Effective is defined by having a known health benefit and/or an additional health benefit relative to available treatment alternatives.
    * Where there is lack of proven additional benefit for Perjeta (pertuzumab) relative to alternatives, and/or a lack of a demonstrated health outcome (such as overall survival), use of Perjeta (pertuzumab) is not coverable ("not medically necessary" or "investigational").
- It is important to note that the fact that a medication is FDA approved for a specific indication does not, in itself, make the treatment medically reasonable and necessary.

Metastatic breast cancer (mBC)

- The combination of Perjeta (pertuzumab), trastuzumab and docetaxel has been shown to significantly improve median overall survival (OS) as a first-line therapy for HER2-positive mBC relative to trastuzumab and docetaxel alone.
- The evidence for Perjeta (pertuzumab) in the second-line HER2-positive mBC setting is of poor quality. However, as it is rapidly becoming the standard of care, coverage is provided in the second-line setting when Perjeta (pertuzumab) was not used with trastuzumab plus chemotherapy in the first-line mBC setting.

Non-metastatic breast cancer (locally advanced, inflammatory, or early-stage)

- *Neoadjuvant*: Evidence for Perjeta (pertuzumab) in the neoadjuvant setting (when given for 3 to 6 doses prior to surgical resection of the breast tumor) is based on a surrogate endpoint (the absence of invasive cancer in the breast and lymph nodes).[1] It is not known if it improves survival, or any other clinically relevant endpoint, when used in this setting. There is no evidence to support the use of more than 6 doses of neoadjuvant Perjeta (pertuzumab).
- *Adjuvant*: The use of Perjeta (pertuzumab) as an add-on to adjuvant chemotherapy plus trastuzumab was FDA-approved based on the results of the APHINITY trial in patients who received no prior neoadjuvant therapy, such as neoadjuvant chemotherapy. [2]
    * In patients who did not receive neoadjuvant therapy, the addition of Perjeta (pertuzumab) to a standard adjuvant regimen results in a nominal improvement in invasive disease-free survival (iDFS) relative to standard therapy (iDFS of 91% vs 88% at 6 years). Though statistically different, this difference is not likely clinically relevant iDFS is a surrogate endpoint which has not been shown to reliably predict clinically relevant outcomes such as a decrease in metastatic disease recurrence or improved OS.
    * To date there is no evidence demonstrating an improvement in OS when Perjeta (pertuzumab) is added to the standard adjuvant regimen (6-year overall survival were 95% vs. 94%).
    * The reporting of preliminary results at 3 years in an early-stage BC population is earlier than the typical 5-year standard. Use of preliminary evidence leads to uncertainty when estimating the net health benefit of this regimen. This can lead to over-estimation of benefit and underestimation of harms.
    * Because the results from this trial are underwhelming, there has been significant focus on subgroup analyses, particularly related to the node-positive subpopulation.

- After an interim analysis suggested a possibility of futility, recruitment of subjects in APHINITY was changed to exclude node-negative women during the trial. Therefore, the application of any benefit in node-negative patients is questionable.
- The hazard ratio in this population suggests a greater likelihood of improvement in iDFS with the addition of Perjeta (pertuzumab) to a standard adjuvant regimen; however, the improvement in iDFS is small and has only been shown in node-positive women on an *a priori* basis.
- Other subgroup analyses that suggested no benefit was associated with treatment in other important populations, such as in pre-menopausal women.
- As node-negative women were excluded from recruitment during the trial and there is no evidence of benefit, the addition of Perjeta (pertuzumab) to standard TCH therapy in this population is considered unproven.

- *Adjuvant, after neoadjuvant therapy*:
  * Women who received neoadjuvant treatment with Perjeta (pertuzumab) or other neoadjuvant chemotherapy prior to surgery were excluded from the APHINITY trial;[2] therefore, it is not known if Perjeta (pertuzumab) in the adjuvant setting is beneficial in this population (after neoadjuvant chemotherapy).
  * Current standard of care for women treated with neoadjuvant chemotherapy with residual disease at the time of surgery is adjuvant Kadcyla (ado-trastuzumab emtansine). The use of pertuzumab in this setting is unproven.
  * The optimal approach to treatment of women who achieve a pathologic complete response (pCR) after neoadjuvant chemotherapy has not been prospectively studied. The NeoSphere trial[1] reported 5-year PFS of 86% in women who received docetaxel, trastuzumab, and pertuzumab in the neoadjuvant setting followed by no adjuvant therapy. It is unknown how this compares to the current standard of care (neoadjuvant TCHP followed by adjuvant trastuzumab to complete 1 year of HER-2 directed therapy), particularly for women who achieve a pCR after neo-adjuvant therapy.
  * Because the addition of Perjeta (pertuzumab) to adjuvant therapy has only been shown to improve outcomes in a narrow group of subjects, extrapolation of these study results outside of the setting in which it has shown benefit is considered investigational and not covered under most benefits.
- NCCN lists the following recommendations:
  * The addition of Perjeta (pertuzumab) to a standard adjuvant regimen is a category 2A recommendation (independent of node-negative vs. node-positive). The use of trastuzumab alone is listed as a category 1 (highest level) recommendation. [3]
  * For patients who received neoadjuvant chemotherapy and are found to have residual disease, adjuvant Kadcyla (ado-trastuzumab emtansine) is a category 1 recommendation. In the infrequent scenario in which Kadcyla (ado-trastuzumab emtansine) is not tolerated, switching to adjuvant trastuzumab with Perjeta (pertuzumab) is a category 1 recommendation.

- Although NCCN does not differentiate adjuvant therapy recommendations for node-negative versus node-positive patients, ASCO guidelines state the APHINITY trial showed no clinically meaningful benefit in node-negative patients.
- Perjeta (pertuzumab) has not been shown to be effective when used alone (i.e., not in combination with trastuzumab) or in the treatment of other types of cancer.
- Perjeta (pertuzumab) has been shown to be safe and effective when dosed as follows: an initial dose of 840 mg via intravenous infusion, followed by 420 mg every three weeks.
- The safety of administering more than six doses (cycles) of Perjeta (pertuzumab) in early breast cancer (neoadjuvant setting) has not been established.

Regence Pharmacy Services performs independent analyses of oncology medication evidence, to establish coverability per the contracts with the health plan.

- Most contracts define coverability based on established clinical benefit in published, peer-reviewed literature, along with consideration of regulatory status.
- FDA approval does not in itself establish medical necessity, as unpublished, low-quality evidence, including exploratory analyses and unvalidated surrogate endpoints, may be used as the basis of approval. Regulatory approval may or may not reflect clinical benefit relative to standard of care and the recommendations of expert clinical advisors such as the Oncologic Drugs Advisory Committee (ODAC). FDA approvals generally do not consider cost compared to established therapies, or value to members.
- Likewise, NCCN clinical practice guidelines assignment of a recommendation (category 1, 2a, or 2b) does not necessarily establish medically necessity. NCCN recommendations are inconsistently supported by published, peer-reviewed literature and do not uniformly consider value of new therapies relative to existing potentially higher-value treatment options, considering effectiveness, safety, and cost.
- Medication coverage criteria are developed based on the 'medical necessity' assessment, as described above.

Regence Pharmacy Services analysis and coverage policy may differ from FDA labeled indication and/or NCCN clinical practice guidelines.

Clinical Efficacy

HER2-POSITIVE METASTATIC BREAST CANCER

- There is fair confidence in the evidence that the addition of Perjeta (pertuzumab) to a standard trastuzumab-containing regimen improves median overall survival (OS) in HER2-positive metastatic breast cancer (BC). [4]
    * A single, phase 3 pivotal trial compared Perjeta (pertuzumab) plus trastuzumab plus docetaxel with trastuzumab plus docetaxel alone in the HER2-positive metastatic BC setting.
        - The trial enrolled patients who had no prior chemotherapy or trastuzumab in the metastatic setting. Prior trastuzumab was allowed in the adjuvant or neoadjuvant setting if 12 months had passed between completion of adjuvant/neoadjuvant therapy and diagnosis of metastatic BC.

- In the initial efficacy analysis, median PFS was prolonged by approximately 6 months in the Perjeta (pertuzumab) treatment arm. [5]
- In a final survival analysis of this trial, a significant improvement in median OS was demonstrated. Subjects in the Perjeta (pertuzumab) arm had a median OS of 56.5 months versus 40.8 months in the control group [hazard ratio of 0.68; 95% CI (0.56, 0.84); p < 0.001]. [6]

* The evidence for Perjeta (pertuzumab) in patients who have had progression while receiving prior HER2-blocking therapy is of poor quality. [7]
  - An uncontrolled study trial evaluated the combination of Perjeta (pertuzumab) and trastuzumab in patients who had progression of their HER2-positive metastatic BC on prior trastuzumab-based therapy.
  - The evidence from this trial is of poor quality because there was no comparator arm or blinding employed in the study. The effects of bias, confounding, and chance cannot be ruled out.
  - The study evaluated overall response rates (ORR) in 58 patients.
  - The authors reported a 24% ORR and a median PFS of 5.5 months.

NON-METASTATIC (EARLY BREAST CANCER), PRIOR TO SURGICAL RESECTION (NEOADJUVANT SETTING)

- The evidence of efficacy for Perjeta (pertuzumab) in the neoadjuvant setting for locally advanced, inflammatory, or early-stage BC is of low quality. [1 8]
  * An open-label trial evaluated pathological complete response (pCR) rates for the combination of Perjeta (pertuzumab)/trastuzumab docetaxel versus trastuzumab/docetaxel alone as neoadjuvant therapy for women with early-stage HER2-positive BC.
  * Therapy was given preoperatively for 3 to 6 cycles prior to tumor resection [Perjeta (pertuzumab) was administered every 3 weeks for 3 to 6 doses].
  * Pathological complete response is defined as the absence of invasive cancer in the breast and lymph nodes. It is unknown if pCR is an accurate predictor of OS in BC.
  * The effect of neoadjuvant Perjeta (pertuzumab) on OS has not been evaluated.
  * There is no evidence to support the use of more than 6 cycles of neoadjuvant Perjeta (pertuzumab). Therefore, the use of more than 6 cycles is not coverable.

ADJUVANT (POST SURGICAL RESECTION) – NON-METASTATIC HER2-POSITIVE BREAST CANCER SETTING

- A multicenter, randomized, double-blind, placebo-controlled APHINITY trial (N=4,805) compared Perjeta (pertuzumab) with placebo each added to standard adjuvant chemotherapy plus 1 year of treatment with trastuzumab in patients with HER2-positive early breast cancer. [2]
  * The 3-year rate of invasive-disease-free survival (iDFS) was 94.1% in the Perjeta (pertuzumab) group and 93.2% in the placebo group [hazard ratio 0.81; 95% CI (0.66, 1.0); p=0.045). Although statistically different, this very small difference is not likely clinically relevant.

    * iDFS is a surrogate endpoint that has not been shown to correlate with a clinically meaningful outcome such as decreased metastatic recurrence or improved overall survival.
    * No overall survival difference has been demonstrated between groups to date.
    * A 3-year follow-up in this population is considered preliminary. A 5-year follow up is a more typical timeframe. Use of preliminary results leads to uncertainty in the net clinical benefit (potential for harms relative to potential for benefit) assessment.
    * Subset analyses in patients with either node-positive disease, or hormone receptor-negative disease appears to show a small benefit in iDFS in the Perjeta (pertuzumab) versus placebo groups; however, the potential for benefit is very small and is likely an overestimate due to enrichment of the study population with node-positive patients. A protocol amendment to stop enrolling node-negative patients was made late in the study because it was noted that this subpopulation was not experiencing any benefit with Perjeta (pertuzumab).
- Overall, the addition of Perjeta (pertuzumab) to a standard adjuvant treatment regimen has not been shown to improve any clinically relevant outcome, may increase the likelihood of side effects to adjuvant therapy, and is associated with a higher cost of care.

USE IN OTHER CONDITIONS

- Early phase 2 trials that studied pertuzumab (Perjeta, previously referred to as Omnitarg) showed that it had only limited activity as a single agent in ovarian, breast, and prostate cancers. [9] It is, therefore, unlikely to be effective when used alone.
- A recently published phase II trial found no benefit in adding Perjeta (pertuzumab) to standard chemotherapy in women with recurrent ovarian cancer. [10]
- A small (n = 30), early phase pharmacokinetic and safety study was conducted with Perjeta (pertuzumab) in patients with advanced gastric or gastro-esophageal junction cancer. A larger, phase 3 study is planned to evaluate the safety and efficacy of Perjeta (pertuzumab) in this condition. [11]
- A small phase 2a basket trial evaluated pertuzumab in HER2-amplified metastatic colorectal cancer. Although 32% of patients had a response (ORR) on pertuzumab plus trastuzumab therapy, there is insufficient evidence to establish the benefit of this combination therapy for colon cancer. While these preliminary results are promising, there is no evidence of benefit on clinically meaningful outcomes, such as increased overall survival. [12]
- The evidence for pertuzumab in HER2-positive non-small cell lung cancer is limited to one phase 2 trial. No benefit was observed with pertuzumab treatment on the primary endpoints of complete response and partial response. Additional trials are ongoing. [13]

GUIDELINES

- National Comprehensive Cancer Network (NCCN) BC guideline recommendations for pertuzumab in HER2-positive BC: [3]
    * ***Metastatic setting:*** The combination of Perjeta (pertuzumab) plus trastuzumab plus docetaxel is listed as a category 1 recommendation for the first-line

treatment of HER2-positive metastatic BC. The regimen gets a category 2A recommendation if paclitaxel is substituted for docetaxel. The guideline also states that Perjeta (pertuzumab) may be given in combination with trastuzumab in the second-line metastatic treatment setting if patients were previously treated in the first-line metastatic setting with trastuzumab plus chemotherapy in the absence of Perjeta (pertuzumab) [category 2A recommendation].

* ***Neoadjuvant setting:*** The use of Perjeta (pertuzumab) in the neoadjuvant setting is listed as a category 2A recommendation when used prior to surgery for early BC when administered concomitantly with a taxane plus trastuzumab.
* ***Adjuvant setting:***
  - The preferred, category 1 recommended adjuvant regimen for non-metastatic, invasive HER2-positive BC is adjunctive chemotherapy followed by paclitaxel plus trastuzumab. The addition of Perjeta (pertuzumab) to a standard adjuvant regimen is listed as a category 2A recommendation (independent of node-negative vs. node-positive).
  - For patients who received neoadjuvant chemotherapy and are found to have residual disease, adjuvant Kadcyla (ado-trastuzumab emtansine) is a category 1 recommendation. In the infrequent scenario in which Kadcyla (ado-trastuzumab emtansine) is not tolerated, switching to adjuvant trastuzumab with Perjeta (pertuzumab) is a category 1 recommendation.

- The American Society of Clinical Oncology (ASCO) breast cancer guideline states that one year of adjuvant Perjeta (pertuzumab) may be added to trastuzumab-based combination chemotherapy for patients with early-stage, HER2-positive breast cancer (moderate strength recommendation). Qualifying statements include: [14]
  * The recommendation is based on a modest disease-free benefit in patient with node-positive disease.
  * No benefit was observed in node-negative patients, and no survival benefit has been shown to date.
  * There is no data to guide the length of Perjeta (pertuzumab) therapy in patients with a complete pathologic response to neoadjuvant therapy.
- The National Institute for Health and Care Excellence (NICE) technical appraisal concluded that there is uncertainty regarding the potential for benefit with Perjeta (pertuzumab) when used in the adjuvant treatment of early-stage HER2-postive breast cancer. Reasons for the uncertainty include: [15]
  * Improvement in invasive disease-free survival is marginal and there is uncertainty in the estimate of effect.
  * There is uncertainty as to whether the invasive disease-free survival endpoint reliably predicts metastatic recurrence or overall survival benefit. A related surrogate endpoint, pathological complete response, was not associated with improved OS over the long term in a previous study in early breast cancer at high risk of recurrence.

* The overall survival data are immature, and there is currently no apparent difference between treatment groups for this endpoint.
* The evidence for increased evidence in the node-positive and hormone receptor-negative subgroups is not convincing because of the non-significant test for interaction in each of these subgroups (implies that there is no evidence that the hazard ratio comparing Perjeta (pertuzumab) versus placebo showed a difference in the subgroups).

Safety *[8 16]*

- Pertuzumab-containing medications (Perjeta, Phesgo) carry a Boxed Warning for embryo-fetal death and birth defects and is listed as a pregnancy Category D. They also carry a Boxed Warning describing the risk of clinical cardiac failure including left ventricular dysfunction and congestive heart failure.
- Common adverse effects when Perjeta (pertuzumab) is combined with trastuzumab plus docetaxel (≥ 30% incidence) include diarrhea, alopecia, neutropenia, nausea, fatigue, rash, and peripheral neuropathy.
- Pertuzumab-containing medications (Perjeta, Phesgo) should be withheld for a left ventricular ejection fraction (LVEF) of < 40% or for a LVEF of 40% to 45% with a 10% absolute decrease below pretreatment values.

Dosing *[8 16]*

- The initial dose of Perjeta (pertuzumab) is 840 mg administered as a 60-minute infusion. This is followed every 3 weeks thereafter with 420 mg doses administered over 30 to 60 minutes.
- The initial dose of Phesgo (pertuzumab/trastuzumab/hyaluronidase) is 1,200 mg pertuzumab, 600 mg trastuzumab, and 30,000 units hyaluronidase administered subcutaneously over approximately 8 minutes, followed every 3 weeks by a dose of 600 mg pertuzumab, 600 mg trastuzumab, and 20,000 units hyaluronidase administered subcutaneously over approximately 5 minutes.
- In the neoadjuvant HER2-positive BC setting, pertuzumab-containing medications (Perjeta, Phesgo) are given preoperatively every 3 weeks for 3 to 6 doses. The safety of pertuzumab-containing medications (Perjeta, Phesgo) given for more than 6 doses for early BC has not been established.
- When used in the adjuvant setting (after surgical resection), pertuzumab-containing medications (Perjeta, Phesgo) are given every three weeks for a total of one year (up to 18 cycles). It should not be continued if trastuzumab is stopped. [Note: Use in this setting is considered 'not medically necessary' based on health plan contracts]

Revision History

Revision Date	Revision Summary
6/20/2024	• Add coverage criteria for patients with intolerance to Kadcyla (adjuvant use in breast cancer). • Clarification of criteria wording in Investigational Uses, to be explicit (no change to intent).
6/15/2023	No criteria changes with this annual update.
6/17/2022	Added colorectal cancer and non-small cell lung cancer as investigational uses. No criteria changes with this annual update.
7/16/2021	No criteria changes with this annual update.
1/20/2021	Added Phesgo (pertuzumab/trastuzumab/hyaluronidase) to policy.
7/22/2020	Reworded references to trastuzumab to be agnostic to brand name to account for upcoming changes in biosimilars policy (dru620).
.4/22/2020	• Added coverage criteria for adjuvant use for specific patients (node-positive, did not receive prior neoadjuvant therapy, and no prior HER2-directed chemotherapy). • Added COT criteria.
7/24/2019	Updated policy with standard language, including clarifying the Authorization Period to state 'until disease progression' (no change to policy intent) when used in the metastatic disease setting.
8/17/2018	• Adjuvant use of pertuzumab was moved from 'investigational' to 'not medically necessary'. • The "Administration, Quantity Limitations, and Authorization Period" section was updated say that pertuzumab should be discontinued when trastuzumab is discontinued (supports investigational position that pertuzumab is not covered as the sole HER2-blocking therapy).
10/13/2017	No criteria changes with this annual update
5/13/2016	For coverage of pertuzumab in the metastatic setting, made the clarification that the patient has had no prior treatment for HER2-positive metastatic BC. The prior criterion (I.A.2.a) stated, "Patient has had no prior therapy for metastatic breast cancer".

Drug names identified in this policy are the trademarks of their respective owners.

Medication Policy Manual | **Policy No:** dru298

Topic: Kadcyla, ado-trastuzumab emtansine | **Date of Origin:** May 16, 2013

Committee Approval Date: June 20, 2024 | **Next Review Date:** 2025

Effective Date: September 1, 2024

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of medication policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Kadcyla (ado-trastuzumab emtansine) is an antibody-drug conjugate (ADC) that is used to treat metastatic, HER2-positive breast cancer when the disease has progressed after standard therapy. It works by blocking HER2 receptors while delivering cytotoxic chemotherapy medication directly to cancer cells. It is administered as an intravenous infusion.

Policy/Criteria

Most contracts require pre-authorization approval of Kadcyla (ado-trastuzumab emtansine) prior to coverage.

I. Continuation of therapy (COT): Kadcyla (ado-trastuzumab emtansine) may be considered medically necessary for COT when criterion A, B, or C below is met.

A. For diagnoses NOT listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND there is documentation that the medication was covered by another health plan. Examples of documentation include the coverage approval letter from the previous health plan or paid claim.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

B. For diagnoses listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

C. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

Please note*: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Kadcyla (ado-trastuzumab emtansine) may be considered medically necessary in patients with breast cancer when there is clinical documentation (including, but not limited to chart notes) that criteria A and B below are met.

A. A diagnosis of **HER2-positive breast cancer**.

AND

B. Use in one of the following treatment settings (criterion 1 or 2):

1. **Metastatic disease:** When there is progression of disease after treatment with trastuzumab and a taxane (docetaxel or paclitaxel), when given either separately or in combination.

OR

2. **Non-metastatic disease (early disease)** when all of the following criteria are met (a, b, and c):

   a. There is documented residual invasive disease (tumor or lymph nodes) after surgery (Kadcyla [ado-trastuzumab emtansine] will be used in the ADJUVANT setting).

   AND

   b. At least six cycles (16 weeks) of neoadjuvant chemotherapy were administered prior to surgery.

   AND

   c. Neoadjuvant therapy (prior to surgery) included both of the following (i and ii):

      i. At least nine weeks of taxane therapy.

      AND

      ii. At least nine weeks of trastuzumab therapy.

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers Kadcyla (ado-trastuzumab emtansine) coverable only under the medical benefit (as a provider-administered medication).

B. When pre-authorization is approved, Kadcyla (ado-trastuzumab emtansine) will be authorized as follows:

1. **Metastatic disease:** Authorization **may** be reviewed at least annually. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, such as disease stability or improvement (including that there is no disease progression).

OR

2. **Non-metastatic disease (early disease):** Until disease progression, or up to a maximum of 14 cycles. No additional doses will be authorized.

IV. Kadcyla (ado-trastuzumab emtansine) is considered investigational when used in combination with Perjeta (pertuzumab).

V. Kadcyla (ado-trastuzumab emtansine) is considered investigational when used for all other conditions, including but not limited to:

A. HER2-positive breast cancer when trastuzumab has not been part of the prior treatment history.

B. HER2-negative breast cancer.

C. Gastric cancer.

D. HER2 mutations in non-small cell lung cancer.

Position Statement

- Kadcyla (ado-trastuzumab emtansine) is an antibody-drug conjugate that works via its blockade of HER2 receptors and delivery of cytotoxic chemotherapy to cancer cells.
- The intent of this policy is to cover Kadcyla (ado-trastuzumab emtansine) for the indications and dose for which it has been shown to be safe and effective, as detailed in the coverage criteria.
    * It was initially approved for use in the treatment of HER2-positive metastatic breast cancer (BC) in patients who have received a prior trastuzumab and taxane-based regimen for their metastatic disease, or when disease recurs during or within six months of completing adjuvant therapy with a trastuzumab and taxane-based regimen.
    * Subsequently, it was approved for use in HER2-positive non-metastatic (early) BC, as adjuvant therapy for residual invasive disease, after trastuzumab and taxane-based neoadjuvant therapy.
- Kadcyla (ado-trastuzumab emtansine) has only been evaluated when used as monotherapy. It should not be used in combination with trastuzumab, because it is duplication of therapy, or Perjeta (pertuzumab), where its safety and effectiveness have not been evaluated.
- Additionally, the safety and effectiveness of Kadcyla (ado-trastuzumab emtansine) have not been evaluated in other types of cancer.
- The most common side effects reported with Kadcyla (ado-trastuzumab emtansine) include fatigue, nausea, thrombocytopenia, headache, elevated liver enzymes, neuropathy, and constipation. Platelet count should be evaluated prior to each dose.
- Kadcyla (ado-trastuzumab emtansine) is given in a dose of 3.6 mg/kg via intravenous infusion over 90 minutes every 3 weeks until disease progression for metastatic disease and for up to 14 total cycles for residual disease in early BC.

Regence Pharmacy Services performs independent analyses of oncology medication evidence, to establish coverability per the contracts with the health plan.

- Most contracts define coverability based on established clinical benefit in published, peer-reviewed literature, along with consideration of regulatory status.
- FDA approval does not in itself establish medical necessity, as unpublished, low-quality evidence, including exploratory analyses and unvalidated surrogate endpoints, may be used as the basis of approval. Regulatory approval may or may not reflect clinical benefit relative to standard of care and the recommendations of expert clinical advisors such as the Oncologic Drugs Advisory Committee (ODAC). FDA approvals generally do not consider cost compared to established therapies, or value to members.
- Likewise, NCCN clinical practice guidelines assignment of a recommendation (category 1, 2a, or 2b) does not necessarily establish medically necessity. NCCN recommendations are inconsistently supported by published, peer-reviewed literature and do not uniformly consider value of new therapies relative to existing potentially higher-value treatment options, considering effectiveness, safety, and cost.

- Medication coverage criteria are developed based on the 'medical necessity' assessment, as described above.

Regence Pharmacy Services analysis and coverage policy may differ from FDA labeled indication and/or NCCN clinical practice guidelines.

Clinical Efficacy

METASTATIC BREAST CANCER

There is moderate certainty in the evidence that Kadcyla (ado-trastuzumab emtansine) improves survival in patients with HER2-positive metastatic breast cancer (mBC) relative to Tykerb (lapatinib) plus capecitabine.

- A large randomized, open-label, controlled trial compared Kadcyla (ado-trastuzumab emtansine) with Tykerb (lapatinib) plus capecitabine in patients with HER2-positive mBC. [1]
    * The study enrolled patients who had progression of their disease after therapy with trastuzumab and a taxane, either in the metastatic or adjuvant setting.
    * Progression-free survival (PFS) and overall survival were evaluated as co-primary endpoints.
    * There was a 6-month improvement in overall survival (OS) in favor of Kadcyla (ado-trastuzumab emtansine) based on an interim survival analysis. The study was stopped after statistical testing determined that a significant OS advantage would be maintained throughout the full planned duration of the study.
    * Any future survival analyses will be confounded because subjects were allowed to cross over to Kadcyla (ado-trastuzumab emtansine) after the interim survival analysis.
- Kadcyla (ado-trastuzumab emtansine) has not been compared with any other medication regimens commonly used in the second- and third-line HER2-positive mBC setting.
- There is a small (n = 137), proof-of-concept trial comparing Kadcyla (ado-trastuzumab emtansine) with trastuzumab plus docetaxel in the first-line (no prior trastuzumab) HER2-positive mBC setting. [2,3]
    * There is low confidence in the evidence from this study due to lack of detail regarding the proportion of subjects who withdrew from the comparator arm, the use of an endpoint (progression-free survival) that has not been correlated with clinically relevant outcomes, and lack of blinding.
    * Larger, well-controlled studies are needed to establish its safety and effectiveness in this treatment setting.
- There are no published clinical trials evaluating the combination of Kadcyla (ado-trastuzumab emtansine) and Perjeta (pertuzumab).
- The National Comprehensive Cancer Network (NCCN) breast cancer guideline recommends Kadcyla (ado-trastuzumab emtansine) for patients with HER2-positive mBC that have had prior exposure to trastuzumab-based regimens. It also has a recommendation as an adjuvant therapy in the resectable disease setting. [4]

NON- METASTATIC (EARLY) BREAST CANCER

There is low certainty in the evidence that adjuvant Kadcyla (ado-trastuzumab emtansine) improves survival in patients with HER2-positive non-metastatic BC relative to trastuzumab.

- A large randomized, open-label controlled trial compared Kadcyla (ado-trastuzumab emtansine) versus trastuzumab as adjuvant therapy in patients with HER2-positive non-metastatic BC and residual invasive disease after neoadjuvant therapy. [5]
    * The study enrolled patients who had residual invasive disease in the breast or axilla at surgery after neoadjuvant therapy with a taxane (with or without anthracycline) and trastuzumab.
    * All patients had at least 16 weeks of neoadjuvant therapy prior to surgery and at least nine weeks (three cycles) each of a taxane and trastuzumab.
    * Patients received a maximum of 14 cycles of Kadcyla (ado-trastuzumab emtansine).
    * Invasive disease-free survival (iDFS) was the primary endpoint. Overall survival was a secondary endpoint.
    * There was a reported invasive disease-free survival (iDFS) advantage with Kadcyla (ado-trastuzumab emtansine) [at 3 years, 88% vs. 77% with trastuzumab].
    * iDFS is a surrogate endpoint that has not been found to accurately predict benefit with regard to any clinically relevant outcome (e.g., overall survival (OS), quality or life). The effect of Kadcyla (ado-trastuzumab emtansine) on OS in this setting is unknown at this time.
- The NCCN breast cancer guideline recommends Kadcyla (ado-trastuzumab emtansine) for locally advanced, invasive, HER2-positive breast cancer after preoperative systemic therapy when residual disease is present. [4]

Use of Kadcyla (ado-trastuzumab emtansine) in other conditions

- Kadcyla (ado-trastuzumab emtansine) is also being studied in gastric cancer; however, there is insufficient evidence evaluating its efficacy in this condition. [6]
- Kadcyla (ado-trastuzumab emtansine) has not been studied in HER2-negative BC.
- Kadcyla (ado-trastuzumab emtansine) is also being studied in *ERBB2* (also known as HER2) mutations; however, there is insufficient evidence evaluating its efficacy in this condition. [4]

Safety [7]

- Commonly (incidence > 25%) adverse effects reported with Kadcyla (ado-trastuzumab emtansine) include fatigue, nausea, musculoskeletal pain, thrombocytopenia, headache, increased transaminases, and constipation.
- Kadcyla (ado-trastuzumab emtansine) labeling carries boxed warnings for hepatotoxicity, reduction in left ventricular ejection fraction (LVEF), and potential for fetal harm.

- Package labeling also carries warnings for pulmonary toxicity, hemorrhage, and peripheral neuropathy. Platelets should be monitored prior to each dose due to the potential for thrombocytopenia.

Dosing and administration [7]

- Kadcyla (ado-trastuzumab emtansine) is given in a dose of 3.6 mg/kg given intravenously over 90 minutes every 3 weeks (until progression in the metastatic setting or for up to 14 cycles as an adjuvant therapy for residual disease).
- Dose modification may be necessary for hepatotoxicity, decrease in LVEF, thrombocytopenia, pulmonary toxicity, or peripheral neuropathy.

Revision History

Revision Date	Revision Summary
6/20/2024	No criteria changes with this annual review.
6/15/2023	There were no changes to the coverage criteria with this annual update.
6/17/2022	There were no changes to the coverage criteria with this annual update. *Note: Revisions were made to update to current standard policy language; however, there was no change to the intent of this policy.*
7/16/2021	Updated continuation of therapy criteria. Added HER2 mutations in non-small cell lung cancer as an investigational use. No other changes with this annual update.
7/22/2020	Added continuation of therapy (COT) criteria. Removed references to brand Herceptin to account for upcoming changes to biosimilar policy (dru620). No other changes with this annual update.
7/24/2019	Add coverage criteria for non-metastatic breast cancer, for use in the adjuvant setting, based on new evidence and indication (effective 8/15/2019).
10/19/2018	Updated policy with standard language, including clarifying the Authorization Period to state 'until disease progression' (no change to policy intent)
10/13/2017	No criteria changes with this annual update
5/13/2016	No changes to coverage criteria with this annual update

Medication Policy Manual

Policy No: dru310

Topic: Abraxane, nab-paclitaxel (a.k.a. albumin-bound paclitaxel, paclitaxel albumin-stabilized nanoparticle formulation, ABI-007)

Date of Origin: July 12, 2013

Committee Approval Date: December 7, 2023

Next Review Date: 2024

Effective Date: March 1, 2024

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of medication policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Abraxane (nab-paclitaxel) is a protein-bound form of paclitaxel (generic Taxol). It is an intravenous taxane chemotherapy medication used in the treatment of certain cancers.

PLEASE NOTE: This policy and the coverage criteria below do not apply to paclitaxel (generic Taxol). Generic paclitaxel (Taxol) does not require pre-authorization.

Policy/Criteria

Most contracts require pre-authorization approval of Abraxane (nab-paclitaxel) prior to coverage.

I. Continuation of therapy (COT): Abraxane (nab-paclitaxel) may be considered medically necessary for COT when criterion A, B, or C below is met.

A. For diagnoses NOT listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND there is documentation that the medication was covered by another health plan. Examples of documentation include the coverage approval letter from the previous health plan or paid claim.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

B. For diagnoses listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

C. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

***Please note**: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Abraxane (nab-paclitaxel) may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) that criterion A, B, or C below is met.

A. A diagnosis of **cancer where paclitaxel is indicated** and criterion 1 or 2 below is met.

1. Previous treatment with paclitaxel or docetaxel was not tolerated due to a documented hypersensitivity reaction, despite use of recommended premedications.

OR

2. There is a medical contraindication to recommended pre-medications (corticosteroids, diphenhydramine, and H2 antagonists for paclitaxel; corticosteroids for docetaxel) such that use of paclitaxel or docetaxel is contraindicated.

OR

B. A diagnosis of recurrent or refractory **metastatic breast cancer (MBC)** and treatment with an anthracycline-based chemotherapy regimen has been ineffective, contraindicated, or not tolerated. (see *Appendix 1*)

OR

C. A diagnosis of locally advanced or metastatic **pancreatic cancer** when given in combination with gemcitabine.

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers Abraxane (nab-paclitaxel) coverable only under the medical benefit (as a provider-administered medication).

B. Authorization may be reviewed at least annually. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, such as disease stability or improvement.

IV. Abraxane (nab-paclitaxel) is considered not medically necessary (unless generic paclitaxel products were not tolerated due to hypersensitivity, despite use of pre-medications) when used for:

A. First-line treatment of non-small cell lung cancer (NSCLC)

B. First-line treatment of breast cancer (any stage)

V. Abraxane (nab-paclitaxel) is considered investigational when used for all other conditions, including but not limited to treatment of the following, unless generic paclitaxel products were not tolerated due to hypersensitivity:

A. Colorectal cancer.

B. Prostate cancer.

C. Uterine sarcoma.

Position Statement

- Abraxane (nab-paclitaxel) is paclitaxel (generic Taxol), a microtubule inhibitor, bound to a protein. It is approved for use in the treatment of metastatic breast cancer when front-line therapies are not effective, in the front-line treatment of metastatic pancreatic cancer when used in combination with gemcitabine, and for advanced non-small cell lung cancer (NSCLC) as a first-line therapy when used in combination with carboplatin.
- Generic taxanes, including docetaxel and paclitaxel, are effective in the treatment of many patients with a variety of cancers including, but not limited to, lung, ovarian and breast cancers.
- For recurrent or refractory metastatic breast cancer, Abraxane (nab-paclitaxel) is one of many effective single-agent options (*see Appendix 1*).

- Abraxane (nab-paclitaxel) has not been proven to be safer or more effective than generic paclitaxel for advanced or metastatic NSCLC. Abraxane (nab-paclitaxel) is among several options (see *Appendix 2*) that may be used first-line to treat advanced or metastatic NSCLC.
- For metastatic pancreatic cancer, the addition of Abraxane (nab-paclitaxel) to gemcitabine improves overall survival over gemcitabine alone.
- Because Abraxane (nab-paclitaxel) is a unique formulation of paclitaxel, there is interest in using it in other indications where standard generic paclitaxel has been shown to be effective. There is currently no reliable evidence supporting superior efficacy of Abraxane (nab-paclitaxel) over generic paclitaxel or other taxanes (docetaxel); however, it is much more costly.
- There is no reliable evidence to allow conclusion that Abraxane (nab-paclitaxel) is safer than generic paclitaxel.
    * Like generic paclitaxel, Abraxane (nab-paclitaxel) is also associated with significant adverse effects including myelosuppression (boxed warning for neutropenia), sensory neuropathy, alopecia, nausea/vomiting, and hypersensitivity.
    * Solvents in generic paclitaxel (Cremophor) may be associated with infusion-related side effects; pre-medication with corticosteroids, diphenhydramine, and H2 antagonists is used to minimize infusion reactions. Although Abraxane (nab-paclitaxel) does not require pre-medication, it also can cause hypersensitivity reactions.
    * Solvents in generic docetaxel (polysorbate 80) can also cause hypersensitivity reactions. Premedication with dexamethasone is recommended.
- Abraxane (nab-paclitaxel) is currently being studied in many other types of cancers; however, the current state of the evidence is insufficient to support a clinical benefit in these populations.

Regence Pharmacy Services performs independent analyses of oncology medication evidence, to establish coverability per the contracts with the health plan.

- Most contracts define coverability based on established clinical benefit in published, peer-reviewed literature, along with consideration of regulatory status.
- FDA approval does not in itself establish medical necessity, as unpublished, low-quality evidence, including exploratory analyses and unvalidated surrogate endpoints, may be used as the basis of approval. Regulatory approval may or may not reflect clinical benefit relative to standard of care and the recommendations of expert clinical advisors such as the Oncologic Drugs Advisory Committee (ODAC). FDA approvals generally do not consider cost compared to established therapies, or value to members.
- Likewise, NCCN clinical practice guidelines assignment of a recommendation (category 1, 2a, or 2b) does not necessarily establish medically necessity. NCCN recommendations are inconsistently supported by published, peer-reviewed literature and do not uniformly consider value of new therapies relative to existing potentially higher-value treatment options, considering effectiveness, safety, and cost.

- Medication coverage criteria are developed based on the 'medical necessity' assessment, as described above.

Regence Pharmacy Services analysis and coverage policy may differ from FDA labeled indication and/or NCCN clinical practice guidelines.

Clinical Efficacy

BREAST CANCER

Recurrent or refractory

- Abraxane (nab-paclitaxel) has not been proven in high quality clinical studies to be more effective than alternative treatment options for recurrent or refractory metastatic breast cancer (MBC). Of note, the doses of paclitaxel, given as Abraxane (nab-paclitaxel), were significantly higher in the comparative trials than the generic paclitaxel doses, yet Abraxane (nab-paclitaxel) failed to produce consistently superior survival.
- One low quality randomized non inferiority trial reported Abraxane (nab-paclitaxel) to be as effective as paclitaxel for MBC, based on overall response rate. There was a trend towards superior overall survival; however, the trial was not powered for overall superiority. A subset analysis found overall survival was superior with Abraxane (nab-paclitaxel) in previously treated women (refractory or recurrent MBC), but not in patients being treated in the first-line setting. [1] As a result, the FDA approved nab-paclitaxel (Abraxane) for use only in the refractory or recurrent metastatic setting. [2]
    * Significant flaws that impacted the certainty of the results included use of an open-label design and an endpoint with subjective components (overall response rate).
    * In addition, use of an open-label design also confounds reliability of overall survival results, as well as use of subsequent, post-protocol chemotherapy.

First-line:

- There is insufficient evidence to support the use of Abraxane (nab-paclitaxel) over generic taxanes for the first-line treatment of MBC. Studies are limited to one phase 2 trial versus docetaxel, [3,4] along with the Phase 3 trial, which failed to show superior overall survival versus generic paclitaxel. [1]
- There is insufficient evidence to support the use of Abraxane (nab-paclitaxel) for earlier stage (non-metastatic) breast cancer. One Phase 3 trial evaluated Abraxane (nab-paclitaxel) vs. paclitaxel for primary invasive breast cancer. Pathological complete response (PCR), the primary outcome, was higher with Abraxane (nab-paclitaxel) than with paclitaxel (38% vs. 29%). Despite a statistically significant difference in PCR, it is unknown if this difference in PCR will translate in to improved overall survival, the most meaningful health outcome for breast cancer. [23]
- Because there is no evidence of superiority for overall survival with Abraxane (nab-paclitaxel) and there are many alternatives that provide a better value, the use of Abraxane (nab-paclitaxel) for first-line breast cancer (any stage) is considered not medically necessary.

NCCN guidelines

- The current National Comprehensive Cancer Network (NCCN) breast cancer guideline lists Abraxane (nab-paclitaxel) among many possible "other" single-agent treatment options for recurrent or metastatic breast cancer. Preferred single-agent options include but are not limited to taxanes (paclitaxel), anthracyclines (doxorubicin HCl, doxorubicin liposomal), anti-metabolites (gemcitabine, capecitabine) and microtubule inhibitors (vinorelbine, eribulin). See *Appendix 1* for "Other" single-agent options. The NCCN does not specifically recognize use of Abraxane (nab-paclitaxel) for early stage (non-metastatic/non-recurrent) breast cancer. [5]

PANCREATIC CANCER:

- In the first-line treatment of metastatic pancreatic cancer, the addition of Abraxane (nab-paclitaxel) to gemcitabine improves overall survival over gemcitabine alone (8.5 versus 6.7 months), based on one large Phase 3 trial (n=861). [6,7]
- Abraxane (nab-paclitaxel) plus gemcitabine is a NCCN preferred, category 2A recommended option for locally advanced pancreatic cancer and a preferred, category 1 recommendation for metastatic pancreatic cancer. [6]

NON-SMALL CELL LUNG CANCER (NSCLC):

- One randomized, controlled study compared Abraxane (nab-paclitaxel) to generic paclitaxel for advanced and metastatic NSCLC. Despite a higher overall response rate with Abraxane (nab-paclitaxel) (33% versus 25%), the primary endpoint, the study failed to demonstrate any statistically significant difference between the two treatments for overall survival (12.1 months versus 11.2 months, p=0.271). Both progression free survival and overall survival were secondary endpoints and part of the non-inferiority analysis. [8]
- The current NCCN guideline lists Abraxane (nab-paclitaxel) among many possible platin-doublet treatment options for first-line treatment of NSCLC, in combination with cisplatin or carboplatin. Other platin-doublet options include but are not limited to cisplatin or carboplatin plus generic taxanes (paclitaxel, docetaxel), anti-metabolites (gemcitabine, pemetrexed), microtubule inhibitors (vinblastine, vinorelbine) and etoposide, as well as non-platin doublets (gemcitabine/docetaxel or gemcitabine/vinorelbine). [9]
- Because there is no evidence of superiority for overall survival and there are many alternatives that provide a better value, the use of Abraxane (nab-paclitaxel) for first-line NSCLC is considered not medically necessary.

Use in Other Conditions

OVARIAN CANCER:

- No single therapy is preferred for treatment of recurrent ovarian cancer based on the current NCCN ovarian cancer guideline. [10]
- For platinum-sensitive disease, carboplatin combinations with paclitaxel (Category 1), docetaxel or gemcitabine are preferred. Abraxane (nab-paclitaxel) is listed as one of many single-agent options for platinum-sensitive recurrent disease (category 2A).
- The evidence for the use of single-agent Abraxane (nab-paclitaxel) in recurrent platinum-sensitive ovarian cancer is limited to one small Phase 2 trial. [11]

- Abraxane (nab-paclitaxel) has not been studied in paclitaxel-resistant disease.
- More trials are needed to evaluate the place of Abraxane (nab-paclitaxel) in ovarian cancer therapy.

COLORECTAL CANCER, PROSTATE CANCER, AND UTERINE SARCOMA

- Several small studies have evaluated Abraxane (nab-paclitaxel) in colorectal cancer [27], and prostate cancer [13]. However, no promising activity was shown in these cancers.
- No published clinical trials evaluating generic paclitaxel or nab-paclitaxel (Abraxane) in uterine sarcoma were identified in researching this policy.
- Generic paclitaxel or Abraxane (nab-paclitaxel) are not part of the standard of care for any of these cancers based on current NCCN guidelines. [19]

OTHER CANCERS

- Generic paclitaxel is part of the treatment paradigm for several other cancers including, but not limit to, endometrial, esophageal junction, head and neck squamous cell cancer (HNSCC), urothelial, and cutaneous melanoma. [19] Although Abraxane (nab-paclitaxel) has also been used in several of these settings, it has not been shown to be safer or more effective than generic paclitaxel. [12, 14-17]
- In some cancers, such as cutaneous melanoma, immune checkpoint inhibitor therapies and targeted therapies have eclipsed the use of chemotherapy agents like generic paclitaxel and Abraxane (nab-paclitaxel) as they are associated with better outcomes (e.g., improved overall survival).
- Biliary tract cancers (BTC), including cholangiocarcinoma (CCA):
    * There are two small, uncontrolled trials evaluating Abraxane (nab-paclitaxel) in biliary tract cancers (BTC), including cholangiocarcinoma (CCA) when used in combination with gemcitabine or gemcitabine plus cisplatin. One study did not meet its primary endpoint. [24] The other study suggested potential activity with this combination relative to a historical cohort. [25]
    * A subsequent unpublished phase 3 study (SWOG 1815) of patients with newly-diagnosed, advanced biliary tract cancers (n=441) did not find a statistical improvement in median overall survival with the addition of albumin-bound paclitaxel (Abraxane) (GAP) to the standard of care gemcitabine/cisplatin (GC). [27]
        - 67% of patients had intrahepatic CCA, 16% had gallbladder adenocarcinoma [GBC], and 17% had extrahepatic CCA. Most pts had metastases (73%).
        - Median OS was 14 months with GAP vs. 12.7 months with GC (p=0.58). In addition, GAP was associated with a higher rate of adverse events, including hematologic adverse events.
        - Exploratory analyses of locally advanced disease and GBC favored use of GAP; however, the analyses were not powered for conclusion of superiority.
        - Further analyses are ongoing and additional trials are needed to establish the safety and efficacy of Abraxane in this clinical setting.
    * There is no evidence for the use of albumin-bound paclitaxel (Abraxane) in resectable BTC.

    * There are several other potential chemotherapy regimens recommended by the NCCN in this treatment setting. [26]
- The NCCN recognizes the use of generic paclitaxel for a variety of cancers, including bladder, breast, cervical, esophageal, gastric, head and neck (SCCHN), kidney, lung, ovarian, penile, testicular, uterine, endometrial, and thyroid cancers; melanoma, unspecified adenocarcinoma, thymoma, and angiosarcoma. [19]

Safety

- There is no reliable evidence to allow conclusion that Abraxane (nab-paclitaxel) is safer than generic paclitaxel.
- Generic paclitaxel contains solvents, such as Cremophor, that dissolve the paclitaxel and may be associated with infusion-related hypersensitivity requiring premedication with corticosteroids, diphenhydramine and H2-receptor antagonists. [19]
- Abraxane (nab-paclitaxel) formulation does not contain solvents and may be an option for patients with hypersensitivity to generic paclitaxel. Of note, use of nab-paclitaxel (Abraxane) has not been studied in patients with severe hypersensitivity reactions to generic paclitaxel. [9] Likewise, Abraxane (nab-paclitaxel) may be an option in patients with hypersensitivity to generic docetaxel.
- Although Abraxane (nab-paclitaxel) does not require pre-medication, it can cause hypersensitivity reactions. [2]
- Although both docetaxel (generic Taxotere) and paclitaxel (generic Taxol) are both "taxanes," they have different side effects. Namely, paclitaxel (generic Taxol) contains the solvent Cremophor which is associated with infusion-related hypersensitivity reactions with paclitaxel. Giving pre-medications (e.g. steroids, diphenhydramine, and ranitidine) can help minimize these infusion reactions. [19]
- Infusion-related reactions, which happen at the time of the infusion, can be seen with docetaxel (generic Taxotere), as it contains polysorbate 80, another diluent known to cause infusion reactions. Pre-medication with dexamethasone is recommended prior to infusion of docetaxel. [19]
- An allergic reaction to docetaxel aside from during an infusion generally is considered a reaction to the docetaxel and not the diluent. Generally, use of another taxane would be relatively contraindicated.
- Neuropathy can be a dose-limiting side effect of either generic paclitaxel or nab-paclitaxel (Abraxane); however, neuropathy is not considered a hypersensitivity reaction. In addition, there is no conclusive evidence that the incidence of neuropathy is lower with Abraxane (nab-paclitaxel) than with generic paclitaxel. [20] A study in patients with breast cancer found a similar incidence of neuropathy with generic paclitaxel and Abraxane (nab-paclitaxel). [21] A recent review of the use of Abraxane (nab-paclitaxel) in patients with non-small cell lung cancer showed less grade four neuropathy, compared to generic paclitaxel, but the incidence of neuropathy overall was about the same. [22]
- The most common adverse reactions (>20%) reported with Abraxane (nab-paclitaxel) include alopecia, blood dyscrasias (anemia, neutropenia, thrombocytopenia), sensory neuropathy, abnormal ECG, fatigue/asthenia, myalgia/arthralgia, liver function test

abnormalities (AST/alkaline phosphatase elevation), GI disturbance (nausea, diarrhea), infections. [2]

- Like generic paclitaxel, Abraxane (nab-paclitaxel) carries a Boxed Warning for neutropenia. [2,17]

Appendix 1: Chemotherapy Agents Used in the Treatment of Metastatic Breast Cancer [5] [a]	
Preferred Single Agents	***Chemotherapy Combinations***
Anthracyclines	AC: doxorubicin/cyclophosphamide
doxorubicin (generic Adriamycin)	EC: epirubicin/cyclophosphamide
Doxorubicin, liposomal (Doxil)	CMF: cyclophosphamide/methotrexate/fluorouracil
Taxanes	docetaxel/capecitabine (generic Xeloda)
paclitaxel (generic Taxol)	GT: gemcitabine/paclitaxel
Anti-metabolites	gemcitabine/carboplatin
capecitabine (generic Xeloda)	paclitaxel/bevacizumab
gemcitabine (generic Gemzar)	carboplatin/paclitaxel OR nab-paclitaxel (Abraxane)
Other microtubule inhibitors	
vinorelbine (generic Navelbine)	
eribulin (generic Halaven	
Other Single Agents	***Agents Targeted for HER-2 positive disease*** [b]
cyclophosphamide (generic Cytoxan)	Perjeta (pertuzumab) [c]
carboplatin	trastuzumab
docetaxel	Kadcyla (ado- trastuzumab)
Abraxane (nab-paclitaxel)	Tykerb (lapatinib)
cisplatin	Tukysa (tucatinib)/trastuzumab/capecitabine [cat 1]
epirubicin	Enhertu (fam-trastuzumab deruxtecan)
Ixempra (ixabepilone)	Nerlynx (neratinib)

[a] All are NCCN 2A recommendations, except as noted

[b] Most agents for HER-2 positive disease are used in combination with cytotoxic chemotherapy (e.g. docetaxel, paclitaxel, carboplatin, capecitabine, vinorelbine).

[c] Category 1, with trastuzumab and docetaxel.

Appendix 2: Cytotoxic Chemotherapy Agents Used in the First-line Treatment of Non-small Cell Lung Cancer [9] [a]	
PD-1/PD-L1 inhibitors	
Keytruda (pembrolizumab) +	Alimta (pemetrexed) + cisplatin or carboplatin (preferred)
Tecentriq (atezolizumab) +	carboplatin/paclitaxel/bevacizumab carboplatin/Abraxane(nab-paclitaxel) [category 2A]
Opdivo (nivolumab) +	Yervoy (ipilimumab) Yervoy (ipilimumab) + Alimta (pemetrexed) + carboplatin/cisplatin
Platin-doublets	
cisplatin or carboplatin +	docetaxel, etoposide, gemcitabine, paclitaxel, Abraxane (nab-paclitaxel), Alimta (pemetrexed)
Other doublet therapies:	
gemcitabine **+** docetaxel or vinorelbine	
Doublet chemotherapy plus bevacizumab	
carboplatin **+** paclitaxel **+** bevacizumab carboplatin or cisplatin + Alimta (pemetrexed) + bevacizumab [category 2A]	

[a] All are NCCN Category 1 recommendations, except as noted. This list includes most but not all regimens (for reference).

Appendix 3: Lung cancer histological subtypes (and approximate incidence, %)
Lung cancer (162.0, 162.2-162.5, 162.8, 162.9)
A. Non-small cell lung cancer (NSCLC) (85-90%)
1) Squamous cell (epidermoid) carcinoma (25-30%)
2) Non-squamous cell (55%)
- Adenocarcinoma (40%)
- Large cell (undifferentiated) carcinoma (10-15%)
- Other
B. Small cell lung cancer (SCLC) (10-15%)
C. Unspecified lung cancer (< 5%)

Revision History

Revision Date	Revision Summary
12/7/2023	No criteria changes with this annual review.
12/9/2022	• Updated standard language in policy. • No changes to coverage criteria with this annual update.
1/20/2021	• Removed the following diagnoses from the 'Investigational' list in criterion V. so use in these conditions could be adjudicated using criterion A. (solvent-based hypersensitivity reaction to generic paclitaxel or when required pre-medications are contraindicated): endometrial cancer, gastroesophageal cancer, squamous cell cancer of the head and neck, ovarian cancer, and cholangiocarcinoma. • Updated continuation of therapy (COT) language.
6/15/2020	Removed references to brand Avastin and brand Herceptin from policy, to account for upcoming changes in biosimilars policy (dru620).
1/22/2020	• Added continuation of therapy (COT) criteria (no change to intent of coverage criteria). • Cholangiocarcinoma was added to investigational uses.
1/31/2019	There were no changes to coverage criteria with this annual update. Clarified documentation requirements (no change to intent).
2/16/2018	No change to intent of coverage criteria with this annual update.
2/17/2017	Add coverage criteria for docetaxel hypersensitivity reaction.
2/12/2016	Added to investigational uses: endometrial cancer, uterine sarcoma.
7/12/2013	New policy.

Drug names identified in this policy are the trademarks of their respective owners.

Medication Policy Manual | **Policy No:** dru327

Topic: Gazyva, obinutuzumab | **Date of Origin:** January 17, 2014

Committee Review Date: March 6, 2025 | **Next Review Date:** 2026

Effective Date: May 1, 2025

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of medication policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Gazyva (obinutuzumab) is an intravenous (IV) humanized monoclonal antibody. It is used in the treatment of chronic lymphocytic leukemia (CLL), and follicular lymphoma (FL), when administered with chemotherapy.

Policy/Criteria

Most contracts require pre-authorization approval of Gazyva (obinutuzumab) prior to coverage.

I. Continuation of therapy (COT): Gazyva (obinutuzumab) may be considered medically necessary for COT when criterion A, B, or C below is met.

A. For diagnoses NOT listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND there is documentation that the medication was covered by another health plan. Examples of documentation include the coverage approval letter from the previous health plan or paid claim.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

B. For diagnoses listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

C. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

Please note*: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Gazyva (obinutuzumab) may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) that criterion A, B or C below is met.

A. Diagnosis of **chronic lymphocytic leukemia** (CLL) when criteria 1 and 2 below are met:

1. Gazyva (obinutuzumab) will be administered in combination with one of the following (a, b, or c):

a. Chlorambucil.

OR

b. Venclexta (venetoclax).

OR

c. Calquence (acalabrutinib).

AND

2. The patient has had no prior medication therapy for CLL.

OR

B. Diagnosis of **relapsed or refractory follicular lymphoma** (FL) when criteria 1 and 2 below are met:

1. Documentation of disease progression on or after a rituximab-containing regimen.

AND

2. Gazyva (obinutuzumab) will be administered in combination with bendamustine for six cycles, followed by Gazyva (obinutuzumab) monotherapy.

OR

C. Gazyva (obinutuzumab) is used as a one-time dose prior to initiation of therapy with Columvi (glofitamab) to deplete circulating and lymphoid tissue B cells.

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers Gazyva (obinutuzumab) coverable only under the medical benefit (as a provider-administered medication).

B. When preauthorization is approved, Gazyva (obinutuzumab) will be authorized as follows:

1. **CLL**: A single treatment course of up to eight 1,000-mg infusions in a 12-month period. No additional treatment courses will be authorized.

2. **FL**: Up to eight 1,000-mg infusions in the initial 6-month period when administered with bendamustine. After the initial 6-month period, up to six 1,000-mg infusions in a 12-month period as monotherapy for a maximum of 24 months of maintenance therapy. Note: there is a lifetime maximum of 30 months of treatment (twenty 1,000-mg infusions).

3. **Prior to Columvi (glofitamab) therapy**: Coverage will be provided for a single dose of 1,000 mg. No additional doses will be authorized.

C. Authorization **may** be reviewed at least annually. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, such as disease stability or improvement.

IV. Gazyva (obinutuzumab) is considered not medically necessary when used for:

A. Untreated follicular lymphoma (FL) [first-line setting].

B. Relapsed/refractory FL, in combination with Brukinsa (zanubrutinib).

V. Gazyva (obinutuzumab) is considered investigational when used for all other conditions.

Position Statement

- Gazyva (obinutuzumab), an anti-CD20 humanized monoclonal antibody, is a B-cell-directed immunotherapy used in combination with chlorambucil for the treatment of chronic lymphocytic leukemia (CLL), in combination with bendamustine for the treatment of relapsed or refractory follicular lymphoma (FL), or in combination with chemotherapy for previously untreated stage II bulky, III, or IV FL.
- The intent of this policy is to allow coverage in the settings with proven benefit. The use of Gazyva (obinutuzumab) is considered 'not medically necessary' for uses with no proven benefit over less-costly alternatives.
- Gazyva (obinutuzumab) for CLL and FL is coverable for a finite treatment course, as detailed in the coverage criteria. The safety and effectiveness of additional treatment courses has not been studied.

Chronic Lymphocytic Leukemia

- Gazyva (obinutuzumab) was studied in patients who had no previous therapy for their CLL, and who were not candidates for more aggressive chemotherapy due to advanced age and/or comorbid conditions.
- FDA approval was based on improved progression-free survival (PFS) in patients who received chlorambucil plus Gazyva (obinutuzumab) versus those who received chlorambucil alone. There is currently no mature overall survival data available. Subsequently, the FDA approved use of Venclexta (venetoclax) in combination with Gazyva (obinutuzumab), based on improvement in PFS as compared to chlorambucil plus Gazyva (obinutuzumab).
- Gazyva (obinutuzumab) for CLL consists of a finite treatment course, as detailed in the coverage criteria. The safety and effectiveness of additional treatment courses has not been studied.
- National Comprehensive Cancer Network (NCCN) CLL/Small Lymphocytic Lymphoma (SLL) guideline lists Gazyva (obinutuzumab) as a treatment option for CLL and SLL.

Relapsed or Refractory Follicular Lymphoma (FL)

- Gazyva (obinutuzumab) was studied in patients with FL who had no response to or progressed on a rituximab-containing regimen.
- FDA approval in relapsed or refractory (r/r) FL was based on PFS in patients who received bendamustine plus Gazyva (obinutuzumab) versus bendamustine alone. There is currently no mature overall survival data available, nor is there any evidence that it improves any clinically relevant outcome such as symptom control or improved quality of life.
- More recently, the FDA approved the use of Brukinsa (zanubrutinib) for r/r FL, in combination with Gazyva (obinutuzumab). However, there is no proven efficacy or safety benefit of Brukinsa (zanubrutinib) with Gazyva (obinutuzumab) over lower cost regimens, including other Gazyva (obinutuzumab)-based regimens. Therefore, the use of Gazyva (obinutuzumab) with Brukinsa (zanubrutinib) for r/r FL is considered not medically necessary.
- The NCCN lists Gazyva (obinutuzumab) plus chemotherapy among several preferred, treatment option for relapsed or refractory FL. Potential third-line treatment options

include Gazyva (obinutuzumab) with Brukinsa (zanubrutinib), as well as the many available second-line treatment options which are listed as potential third-line treatment options if not previously used.

Previously Untreated Follicular Lymphoma (first-line)

- Gazyva (obinutuzumab) was also studied in patients with previously untreated stage II bulky (tumor ≥ 7 cm), III, or IV FL when given in combination with chemotherapy. It was compared with rituximab plus chemotherapy.
- There was a small advantage in PFS at three years; however, there was no difference in three-year survival. This study does not establish any clinically relevant difference between these two therapies.
- Rituximab-based regimens are the standard of care in treating FL, and are generally more cost effective than Gazyva (obinutuzumab)-based regimens.
- Because there is no proven efficacy or safety benefit of Gazyva (obinutuzumab)-based regimens over lower cost rituximab- based regimens, the use of Gazyva (obinutuzumab) in the first-line setting for FL is considered not medically necessary.

Use as a premedication prior to Columvi (glofitamab) therapy:

- A study evaluating Columvi (glofitamab) used a single dose of Gazyva (obinutuzumab) prior to initiating therapy with Columvi (glofitamab) to deplete circulating and lymphoid tissue B cells to reduce the incidence and severity of cytokine release syndrome (CRS).

Safety

- There is a high potential for off-label use of Gazyva (obinutuzumab) in B-cell-mediated diseases other than CLL and FL; however, there is no evidence supporting its safety and efficacy in these settings.
- Gazyva (obinutuzumab), as well as all anti-CD20 monoclonal antibodies, carries a boxed warning describing a risk for hepatitis B virus reactivation and for progressive multifocal leukoencephalopathy (PML).
- Infusion reactions are common and may be severe. Premedication is recommended. The first dose should be administered slowly and divided over two days.
- Other common adverse effects include bone marrow suppression, fever, cough, and musculoskeletal disorder.

Regence Pharmacy Services performs independent analyses of oncology medication evidence, to establish coverability per the contracts with the health plan.

- Most contracts define coverability based on established clinical benefit in published, peer-reviewed literature, along with consideration of regulatory status.
- FDA approval does not in itself establish medical necessity, as unpublished, low-quality evidence, including exploratory analyses and unvalidated surrogate endpoints, may be used as the basis of approval. Regulatory approval may or may not reflect clinical benefit relative to standard of care and the recommendations of expert clinical advisors such as the Oncologic Drugs Advisory Committee (ODAC). FDA approvals generally do not consider cost compared to established therapies, or value to members.
- Likewise, NCCN clinical practice guidelines assignment of a recommendation (category 1, 2a, or 2b) does not necessarily establish medically necessity. NCCN recommendations

are inconsistently supported by published, peer-reviewed literature and do not uniformly consider value of new therapies relative to existing potentially higher-value treatment options, considering effectiveness, safety, and cost.

- Medication coverage criteria are developed based on the 'medical necessity' assessment, as described above.

Regence Pharmacy Services analysis and coverage policy may differ from FDA labeled indication and/or NCCN clinical practice guidelines.

Clinical Efficacy

Chronic Lymphocytic Leukemia

- There is a single, low-quality, unpublished, open-label, randomized controlled trial evaluating Gazyva (obinutuzumab) in combination with chlorambucil as a first-line therapy for certain patients with chronic lymphocytic leukemia (CLL). [1 2]
    - * Patients enrolled in the trial had confirmed B-cell CLL, had no prior medication treatment for their disease, and were not candidates for more aggressive chemotherapy due to comorbid conditions (e.g. reduced renal function).
    - * The primary endpoint in the study was investigator-reported progression-free survival (PFS). Overall survival (OS) will be reported as a secondary endpoint. PFS has not been validated as an accurate predictor of OS in this setting. [3]
    - * The study was completed in two stages. Stage 1 of the trial compared chlorambucil plus Gazyva (obinutuzumab) with chlorambucil alone. Stage 2 of the trial compared chlorambucil plus Gazyva (obinutuzumab) with chlorambucil plus rituximab.
    - * The Gazyva (obinutuzumab) treatment arm was reported to have a 12-month PFS advantage over chlorambucil alone (23 months and 11 months, respectively).
    - * In stage 2 of the trial, the Gazyva (obinutuzumab) treatment arm was reported to have an 11.5-month PFS advantage over the rituximab treatment arm (26.7 months and 15.2 months, respectively). [4 5] OS data from this trial is not mature at this time.
    - * Evidence from the trial was appraised as being of low quality due to the open-label design or the study and the high rate of attrition.
- A subsequent phase 3 trial compared Venclexta (venetoclax) plus Gazyva (obinutuzumab) versus chlorambucil plus Gazyva (obinutuzumab). The combination with venetoclax was numerically superior to chlorambucil for PFS (88.2% vs. 64% at 24 months). However, all-cause mortality was higher in the venetoclax group (9.3% vs. 7.9% with chlorambucil). [6 7]
- The evidence of efficacy for Gazyva (obinutuzumab) in combination with Calquence (acalabrutinib) in the front-line CLL setting is based on one phase III, open-label trial; ELEVATE-TN. This trial evaluated progression free survival (PFS) as the primary endpoint, and overall response rate (ORR) as a secondary endpoint. [8]
    - * Patients with treatment-naïve CLL were randomized to receive acalabrutinib monotherapy, acalabrutinib with obinutuzumab, or chlorambucil with obinutuzumab.

    - At median follow-up of 28.3 months, median PFS was longer with acalabrutinib-obinutuzumab (NR) and acalabrutinib monotherapy (NR), compared with obinutuzumab-chlorambucil (22.6 months). In addition, Treatment with acalabrutinib-obinutuzumab, acalabrutinib, and obinutuzumab-chlorambucil led to an overall response rate (ORR) of 94%, 86%, and 79%, respectively.
    - This trial was not designed nor powered to assess the benefit of acalabrutinib monotherapy versus acalabrutinib-obinutuzumab.
- Gazyva (obinutuzumab) has not been studied in the relapsed or refractory CLL setting, or when used as a single agent for CLL.
- NCCN lists Gazyva (obinutuzumab) as a treatment option when used as monotherapy for relapsed or refractory CLL/SLL. Gazyva (obinutuzumab) in combination with Venclexta (venetoclax) or Calquence (acalabrutinib) is listed as a preferred treatment regimen in the first-line CLL setting in patients without del(17p)/TP53 mutation as well as in the first-line CLL setting in patients with a del(17p)/TP53 mutation. [9]

Follicular lymphoma

- There is a low-quality, unpublished, open-label, randomized controlled (RCT) trial [GADOLIN] evaluating Gazyva (obinutuzumab) in combination with bendamustine as a therapy for patients with relapsed or refractory (r/r) indolent non-Hodgkin lymphomas (NHLs) who had no response or progressed on a rituximab-containing regimen, The vast majority of the subjects enrolled in the trial had follicular lymphoma (FL). [2 10] Results reported below are for the cohort with FL (N = 321).
    - Patients were randomized to receive either Gazyva (obinutuzumab) plus bendamustine or bendamustine alone. Patients who received Gazyva (obinutuzumab) plus bendamustine and did not have disease progression at the end of 6 months continued receiving Gazyva (obinutuzumab) monotherapy for up to 2 years.
    - The median PFS of the Gazyva (obinutuzumab) plus bendamustine arm has not been reached, although it is estimated to be 29.2 months. The reported median PFS of the bendamustine alone arm is 13.8 months.
    - The median OS has not been reached in either arm after about 45 months.
- A second open-label, RCT compared Gazyva (obinutuzumab) plus chemotherapy with rituximab plus chemotherapy as a front-line regimen in patients with CD20-positive indolent non-Hodgkin's lymphoma [GALLIUM]. [2 11]
    - Patients in the FL cohort had stage II bulky, stage III, or stage IV disease, and had no prior systemic therapy for their disease.
    - Those achieving at least a partial response after initial combination therapy were continued on monotherapy with the assigned monoclonal antibody therapy.
    - The three-year PFS was 81.9% and 77.9% in the Gazyva (obinutuzumab) and rituximab treatment arms, respectively [HR 0.71; 95% CI 0.54, 0.93; p = 0.01]. Median PFS was not reached in either group.
    - There was no difference between groups in 3-year OS. Median OS was not reached in either group.

- More recently, the FDA approved the use of Brukinsa (zanubrutinib) for r/r FL, in combination with Gazyva (obinutuzumab), after two or more lines of systemic therapy, based on unpublished results (abstract) of a phase 2 trial comparing the combination regimen with Gazyva (obinutuzumab) monotherapy [ROSEWOOD].[12 13] However, there is no proven efficacy or safety benefit of Brukinsa (zanubrutinib) with Gazyva (obinutuzumab) over lower cost regimens, including other Gazyva (obinutuzumab)-based regimens. Therefore, the use of Gazyva (obinutuzumab) with Brukinsa (zanubrutinib) for r/r FL is considered not medically necessary.
    * All patients in the trial received ≥2 previous systemic therapies for FL (including an anti-CD20 antibody and an alkylating agent). About half of enrolled patients were refractory to rituximab.
    * Based on details from the unpublished abstract, overall response rate (ORR) was higher with combination therapy as compared to monotherapy (69% vs. 46%). However, a large portion (49%) of patients crossed over from monotherapy to the combination arm, such that the results are confounded and interpretation of any benefit of one treatment arm over the other is uncertain.
    * In addition, Brukinsa (zanubrutinib) with Gazyva (obinutuzumab) has not been compared to any pf the many other lower cost regimens, including other Gazyva (obinutuzumab)-based regimens. Therefore, the use of Gazyva (obinutuzumab) with Brukinsa (zanubrutinib) for r/r FL is considered not medically necessary.
- The NCCN lists Gazyva (obinutuzumab) plus chemotherapy among several preferred, treatment options for relapsed or refractory FL. Potential third-line treatment options include Gazyva (obinutuzumab) with Brukinsa (zanubrutinib), as well as the many available second-line treatment options which are listed as potential third-line treatment options if not previously used. Choice of third-line therapy is dependent on prior lines of treatment, which may include autologous hematopoietic stem cell rescue. For front-line treatment, the guideline lists both Gazyva (obinutuzumab) plus chemotherapy and rituximab plus chemotherapy as preferred, treatment options. [9]

Investigational conditions

- Although the GADOLIN study enrolled patients with indolent NHLs that had no response to, or had advanced on rituximab-containing regimens, the vast majority of subjects enrolled in this study had relapsed or refractory FL. There were very low numbers of patients with other indolent NHLs enrolled in the trial so the safety and efficacy of Gazyva (obinutuzumab) in other NHL populations could not be evaluated. [2 10]
- ***Use in DLBCL:*** A phase 3 study [GOYA] compared Gazyva (obinutuzumab) plus chemotherapy (G-CHOP regimen) with rituximab plus chemotherapy (R-CHOP) in patients with previously untreated DLBCL. There was no difference in PFS between the two groups. There was a higher incidence of grade 3 to 5 AEs in the G-CHOP arm. Additionally, there is no evidence demonstrating that Gazyva (Obinutuzumab) is superior to rituximab in the subsequent-line DBLCL treatment setting. [14]
- ***Use in FL with lenalidomide:*** There is no good evidence that Gazyva (obinutuzumab) plus lenalidomide is superior to other chemoimmunotherapy regimens used for the treatment of relapsed or refractory FL. Current studies are limited to small, single-arm trials that evaluate ORR as the primary endpoint. [15]

- Gazyva (obinutuzumab) has not been evaluated in non-cancer B-cell mediated conditions (e.g., rheumatoid arthritis).

Safety [2]

- Package labeling for Gazyva (obinutuzumab) carries a boxed warning for reactivation of hepatitis B virus and for progressive multifocal leukoencephalopathy (PML).
- Infusion reactions are common and may be severe or fatal. Premedication is recommended and the first infusion should be split over two days, with 100 mg infused on day 1 and 900 mg infused on day 2.
- Gazyva (obinutuzumab) should only be administered by a healthcare professional (HCP) with access to appropriate medical support (e.g., crash cart).
- Common adverse effects (incidence $\geq$ 10%) include: infusion reactions, neutropenia, thrombocytopenia, anemia, pyrexia, cough, and musculoskeletal disorders.
- Live virus vaccines should not be administered prior to or during therapy with Gazyva (obinutuzumab).

Dosing [2]

- Gazyva (obinutuzumab) should only be given intravenously through a dedicated line by a healthcare professional (HCP).
- A treatment course of Gazyva (obinutuzumab) is as follows (given in 28-day cycles) for CLL:
  - 100 mg IV on day of 1 cycle 1, then 900 mg IV on day 2 of cycle 1
  - 1,000 mg IV on days 8 and 15 of cycle 1
  - 1,000 mg IV on day 1 of cycles 2 through 6
- A treatment course of Gazyva (obinutuzumab) is as follows (given in 28-day cycles) for FL:
  - 1,000 mg IV on days 1, 8 and 15 of cycle 1
  - 1,000 mg IV on day 1 of cycles 2 through 6
  - Maintenance: 1,000 mg IV monotherapy every 2 months for up to 2 years
- The use of Gazyva (obinutuzumab) beyond one treatment course for CLL has not been studied.
- A single 1,000-mg dose of Gazyva (obinutuzumab) is indicated prior to initiating therapy with Columvi (glofitamab) to deplete circulating and lymphoid tissue B cells to reduce the incidence and severity of cytokine release syndrome (CRS).

Revision History

Revision Date	Revision Summary
3/6/2025	QL for follicular lymphoma corrected (no change to intent of coverage criteria).
9/19/2024	Added use in combination with Brukinsa (zanubrutinib) for relapsed/refractory follicular lymphoma as 'not medically necessary.'
3/21/2024	Removed archived Arzerra, ofatumumab (dru196) from Cross References. No change to intent of coverage criteria with this annual review.
9/14/2023	Added coverage for use as a one-time dose prior to initiation of Columvi (glofitamab) as indicated in the Columvi (glofitamab) package labeling.
3/16/2023	No criteria changes with this annual update.
3/18/2022	No criteria changes with this annual update.
7/16/2021	No criteria changes with this annual update.
10/28/2020	Added coverage criteria for use in combination with Calquence (acalabrutinib) for treatment-naïve CLL/SLL.
6/15/2020	Removed references to brand Rituxan from policy to account for upcoming changes in biosimilars policy (dru620).
4/22/2020	Added continuation of therapy (COT) criteria (no change to intent of coverage criteria).
10/23/2019	Effective 11/15/2019, added coverage criteria for use in previously-untreated CLL, in combination with Venclexta (venetoclax), a new FDA indication.
4/25/2019	No changes to coverage criteria with this annual update.
3/19/2019	Added use in untreated follicular lymphoma (first-line) as not medically necessary.
1/13/2017	Added coverage criteria for refractory or relapsing follicular lymphoma.
1/8/2016	Adjusted quantity limit to better reflect dosing in package labeling (limit to eight 1000-mg infusions as per package labeling).
1/7/2014	New policy.

Drug names identified in this policy are the trademarks of their respective owners.

Medication Policy Manual

Policy No: dru351

Topic: Non-Preferred Intra-Articular Hyaluronic Acid Derivatives:

- Durolane (sodium hyaluronate)
- Euflexxa (1% sodium hyaluronate)
- Gel-One (sodium hyaluronate)
- Gelsyn-3 (sodium hyaluronate)
- GenVisc 850 (sodium hyaluronate)
- Hyalgan (sodium hyaluronate)
- Hymovis (high molecular weight hyaluronan)
- Monovisc (sodium hyaluronate)
- Supartz FX (sodium hyaluronate)
- Synojoynt (1% sodium hyaluronate)
- Triluron (1% sodium hyaluronate)
- Trivisc (sodium hyaluronate)
- Visco-3 (sodium hyaluronate)

Date of Origin: May 09, 2014

Committee Approval Date: December 7, 2023

Next Review Date: 2024

Effective Date: March 1, 2024

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of medication policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Hyaluronic acid derivatives are injected directly into the knee joint to help improve the pain associated with osteoarthritis of the knee.

PLEASE NOTE: Preferred Intra-Articular Hyaluronic Acid (IAHA) products do not require pre-authorization. The preferred IAHA products are Synvisc, Synvisc-One, and Orthovisc.

Policy/Criteria

Most contracts require pre-authorization approval of non-preferred intra-articular hyaluronic acid derivatives prior to coverage.

I. Continuation of therapy (COT): Non-preferred intra-articular hyaluronic acid derivatives may be considered medically necessary for COT when full policy criteria below are met, including quantity limit.

***Please note**: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Non-preferred intra-articular hyaluronic acid derivatives may be considered medically necessary when criteria A and B are met.

A. Treatment with both of the following has been ineffective, contraindicated, or not tolerated:

1. Orthovisc (high molecular weight hyaluronan).

2. Synvisc or Synvisc-One (hylan G-F 20).

AND

B. The member has a documented diagnosis of osteoarthritis of the knee.

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers intra-articular hyaluronic acid derivatives coverable only under the medical benefit (as provider-administered medications).

B. Initial authorization:

1. When pre-authorization is approved, intra-articular hyaluronic acid derivatives may be authorized in quantities of up to 2 treatment courses per knee for the initial 1-year period according to the chart below.

Product Name	**Number of Injections Per Treatment Course**
Durolane (sodium hyaluronate)	1 dose per knee
Euflexxa (1% sodium hyaluronate)	3 doses per knee
Gel-One (sodium hyaluronate)	1 dose per knee
Gelsyn-3 (sodium hyaluronate)	3 doses per knee
GenVisc 850 (sodium hyaluronate)	5 doses per knee
Hyalgan (sodium hyaluronate)	5 doses per knee
Hymovis (high molecular weight hyaluronan)	2 doses per knee
Monovisc (sodium hyaluronate)	1 dose per knee
Supartz FX (sodium hyaluronate)	5 doses per knee
Synojoynt (1% sodium hyaluronate)	3 doses per knee
Trivisc (sodium hyaluronate)	3 doses per knee
Visco-3 (sodium hyaluronate)	3 doses per knee
Triluron (1% sodium hyaluronate)	3 doses per knee

C. Continued authorization:

1. After the initial authorization, up to 2 courses per knee over a one-year period may be considered medically necessary if there is clinical documentation supporting clinical benefit from treatment, as defined by at least one of the following:

a. There is an improvement in pain or functional ability.

b. There has been a reduction in the use or frequency analgesics or anti-inflammatory medication.

2. Subsequent authorizations may be reviewed at least every 12 months to confirm that current medical necessity criteria are met, and that the medication is effective.

IV. Non-preferred intra-articular hyaluronic acid derivatives are considered not medically necessary for the following uses:

A. Osteoarthritis in joints other than the knee.

B. Skin wrinkles or other cosmetic indications.

V. Non-preferred intra-articular hyaluronic acids are considered investigational when used for all other conditions, including but not limited to:

A. Temporomandibular joint degenerative disorders.

B. Trigger finger.

Position Statement

- Hyaluronic acids are used as viscosupplementation and are injected directly into the knee joint to improve lubrication and reduce the pain associated with osteoarthritis of the knee.
- Given the inconclusive evidence for safety and efficacy, as well as inconsistent support from evidence-based clinical guidelines, the use of non-preferred hyaluronic acids is limited to patients with significant functional impairment that impacts quality of life or employment who have tried and failed conservative management strategies (analgesics and physical therapy/exercise) and/or intra-articular corticosteroid injections.
  * Standard therapies for treatment of knee pain related to arthritis include oral NSAIDs (such as ibuprofen, naproxen, or diclofenac), intra-articular corticosteroid injections, and physical therapy/exercises. These therapies are effective for providing pain relief for the vast majority of patients.
  * Hyaluronic acids are not recommended for routine use by the 2021 American Academy of Orthopedic Surgeons (AAOS) guidelines for management of osteoarthritis of the knee. The strength of this recommendation is characterized as “moderate” as it is based on multiple moderate-quality studies. [1 2]
  * 2019 American College of Rheumatology (ACR)/Arthritis Foundation (AF) guidelines conditionally recommend against the use of hyaluronic acids for osteoarthritis of the knee. The recommendation is based on lack of benefit in high-quality studies and the potential for harm associated with injections. The authors of a systematic review conducted as part of ACR/AF guideline development stated that benefit is restricted to low-quality studies and that in higher quality studies the benefit diminishes compared to saline injections alone. [3]

    * 2019 Guidelines by the Osteoarthritis Research Society International (OARSI) conditionally recommend the use of intra-articular hyaluronic acid when core treatments (exercise programs, dietary weight management, etc.) and pharmacologic therapies have been ineffective. [4]
    * 2020 Veteran's Administration (VA) guidelines suggest offering intra-articular hyaluronic acid derivatives for patients with persistent pain due to osteoarthritis of the knee inadequately relieved by other interventions. Although the recommendation is in favor of use, the guideline working group noted that the quality of evidence is low. [5]
- Several intra-articular hyaluronic acid products are available and there is little comparative evidence to differentiate the various products. Orthovisc, Synvisc, and Synvisc-One offer the best value for members.
- The use of intra-articular hyaluronic acids for osteoarthritis of the hip is considered not medically necessary. The majority of guidelines strongly or conditionally recommend against use in the hip due to high-quality evidence demonstrating a lack of benefit. [3,4] VA guidelines also noted the use of intra-articular hyaluronic acids in the hip have a higher risk profile due to proximity to the neurovascular structures. [5]
- There is inadequate evidence to support the use of hyaluronic acids in temporomandibular joint degenerative disorders or trigger finger.

CLINICAL EFFICACY

- Hyaluronic acids have not been proven in reliable clinical studies to be more effective than non-pharmacologic or generic analgesics such as acetaminophen and NSAIDs. The overall body of evidence is conflicting and additional high-quality studies are needed.
    * Systematic reviews of randomized controlled trials evaluating viscosupplementation in patients with osteoarthritis of the knee conclude that there are low-quality data available to determine efficacy and safety.
    * Clinical trials studying the effect of viscosupplementation on knee pain and functional outcomes have reported inconsistent results. Intra-articular injections are associated with a robust placebo-response; it is unclear if hyaluronic acid differs from placebo in a clinically meaningful way.
    * Several studies have reported no improvement in pain or mobility compared to placebo, simple analgesics, or exercise. [6-9]
    * Despite these limitations, authors of the Veteran's Administration (VA) guideline on knee osteoarthritis noted that large systemic reviews have shown some benefit and despite downgrades in the quality of evidence due to risk of bias, the outcomes were consistent across study groups. Thus, they have a weak recommendation in favor of offering hyaluronic acids as a treatment option. [5]
    * A 2015 Agency for Healthcare Research and Quality (AHRQ) review of clinical trials found no significant association between treatment with HLA and time to total knee arthroplasty (TKA). [10,11] The authors concluded that there is insufficient data to make any conclusions regarding the effect of HLA treatment on time to TKA.
- There is no reliable evidence, based on two comparative trials identified, to differentiate between hyaluronic acid products used for viscosupplementation in terms of safety or efficacy.

    * One randomized controlled trial in 660 patients with osteoarthritis of the knee did not demonstrate a difference in efficacy or safety of Synvisc compared with Orthovisc. [12]
    * A randomized trial comparing the effectiveness of Synvisc and Hyalgan is unreliable due to uncertain blinding which may have influenced patient reported outcomes. [13]

Guidelines

- The majority of guidelines offer conflicting recommendations with regard to intra-articular hyaluronic acids for the knee. Guidelines range from strong recommendations against use to conditional or weak recommendations in favor of use. Despite conflicting recommendations on hyaluronic acids, all guidelines recommend the use of conservative management strategies such as physical therapy, exercise, weight management, and NSAIDs.
- Systematic reviews have concluded that there is limited evidence to support subsequent treatment courses with hyaluronic acids; however, individual patients may benefit from additional courses of hyaluronic acids. [2,14] While there are conflicting recommendations among guidelines, the highest quality evidence supports minimal or no benefit.
- American College of Rheumatology (ACR)/Arthritis Foundation (AF) guidelines conditionally recommend against the use of hyaluronic acids for osteoarthritis of the knee. [3] The recommendation is based on a systematic review that concluded that the evidence supporting efficacy is limited to low-quality trials. When the analysis was limited to higher quality studies, the benefit of hyaluronic acid injections approached zero. Thus, the ACR/AF concluded that the best evidence does not demonstrate a benefit and there may be harms associated with the injections.
    * Conditional recommendations are used when the evidence is of low or very low-quality or the balances of risks and harms is close. Conditional recommendations meant to describe that the majority of informed patients would choose to follow the recommended course of action, but some would not.
    * ACR/AF Guidelines strongly recommend the use of intra-articular glucocorticoid injections for knee osteoarthritis and conditionally recommends them over other intra-articular injections (including hyaluronic acid). The recommendation is based on high-quality evidence for short-term efficacy. The guidelines do acknowledge that steroid injections may contribute to cartilage loss, but the clinical significance is unclear as change in cartilage thickness has not been shown to be associated with a worsening in pain, functioning, or other radiographic features. [3]
- The American Academy of Orthopedic Surgeons (AAOS) guidelines cannot recommend the routine use of hyaluronic acid for patients with symptomatic osteoarthritis of the knee. The use of hyaluronic acid was downgraded one level (from “strong” to “moderate”) due to a lack of generalized study results and moderate strength of supporting evidence. [1]
    * The AAOS position is based on assessment of the clinical meaningfulness of the result. The AAOS analysis concluded that the point estimate for the improvement in pain and function was less than half the pre-defined magnitude for clinically meaningful improvement.[1,2]

    * Statistically significant improvements were associated with high-molecular cross-linked hyaluronic acid but when compared to mid-range molecular weight, statistical significance was not maintained. This newer analysis did not demonstrate clinically relevant differences when compared to controls.[1]
    * Crosslinking features of the viscosupplementation products was assessed in two high quality studies. In patients with osteoarthritis, there was no difference between cross-linked and non-cross-linked HA.[1]
    * These guidelines also state that a specific subset of patients might benefit from intra-articular hyaluronic acids for the knee based on previous research reporting benefits in their use.[1]
- Osteoarthritis Research Society International (OARSI) guidelines conditionally recommend the use of hyaluronic acids after non-pharmacologic and NSAIDs/acetaminophen have been tried. The recommendations were also based on systematic reviews and meta-analyses of the available evidence though the guideline did account for differences in efficacy in high versus low-quality studies or address the impact of publication bias. [4]
- 2020 Veteran's Administration (VA) guidelines suggest offering intra-articular hyaluronic acid derivatives for patients with persistent pain due to osteoarthritis of the knee inadequately relieved by other interventions. Although the recommendation is in favor of use, the guideline working group noted that the quality of evidence is low. [5]

SAFETY

- The most common adverse events reported with hyaluronic acids include joint pain, stiffness and swelling, as well as injection site reactions. [15-22]

NOT MEDICALLY NECESSARY USES

- The use of intra-articular hyaluronic acids for osteoarthritis of the hip is considered not medically necessary.
    * 2019 ACR/AF Guidelines strongly recommend against the use of hyaluronic acid for the treatment of hip osteoarthritis due to high-quality evidence for lack of benefit. [3]
    * 2020 VA Guidelines conditionally recommend against the use of intra-articular hyaluronic acids in the hip due to high-quality evidence demonstrating a lack of benefit and safety concerns associated with the administration, specially the proximity to neurovascular structures. [5]

INVESTIGATIONAL USES

Use in Joints Other than the Knee

- Hyaluronic acids have been studied in the treatment of osteoarthritis of joints other than the knee, including the hip, shoulder, and ankle.
    * Small studies in patients with osteoarthritis of the ankle demonstrated that hyaluronic acid may be an effective treatment option; however, several larger, well-controlled trials have concluded that hyaluronic acid is not effective in this setting (no different than saline). [19-22]

* A randomized trial in patients with osteoarthritis of the shoulder did not demonstrate a significant difference in pain on movement between patients treated with sodium hyaluronate or placebo. [23]
* 2019 ACR/AF Guidelines strongly recommend against the use of hyaluronic acid for the treatment of hip osteoarthritis due to high-quality evidence for lack of benefit. [3]

Temporomandibular Joint (TMJ) degenerative disorders

- Several small studies have evaluated hyaluronic acids n in the treatment of symptoms of TMJ degenerative disorders (pain, range-of-motion, chewing efficiency). Larger, well-controlled studies are needed to confirm the benefit of hyaluronic acids and to determine the optimal frequency, dose, and product. [24-27]

Trigger finger

- One small randomized, controlled trial (N=36) evaluated patients with a diagnosis of trigger finder. Patients were randomized to hyaluronic acid or steroid injections, after the months of follow-up the percent of patients without triggering effect was numerically lower in the hyaluronic acid group, but not statistically significant. While promising the results must be confirmed in larger studies. Additionally, the optimal frequency, dose, and hyaluronic acid product has not been determined. [28]

Revision History

Revision Date	Revision Summary
12/7/2023	No criteria changes with this annual review.
12/9/2022	No changes to criteria with this annual update.
9/23/2022	Updated preferred intra-articular hyaluronic acid (IAHA) products to Orthovisc, Synvisc, and Synvisc One. Added Synojoynt (1% sodium hyaluronate) to policy. Effective 1/1/2023.
7/16/2021	Effective 10/1/2021: • Preferred intra-articular hyaluronic acid (IAHA) products will not require pre-authorization. • Revised policy to allow coverage of non-preferred IAHA products in patients with osteoarthritis of the knee who have tried and failed all preferred IAHA products. • Products may be authorized for up to 1 year initially. Re-authorization requires documentation of ongoing clinical benefit.
4/22/2020	No criteria changes with this annual update. Policy position statements were updated to include updated guidelines from the American College of Rheumatology/Arthritis Foundation and Osteoarthritis Research Society International.
1/22/2020	• Added continuation of therapy (COT) criteria (no change to intent of coverage criteria). • Added sodium hyaluronate (Trivisc, Durolane, and Triluron) to policy.
1/31/2019	No criteria changes with this annual update.
12/14/2018	No criteria changes with this annual update.
12/8/2017	No criteria changes with this annual update. Added sodium hyaluronate (Durolane) to policy.
4/14/2017	No criteria changes with this annual update.
4/8/2016	Added temporomandibular joint disorders and trigger finger as investigational uses.
5/9/2014	New policy.

Drug names identified in this policy are the trademarks of their respective owners.

Medication Policy Manual | **Policy No:** dru355

Topic: Cyramza, ramucirumab | **Date of Origin:** July 11, 2014

Committee Approval Date: December 7, 2023 | **Next Review Date:** 2024

Effective Date: March 1, 2024

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Cyramza (ramucirumab) is an intravenously infused recombinant human monoclonal antibody that is used for the treatment of various cancers. It works by blocking the formation of blood vessels, thereby preventing the tumor from getting essential nutrients that it needs for growth.

Policy/Criteria

Most contracts require pre-authorization approval of Cyramza (ramucirumab) prior to coverage.

I. Continuation of therapy (COT): Cyramza (ramucirumab) may be considered medically necessary for COT when criterion A, B, or C below is met.

A. For diagnoses NOT listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND there is documentation that the medication was covered by another health plan. Examples of documentation include the coverage approval letter from the previous health plan or paid claim.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

B. For diagnoses listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

C. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

Please note*: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Cyramza (ramucirumab) may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) that criterion A, B, C, or D below is met:

A. A diagnosis of **metastatic or unresectable, locally advanced gastric cancer** or **esophageal junction (GEJ) adenocarcinoma** when there was disease progression after prior treatment with fluoropyrimidine- or platinum-containing chemotherapy (see *Appendix 1*), or therapy with these regimens was not tolerated or is contraindicated.

OR

B. A diagnosis of squamous or non-squamous **metastatic non-small cell lung cancer (NSCLC)** when criteria 1 and 2 below are met:

1. There has been disease progression after one prior treatment with a platinum-containing regimen (see *Appendix 1*), unless either criterion a or b below is met:

a. If the NSCLC is ALK-positive, there has been progression of disease following treatment with an ALK inhibitor (see *Appendix 2*).

OR

b. If the NSCLC is positive for an epidermal growth factor receptor (EGFR) exon 19 deletion or exon 21 (L858R) substitution mutation, there has been progression of disease following treatment with an EGFR inhibitor (see *Appendix 2*) .

AND

2. Cyramza (ramucirumab) is given in combination with a taxane (see *Appendix 1*).

OR

C. A diagnosis of **metastatic colorectal cancer** when criteria 1 and 2 below are met:

1. There has been disease progression on or after prior therapy with bevacizumab, oxaliplatin, and a fluoropyrimidine (see *Appendix 3* for example regimens).

AND

2. Cyramza (ramucirumab) is given in combination with FOLFIRI (leucovorin, fluorouracil, and irinotecan).

OR

D. A diagnosis of **metastatic hepatocellular carcinoma (HCC)** when criteria 1 through 3 below are met:

1. A documented alpha fetoprotein of ≥ 400 ng/mL.

AND

2. There has been disease progression on, or intolerance to, at least one prior systemic HCC regimen (see *Appendix 5*).

AND

3. Cyramza (ramucirumab) will be used as a monotherapy.

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers Cyramza (ramucirumab) coverable only under the medical benefit (as a provider-administered medication).

B. When pre-authorization is approved, Cyramza (ramucirumab) may be authorized as follows:

1. **Gastric cancer, esophageal junction (GEJ) adenocarcinoma, colorectal cancer (CRC), or hepatocellular carcinoma (HCC):** Up to 8 mg/kg every two weeks until disease progression.

2. **Non-small cell lung cancer (NSCLC):** Up to 10 mg/kg every 21 days until disease progression.

C. Authorization may be reviewed at least annually. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, such as disease stability or improvement.

IV. Cyramza (ramucirumab) is considered not medically necessary for the first-line treatment of metastatic NSCLC with EGFR exon 19 deletions or exon 21 (L858R) mutations.

V. Cyramza (ramucirumab) is considered investigational when used for all other conditions, including but not limited to:

A. Brain cancer.
B. Breast cancer.
C. Prostate cancer.
D. Renal cell carcinoma (RCC).

VI. Cyramza (ramucirumab) is considered investigational when used concomitantly with any other targeted therapy, including, but not limited to bevacizumab, Erbitux (cetuximab), Gilotrif (afatinib), Iressa (gefitinib), Nexavar (sorafenib), Opdivo (nivolumab), Stivarga (regorafenib), Vectibix (panitumumab), Xalkori (crizotinib), Zaltrap (ziv-aflibercept), or Zykadia (ceritinib).

Position Statement

- Cyramza (ramucirumab), a human IgG1 monoclonal antibody that binds to vascular endothelial growth factor (VEGF) receptors.
- The intent of this policy is to cover Cyramza (ramucirumab) for the indications and dose for which it has been shown to be safe and effective, as detailed in the coverage criteria
- Cyramza (ramucirumab) is approved:
  * As a monotherapy or in combination with paclitaxel for the treatment of advanced gastric cancer or advanced gastro-esophageal junction (GEJ) adenocarcinoma after prior treatment with front-line fluoropyrimidine- or platinum-containing chemotherapy.
  * In combination with erlotinib, for first-line treatment of metastatic non-small cell lung cancer with epidermal growth factor receptor (EGFR) exon 19 deletions or exon 21 (L858R) mutations.
  * In combination with docetaxel for the treatment of metastatic non-small cell lung cancer (NSCLC) after prior treatment with front-line platinum-based chemotherapy (with or without maintenance therapy). Patients with EGFR or ALK genomic tumor aberrations should have disease progression on FDA-approved therapy for these aberrations prior to receiving Cyramza (ramucirumab).
  * For metastatic colorectal cancer when there has been disease progression on or after prior therapy with bevacizumab, oxaliplatin, and a fluoropyrimidine. Cyramza (ramucirumab) is given in combination with FOLFIRI. In the pivotal clinical trial in patients with locally advanced or metastatic gastric cancer or GEJ adenocarcinoma, a small but statistically significant improvement in overall survival (~ 5.5 weeks) was reported with Cyramza (ramucirumab) relative to best supportive care in the second-line, recurrent disease setting.

* For advanced hepatocellular carcinoma (HCC), as a single agent when there is an alpha-fetoprotein (AFP) level ≥ 400 ng/mL and disease progression on, or intolerance to, front-line Nexavar (sorafenib). It was approved in this setting based on a single, placebo-controlled trial.

- In the pivotal clinical trial for second-line NSCLC, a small but statistically significant improvement in overall survival (~5.6 weeks) was reported with Cyramza (ramucirumab) in combination with docetaxel relative to placebo after progression on front-line therapy.
- In the pivotal clinical trials for metastatic colorectal cancer, Cyramza (ramucirumab) plus FOLFIRI demonstrated a 1.6-month overall survival advantage compared to placebo plus FOLFIRI in patients who had disease progression on or after prior therapy with bevacizumab, oxaliplatin, and a fluoropyrimidine.
- Cyramza (ramucirumab) is considered not medically necessary for the first-line treatment of EGFR mutated NSCLC. In the pivotal trial in this setting, combination therapy with ramucirumab and erlotinib improved progression free survival by ~7 months. However, PFS is not a clinically relevant endpoint in metastatic NSCLC as it has not been found to accurately predict overall survival or quality of life. There is currently no evidence that the combination of Cyramza (ramucirumab) and erlotinib provides any clinically meaningful benefit over erlotinib alone, such as improved overall survival or quality of life. Furthermore, combination therapy adds toxicity compared to erlotinib alone. Rates of serious adverse events were higher in patients who received combination therapy. Cyramza (ramucirumab) in combination is covered in patients with NSCLC who progressed after treatment with platinum-based chemotherapy.
- A single placebo-controlled trial compared Cyramza (ramucirumab) with best supportive care (BSC) in elderly patients with advanced HCC with AFP levels ≥ 400 ng/ml who had disease progression on first-line Nexavar (sorafenib). The majority of subjects had cancer that had spread beyond the liver. Subjects on Cyramza (ramucirumab) had a one-month longer median survival than those receiving BSC.
- There is interest in studying Cyramza (ramucirumab) in other cancers, such as breast cancer, based on its pharmacology; however, there is currently no published, peer-reviewed evidence that supports clinical benefit in other cancers at this time.
- Cyramza (ramucirumab) may be covered for the doses studied and shown to be safe and effective (as detailed in the coverage criteria), until disease progression.
- The prescribing information for Cyramza (ramucirumab) includes a boxed warning describing an increased risk of hemorrhage, gastrointestinal perforation, and impaired wound healing. Death from hemorrhage has been reported.
- Common side effects include hypertension and diarrhea. Infusion reactions may also occur. Premedication with intravenous diphenhydramine is recommended. Dexamethasone and acetaminophen may be added for more severe infusion reactions.

Regence Pharmacy Services performs independent analyses of oncology medication evidence, to establish coverability per the contracts with the health plan.

- Most contracts define coverability based on established clinical benefit in published, peer-reviewed literature, along with consideration of regulatory status.
- FDA approval does not in itself establish medical necessity, as unpublished, low-quality evidence, including exploratory analyses and unvalidated surrogate endpoints, may be used as the basis of approval. Regulatory approval may or may not reflect clinical benefit relative to standard of care and the recommendations of expert clinical advisors such as the Oncologic Drugs Advisory Committee (ODAC). FDA approvals generally do not consider cost compared to established therapies, or value to members.
- Likewise, NCCN clinical practice guidelines assignment of a recommendation (category 1, 2a, or 2b) does not necessarily establish medically necessity. NCCN recommendations are inconsistently supported by published, peer-reviewed literature and do not uniformly consider value of new therapies relative to existing potentially higher-value treatment options, considering effectiveness, safety, and cost.
- Medication coverage criteria are developed based on the 'medical necessity' assessment, as described above.

Regence Pharmacy Services analysis and coverage policy may differ from FDA labeled indication and/or NCCN clinical practice guidelines.

Clinical Efficacy

Advanced Gastric Cancers

The body of evidence for advanced gastric cancers includes two randomized controlled trials (RCTs): one using Cyramza (ramucirumab) as a single agent and one using Cyramza (ramucirumab) in combination with chemotherapy.

- A published, randomized, double-blind, placebo-controlled trial (REGARD) evaluated the efficacy of Cyramza (ramucirumab) relative to placebo in patients with previously treated advanced gastric or gastro-esophageal junction (GEJ) adenocarcinoma. [1]
    * The study enrolled 355 patients who had failed prior therapy with a fluoropyrimidine- or platinum-containing chemotherapy regimen.
    * There was a modest improvement in overall survival in patients receiving Cyramza (ramucirumab) versus best supportive care (5.2 months and 3.8 months, respectively).
- An unpublished, randomized, double-blind, placebo-controlled trial (RAINBOW) evaluated the efficacy of Cyramza (ramucirumab) plus paclitaxel versus paclitaxel alone in patient with previously treated advanced gastric or GEJ adenocarcinoma. [2]
    * The study enrolled 665 patients who had failed prior therapy with a fluoropyrimidine- or platinum-containing chemotherapy regimen.
    * There was a modest improvement in overall survival in patients receiving Cyramza (ramucirumab) plus paclitaxel versus those receiving paclitaxel alone (9.6 months and 7.4 months, respectively).
- There is currently no evidence evaluating the efficacy of Cyramza (ramucirumab) in the first-line advanced gastric or GEJ adenocarcinoma setting.

- The National Comprehensive Cancer Network (NCCN) gastric cancer guideline lists Cyramza (ramucirumab) as a category 1 option for the second-line treatment of metastatic or locally advanced gastric cancer or GEJ adenocarcinoma when used as monotherapy or in combination with paclitaxel. [3]

EGFR Mutated Non-Small Cell Lung Cancer (NSCLC)

- A randomized, double-blind, placebo-controlled (RELAY study) evaluated the efficacy of Cyramza (ramucirumab) in combination with erlotinib versus erlotinib alone as first-line therapy in patients with stage IV NSCLC with EGFR exon 19 deletions or exon 21 (L858R) mutations. [4]
- Median investigator assessed PFS 19.4 months in the ramucirumab/erlotinib group compared to 12.4 months in the erlotinib group (HR 0.59, 95% CI 0.46 to 0.76).
- PFS is not a clinically relevant endpoint in metastatic NSCLC as it has not been found to accurately predict overall survival or quality of life.
- There is currently no evidence that the combination of Cyramza (ramucirumab) and erlotinib provides any clinically meaningful benefit over erlotinib alone, such as improved overall survival (OS) or quality of life. OS data from the pivotal front-line trial will be evaluated in the future after the data matures.
- The combination of Cyramza (ramucirumab) and erlotinib also added toxicity compared to erlotinib alone. Rates of adverse events, including diarrhea (75% versus 65%), hypertension (50% versus 40%), increased ALT (49% versus 35%), increased AST (49% versus 33%), stomatitis (46% versus 36%), decreased appetite (32% versus 19%), dysgeusia (23% versus 12%), and weight loss (19% versus 6%) were higher with combination therapy.

Non-Small Cell Lung Cancer (NSCLC)

- A published, randomized, double-blind, placebo-controlled trial (REVEL study) evaluated the efficacy of Cyramza (ramucirumab) plus docetaxel versus placebo plus docetaxel as second-line therapy in patients with stage IV NSCLC. [5]
    * The study enrolled 1,253 patients whose disease had progressed during or after first-line platinum-based chemotherapy with or without bevacizumab or maintenance therapy.
    * Patients whose only previous therapy for advanced or metastatic disease was EGFR tyrosine kinase inhibitor monotherapy were excluded from the study.
    * There was a modest improvement in overall survival in patients receiving Cyramza (ramucirumab) plus docetaxel versus those receiving docetaxel alone (10.5 months and 9.1 months, respectively).
- There is currently no evidence evaluating the efficacy of Cyramza (ramucirumab) beyond the second-line setting.
- The NCCN NSCLC guideline lists Cyramza (ramucirumab) in combination with docetaxel as a category 2A option for metastatic disease in the second-line setting. [3]

Metastatic Colorectal Cancer

- A published, randomized, double-blind, placebo-controlled trial (RAISE study) evaluated the efficacy of Cyramza (ramucirumab) versus placebo in combination with second-line FOLFIRI (leucovorin, fluorouracil, and irinotecan) for metastatic colorectal cancer in patients with disease progression during or after first-line therapy with bevacizumab, oxaliplatin, and a fluoropyrimidine. [6]

- The study included 1,072 patients who had disease progression during or within 6 months of the last dose of first-line therapy. The primary endpoint was overall survival (OS).
- Median OS was 13.3 months (95% CI 12.4 – 14.5) for Cyramza (ramucirumab)-treated patients compared to 11.7 months (95% CI 10.8 – 12.7) for placebo-treated patients. However, the clinical significance of a 1.6-month survival advantage in colorectal cancer is uncertain.
- The NCCN colon cancer and rectal cancer guidelines include Cyramza (ramucirumab) in combination with FOLFIRI as a category 2A recommendation for therapy after first progression. Bevacizumab plus FOLFIRI is the preferred option in this setting. [3]

Hepatocellular carcinoma (HCC)

- In a phase 3 study (REACH) in 565 patients with previously treated hepatocellular carcinoma, treatment with second-line Cyramza (ramucirumab) failed to improve overall survival over best supportive care. [7,8]
- However, a subsequent trial (REACH-2) limited to patients with elevated AFP levels found a small improvement in OS (one month). The placebo-controlled trial compared ramucirumab with best supportive care (BSC) in elderly patients with advanced HCC. [9]
    * All patients had AFP levels > 400 ng/ml and disease progression on first-line sorafenib.
    * The majority of subjects had cancer that had spread beyond the liver. The trial enrolled patients with Child-Pugh Class A disease, BCLC stage B and no longer amenable to locoregional therapy, or BCLC stage C.
    * Subjects on Cyramza (ramucirumab) had a small, one-month improvement in median survival than those receiving BSC (8.5 versus 7.3 months).
- Cyramza (ramucirumab) is a NCCN category 1 recommendation as a subsequent-line treatment option for advanced HCC when the AFP level is ≥ 400 ng/mL. [3]

Other Cancer Settings and Conditions

- There are ongoing clinical trials designed to evaluate the efficacy of Cyramza (ramucirumab) in brain cancer, prostate cancer, and renal cell carcinoma; however, there is currently no clinical evidence to support its use in these conditions. [10]
- In a phase 3 study in patients with human epidermal growth factor receptor 2 (HER2)-negative, unresectable, locally recurrent or metastatic breast cancer, the addition of Cyramza (ramucirumab) to docetaxel failed to improve overall survival over docetaxel alone. [11]
- A phase 2, Italian study compared Cyramza (ramucirumab) plus gemcitabine with gemcitabine alone as a second-line therapy in patients with advanced malignant pleural mesothelioma (MPM). [12] Though the authors concluded there was improved overall survival in the Cyramza (ramucirumab) treatment arm, the clinical relevance of the finding is not known as gemcitabine is not the standard of care for second-line treatment of MPM in the U.S. Of note, the subsequently updated NCCN guidelines do not include the use of Cyramza (ramucirumab) for advanced MPM.

Safety [13]

- The prescribing information for Cyramza (ramucirumab) includes a boxed warning describing an increased risk of hemorrhagic events, gastrointestinal perforation, and impaired wound healing with Cyramza (ramucirumab). Some cases of hemorrhage have resulted in death.
- The most common adverse events reported with Cyramza (ramucirumab) as a single agent include hypertension and diarrhea.
- The most common adverse reactions reported with Cyramza (ramucirumab) plus paclitaxel include fatigue, neutropenia, diarrhea, and epistaxis. When used in combination with docetaxel, the most common adverse reactions reported include neutropenia, fatigue/asthenia, and stomatitis/mucosal inflammation.
- The most common adverse reactions reported with Cyramza (ramucirumab) plus erlotinib include infections, hypertension, diarrhea, stomatitis, proteinuria, alopecia, epistaxis, peripheral edema, headache, and gastrointestinal hemorrhage. The majority of adverse events occurred at a greater frequency with combination therapy compared to erlotinib alone.
- Infusion-related reactions are also possible. Premedication with diphenhydramine is recommended. For more severe reactions, dexamethasone and acetaminophen may be used.
- Similar to other VEGF inhibitors, Cyramza (ramucirumab) may cause gastrointestinal perforation, impaired wound healing, and clinical deterioration in patients with cirrhosis.

Dosing considerations [13]

- The recommended dose of Cyramza (ramucirumab) for gastric cancer, esophageal junction adenocarcinoma, hepatocellular carcinoma, and metastatic colorectal cancer is 8 mg/kg intravenously every two weeks until disease progression or unacceptable toxicity.
- For NSCLC in combination with docetaxel, the recommended dose of Cyramza (ramucirumab) is 10 mg/kg intravenously on day 1 of a 21-day cycle prior to docetaxel infusion until disease progression or unacceptable toxicity.
- For EGFR mutated NSCLC in combination with erlotinib, the recommended dose of Cyramza (ramucirumab) is 10 mg/kg intravenously every two weeks, until disease progression or unacceptable toxicity.

Appendix 1: Platinum, Taxane and Fluoropyrimidine Medications

Platinum Medications	Fluoropyrimidine Medications	Taxane Medications
Cisplatin	Xeloda (capecitabine)	Jevtana (cabazitaxel)
Carboplatin	Floxuridine	Docetaxel
Eloxatin (oxaliplatin)	Fluorouracil (5-FU, Adrucil)	- Paclitaxel - Abraxane (nab-paclitaxel)

Appendix 2: EGFR and ALK Inhibitors Used in the Treatment of Metastatic Lung Cancer

EGFR Inhibitors	ALK Inhibitors
Gilotrif (afatinib)	Alecensa (alectinib)
Iressa (gefitinib)	Alunbrig (brigatinib)
Tagrisso (osimertinib)	Lorbrena (lorlatinib)
Tarceva (erlotinib)	Xalkori (crizotinib)
Vizimpro (dacomitinib)	Zykadia (ceritinib)

Appendix 3: Example Chemotherapy Regimens for Metastatic Colorectal Cancer Containing bevacizumab, oxaliplatin, and a fluoropyrimidine

Regimen Name	Included Medications
mFOLFOX6 + bevacizumab	Oxaliplatin, leucovorin, fluorouracil (5-FU), bevacizumab
CapeOx + bevacizumab	Oxaliplatin, capecitabine, bevacizumab
FOLFIRI + bevacizumab	Irinotecan, leucovorin, fluorouracil (5-FU), bevacizumab
FOLFOXIRI + bevacizumab	Irinotecan, oxaliplatin, leucovorin, fluorouracil (5-FU), bevacizumab

Appendix 4: Child-Pugh Classification Of Severity Of Liver Disease

Child-Pugh Classification	**Points**		
A: well-compensated disease	5 to 6		
B: significant functional compromise	7 to 9		
C: decompensated disease	10 to 15		
	Points Assigned		
Parameter	1	2	3
Ascites	Absent	Slight	Moderate
Bilirubin (mg/dL)	< 2	2 to 3	> 3
Albumin (g/dL)	> 3.5	2.8 to 3.5	< 2.8
Prothrombin Time			
Seconds over control	1 to 3	4 to 6	>6
INR	< 1.7	1.8 to 2.3	> 2.3
Encephalopathy	None	Grade 1 to 2	Grade 3 to 4

Appendix 5: First-line Regimens Used in the Treatment of Hepatocellular Carcinoma [3]

NCCN Front-Line HCC Regimens [category 1 recommendations]
Preferred regimens:
Tecentriq (atezolizumab) + bevacizumab for Child-Pugh Class A disease
Imjudo (tremelimumab) + Imfinzi (durvalumab)
Other recommended regimens:
Nexavar (sorafenib), for Child-Pugh Class A disease (category 2A for class B7)
Lenvima (lenvatinib), for Child-Pugh Class A disease
Imfinzi (Durvalumab)

Revision History

Revision Date	Revision Summary
12/7/2023	No criteria changes with this annual review.
12/9/2022	• Updated in standard language in policy. • No changes to coverage criteria with this annual update.
1/20/2021	• COT language was updated (No change to intent of coverage criteria) • The list of acceptable prerequisite therapies under the HCC criteria (criterion II.D.2.) was expanded to include additional medication regimens because Nexavar (sorafenib) is no longer the only available front-line therapy recommended for use in this setting.
10/28/2020	Added first-line treatment of EGFR mutated NSCLC as not medically necessary.
6/15/2020	Removed references to brand Avastin from policy to account for upcoming changes in biosimilars policy (dru620).
1/22/2020	Added continuation of therapy (COT) criteria (no change to intent of coverage criteria).
7/24/2019	Add coverage criteria for advanced HCC, based on new evidence and indication (effective 8/15/2019).
1/31/2019	No changes to coverage criteria with this annual update.
6/15/2018	• Coverage criteria were updated to include <u>any</u> EGFR or ALK inhibitor as satisfying the condition for prior therapy in lung cancer to recognize the additional products now available to treat these mutations. • The authorization period was clarified to state that ramucirumab can be covered in the stated doses 'until disease progression'. This was always the intent of the policy, but is now explicitly stated.
9/8/2017	No changes to coverage criteria with this annual update.
9/9/2016	No changes to coverage criteria with this annual update
7/11/2014	New policy.

Medication Policy Manual | **Policy No:** dru367

Topic: Keytruda, pembrolizumab | **Date of Origin:** November 13, 2014

Committee Approval Date: September 19, 2024 | **Next Review Date:** 2025

Effective Date: December 1, 2024

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of medication policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Keytruda (pembrolizumab) is an intravenously infused immunotherapy that is used in the treatment of many different types of cancers.

Policy/Criteria

Most contracts require pre-authorization approval of Keytruda (pembrolizumab) prior to coverage.

I. Continuation of therapy (COT): Keytruda (pembrolizumab) may be considered medically necessary for COT when criterion A, B, or C below is met.

A. For diagnoses NOT listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND there is documentation that the medication was covered by another health plan. Examples of documentation include the coverage approval letter from the previous health plan or paid claim.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

B. For diagnoses listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

C. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

Please note*: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Keytruda (pembrolizumab) may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) confirming that one of the following criterion A through R below are met:

A. A diagnosis of **Merkel cell carcinoma** (MCC), **unresectable locally advanced or metastatic**, when criteria 1, 2, and 3 below are met:

1. No prior systemic therapy (chemotherapy or immunotherapy) used in the advanced setting.

AND

2. Keytruda (pembrolizumab) will be used as monotherapy.

AND

3. No prior programmed death receptor-1 (PD-1) blocking antibody (PD-1 inhibitor) or programmed death-ligand 1 (PD-L1) blocking antibody therapy (see *Appendix 1*).

OR

B. A diagnosis of **cervical cancer** when criterion 1 or 2 below is met:

1. Diagnosis of **cervical cancer, recurrent or metastatic**, when criteria a through c below are met:

a. The tumor is PD-L1 positive as defined by a Combined Positive Score of 1 or more (CPS ≥ 1).

AND

b. Keytruda (pembrolizumab) will be used in one of the following two settings (i or ii):

i. As monotherapy when there has been disease progression on or after chemotherapy.

OR

ii. In combination with chemotherapy when used in patients who have had no prior systemic therapy for advanced disease.

AND

c. No prior therapy with PD-1/PD-L1 blocking antibody therapy (see *Appendix 1*).

OR

2. Diagnosis of **cervical cancer, unresectable locally advanced, International Federation of Gynecology and Obstetrics (FIGO) 2014 Stage III to IVA** when criteria a through d below are met:

a. One of the following histologies: squamous cell carcinoma (SCC), adenocarcinoma, or adenosquamous carcinoma.

AND

b. No prior definitive surgery, radiation, or systemic therapy in the advanced disease setting.

AND

c. Keytruda (pembrolizumab) will be used in combination with chemoradiation [e.g., a platinum plus external beam radiation therapy (EBRT)].

AND

d. No prior therapy with PD-1/PD-L1 blocking antibody therapy (see *Appendix 1*).

OR

C. A diagnosis of **gastric or gastroesophageal junction (GEJ) cancer** when criterion 1 or 2 below is met:

1. A diagnosis of **HER2-positive gastric or gastroesophageal junction (GEJ) adenocarcinoma, unresectable locally advanced or metastatic,** when criteria a through d below are met:

a. The tumor expresses PD-L1 as defined by a Combined Positive Score of 1 or more (CPS ≥1).

AND

b. No prior systemic therapy in the advanced disease setting.

AND

c. Keytruda (pembrolizumab) will be used in combination with trastuzumab plus fluoropyrimidine- (e.g., fluorouracil, capecitabine) and platinum-containing (e.g., cisplatin, oxaliplatin) chemotherapy.

AND

d. No prior therapy with PD-1/PD-L1 blocking antibody therapy (see *Appendix 1*).

OR

2. A diagnosis of **HER2-negative gastric or gastroesophageal junction (GEJ) adenocarcinoma, unresectable locally advanced or metastatic,** when criteria a through d below are met:

a. The tumor expresses PD-L1 as defined by a Combined Positive Score of 1 or more (CPS ≥1).

AND

b. No prior systemic therapy in the advanced disease setting.

AND

c. Keytruda (pembrolizumab) will be used in combination with fluoropyrimidine- (e.g., fluorouracil, capecitabine) and platinum-containing (e.g., cisplatin, oxaliplatin) chemotherapy.

AND

d. No prior therapy with PD-1/PD-L1 blocking antibody therapy (see *Appendix 1*).

OR

D. A diagnosis of **esophageal cancer** when criterion 1 or 2 below is met:

1. A diagnosis of **esophageal cancer, squamous cell carcinoma of the esophagus (ESCC)**, **recurrent unresectable locally advanced or metastatic,** when criteria a through d below are met:

a. Disease progression on or after prior systemic therapy.

AND

b. The tumor is PD-L1 positive as defined by a Combined Positive Score of 10 or more (CPS ≥ 10).

AND

c. Keytruda (pembrolizumab) will be used as monotherapy.

AND

d. No prior therapy with PD-1/PD-L1 blocking antibody therapy (see *Appendix 1*).

OR

2. A diagnosis of **esophageal (adenocarcinoma or ESCC) or gastroesophageal junction (GEJ) cancer, unresectable locally advanced or metastatic,** when criteria a through e below are met:

a. The patient is not a candidate for surgical resection or definitive chemoradiotherapy (CRT).

AND

b. The tumor is PD-L1 positive as defined by a Combined Positive Score of 10 or more (CPS $\geq$ 10).

AND

c. Keytruda (pembrolizumab) will be used in combination with platinum (e.g., cisplatin or oxaliplatin) and fluoropyrimidine (e.g., fluorouracil or capecitabine) based chemotherapy.

AND

d. No prior systemic therapy in the advanced disease setting.

AND

e. No prior therapy with PD-1/PD-L1 blocking antibody therapy (see *Appendix 1*).

OR

E. A diagnosis of **head and neck squamous cell cancer (HNSCC), recurrent or metastatic,** and no prior therapy with PD-1/PD-L1 blocking antibody therapy (see *Appendix 1*).

OR

F. A diagnosis of **biliary tract cancer (BTC), unresectable locally advanced or metastatic,** when criteria 1 through 3 below are met:

1. No prior systemic therapy in the advanced disease setting.

AND

2. Keytruda (pembrolizumab) will be used in combination with gemcitabine and cisplatin.

AND

3. No prior therapy with PD-1/PD-L1 blocking antibody therapy (see *Appendix 1*).

OR

G. A diagnosis of **hepatocellular carcinoma (HCC)** when criteria 1 through 5 below are met:

1. The HCC is secondary to hepatitis B virus (HBV) infection.

AND

2. A documented Child-Pugh score of 5 or 6 (Class A).

AND

3. Disease progression on, or intolerance to at least one prior 'non-PD-1/PD-L1 inhibitor' systemic therapy for HCC (e.g., sorafenib or lenvatinib).

AND

4. Keytruda (pembrolizumab) will be used as monotherapy.

AND

5. No prior therapy with PD-1/PD-L1 blocking antibody therapy (see *Appendix 1*).

OR

H. A diagnosis of **melanoma** when criteria 1, 2, and 3 below are met**:**

1. Keytruda (pembrolizumab) will be used in one of the following settings (a or b):

a. **Unresected**: Unresectable locally advanced or metastatic melanoma (stage III or IV).

OR

b. **As adjuvant therapy (after surgery):** Stage IIB, IIC, or III melanoma after complete tumor resection.

AND

2. Keytruda (pembrolizumab) will be used as monotherapy.

AND

3. No prior therapy with PD-1/PD-L1 blocking antibody therapy (see *Appendix 1*).

OR

I. A diagnosis of **primary mediastinal B-cell lymphoma (PMBCL)** when criteria 1 through 3 below are met:

1. Disease progression on or after two or more lines of therapy [such as chemotherapy or hematopoietic stem cell transplant (HSCT); a.k.a. ASCT or bone marrow transplant (BMT)].

AND

2. Keytruda (pembrolizumab) will be used as monotherapy.

AND

3. No prior therapy with PD-1/PD-L1 blocking antibody therapy (see *Appendix 1*).

OR

J. A diagnosis of **non-small cell lung cancer (NSCLC),** when criterion 1, 2 or 3 below is met:

1. **Metastatic NSCLC (stage IV disease)**, when one of the following criteria below is met (a or b):

a. There is either no prior use of PD-1 inhibitors or PD-L1 inhibitors (see *Appendix 1*).

OR

b. Documented prior use of Keytruda (pembrolizumab) with NO progression of disease while on Keytruda (pembrolizumab) adjuvant therapy.

OR

2. **Earlier-stage, resected NSCLC, as adjuvant therapy only,** when all criteria (a through e) below are met.

a. Documented stage IB (T2a ≥4 cm), II, or IIIA disease

AND

b. Used in the adjuvant setting, after complete tumor resection.

AND

c. Used as a monotherapy.

AND

d. There is clinical documentation of previous adjuvant platinum-containing chemotherapy unless the patient is ineligible for any platinum-containing chemotherapy (such as cisplatin or carboplatin).

AND

e. There is no prior use of PD-1 inhibitors or PD-L1 inhibitors (see *Appendix 1*), including but not limited to use of Opdivo (nivolumab) in the neoadjuvant setting or Tecentriq (atezolizumab) in the adjuvant setting.

PLEASE NOTE: Platinum ineligibility may include poor kidney function, poor performance status (Eastern Cooperative Oncology Group [ECOG] score ≥2), heart failure, other comorbidities, etc.).

OR

3. **Earlier-stage, resectable NSCLC, as neoadjuvant therapy followed by adjuvant therapy**, when both criteria (a, b, and c) below are met:

a. Documented stage II, IIIA, or IIIB disease (tumors ≥4 cm and/or node positive)

AND

b. Keytruda (pembrolizumab) is used as follows (i and ii):

i. In combination with platinum-containing chemotherapy in the neoadjuvant setting (prior to surgical resection) for up to four cycles.

AND

ii. As monotherapy in the adjuvant setting (after surgical resection) for up to 13 cycles.

AND

c. No prior systemic anticancer therapy for NSCLC in any setting, including prior PD-1 inhibitors or PD-L1 inhibitors (see *Appendix 1*).

OR

K. A diagnosis of **classical Hodgkin Lymphoma (cHL), relapsed/refractory**, when criteria 1 and 2 below are met:

1. Disease progression on or after one or more lines of systemic therapy [such as chemotherapy or a hematopoietic stem cell transplant (HSCT, BMT)].

AND

2. No prior therapy with PD-1/PD-L1 blocking antibody therapy (see *Appendix 1*).

OR

L. A diagnosis of **urothelial carcinoma (UC, bladder cancer)**, when criteria 1 and 2 below are met:

1. Keytruda (pembrolizumab) will be used in one of the following settings (a, b, or c):

a. **First-line setting:** A diagnosis of **unresectable locally advanced (stage III) or metastatic (stage IV) bladder cancer,** when criteria i., ii., and iii. below are met:

i. The patient has not had prior systemic therapy (chemotherapy or immunotherapy) in the locally advanced or metastatic disease setting.

AND

ii. The patient is ineligible for any platinum-containing chemotherapy (such as cisplatin or carboplatin).

PLEASE NOTE: Any platinum ineligibility may include poor kidney function (CrCl<60), poor performance status (≥2), significant hearing loss (≥ 25 dB), grade 2-4 peripheral neuropathy, heart failure, other comorbidities, etc.

AND

iii. Keytruda (pembrolizumab) will be used either as a monotherapy or in combination with Padcev (enfortumab vedotin).

OR

b. **Subsequent-line setting:** A diagnosis of **unresectable locally advanced (stage III) or metastatic (stage IV) bladder cancer,** when criteria i. and ii. below are met:

i. There is clinical documentation of disease progression during or following platinum-containing chemotherapy,

AND

ii. Keytruda (pembrolizumab) will be used as monotherapy.

OR

c. A diagnosis of **non-muscle invasive bladder cancer (NMIBC)** when criteria i., ii., and iii. below are met:

i. The tumor is carcinoma in situ (CIS, stage Tis) OR recurrent Ta/T1 disease within 12 months of BCG therapy.

AND

ii. Prior use of Bacillus Calmette-Guerin (BCG) therapy documented.

AND

iii. Keytruda (pembrolizumab) will be used as monotherapy.

AND

2. No prior therapy with PD-1/PD-L1 blocking antibody therapy (see *Appendix 1*).

OR

M. A diagnosis of **colorectal cancer (CRC),** locally advanced or metastatic, when criteria 1 through 3 below are met:

1. The tumor is microsatellite instability high (MSI-H) or mismatch repair deficient (dMMR) CRC by immunohistochemistry (IHC) or polymerase chain reaction (PCR) testing.

AND

2. Keytruda (pembrolizumab) will be used as monotherapy.

AND

3. No prior therapy with PD-1/PD-L1 blocking antibody therapy (see *Appendix 1*).

OR

N. A diagnosis of **renal cell carcinoma (RCC)** when criteria 1 and 2 below are met:

1. Clear cell histology.

AND

2. Keytruda (pembrolizumab) will be used in one of the following settings (a or b):

a. A diagnosis of **recurrent or metastatic** disease when criteria i, ii, and iii are met:

i. No prior systemic therapy for advanced disease.

AND

ii. Use in combination with Inlyta (axitinib) or Lenvima (lenvatinib).

AND

iii. No prior therapy with PD-1/PD-L1 blocking antibody therapy (see *Appendix 1*).

OR

b. **As adjuvant therapy** (after surgery) when criteria i., ii., and iii. are met:

i. No prior systemic therapy for RCC.

AND

ii. Keytruda (pembrolizumab) will be administered as monotherapy.

AND

iii. Use in one of the following settings (1 or 2):

1. The tumor was **completely resected with clear margins** (the patient is tumor free based on MRI/CT scan) but there is intermediate-high or high-risk of RCC recurrence (per attestation or *Appendix 2*)

OR

2. The patient has RCC with stage M1 metastasis but there is **no evidence of disease (M1 NED) after nephrectomy and resection of metastatic lesions** (per attestation or *Appendix 2*).

OR

O. A diagnosis of **endometrial carcinoma, advanced (not curable with resection)**, when criteria 1 and 2 below are met:

1. Keytruda (pembrolizumab) will be used in one of the following two settings (a or b):

a. **Subsequent-line setting**: There has been disease progression on or after at least one prior systemic therapy.

OR

b. **First-line setting**: when criteria i and ii below are met:

i. As part of a front-line regimen (no prior systemic therapy).

AND

ii. Keytruda (pembrolizumab) is initiated in combination with carboplatin and paclitaxel.

AND

2. No prior therapy with PD-1/PD-L1 blocking antibody therapy (see *Appendix 1*).

OR

P. A diagnosis of **anal squamous cell carcinoma (aSCC), recurrent or metastatic,** when criteria 1, 2, and 3 below are met:

1. Disease progression on or after first-line cytotoxic chemotherapy.

AND

2. Keytruda (pembrolizumab) will be used as monotherapy.

AND

3. No prior therapy with PD-1/PD-L1 blocking antibody therapy (see *Appendix 1*).

OR

Q. A diagnosis of **cutaneous squamous cell carcinoma (cSCC),** when criteria 1, 2, and 3 below are met:

1. Documentation that the disease is metastatic or is not curable with surgical excision or radiation therapy.

AND

2. Keytruda (pembrolizumab) will be used as monotherapy.

AND

3. No prior therapy with PD-1/PD-L1 blocking antibody therapy (see *Appendix 1*).

OR

R. A diagnosis of **triple-negative breast cancer (TNBC)** when criteria 1 and 2 below are met:

1. Keytruda (pembrolizumab) will be used in one of the following settings (a or b):

a. **High-risk, early-stage (stage II or III) TNBC** in combination with cytotoxic chemotherapy as a neoadjuvant therapy, and then continued as a single agent as an adjuvant therapy after surgical excision.

OR

b. **Recurrent or metastatic TNBC** when criteria i through iii below are met:

i. The tumor is PD-L1 positive as defined by a Combined Positive Score of 10 or more (CPS $\geq$ 10).

AND

ii. No prior systemic therapy in the advanced disease setting.

AND

iii. Keytruda (pembrolizumab) will be given in combination with cytotoxic chemotherapy.

AND

2. No prior therapy with PD-1/PD-L1 blocking antibody therapy (see *Appendix 1*).

III. Administration, Quantity Limitations (QL), and Authorization Period

A. Regence Pharmacy Services considers Keytruda (pembrolizumab) coverable only under the medical benefit (as a provider-administered medication).

B. When pre-authorization is approved, Keytruda (pembrolizumab) will be authorized as follows in *Table 1* below:

Table 1: QL and Authorization Period

Diagnosis	Dose [a]	Authorization Period(s) [b]	Total Coverable Doses and/or Duration of Therapy [b]
Earlier stage disease (resected or planned resection)			
➢ Neoadjuvant followed by adjuvant			
Neoadjuvant/adjuvant TNBC, early-stage	Up to 200 mg every 3 weeks [a]	Neoadjuvant -up to 8 doses (24 weeks) Adjuvant -up to 9 doses (27 weeks)	Until disease progression, total of 8 doses neoadjuvant followed by up to 9 doses adjuvant (51 weeks)
Neoadjuvant/adjuvant NSCLC, earlier-stage	Up to 200 mg every 3 weeks [a]	Neoadjuvant -up to four doses pre-surgical resection (12 weeks) Initial Adjuvant -up to 8 doses (24 weeks) Continued Adjuvant -up to 5 doses (15 weeks)	Until disease progression, total of 4 doses neoadjuvant followed by up to 13 doses adjuvant
➢ Adjuvant only			
Adjuvant ONLY: - NSCLC, earlier-stage - Melanoma - RCC	Up to 200 mg every 3 weeks [a]	Initial Adjuvant -up to 8 doses (24 weeks) [c] Continued Adjuvant -up to 10 doses (30 weeks) [c]	Until disease progression, up to 18 doses (54 weeks) [c]
Advanced disease (non-resectable)			
Melanoma, unresectable or metastatic	Up to 200 mg every 3 weeks [a]	Initial / Continued -up to 8 doses (24 weeks)	Until disease progression
All other covered diagnoses [d]	Up to 200 mg every 3 weeks [a]	Initial / Continued -up to 8 doses (24 weeks)	Until disease progression, up to 24 months

NSCLC: non-small cell lung cancer; RCC: renal cell carcinoma; TNBC: triple-negative breast cancer

[a] Alternative dosing regimen: up to 400 mg every 6 weeks

[b] All dose quantity limits are based on dosing every 3 weeks. Every 6-week dosing is coverable for half the number of doses (rounded to a whole number).

[c] Adjuvant therapy of '12 months' is limited to up to 17-18 doses (every 3 weeks) or 9 doses (every 6 weeks). See '*Dosing'* for additional information.

[d] Including advanced forms of diagnoses in the coverage criteria, except as specifically noted above in this table.

C. Reauthorization: Authorization **shall** be reviewed at least every 24 weeks for documented benefit. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met. Specifically, documentation that the medication is providing clinical benefit, including disease stability or improvement, and lack of disease progression, based on an assessment of change in tumor burden. If there is documentation of potential disease progression, a shortened authorization (up to three months) may be approved to allow time for clarification of response to Keytruda (pembrolizumab), including clinical re-evaluation of the patient and reimaging.

PLEASE NOTE: Additional doses of Keytruda (pembrolizumab) will not be authorized without a documented recent assessment by the treating provider (such as oncologist) with objective evidence of response to therapy, such as by re-imaging and use of iRECIST criteria.

D. For treatment beyond the maximum doses/duration of therapy specified above (in "QL and Authorization Period" Table 1): Authorization **shall** be reviewed at least every 24 weeks for documented benefit. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met. Specifically, documentation that the medication is providing clinical benefit, including disease stability or improvement, and lack of disease progression based on an assessment of change in tumor burden (as detailed above).

IV. Keytruda (pembrolizumab) is considered investigational when used for all other conditions, including but not limited to:

A. Triple negative breast cancer (TNBC) [except as specified in the sections above].

B. Microsatellite instability high (MSI-H) or mismatch repair deficient (dMMR) tumors [unless specified in the sections above].

C. Multiple myeloma.

D. Ovarian cancer.

E. Small cell lung cancer (SCLC).

F. Soft tissue sarcomas (STS), including uterine leiomyosarcoma (LMS).

G. TMB-H tumors (solid tumors with high mutational burden).

Position Statement

Summary

- Keytruda (pembrolizumab) is a human programmed death receptor-1 (PD-1) blocking monoclonal antibody (immunotherapy) used in the treatment of several types of cancers.
- The intent of this policy is to cover Keytruda (pembrolizumab) in settings where it has been shown to be safe and effective, as detailed in the coverage criteria, with consideration for other available treatment options.

    * Where there is lack of proven additional benefit and/or lack of demonstrated health outcome (such as overall survival or improved quality of life) relative to alternative therapies, use of Keytruda (pembrolizumab) alone or in combination with other therapies is not coverable ("not medically necessary" or "investigational").
    * It is important to note that the fact that a medication is FDA approved for a specific indication does not, in itself, make the treatment medically reasonable and necessary.

- Keytruda (pembrolizumab) is also FDA approved for use in the following conditions; however, the health plan considers these uses to be "investigational" (not covered) as Keytruda (pembrolizumab) has not demonstrated to provide any health benefit, based on the currently available evidence:
    * Adjuvant therapy for Stage IIB and IIC (completely resectable) melanoma.
    * MSI-H Tumors, other than CRC and endometrial carcinoma *(as described in the Clinical Efficacy section below).*
    * Tumor Mutational Burden-High (TMB-H) Solid Tumors (any).
- Many of the clinical indications for immunotherapies (PD-1, PD-L1, and others) have been approved by the FDA and endorsed by clinical guidelines based on surrogate measures such as overall tumor response rate (ORR) and progression-free survival (PFS) which are not proven to accurately predict clinically important outcomes such as improved overall survival or improved quality of life.
- *PD-L1 expression testing*: is required for coverage of many clinical indications for PD-1 and PD-L1 inhibitors.
    * There are several ways in which PD-L1 expression can be defined. In addition, how PD-L1 expression is defined varies by tumor type and setting.
    * PD-L1 expression is determined by the FDA-approved companion diagnostic testing, based on both the specific PD-1/PD-L1 inhibitor and the tumor type.
    * However, PD-L1 test results are not interchangeable across PD-1/PD-L1 inhibitors and/or indications. There is no conversion available from one type of test to another, such as combined positive score (CPS) versus tumor proportion score (TPS) versus percent of tumor cells (TC). Therefore, the correct test must be conducted for proper selection of patient populations for a given use.
- National Comprehensive Cancer Network (NCCN) guidelines recommend Keytruda (pembrolizumab) as a potential option in each of the treatment settings listed in the coverage criteria. In general, NCCN recommendations parallel the FDA approved indications.
- The PD-1 and PD-L1 inhibitors have the potential to cause immune-mediated adverse reactions that can result in pneumonitis, colitis, hepatitis, endocrinopathies, and nephritis.
- Keytruda (pembrolizumab) is coverable for up to the dose and quantity as specified in the coverage criteria.
    * It is administered until disease progression or unacceptable toxicity when used in melanoma (unresectable) and for up to 12 months as adjuvant therapy for resectable melanoma, resectable RCC, or resectable early-stage NSCLC.

    * For neoadjuvant/adjuvant therapy for very specific resectable cancers, a pre-specified number of doses (per the clinical trials) are administered as neoadjuvant therapy before surgery and, specific number of doses of adjuvant therapy after surgery (or until disease recurrence or unacceptable toxicity).
        - For high-risk, early-stage triple-negative breast cancer (TNBC), it is administered as neoadjuvant therapy for up to 24 weeks and adjuvant therapy for up to 27 weeks (or until disease recurrence or unacceptable toxicity).
        - For earlier stage NSCLC: it is administered as neoadjuvant therapy for up to 12 weeks and adjuvant therapy for up to 39 weeks (or until disease recurrence or unacceptable toxicity).
    * For its other advanced, non-resectable indications, it is given until disease progression, unacceptable toxicity, or for up to 24 months in patient without disease progression. Given that trials for most indications were specifically designed for a 24-month course of therapy, there is no conclusive additional benefit with higher doses or when given for longer durations.
- Optimal sequencing of chemotherapy and immunotherapy in many cancers is unknown or the data is evolving. At this time, sequential use of immunotherapies is not supported by current evidence. Specifically, there is no evidence to support the sequential use of different PD-1 or PD-L1 inhibitors once there is disease progression on prior PD-1 or PD-L1 inhibitor therapy, as well as use of adjuvant PD-1/PD-L1 inhibitor after neoadjuvant PD-1/PD-L1 inhibitor therapy (unless explicitly listed in the coverage criteria). Therefore, the use of sequential courses of PD-1/PD-L1 immunotherapy is not coverable.
- There are ongoing studies using Keytruda (pembrolizumab) in a variety of other cancers. However, although initial evidence may be promising, the potential for clinical benefit in these conditions is still being investigated.
- The use of Keytruda (pembrolizumab) for small cell lung cancer (SCLC) is considered investigational. The FDA indication for SCLC was withdrawn after confirmatory trials failed to demonstrate an improvement in any health outcome when used in this setting.
- *Reauthorization Criteria*: When coverage criteria are met, Keytruda (pembrolizumab) is authorized for six months (24 weeks) of therapy, after which time documentation must be provided to establish that the medication is effective. Specifically, there must be documentation of clinical benefit, including disease stability or improvement and there is a lack of disease progression, based on an assessment of change in tumor burden.
    * The standard of care for evaluation of response to cancer immunotherapy, such as Keytruda (pembrolizumab), is use of the iRECIST criteria for assessment of tumor burden. [1]
    * The iRECIST criteria include use of quantitative and qualitative criteria for assessment of change in tumor burden for target lesions and non-target lesions. [2]
        - Quantitative measurements for target lesions (tumor size and % change)
        - Qualitative evaluation for non-target lesions (present/disappeared/ unequivocal progression)

* Documentation of benefit must include an assessment of the most recent imaging ("restaging scans") by the treating oncologist. Given the complexity of the evaluation, including use of the iRECIST criteria, Keytruda (pembrolizumab) will not be reauthorized without an assessment of response to therapy, such a partial response (iPR), complete response (iCR), or stable disease (iSD).
* Use of immunotherapy may result in pseudoprogression, due to immune and T-cell activation, which can appear similar to tumor flare. If there is documentation of potential disease progression ["unconfirmed progressive disease (iUPD)"], a shortened authorization (up to three months) may be approved to allow time for clarification of response to Keytruda (pembrolizumab), including clinical re-evaluation of the patient and reimaging. Guidelines recommend reimaging for iUPD after 4-8 weeks.
* If a patient has confirmed, unequivocal new lesions (progression of disease, iPD), additional Keytruda (pembrolizumab) is not coverable. If a new lesion is equivocal, iUPD reassessment by the treating oncologist with repeat imaging would apply (as noted above).

Regence Pharmacy Services performs independent analyses of oncology medication evidence, to establish coverability per the contracts with the health plan.

- Most contracts define coverability based on established clinical benefit in published, peer-reviewed literature, along with consideration of regulatory status.
- FDA approval does not in itself establish medical necessity, as unpublished, low-quality evidence, including exploratory analyses and unvalidated surrogate endpoints, may be used as the basis of approval. Regulatory approval may or may not reflect clinical benefit relative to standard of care and the recommendations of expert clinical advisors such as the Oncologic Drugs Advisory Committee (ODAC). FDA approvals generally do not consider cost compared to established therapies, or value to members.
- Likewise, NCCN clinical practice guidelines assignment of a recommendation (category 1, 2a, or 2b) does not necessarily establish medically necessity. NCCN recommendations are inconsistently supported by published, peer-reviewed literature and do not uniformly consider value of new therapies relative to existing potentially higher-value treatment options, considering effectiveness, safety, and cost.
- Medication coverage criteria are developed based on the 'medical necessity' assessment, as described above.

Regence Pharmacy Services analysis and coverage policy may differ from FDA labeled indication and/or NCCN clinical practice guidelines.

Clinical Efficacy

CERVICAL CANCER

Recurrent or metastatic

- Keytruda (pembrolizumab) received FDA Accelerated approval for use in recurrent or metastatic cervical cancer when tumors express PD-L1 (CPS $\geq$ 1) based on tumor response rates from a single-arm, open-label study [KEYNOTE-158]. To date, there is no evidence that it improves any clinically relevant outcome [e.g., improved overall survival (OS), symptom control, function, or quality of life (QOL)] in this disease setting. [3]
    * The current available evidence is limited to two small, uncontrolled, open-label Phase 1b/2 studies evaluated subjects with metastatic cervical cancer who had between one and four prior systemic therapies. Nearly all tumors expressed PD-L1 with a Combined Positive Score (CPS) of at least 1%. [4-6]
    * The reported objective response rate (ORR) in the pivotal study was 14.6%. Three patients (3.6%) had a complete response.
    * ORR has not been shown to accurately predict improvement in clinical endpoints in cervical cancer.
- A phase 3, double-blind RCT [KEYNOTE-826] evaluated the addition of Keytruda (pembrolizumab) to a platinum-based chemotherapy regimen in patients with carcinoma of the cervix that had not been treated with prior systemic chemotherapy and which was not amenable to curative treatment. [7]
    * Patients had persistent, recurrent, or metastatic adenocarcinoma, adenosquamous carcinoma, or squamous cell carcinoma of the cervix. Patients were naïve to prior systemic chemotherapy and PD-1/PD-L1 inhibitor therapy.
    * Patients were enrolled without regard to PD-L1 status; however, all patients were tested after enrolling in the study. Eighty-nine percent of patients in the study had a PD-L1 combined positive score (CPS) of at least 1.
    * Patients received either Keytruda (pembrolizumab) or placebo plus a platinum and paclitaxel (with or without bevacizumab). Chemotherapy was given for up to six cycles and Keytruda (pembrolizumab) was given for up to 35 cycles.
    * OS was significantly longer in the Keytruda (pembrolizumab) versus the placebo arm among patients with a PD-L1 CPS $\geq$ 1 (primary analysis population). The HR for death was 0.64 [95% CI: 0.50 to 0.81] with $p < 0.001$. There was also a statistically significant survival benefit in the entire population, which included patients with PD-L1 CPS < 1 ("All comers"). However, patients with a PD-L1 CPS $\geq$ 1 made up the vast majority (~90%) of the study population which likely confounded the "All comers" analysis by enriching the population with potential responders. A sub analysis in patients with PD-L1 CPS < 1 showed no survival benefit which supports this conclusion.

High-risk, locally advanced (FIGO 2014 Stage III/IVA)

- Keytruda (pembrolizumab) was also evaluated as an add-on therapy to chemoradiation for high-risk, locally advanced cervical cancer in a large placebo-controlled RCT [KEYNOTE A-18]. The current indication in this population is based on a subgroup from this study

that had International Federation of Gynecology and Obstetrics (FIGO) 2014 stage III to IVA disease (tumor involvement in the lower vagina with or without extension into the pelvic sidewall, or hydronephrosis/non-functioning kidney, or spread to adjacent pelvic organs). Patients with FIGO stage IVB disease were excluded from the study. [8]

* The study enrolled patients with the following disease histologies: Squamous cell carcinoma (SCC), adenocarcinoma, or adenosquamous carcinoma of the cervix.
* Patients enrolled in the study had no prior definitive surgery, radiation, or systemic therapy.
* The study compared Keytruda (pembrolizumab) 200 mg IV Q3W for 5 cycles plus cisplatin (5 to 6 cycles) and radiotherapy, followed by Keytruda (pembrolizumab) 400 mg IV Q6W as monotherapy for an additional 15 cycles with matching placebo plus chemoradiotherapy as described above.
* Ninety-three percent of the tumors had PD-L1 CPS $\geq$1.
* The median PFS was not reached in either treatment arm. The hazard ratio for progression or death was 0.59 [95% CI: 0.43, 0.82] in favor of Keytruda (pembrolizumab). The impact of this therapy on clinically relevant outcomes is unknown as the OS data is not mature.

- The NCCN cervical cancer guideline recommends the following: [9]
  * ***Recurrent or metastatic disease:*** Front-line platinum-based chemotherapy with or without bevacizumab. Keytruda (pembrolizumab) can be added for PD-L1-expressing tumors (CPS $\geq$ 1%).
  * ***FIGO 2014 stage III to IVA disease:*** Cisplatin or carboplatin plus external beam radiation therapy (EBRT) plus Keytruda (pembrolizumab).

COLORECTAL CARCINOMA (CRC), MSI-H or dMMR

- Keytruda (pembrolizumab) was initially approved for CRC as a subsequent therapy for locally advanced or metastatic MSI-H/dMMR CRC, when there is progression of disease on or after standard front-line therapy with fluoropyrimidine, oxaliplatin, and irinotecan, based on a combined cohort of 90 patients from several single-arm studies (a "basket" trial). [8,10]
  * The accelerated approval of Keytruda (pembrolizumab) was for microsatellite instability-high (MSI-H) or mismatch repair deficient (dMMR) tumors was based on preliminary tumor response [overall response rate (ORR)] and duration of response (DOR) data from a "basket trial" pooled analysis of 149 patients across five different early phase, open-label trials (90 patients with CRC and 59 non-CRC patients).
  * Subjects enrolled in the basket trial had advanced solid tumors and at least one prior chemotherapy regimen. CRC-specific trials required prior CRC therapy.
  * In 90 CRC patients, tumor response rate was 36%. However, no other outcomes were measured, and clinical benefit has not been established.
  * Despite the low level of evidence, Keytruda (pembrolizumab) may be a reasonable treatment alternative in patients with in MSI-H/dMMR CRC when there is progressive disease on or after standard CRC therapies.

- Subsequently, the FDA approved Keytruda (pembrolizumab) for use as an initial therapy for MSI-H/dMMR CRC, based on an improvement in PFS in a single unblinded Phase 3 trial [KEYNOTE-177]. [10] Keytruda (pembrolizumab) was superior to investigator's choice of chemotherapy (fluorouracil-based chemotherapy with or without bevacizumab or cetuximab) for PFS. However, overall survival data, a secondary endpoint, was not mature at the time of FDA approval. Therefore, the clinical benefit is unknown. Of note, high crossover to Keytruda (pembrolizumab) will confound interpretation of future OS results.
- The NCCN CRC guideline recommends against the use of Keytruda (pembrolizumab) for MSI-H CRC in the adjuvant setting, meaning after surgery, but before any progression of disease. Standard therapies with fluoropyrimidine (fluorouracil, capecitabine), oxaliplatin, and irinotecan are recommended (with regimens such as FOLFOX, CAPEOX, or FOLFIRI). In the locally advanced and metastatic setting, treatment is recommended based on tumor markers, including KRAS wild type [Erbitux (cetuximab)], or prior therapies and may include addition of a VGEF inhibitor (bevacizumab). [9]

HEAD AND NECK SQUAMOUS CELL CANCER (HNSCC)

- Keytruda (pembrolizumab) was FDA approved as a <u>first-line</u> treatment for unresectable or metastatic HNSCC as a monotherapy OR in combination with standard chemotherapy, based on small improvement in overall survival (OS) in an open-label phase 3 trial [KEYNOTE-048]: [11]
    * The combination of Keytruda (pembrolizumab) and a platin plus fluorouracil improved median OS relative to Erbitux (cetuximab) plus a platin and fluorouracil (13.0 months versus 10.7 months, respectively; p = 0.0067).
    * A small survival advantage (statistically significant) was noted with use of Keytruda (pembrolizumab) <u>monotherapy</u> relative to Erbitux (cetuximab) plus a platin and fluorouracil in PD-L1-positive tumors (CPS $\geq$ 1). Median OS was 12.3 months and 10.3 months in the Keytruda (pembrolizumab) and chemotherapy arms, respectively. The advantage did not extend to the overall population (OS superiority was only for tumors with CPS $\geq$ 1).
- Keytruda (pembrolizumab) also has approval (Accelerated) as a <u>subsequent-line</u> therapy for recurrent or metastatic HNSCC as a single agent when used after progression of disease on or after a platinum-containing chemotherapy. Efficacy was based on improved tumor response rates in two uncontrolled, open-label studies, with a 16% objective response rate (ORR). A small proportion of complete responses (4.6%) was reported in one of the trials. The remainder were partial responses. To date, there is no evidence that it improves any clinically relevant outcome (e.g., improved survival, symptom control, function, or quality of life) in this setting. [8,12]
- There is no evidence to support the use of Keytruda (pembrolizumab) as a second-line therapy in patients unable to use first-line platinum-based chemotherapy for HNSCC.
- The NCCN head and neck cancers guideline lists use of Keytruda (pembrolizumab) for recurrent, unresectable, or metastatic HNSCC when used in the front-line treatment setting, as well as when used in the subsequent-line treatment setting. [9]

HEPATOCELLULAR CARCINOMA (HCC)

- Keytruda (pembrolizumab) received Accelerated FDA approval for use in HCC after progression of disease on, or intolerance to, first-line Nexavar (sorafenib) based on a small, single-arm, open-label Phase 2 preliminary study [KEYNOTE-224] in patients with Child-Pugh (CP) Class A disease that evaluated tumor response rate. Clinical benefit in this setting has not been demonstrated. [13] The confirmatory phase 3 trial [KEYNOTE-240] failed to demonstrate PFS or OS benefit. A subsequent phase 3 trial [KEYNOTE-394] demonstrated a very small improvement in OS in a more limited population and the FDA narrowed the approved indication to relapsed/refractory HCC due to hepatitis B virus (HBV), in CP-Class A only.
    * Subjects enrolled in the trial had progressive disease while on Nexavar (sorafenib) or had intolerable adverse effects to Nexavar (sorafenib) therapy.
    * Nearly all of the patients were Child-Pugh Class A (score of A5 or A6); however, a small portion (6%) had a score of B7/B8 (Class B).
    * Most patients (64%) had disease that had spread beyond the liver.
    * An ORR of 17% was reported in the trial. ORR has not been shown to accurately predict clinically relevant outcomes. Additionally, it is not known how Keytruda (pembrolizumab) compares with other second-line HCC therapies.
- The confirmatory phase 3 RCT [KEYNOTE-240] evaluating Keytruda (pembrolizumab) relative to placebo (best supportive care) in the second-line advanced HCC setting failed to meet the primary endpoints of PFS and OS. [14] There is the potential for this indication to be withdrawn in the future based on FDA guidance for Accelerated approvals that states: "Continued approval for this indication may be contingent upon verification and description of clinical benefit in the confirmatory trials".
- A subsequent RCT [KEYNOTE-394] intended as the confirmatory trial for Keytruda (pembrolizumab) in relapsed or refractory unresectable or metastatic HCC demonstrated a <1-month improvement in median OS relative to placebo. The trial evaluated Asian patients (primarily conducted in China) who had HCC secondary to hepatitis B virus (HBV) infection. All patients had Child-Pugh Class A disease, and all had prior systemic therapy for HCC, the majority (83%) with sorafenib. The FDA subsequently updated the Keytruda (pembrolizumab) HCC indication to reflect the population used in this study (more narrow than initially approved). [15]
- The NCCN hepatocellular carcinoma guideline lists several recommended (category 1 and 2A) therapies for subsequent therapy for HCC, including Opdivo (nivolumab) alone or in combination with Yervoy (ipilimumab). Keytruda (pembrolizumab) is listed as an option for patients with Child-Pugh Class A disease who have not had prior checkpoint inhibitor therapy. [9]

BILIARY TRACT CANCER (BTC)

- An RCT [KEYNOTE-966] evaluated Keytruda (pembrolizumab) in patients with unresectable locally advanced or metastatic biliary tract cancer (BTC) as an add-on to front-line chemotherapy. [16]
    * Patients had histologically confirmed extra- or intrahepatic cholangiocarcinoma

(CCA) or gall bladder cancer and had not received prior therapy for their advanced disease. Patients treated with neoadjuvant or adjuvant therapy for resectable, non-metastatic disease were allowed to enroll if their disease recurred at least 6 months after completing these therapies.

  * The study compared Keytruda (pembrolizumab) plus gemcitabine/cisplatin with placebo plus gemcitabine/cisplatin (chemotherapy alone). Cisplatin was given for up to eight cycles, and Keytruda (pembrolizumab) was given for up to 35 cycles.
  * Sixty-eight percent of the tumors had PD-L1 CPS $\geq$1, though PD-L1 status was not a condition for enrollment.
  * The median OS was 12.7 months and 10.9 months in the Keytruda (pembrolizumab) and placebo treatment arms, respectively.

- Imfinzi (durvalumab) is also approved in this treatment setting with similar evidence and outcomes; however, there is no evidence directly comparing the two therapies.
- The NCCN BTC guideline list gemcitabine/cisplatin plus either Imfinzi (durvalumab) or Keytruda (pembrolizumab) among preferred, category 1 recommendations for the front-line treatment of unresectable or metastatic BTC. [9]

CLASSICAL HODGKIN LYMPHOMA (cHL)

- Keytruda (pembrolizumab) was FDA-approved in classical Hodgkin lymphoma based on a single-arm trial that evaluated tumor response rates in patients with relapsed or refractory disease. Patients in the study were heavily treatment-experienced. [8,17] To date, there is no evidence that Keytruda (pembrolizumab) improves any clinical outcome in this population.
  * Subjects enrolled in the trial had received a median of four prior therapies, including prior autologous hematopoietic stem cell transplant (61%) and/or Adcetris (brentuximab vedotin) 83%.
  * The ORR reported in the study was 69%, with 22% complete responses.
- Subsequently, the Keytruda (pembrolizumab) was studied in an open-label (not blinded) phase 3 RCT in an earlier line of therapy for relapsed or refractory cHL, after chemotherapy and/or hematopoietic stem cell transplant (HSCT), or in patients ineligible for HSCT in one unblinded Phase 3 trial [KEYNOTE-204]. [8]
  * Keytruda (pembrolizumab) was superior to brentuximab vedotin (BV, Adcetris), based on an improvement in PFS (13.2 months with pembrolizumab vs. 8.3 months with BV).
  * Overall survival data, a co-primary endpoint, was not mature at the time of the interim data analysis and the FDA approval. Therefore, the clinical benefit is unknown. Of note, a significant number of subjects received subsequent SCT (30% and 21% in the pembrolizumab and BV arms, respectively), which will confound future OS results.
- A small (N=38), single-arm, phase 2 study evaluated pembrolizumab plus gemcitabine/vinorelbine/liposomal doxorubicin (GVD) given for two to four cycles prior to autologous stem cell transplant as a second-line therapy for patients with relapsed/refractory cHL. [34170745]

    * Ninety-five percent of patients achieved a complete remission and 36 of 38 patients went on to receive an ASCT.
    * It is unknown how pembrolizumab + GVD compares with other regimens used in this setting, or if it improves long-term outcomes such as overall survival.
- The NCCN Hodgkin lymphoma guideline lists Keytruda (pembrolizumab) as a treatment option for relapsed/refractory Hodgkin lymphoma. [9]

MALIGNANT MELANOMA

Advanced (Unresectable or Metastatic) Melanoma Setting

- The efficacy of Keytruda (pembrolizumab) in malignant melanoma (unresectable or metastatic) is based on two, multi-center, open-label, pivotal clinical trials; one in Yervoy (ipilimumab)-refractory subjects and the other in Yervoy (ipilimumab)-naïve subjects.
    * One trial compared Keytruda (pembrolizumab) in doses of 10 mg/kg IV every 2 weeks or every 3 weeks with Yervoy (ipilimumab) 3 mg/kg IV every 3 weeks in progressive, unresectable, or metastatic disease. [8,18] Progression-free survival (PFS) and 12-month survival were superior in the Keytruda (pembrolizumab) treatment arms. Overall survival (OS) was not yet mature. [Note: The FDA-approved dosing of Keytruda (pembrolizumab) is 2 mg/kg IV every 3 weeks, so the applicability of these results is uncertain]
    * A second trial compared Keytruda (pembrolizumab) 2 mg/kg or 10 mg/kg IV every 3 weeks with investigator's choice of chemotherapy in progressive, unresectable, or metastatic disease. [8,19] There was a statistically significant improvement in median PFS with Keytruda (pembrolizumab) relative to the chemotherapy arm; however, the clinical relevance of the small numerical difference (0.2 months) is uncertain. There was no difference in PFS between the two Keytruda (pembrolizumab) dosing arms. Overall survival is not mature.
    * There is no evidence to date that Keytruda (pembrolizumab) has any clinical benefit (improved overall survival, symptom control, function, or quality of life) in melanoma. Additionally, much of the available evidence is for doses that are much higher than the FDA-approved dose of Keytruda (pembrolizumab).

Keytruda (pembrolizumab) as an Adjuvant Therapy for Resectable Melanoma

- Keytruda (pembrolizumab) was evaluated as an adjuvant therapy in patients with resectable stage IIIB/C or stage IV (metastatic) melanoma after complete surgical resection [KEYNOTE-054]. [20]
    * The study compared Keytruda (pembrolizumab) with placebo, dosed every 3 weeks for 18 cycles. Treatment was started within 13 weeks of tumor resection and was continued for up to one year.
    * There was a statistically significant improvement in recurrence-free survival (RFS) with Keytruda (pembrolizumab). It is unknown whether this will eventually translate to improvement in OS, a clinically relevant endpoint.
- Keytruda (pembrolizumab) was also evaluated as an adjuvant therapy for stage IIB and IIC (completely resectable) melanoma [KEYNOTE-716] where it was found to improve RFS and distant metastasis-free survival (DMFS) relative to placebo. [21] There is currently no

evidence of clinical benefit, such as improved OS. Since there is a high cure rate with complete resection alone in early melanoma the potential for introducing serious side effects with adjuvant immunotherapy should be carefully considered, particularly in the absence of clinical outcomes data.

  * Mature survival data are not expected for many years because the prognosis for these early-stage melanoma patients is good, and life expectancy is relatively long with five-year survival rates approaching 99%.
  * Based on preliminary results, fourteen patients would need to be treated with Keytruda (pembrolizumab) for one patient to avoid disease relapse within the first year; however, only seven patients would need to be treated for one patient to discontinue Keytruda (pembrolizumab) due to a severe AE by one year.

- NCCN melanoma guideline: Keytruda (pembrolizumab) is listed as an option for metastatic/unresectable melanoma (first-line or subsequent therapy) and in the adjuvant setting (after complete resection) for stage IIIB and IIIC disease. For stage IIB and IIC disease, observation and adjuvant Keytruda (pembrolizumab) are listed as recommendations. If Keytruda (pembrolizumab) is considered, the guideline states the need for careful assessment of risk versus benefit as there is currently no information evaluating its impact on overall survival in this population. [9]

MERKEL CELL CARCINOMA (MCC):

- Keytruda (pembrolizumab) was FDA-approved as a single agent for locally advanced or metastatic MCC, previously untreated with systemic therapy for advanced disease, based on a small, single-arm Phase 2 trial that evaluated tumor response rate [KEYNOTE-017]. [22]
- A clinically relevant benefit, such as improved OS relative to standard of care, has not been established. Phase 3 trials are ongoing. [23]
- Chemotherapy historically has been the standard approach for advanced MCC. Although MCC appears to be chemosensitive, the duration of response is limited. The impact of chemotherapy on survival in patients with metastatic MCC is unclear. [9]
- The NCCN guideline lists pembrolizumab among potential treatment options for unresectable MCC. [9]

NON-SMALL LUNG CANCER (NSCLC)

<u>Advanced (unresectable or metastatic) NSCLC</u>

- Keytruda (pembrolizumab) improves overall survival (OS) relative to cytotoxic chemotherapy in patients with metastatic NSCLC in the following treatment settings:
  * Front-line therapy for nonsquamous disease when administered with a platinum plus Alimta (pemetrexed) [KEYNOTE-021]. [24]
  * First-line therapy for squamous disease when administered with carboplatin plus a taxane [KEYNOTE-407]. [25]
  * First- or subsequent-line therapy for PD-L1-positive tumors [Tumor Proportion Score (TPS) $\geq$ 50% first-line; $\geq$ 1% subsequent] when used as a single agent [KEYNOTE-024, -010]. [26,27]

- An FDA-approved test (PD-L1 IHC 22C3 pharmDx) was developed in conjunction with Keytruda (pembrolizumab). The TPS measures the proportion of viable tumor cells that show partial or complete membrane staining on immunohistochemical (IHC) assay. [28]
- The NCCN NSCLC guideline recommends Keytruda (pembrolizumab) for: [9]
    * First-line, metastatic NSCLC when:
        - PD-L1 expression positive (≥ 50%) and tumor is EGFR-, ALK-, ROS1-, or BRAF-negative [category 1].
        - Nonsquamous histology: with a platin plus pemetrexed [category 1, preferred].
        - Squamous histology: with carboplatin plus paclitaxel or albumin-bound Abraxane (paclitaxel) [category 1, preferred].
    * Subsequent therapy for metastatic, PD-L1 expression positive (≥ 1%) NSCLC with ECOG performance status of 0, 1, or 2 [category 1].

Earlier stage NSCLC, resected - Adjuvant therapy

- Keytruda (pembrolizumab), as a single agent, demonstrated improved disease-free survival (DFS) relative to best supportive care in the adjuvant setting for patients with stage IB (T2a ≥4 cm), II, or IIIA NSCLC after complete tumor resection and standard adjuvant therapy with a platinum-based chemotherapy regimen, based on an interim analysis. [8,29]
    * Patients in the experimental arm received Keytruda (pembrolizumab) every 3 weeks for one year (up to 18 cycles) unless disease recurrence or unacceptable toxicity occurred.
    * Patients in the trial received a median of four cycles of adjuvant cisplatin-based chemotherapy after complete resection.
    * Prior use of PD-1/PD-L1 inhibitors was not allowed, such as in the neoadjuvant setting.
    * Although patients with TC >1% PD-L1 expression demonstrated a DFS benefit, patients with a high PD-L1 expression (TC ≥ 50%) appeared to have the most significant DFS benefit based on a pre-determined subgroup analysis.
    * DFS is not a validated endpoint in adjuvant NSCLC and has not been correlated to meaningful clinical outcomes such as overall survival.
- The NCCN NSCLC treatment guideline lists Keytruda (pembrolizumab) as an option in the adjuvant setting for completely resected stage II-IIIA NSCLC in patients who received previous adjuvant chemotherapy, with a footnote that the value of adjuvant therapy in PD-L1 negative NSCLC is unclear. [9]

Earlier stage NSCLC, resectable - Neoadjuvant therapy followed by adjuvant therapy

- An RCT [KEYNOTE-671] evaluated Keytruda (pembrolizumab) in resectable NSCLC as an add-on to platinum-containing chemotherapy used in the neoadjuvant setting (prior to surgical resection), and then continued as a monotherapy in the adjuvant setting (after surgical resection). [30]

    * Patients had pathologically confirmed stage II, IIIA, or IIIB NSCLC [involvement of ≥1 ipsilateral mediastinal lymph node or subcarinal lymph node (N2 stage)].
    * Keytruda (pembrolizumab) was given 200 mg every three weeks for 4 cycles (4 doses) prior to surgical resection, and then continued until disease progression or up to a maximum of 13 cycles (13 doses, as 200 mg every 3 weeks) after surgical resection.
    * The primary endpoint was event-free survival (EFS). The median EFS was not reached in the Keytruda (pembrolizumab) treatment arm and was 17 months in the placebo arm with a hazard ratio of 0.58 [95% CI: 0.46, 0.72] and p-value <0.001. OS results are not mature; however, no difference in OS has been detected to date.
- EFS is not a validated surrogate endpoint. It has not been shown to accurately predict significant improvement in clinical endpoints of interest such as OS and quality of life.
- Currently, another PD-1 inhibitor, Opdivo (nivolumab) is approved in this population as a neoadjuvant therapy (not continued as an adjuvant therapy). One of the outstanding questions from the Keytruda (pembrolizumab) study is the extent to which continuing a PD-1 inhibitor as an adjuvant therapy may (or may not) contribute to the efficacy of this longer regimen. Additional evidence, including impact on clinical outcomes, is needed. Trials of Opdivo (nivolumab) as neoadjuvant therapy followed by adjuvant therapy for resectable NSCLC are currently ongoing. Results are expected later in 2024.
- The NCCN NSCLC treatment guideline recommendations for resectable NSCLC include neoadjuvant Opdivo (nivolumab) plus platinum-doublet therapy for three cycles prior to surgical excision [preferred, cat 2A], and Keytruda (pembrolizumab) plus platinum-doublet therapy for four cycles prior to surgical resection followed by monotherapy for up to 13 cycles after surgical excision [preferred, cat 1]. [9]

PRIMARY MEDIASTINAL B-CELL LYMPHOMA (PMBCL)

- Keytruda (pembrolizumab) received FDA Accelerated approval for use in relapsed or refractory PMBCL based on tumor response rates from a single-arm, open-label study [KEYNOTE-170]. [8] To date, there is no evidence that it improves any clinically relevant outcome (e.g., improved survival, symptom control, function, or quality of life) in this disease setting.
    * Two small, uncontrolled, open-label studies evaluated patients with relapsed or refractory PMBCL who failed to achieve a complete remission after, or were ineligible for, an autologous stem cell transplant. [31-33]
    * Patients received a median of three prior therapies prior to Keytruda (pembrolizumab), and all had prior rituximab.
    * The reported objective response rate (ORR) was 45.3% and 47.6%. Six patients (11.3%) and seven patients (33.3%) had complete responses, respectively.
    * ORR has not been shown to accurately predict improvement in clinical endpoints in PMBCL.
- The NCCN B-cell lymphomas guideline lists rituximab-containing chemotherapy regimens among recommended therapy options for relapsed or refractory PMBCL when patients are

not candidates for high-dose therapies with stem cell rescue. Keytruda (pembrolizumab) is listed as a treatment option for relapsed disease. [9]

RENAL CELL CARCINOMA (RCC)

- FDA approval for Keytruda (pembrolizumab) in combination with Inlyta (axitinib) was based on interim PFS results from a phase 3, open-label (not blinded) randomized controlled trial (RCT) versus Sutent (sunitinib) monotherapy in patients with advanced, clear cell RCC in the front-line treatment [KEYNOTE-426]. [34] Overall survival, the co-primary endpoint, was not mature at the time of approval.
    * Median progression-free survival (PFS) was greater in the combination treatment arm [15.1 months versus 11.1 months with sunitinib].
    * Median overall survival was not met in either treatment arm at the time of the interim analysis.
    * In a subsequent analysis of overall survival, the median OS was not reached with pembrolizumab/axitinib and was 35.7 months in the sunitinib treatment arm. [35]
- There was a slight increase in grade 3 and 4 adverse effects in the combination arm. Additionally, 27% of subjects in the combination arm had immune-mediated AEs that required 40 mg or more per day of prednisone. [8]
- FDA approval of Keytruda (pembrolizumab) in combination with Lenvima (lenvatinib) is based on results from a phase 3, open-label (not blinded) RCT where this combination was found to show improved PFS relative to Sutent (sunitinib) monotherapy in patients with advanced, clear cell RCC in the front-line treatment [KEYNOTE-581/CLEAR Study]. [8,36]
    * All patients in the trial had a clear cell component (histology) and good performance status.
    * The median PFS was 23.9 months versus 9.2 months in the Keytruda (pembrolizumab)- Lenvima (lenvatinib) and Sutent (sunitinib) treatment arms, respectively.
    * Median OS was not met in either treatment arm.
    * Limitations of this study include, but are not limited to:
        - PFS is a surrogate radiographic endpoint that may not accurately predict that a patient will live a longer or better life.
        - Front-line therapies for advanced RCC have evolved such that Sutent (sunitinib) is no longer considered a standard of care. The efficacy and safety of Keytruda (pembrolizumab) plus Lenvima (lenvatinib) relative to other available standards of care is not known.
- The use of Keytruda (pembrolizumab) as an adjuvant therapy for patients with resected RCC with a high risk of recurrence was based on a RCT [KEYNOTE-564] that compared it with best supportive care. Keytruda (pembrolizumab) or placebo was given every 3 weeks for a maximum of 17 cycles (one year). [37]
    * Patients had either localized, resectable RCC; or had RCC with a fully resectable metastatic lesion [M1 No Evidence of Disease (NED)] and had a high risk of disease recurrence (refer to *Appendix 2* for definitions).

* Only patients with RCC with a clear cell component were included. No prior systemic therapy for RCC was allowed.
* The primary endpoint was disease-free survival (DFS), a non-validated endpoint. At 24 months, 77% and 68% of patients in the Keytruda (pembrolizumab) and placebo arms were alive and recurrence free, respectively. Overall survival data is not yet mature.

- Currently, there is no evidence supporting the use of Keytruda (pembrolizumab) in subsequent-line RCC settings, or as a monotherapy for advanced RCC.
- The NCCN kidney cancer guideline lists: [9]
  * The combination of Keytruda (pembrolizumab) with Inlyta (axitinib) or Lenvima (lenvatinib) among several recommended regimens as a first-line treatment for advanced, clear cell RCC. The recommendation ratings vary, based on risk assessment.
  * For resectable RCC with high risk of recurrence, Keytruda (pembrolizumab) as a single agent or surveillance are listed among recommendations for clear cell, previously untreated disease.

UROTHELIAL CARCINOMA (UC; BLADDER CANCER)

- ***As initial therapy (cisplatin ineligible) – Advanced disease -***

Monotherapy:

* A single-arm, open-label trial [KEYNOTE-052] evaluated Keytruda (pembrolizumab) in subjects with locally advanced or metastatic urothelial carcinoma who were ineligible for treatment with a cisplatin-based regimen. Approval was based on tumor response. [8,38]
  - ORR was 29%, with 7% of the responses considered complete.
  - Response rate was higher in patients with a combined positive score (CPS) $\geq$ 10%. [38]
  - There is no evidence that Keytruda (pembrolizumab) improves any clinically relevant outcome in this population. Although a median OS was reported, this information is of little relevance as there was no comparator group to allow any conclusion of a health benefit relative any other therapy.

In combination with Padcev (enfortumab vedotin):

* Padcev (enfortumab vedotin) was also evaluated as a front-line therapy for locally advanced or metastatic UC in combination with Keytruda (pembrolizumab) [Study EV-302/KEYNOTE-A39]. The evidence is based on a large (N=886), open-label RCT that compared this combination with a platinum-based chemotherapy regimen. [39]
  - Patients enrolled in the study had no prior therapy for advanced disease and were eligible to receive platinum-based chemotherapy. Prior neoadjuvant or adjuvant chemotherapy was allowed if there had been no disease recurrence within 12 months after its completion.

- Padcev (enfortumab vedotin) was given in 21-day cycles until disease progression. Keytruda (pembrolizumab) was given in 21-day cycles until disease progression or for a maximum of 35 cycles (2 years).
- Ninety-five percent of the population had metastatic disease. Approximately 27% had upper tract UC while the remaining 73% had lower tract UC.
- The median OS was 31.5 months and 16.1 months in the Padcev (enfortumab vedotin) plus Keytruda (pembrolizumab) and chemotherapy treatment arms, respectively.
- Although this trial included patients who were eligible to receive platinum-based chemotherapy, there is no evidence to establish superiority of this combination as compared to standard of care platinum-based chemotherapy followed by Bavencio (avelumab) maintenance. However, the use of the Padcev (enfortumab vedotin) plus Keytruda (pembrolizumab) is significantly more costly. In addition, the standard of care platinum-based chemotherapy followed by Bavencio (avelumab) maintenance is among the highest Category 1 recommended treatment options. Therefore, the use of Padcev (enfortumab vedotin) plus Keytruda (pembrolizumab) in patients who are eligible to receive platinum-based chemotherapy is considered 'not medically necessary.' As reflected in the coverage criteria, patients unable to receive platinum-based chemotherapy may be coverable for the combination of Padcev (enfortumab vedotin) plus Keytruda (pembrolizumab) in the first-line setting.

- ***As subsequent therapy - Advanced disease -*** A randomized, active-controlled, open-label trial [KEYNOTE-045] evaluated Keytruda (pembrolizumab) versus investigator's choice of single-agent chemotherapy in subjects with locally advanced or metastatic urothelial carcinoma who had disease progression on or after platinum-containing chemotherapy. [8,40]
  * Fifteen percent of subjects enrolled in the trial had disease progression following platinum-containing neoadjuvant or adjuvant chemotherapy.
  * The median OS was statistically greater with pembrolizumab vs. chemotherapy (10.3 months versus 7.4 months, respectively).
- ***For BCG-unresponsive non-muscle invasive bladder cancer (NMIBC) -*** A small, single-arm, non-blinded study evaluated Keytruda (pembrolizumab) in subjects with high-risk, recurrent or persistent NMIBC that was unresponsive to adequate treatment with Bacillus Calmette-Guerin (BCG) therapy who were either not eligible for a cystectomy (bladder removal), or did not elect to undergo cystectomy [KEYNOTE-057]. [8,41]
  * All patients had NMIBC with carcinoma *in situ* [stage Tis (63%), Ta (25%), or T1 (13%)].
  * Adequate BCG therapy was defined as having at least 5 of 6 induction intravesicular instillations AND either 2 of 3 maintenance instillations, or at least 2 of 6 doses of a second induction course. The median number of BCG instillations in the trial was 12.

* Complete response (CR) was the study endpoint and was achieved in 41% of patients. The median duration of response was 16.2 months. Overall response rate (ORR) is an unvalidated surrogate endpoint that has not been shown to accurately predict clinical outcomes.

- ***NCCN bladder cancer treatment guidelines*** recognize: [9]
  * *Front-line:* Category 1 recommendations for cisplatin-eligible patients include cisplatin plus gemcitabine followed by Bavencio (avelumab) maintenance, (Opdivo) nivolumab plus gemcitabine/cisplatin followed by (Opdivo) nivolumab maintenance, Padcev (enfortumab vedotin) plus Keytruda (pembrolizumab), and dose-dense methotrexate/vinblastine/doxorubicin/cisplatin followed by Bavencio (avelumab) maintenance therapy. Both Padcev (enfortumab vedotin) plus Keytruda (pembrolizumab), and dose-dense methotrexate/vinblastine/doxorubicin/ cisplatin followed by Bavencio (avelumab) maintenance therapy are also listed as category 1 recommendations for cisplatin-ineligible patients.
  * *Second- and subsequent-line:* Keytruda (pembrolizumab) after initial therapy with a platinum-containing regimen when used as monotherapy [preferred, category 1]; and Padcev (enfortumab vedotin) monotherapy is listed among several category 2A recommendations.
  * Ineligibility for cisplatin in the clinical trial was defined as CrCl 30 to 60 mL/min, poor kidney function (CrCl < 60 mL/min), poor performance status (≥2), significant hearing loss (≥ 25 dB), grade 2-4 peripheral neuropathy, heart failure, other comorbidities. [38] Ineligibility for cisplatin is mentioned in NCCN as renal impairment (CrCl < 60 mL/minute) or comorbidities. Ineligibility for any platinum-containing chemotherapy is not explicitly defined by the clinical trials or NCCN. However, NCCN notes that carboplatin can be substituted for cisplatin for patients with a CrCl < 60 mL/min. Overall comorbidities should be considered for platinum eligibility (such as cardiac disease, advanced age, performance status, or "if the patient is unfit").
  * In patients with NMIBC, the NCCN lists Keytruda (pembrolizumab) as a recommended option for recurrent or persistent disease unresponsive to BCG and the patient is ineligible for a cystectomy or chooses not to have one.

GASTRIC AND GASTROESOPHAGEAL JUNCTION (GEJ) ADENOCARCINOMA

HER2-positive gastric and GEJ adenocarcinoma:

- A multicenter, randomized, double-blind, placebo-controlled trial [KEYNOTE-811] evaluated the addition of Keytruda (pembrolizumab) to standard of care (SOC) trastuzumab plus chemotherapy relative to placebo plus SOC in patients with ***HER2-positive***, locally advanced unresectable, or metastatic gastric or gastroesophageal junction (GEJ) adenocarcinoma. [8,42,43]
  * All patients enrolled in this study had no prior therapy for metastatic disease, no prior PD-1/PD-L1 inhibitor therapy and had good performance status (PS).
  * Patients received SOC trastuzumab plus chemotherapy [either CAPEOX (87%) or fluorouracil plus cisplatin (13%)] in addition to either Keytruda (pembrolizumab) or placebo.

* Approximately 87% of patients had a PD-L1 CPS of 1% or more.
* There was no difference in median OS between the Keytruda (pembrolizumab) and placebo treatment arms in the intent-to-treat population. A subgroup analysis suggests a significant improvement in median OS in the patients with PD-L1-expressing tumors (CPS ≥1). Based on this information, the FDA updated the indication for Keytruda (pembrolizumab) in HER2-positive, advanced/metastatic gastric or GEJ adenocarcinoma to limit use to the PD-L1 CPS ≥1 subpopulation.

HER2-negative gastric and GEJ adenocarcinoma:

- A second, similarly designed trial [KEYNOTE-859] evaluated Keytruda (pembrolizumab) as an add-on to SOC chemotherapy as a front-line therapy for ***HER2-negative***, locally advanced unresectable, or metastatic gastric or GEJ adenocarcinoma. [44]
  * As in the study above, all patients enrolled in this study had no prior therapy for metastatic disease, no prior PD-1/PD-L1 inhibitor therapy and had good PS.
  * Patients received SOC chemotherapy [either CAPEOX (86%) or fluorouracil plus cisplatin (14%)] in addition to either Keytruda (pembrolizumab) or placebo.
  * Approximately 78% of patients had a PD-L1 CPS of 1% or more and 35% had a CPS ≥10.
  * There was a significant improvement in median OS in the Keytruda (pembrolizumab) treatment arm relative to the placebo arm in the intent-to-treat population (12.9 months and 11.5 months, respectively). The difference in median OS was greater in the subgroups with high levels of PD-L1 expression suggesting results may have been driven by PD-L1 expression. The median OS in patients with tumors that had PD-L1 CPS ≥10 was 15.7 months and 11.8 months in the Keytruda (pembrolizumab) and placebo arms, respectively.

NCCN gastric/GEJ cancer guidelines

- The NCCN guideline recommendations for the front-line treatment of unresectable, recurrent, or metastatic gastric or GEJ cancer include: [9]
  * ***HER2-positive disease:*** Fluoropyrimidine/cisplatin plus trastuzumab is listed as a preferred, category 1 recommendation. Keytruda (pembrolizumab) may be added to this regimen for tumors with PD-L1 CPS≥1 (also a preferred, category 1 recommendation).
  * ***HER2-negative disease:*** Fluoropyrimidine/oxaliplatin plus Opdivo (nivolumab) for PD-L1 CPS ≥5, and fluoropyrimidine/oxaliplatin or cisplatin plus Keytruda (pembrolizumab) for PD-L1 CPS ≥10 are listed as preferred, category 1 recommendations. The Keytruda (pembrolizumab) combination therapy recommendation drops to category 2A for CPS ≥1, and to category 2B for CPS 1 to <10.

PD-L1 expressing and other gastric and GEJ adenocarcinomas:

- Keytruda (pembrolizumab) received Accelerated approval as a monotherapy for recurrent locally advanced or metastatic gastric or GEJ adenocarcinoma in tumors expressing PD-L1 (CPS ≥ 1) when disease progressed on or after two or more lines of therapy [KEYNOTE-059]. Subsequently, this indication was voluntarily withdrawn by the manufacturer because clinical benefit was not demonstrated in confirmatory trials. [8,45]

Therefore, use of Keytruda (pembrolizumab) in the subsequent-line advanced gastric and GEJ adenocarcinoma settings is considered investigational.

- Several other Keytruda (pembrolizumab) trials have also failed to establish clinical benefit in various gastric cancer settings:
    * Keytruda (pembrolizumab) in the second-line setting failed to meet the primary endpoints of PFS and OS as compared to paclitaxel in a phase 3 trial [KEYNOTE-061]. [46] All subjects had gastric/GEJ cancer with a PD-L1 CPS of 1 or higher that progressed on first-line chemotherapy with a platinum and fluoropyrimidine.
    * In the first-line setting, Keytruda (pembrolizumab), as a monotherapy or in combination with chemotherapy, failed to improve PFS and OS as compared to chemotherapy alone in a phase 3 trial [KEYNOTE-062]. [47] All subjects had gastric/GEJ cancer with a PD-L1 CPS of 1 or higher. Among patients with a CPS of ≥ 10, Keytruda (pembrolizumab) was numerically, but not statistically, superior to chemotherapy. Of note, 15% of patients in the control arm were treated with post-trial immune checkpoint inhibitors.

ESOPHAGEAL and GEJ CANCER

Front-line setting:

- A double-blind RCT [KEYNOTE-590] evaluated the addition of Keytruda (pembrolizumab) to standard front-line chemotherapy relative to placebo plus chemotherapy in patients with locally advanced or metastatic esophageal or gastroesophageal junction (GEJ) carcinoma. The coprimary endpoints were PFS and OS. [8,48]
    * The trial included patients with esophageal cancer with either squamous cell carcinoma or adenocarcinoma histology. GEJ cancers were included if they had an epicenter 1 to 5 centimeters above the GEJ.
    * Therapy was continued until disease progression, unacceptable toxicity, or for up to a maximum of two years.
    * Patients enrolled in the trial were not candidates for surgical excision of their tumor or for definitive chemoradiation (CRT) and had no prior treatment in the advanced disease setting. The majority (54%) of patients enrolled had tumors that had a PD-L1 CPS ≥ 10.
    * The median OS in the overall population was 12.4 months and 9.8 months in the Keytruda (pembrolizumab) and placebo treatment arms, respectively; and the median OS in the PD-L1 CPS ≥ 10 population was 13.5 months and 9.4 months, respectively. An exploratory analysis found there was no difference in median OS in the PD-L1 CPS < 10 population (10.5 months and 10.6 months, respectively), suggesting that efficacy of Keytruda (pembrolizumab) was being driven by PD-L1 expression.
- The NCCN guidelines list chemotherapy plus a platin plus Keytruda (pembrolizumab) among several recommended treatment options for unresectable locally advanced or metastatic esophageal or esophagogastric junction cancer, but limits the use of Keytruda (pembrolizumab) to tumors with PD-L1 CPS ≥ 10. [9]

Subsequent-line setting:

- Keytruda (pembrolizumab) was evaluated in a randomized, controlled trial in patients with recurrent locally advanced, or metastatic esophageal carcinoma who progressed on or after on prior systemic therapy [KEYNOTE-181]. [49] The trial included both squamous cell carcinoma (ESCC) and adenocarcinoma. However, the primary efficacy endpoint was OS in patients with ESCC, patients with tumors expressing PD-L1 CPS ≥10, and all randomized patients.
    * Keytruda (pembrolizumab) as a single agent was compared with investigator's choice of chemotherapy.
    * Patients with HER2/neu-positive disease were required to have received treatment with an approved HER2/neu targeted therapy [e.g., trastuzumab].
    * The primary analysis for this study was in the subgroup of patients with PD-L1 expressing ESCC (CPS ≥ 10) found an overall survival advantage with Keytruda (pembrolizumab) relative to cytotoxic chemotherapy. There was no survival difference between the groups when the intent-to-treat population was analyzed so the FDA-approval excluded PD-L1 negative tumors.
    * Subpopulations with tumor histologies other than ESCC (e.g., patients with esophageal adenocarcinoma) were not part of the primary analysis so are not included as part of the FDA indication.
    * Randomization was not stratified by PD-L1 status which is a potential limitation of this data.
- The NCCN esophageal cancer guideline lists Keytruda (pembrolizumab) as a preferred, recommended option for esophageal squamous cell carcinoma (ESCC) when used in the second-line setting for PD-L1-positive tumors with CPS ≥ 10. It is also a recommended option when used in the third or subsequent-line setting for PD-L1-positive tumors with CPS of ≥ 1. [9]

ENDOMETRIAL CANCER

- Keytruda (pembrolizumab) received Accelerated FDA-approval for use in patients with metastatic endometrial carcinoma, in combination with Lenvima (lenvatinib), in patients whose disease progressed on prior therapy in any treatment setting and curative surgery or radiation is not an option. It was approved in this setting based on a cohort of patients from a small, single-arm trial that evaluated tumor response rate [KEYNOTE-146). [50] Clinical benefit has not been established.
- The evidence supporting the use of Keytruda (pembrolizumab) as a single agent in unresectable or metastatic, MSI-H/dMMR endometrial carcinoma after progression on standard front-line therapies is of poor quality. It is derived from a multi-cohort, single-arm trial that reported tumor response rate as the endpoint [KEYNOTE-158]. There is currently no comparative data or information related to improvement in any clinical outcome. [51]
- Subsequently, Keytruda (pembrolizumab) was evaluated in a large (N=816), randomized, double-blind, placebo-controlled trial [NRG-GY018] as part of a front-line regimen for advanced endometrial cancer where it was found to improve PFS. [52]
    * Patients enrolled in the trial had no prior systemic therapy in the advanced disease setting, including no prior PD-1/PD-L1 inhibitor therapy.

    * Keytruda (pembrolizumab) was initiated in combination with carboplatin plus paclitaxel chemotherapy for six cycles and was then continued as a single agent until disease progression.
    * Patients in the Keytruda (pembrolizumab) treatment arm had improved median PFS relative to those who received placebo. This PFS benefit extended to both mismatch repair proficient and deficient tumors (pMMR and dMMR).
    * PFS has not been shown to accurately predict any beneficial clinical outcome (it is an unvalidated surrogate endpoint).
    * The overall survival data from this study are not mature; however, interim results have not yet detected any survival difference between treatment groups.
- The NCCN uterine cancer guideline, which includes endometrial carcinoma, lists many single-agent and combination chemotherapy regimens as recommended regimens, including Keytruda (pembrolizumab) plus Lenvima (lenvatinib) under "Useful in Certain Circumstances." Keytruda (pembrolizumab) as a single-agent is also listed among recommendations for MSI-H/dMMR endometrial tumors, and in the front-line setting when used in combination with carboplatin and paclitaxel (in either dMMR or pMMR tumors). [9]

CUTANEOUS SQUAMOUS CELL CARCINOMA (cSCC)

- Keytruda (pembrolizumab) was evaluated in a Single-arm, non-blinded, multi-cohort, phase 2 trial in patients with cSCC [KEYNOTE-629]. [53]
    * The cohort evaluated for the FDA accelerated approval included metastatic cSCC (55) and advanced recurrent disease in which is not curable with surgery or radiation.
    * All subjects had prior systemic therapy, and 87% had ≥ 2 prior therapies.
    * An ORR of 34% was reported, with 3.8% complete response (CR) and 30% partial response (PR). However, health outcomes are unknown.
- ORR is an unvalidated surrogate endpoint that has not been shown to accurately predict clinical outcomes. ORR is a measure of tumor size (visible by physical observation or on x-ray) and is a combination of complete and partial responses. In advanced disease, ORR may not be representative of disease that has traveled to lymph nodes of other parts of the body, so it may not be an accurate measure of clinical benefit.
- The NCCN lists Keytruda (pembrolizumab) among several potential therapy recommendations for cSCC that has recurred or metastasized (disease that is not curable with resection and/or radiation). [9]

ANAL SQUAMOUS CELL CARCINOMA (SCC)

- Although not FDA-approved for this use, Keytruda (pembrolizumab) and Opdivo (nivolumab) have been used in anal squamous cell carcinoma that is refractory to or recurs on front-line chemotherapy based on the lack of effective therapies for refractory disease. The majority of patients with anal SCC respond well to standard cytotoxic chemotherapy.
- Preliminary studies suggest these therapies have potential activity in this setting:

    * A manufacturer-funded study reported an ORR of 17% (all partial responses) in 24 patients with recurrent PD-L1-positive (> 1%) advanced anal SCC who received Keytruda (pembrolizumab). [54]
    * A National Institutes of Health (NIH) funded study reported an ORR of 24% (two complete and seven partial responses) in 37 patients with treatment refractory metastatic anal SCC who received Opdivo (nivolumab). [55]
    * Additional studies are needed to establish whether there is a lasting clinical benefit with these PD-1 inhibitors in this treatment setting. However, given the lack of treatment alternatives in a relatively small patient population, the use of Keytruda (pembrolizumab) and Opdivo (nivolumab) are considered medically necessary and coverable in chemotherapy-refractory disease.

- Both Keytruda (pembrolizumab) and Opdivo (nivolumab) are listed as treatment options for subsequent therapy for recurrent anal carcinoma in the NCCN guideline. [9]
- Given the lack of treatment alternatives in a relatively small patient population, the use of Keytruda (pembrolizumab) is considered medically necessary and coverable in chemotherapy-refractory disease.

BREAST CANCER

- *Advanced (locally advanced or metastatic) triple-negative breast cancer (TNBC):*

  FDA approval in TNBC is based on an RCT that studied the addition of Keytruda (pembrolizumab) to standard chemotherapy (paclitaxel, paclitaxel protein-bound, or gemcitabine and carboplatin) relative to chemotherapy alone (placebo arm) in patients with locally recurrent unresectable or metastatic TNBC who had not been previously treated with chemotherapy in the metastatic setting [KEYNOTE-355]. [56] In patients with PD-L1 CPS $\geq$ 10, the addition of Keytruda (pembrolizumab) to standard chemotherapy improved OS, relative to chemotherapy alone.
    * The trial enrolled patients regardless of their PD-L1 status. When it became apparent that there was no PFS difference between the treatment groups, the protocol was amended to change the primary analysis from all comers to the subpopulation with a PD-L1 combined positive score (CPS) $\geq$ 10.
    * In subjects with a PD-L1 CPS of $\geq$ 10, the median PFS was 9.7 months and 5.6 months in the Keytruda (pembrolizumab)/chemotherapy and chemotherapy only treatment arms, respectively. The secondary endpoint was PFS in the PD-L1 CPS $\geq$ 1 subgroup. No difference in PFS was demonstrated in this population.
    * A subsequent analysis reported a statistically significant improvement in median OS for the subpopulation with PD-L1 CPS $\geq$ 10. The median OS was 23.0 months and 16.1 months in the Keytruda (pembrolizumab)/chemotherapy and chemotherapy only treatment arms, respectively [HR 0.73 (95% CI: 0.55, 0.95)]. There was no difference in OS detected between the Keytruda (pembrolizumab) and placebo groups in the subgroup with PD-L1 CPS $\geq$ 1 or in the ITT population ('All comers' regardless of PD-L1 status). [57]
    * NCCN guidelines list the use of Keytruda (pembrolizumab) among recommended therapies for PD-L1-positive advanced TNBC. [9]

- *Neoadjuvant/adjuvant triple-negative breast cancer (TNBC)*:

  FDA approval of Keytruda (pembrolizumab) in combination with chemotherapy as a neoadjuvant therapy and then continued as a single agent as an adjuvant therapy after surgical excision was based on a double-blind, placebo-controlled RCT that compared pembrolizumab (plus chemotherapy) with placebo (plus chemotherapy) and evaluated event-free survival (EFS) as a surrogate endpoint. [KEYNOTE-522] [8,58] The health benefit of the addition of Keytruda (pembrolizumab) to chemotherapy relative to alternatives (chemotherapy alone) for early TNBC is currently unknown. The OS data is not yet mature and EFS is not a validated endpoint for predicting an OS benefit.

  * Patients had newly diagnosed early-stage, high-risk TNBC who had no prior systemic therapy for their disease and were newly diagnosed. Patients with metastatic disease were excluded from the study.
  * Keytruda (pembrolizumab) was given with chemotherapy for eight total 3-week cycles prior to surgical excision and was continued as monotherapy as a single agent for up to 9 additional, 3-week cycles [total of up to one year of Keytruda (pembrolizumab)].
  * There was a relative improvement in EFS reported for patients in the Keytruda (pembrolizumab) arm of the study in a preliminary analysis. OS data is not currently mature.
  * EFS is not a validated endpoint for predicting an OS benefit. Therefore, it is not currently known if Keytruda (pembrolizumab) contributes to a better or a longer life when used in this setting. Results from a future OS analysis are needed to confirm clinical benefit (OS data is not mature).
    - The FDA allows the use of EFS as a surrogate marker for the approval of drugs in early-stage breast cancer; however, its accuracy in predicting clinically relevant outcomes is controversial. [59] This scenario is analogous to the use of PFS (another radiographic surrogate endpoint) for drug approvals for advanced breast cancer where several medications were found to improve PFS without confirmation of any clinical benefit in follow up trials.
    - A recent publication analyzed EFS as a surrogate for OS in early breast cancer. The analysis included 7 studies for this surrogacy analysis. The authors concluded that although EFS moderately correlated with improved OS in early breast cancer in the neoadjuvant setting, the confidence intervals are wide, and the association was not significant. [59]
  * The current NCCN guidelines list the use of adjuvant or neoadjuvant Keytruda (pembrolizumab) among potential treatment options for early-stage, high-risk TNBC. [9]

OTHER INVESTIGATIONAL USES

- Keytruda (pembrolizumab) is actively being studied to determine if there is benefit in treating other types of cancers including multiple myeloma (MM), and ovarian cancer. To date, studies are preliminary and ongoing and the risk versus potential for clinical benefit remains under investigation. [23]

- *Vulvar Cancer*
  * The evidence for Keytruda (pembrolizumab) in vulvar cancer is limited to an ongoing, single-arm, basket study (KEYNOTE-158) in multiple types of solid tumors. The cohort of patients with metastatic and/or unresectable vulvar squamous cell carcinoma consisted of 101 patients. The tumor response rate for this cohort was 10.9% with only 1 complete response. There is no comparative evidence or outcomes data available in this population. [60]
  * The NCCN vulvar cancer guideline lists Keytruda (pembrolizumab) as a potential biomarker-directed systemic therapy for recurrent or metastatic vulvar cancer for tumors that are TMB-H, MSI-H/dMMR, or PD-L1 (CPS) $\geq$ 1. [9]
- *MSI-H Tumors (other than CRC and endometrial carcinoma)*
  * Keytruda (pembrolizumab) is FDA approved as a treatment option for patients with any progressive MSI-H/dMMR solid tumor ("tumor agnostic") when no satisfactory treatment alternatives are available. [8] However, currently there is insufficient evidence to establish the efficacy or safety of Keytruda (pembrolizumab) in patients with other MSI-H/dMMR tumors. [8,61,62]
  * The Accelerated approval of Keytruda (pembrolizumab) for MSI-H or dMMR tumors was based on preliminary tumor response [overall response rate (ORR)] and duration of response (DOR) data from a "basket trial" pooled analysis of 149 patients across five different early phase, open-label trials (90 patients with CRC and 59 non-CRC patients). [61,63]
  * Subjects enrolled in the trial had advanced solid tumors and at least one prior chemotherapy regimen.
    - This tumor agnostic approval includes use in many cancer types that were either not tested in the "basket trial" or were only tested in very low numbers (n < 14) of patients.
    - Fourteen types of solid tumors were represented in the non-CRC cohort of 59 patients. Nine tumor types were represented by only one or two patients.

      No patients with uterine cancer (leiomyosarcoma) were represented in the sample.
  * Subsequently, one non-randomized, single-arm Phase 2 trial evaluated Keytruda (pembrolizumab) for non-CRC MSI-H/dMMR solid tumors.
    - The trial enrolled 233 patients with 27 tumor types.
    - Similar to the basket trial above, ORR was used as the primary endpoint.
    - An ORR of 34% was reported. However, health outcomes are unknown.
    - Endometrial cancer was the most common tumor type (n=49), followed by gastric (n=24), and cholangiocarcinoma (n=22). However, insufficient details were reported to establish if the endometrial tumors were sufficiently treated with standard therapies ("treatment alternatives").
  * Although reported tumor response rates appear promising, it is not known if Keytruda (pembrolizumab) improves tumor response in all MSI-H/dMMR solid tumors, or positively impacts any clinically relevant outcome. Confirmatory studies

are necessary to establish clinical benefit. Therefore, the use of Keytruda (pembrolizumab) for MSI-H/dMMR tumors (other than CRC and endometrial carcinoma, or as detailed in the coverage criteria) is considered investigational.

- *Ovarian cancer*:
  * The evidence for the use of Keytruda (pembrolizumab) is limited to a non-randomized, non-comparative phase 2 trial for advanced recurrent ovarian cancer [KEYNOTE-100]. [64] Although this initial evidence of overall response rate (ORR) is promising, along with other posters reporting single-arm data, there is insufficient data at this time to establish an improvement in clinically meaningful endpoints in ovarian cancer such as survival or quality of life. Therefore, the use of Keytruda (pembrolizumab) for ovarian cancer is considered investigational.
- *Sarcoma (including STS, osteosarcoma)*:
  * There is interest in the use of Keytruda (pembrolizumab) for various soft tissue sarcomas (STS) including liposarcoma, as well as osteosarcoma.
  * Keytruda (pembrolizumab) is included in the NCCN STS guidelines as an option for salvage therapy for certain types of STS, such as undifferentiated pleomorphic sarcoma (UPS). [9] However, the recommendation is based on one phase 2 trial in STS and osteosarcoma which did not meet the primary endpoint. [65]
  * A second trial in osteosarcoma also did not meet the primary endpoint. [66] Additional trials are ongoing. [23] Therefore, the use of Keytruda (pembrolizumab) for STS and osteosarcoma is considered investigational.
- *Small cell lung cancer (SCLC)*:
  * Keytruda (pembrolizumab) received Accelerated approval for metastatic SCLC, based on cohort of patients from single-arm, open-label trials that evaluated tumor response rates as an endpoint with pretreated metastatic (after a platinum-based chemotherapy and at least one other prior systemic regimen). [8,67]
  * However, subsequent trials [KEYNOTE-604] failed to demonstrate a proven health benefit and the company withdrew the FDA indication. [68] Therefore, the use of Keytruda (pembrolizumab) for SCLC is considered investigational at this time.
- *Tumor mutational burden-high (TMB-H) solid tumors*
  * Keytruda (pembrolizumab) received Accelerated FDA approval in patients with solid tumors that have high tumor mutational burden (TMB-H, based on genetic testing) and who have no remaining satisfactory treatment options, based on a 'basket trial' in a small number of patients with tumors that were found to be TMB-H. [8,69] Accelerated approval means that no clinical benefit has yet been demonstrated. The available evidence is of very poor quality. Additional clinical trials are needed to establish clinical benefit.
    - Patients were enrolled based on having TMB-H solid tumors. Inclusion was independent of tumor type or site. Pembrolizumab was given and tumor

size monitored using x-rays, for overall response rate (ORR).

- Small sample size, heterogeneity of tumor types, and lack of clinical outcomes limit interpretation of the data for estimation of clinical benefit.
  - A very small number of types of tumors were represented, only nine at the time of the initial data cut. ORR varied widely across tumor types with some types showing no response (e.g., salivary, thyroid, and mesothelioma).
  - ORR has not been shown to accurately predict clinical benefit such as improved survival, quality of life, or symptom control.
- A high tumor mutational burden (TMB-H) was defined as having 10 or more mutations per megabase (mut/Mb) as determined by the FoundationOne CDx panel. The selection of 10 mut/Mb as a cutoff for administration of Keytruda (pembrolizumab) is arbitrary. Use of this definition is not associated with improvement in any clinically important outcome. Furthermore, this definition is based specifically on the FoundationOne CDx genetic test. Since there is no current standard for determining TMB-high status across different genetic tests, selection of appropriate patients may be confounded.
- TMB is heterogeneous both within and across different tumor types. The extrapolation of this evidence from this small sample of tumors across all tumor types is not a valid predictor of potential for benefit.

* The NCCN compendium generally aligns with the FDA label and recommends Keytruda (pembrolizumab) in TMB-high tumors when there are no other treatment options. [70] However, for the reasons stated above, the use of Keytruda (pembrolizumab) in TMB-H tumors is considered investigational.

Dosing [8]

- Keytruda (pembrolizumab) is administered via intravenous (IV) infusion as follows:
  * ***Earlier stage disease, resected (or planned resection)***
    - ***Earlier-stage NSCLC neoadjuvant/adjuvant setting:*** neoadjuvant treatment with Keytruda (pembrolizumab) in combination with chemotherapy for up to 12 weeks (four doses of 200 mg every 3 weeks) or until disease progression or unacceptable toxicity, followed by surgery (within 20 weeks of starting neoadjuvant therapy), then followed by adjuvant treatment with Keytruda (pembrolizumab) [starting between 4 to 12 weeks after surgery] as a single agent for up to 39 weeks (13 doses of 200 mg every 3 weeks) or until disease recurrence or unacceptable toxicity.
    - ***Early-stage TNBC neoadjuvant/adjuvant setting***: neoadjuvant treatment with Keytruda (pembrolizumab) in combination with chemotherapy for 24 weeks (8 doses of 200 mg every 3 weeks or 4 doses of 400 mg every 6 weeks) or until disease progression or unacceptable toxicity, followed by surgery (3 to 6 weeks after the last neoadjuvant cycle), followed by adjuvant treatment with Keytruda (pembrolizumab) as a single agent for up to 27 weeks (9 doses of 200 mg every 3 weeks or 5

doses of 400 mg every 6 weeks) or until disease recurrence or unacceptable toxicity.

- ***Adjuvant melanoma setting:*** Doses up to 200 mg every 3 weeks until disease progression, for up to a maximum of 18 cycles (12 months, 54 weeks). There is no evidence to establish the efficacy of use beyond 54 weeks in patients with resected melanoma.
- ***Adjuvant RCC setting:*** Doses up to 200 mg every 3 weeks until disease progression, for up to a maximum of 17 cycles (51 weeks). There is no evidence to establish the efficacy of use beyond 51 weeks in patients with resected RCC.
- ***Adjuvant NSCLC setting:*** Doses up to 200 mg every 3 weeks until disease progression, for up to a maximum of 18 cycles (54 weeks). There is no evidence to establish the efficacy of use beyond 54 weeks in patients with resected NSCLC.

* ***Advanced Disease/Stages (unresectable)***

- ***Melanoma (unresectable or metastatic)***: 200 mg IV every 3 weeks until disease progression.
- ***Most all other indications***: 200 mg IV every 3 weeks until disease progression, intolerable AEs, or for up to 24 months in the absence of disease progression.
- ***Hodgkin lymphoma or PMBCL, pediatrics***: 2 mg/kg (up to 200 mg per dose) IV every 3 weeks until disease progression, intolerable adverse events, or for up to 24 months in the absence of disease progression.

* ***Consolidated dosing***: pembrolizumab may be dosed 400 mg every 6 weeks for many labeled indications.

* ***Dose interruptions:*** For patients who have the course of therapy interrupted or doses delayed, dose authorization periods (date range of the authorization) may be extended to allow the full course (such as 12- or 24-months) to be completed, not to exceed the number of doses that would be given in a contiguous period.

* ***Dosing beyond 24 months***: Most Keytruda (pembrolizumab) trials were specifically designed to administer a 24-month treatment course, at which time therapy was stopped and patients observed. However, in clinical practice, ongoing therapy (beyond 24 months) may be warranted in patients with advanced/metastatic disease who have a partial response to, and overall disease stability on Keytruda (pembrolizumab). Per the policy "Quantity limits," pembrolizumab is coverable only "until disease progression." Therefore, use beyond 24 months will not be authorized for patients with documented disease progression.

Appendix 1: FDA-approved PD-1 and PD-L1 blocking monoclonal antibody therapies [a]
Programmed death receptor-1 (PD-1) inhibitors
Jemperli (dostarlimab)
Keytruda (pembrolizumab)
Libtayo (cemiplimab-rwlc)
Loqtorzi (toripalimab)
Opdivo (nivolumab)
Tevimbra (tislelizumab)
Zynyz (retifanlimab)
Programmed death-ligand 1 (PD-L1) inhibitor
Bavencio (avelumab)
Imfinzi (durvalumab)
Tecentriq (atezolizumab)

[a] Or as listed on the FDA.gov website.

Appendix 2: Definition for High-Risk of Renal Cell Carcinoma (RCC) Recurrence [37]
Intermediate-High Risk
- pT2, Grade 4 (histology) or sarcomatoid, N0, M0 (nodes negative, no metastases) **OR** - pT3, Any Grade (histology), N0, M0 (nodes negative, no metastases)
High-Risk
- pT4, Any Grade 4 (histology), N0, M0 (nodes negative, no metastases) **OR** - pT Any Stage, Any Grade (histology), N+, M0 (nodes positive, no metastases)
M1 No Evidence of Disease (NED)
RCC is present not only with the primary kidney tumor but also solid, isolated, soft tissue metastasis that can be completely resected at the time of nephrectomy

T = tumor; N = lymph nodes; M = metastases

Revision History

Revision Date	Revision Summary
9/19/2024	• Broadened coverage criteria for front-line use in combination with carboplatin and paclitaxel in advanced or recurrent endometrial carcinoma to extend to mismatch repair proficient (pMMR) tumors based on emerging evidence in this population which resulted in an expanded FDA indication. • Updated and made language pertaining to advanced disease settings more consistent across the different covered uses (no change to the intent of the policy). • Reorganized criteria under Urothelial Carcinoma to improve the ease of administration (no change to the intent of the policy) • Changed '6 months' to '24 weeks' in criteria III.C. and III.D. for consistency across the policy (no change to the intent of the policy).

Revision Date	Revision Summary
6/20/2024	**Effective 7/15/24:** • Added coverage for locally advanced, FIGO 2014 stage III to IVA cervical cancer with squamous cell carcinoma, adenocarcinoma, or adenosquamous carcinoma for newly diagnosed (untreated) disease when used in combination with chemoradiation. [new indication] • Updated coverage criteria for Keytruda (pembrolizumab) when used in combination with trastuzumab and chemotherapy for locally advanced or metastatic HER2-positive gastric or GEJ in an addition that tumor PD-L1 CPS is >1 based on updated results showing predominance for benefit in this subpopulation. [newly modified FDA indication] • Added coverage for Keytruda (pembrolizumab) when used in combination with chemotherapy for locally advanced or metastatic HER2-negative gastric or GEJ when there has been no prior systemic therapy in the advanced disease setting [new indication]. A criterion was also added to restrict use to tumors with PD-L1 CPS ≥1 based on results suggesting results were driven by this subpopulation. • Added coverage for Keytruda (pembrolizumab) as a front-line therapy for unresectable locally advanced or metastatic biliary tract cancer (BTC) when used in combination with gemcitabine and cisplatin. [new indication] • Updated hepatocellular carcinoma (HCC) criteria by limiting coverage to HCC secondary to hepatitis B virus infection and document Child-Pugh Class A based on a recently completed pivotal trial. The step therapy requirement was updated to make it less specific ('one prior systemic therapy') to reflect changing standards of care over time. [newly modified FDA indication] • Added coverage for Keytruda (pembrolizumab) as a neoadjuvant therapy (in combination with platinum-containing therapy for up to four doses), followed by adjuvant therapy (as monotherapy) for up to 13 additional doses when used for stage II, IIIA, or IIIB non-small cell lung cancer (NSCLC). [new indication] • Updated criteria for Keytruda (pembrolizumab) in locally advanced unresectable or metastatic urothelial carcinoma (UC) to clarify that the patient has not had prior systemic therapy in the advanced disease setting (no change to intent). • Updated 'Quantity limits and Authorization' section to include information for the new indications added above.

Revision Date	Revision Summary
12/7/2023	• Added coverage criteria for adjuvant use in stage IIB and IIC melanoma and removed use in this population from the list of investigational uses. • Added coverage for use as part of a front-line regimen for unresectable endometrial cancer when given in combination with carboplatin/ paclitaxel for dMMR or MSI-H tumors based on evidence that is similar to that for Jemperli (dostarlimab) in this population. • Updated the criteria related to tumor staging under NMIBC to parallel the criteria for Adstiladrin (nadofaragene firadenovec) based on the Keytruda (pembrolizumab) study population and their similar placement in guidelines. • Updated reauthorization criteria to allow for a shortened authorization length for noted potential disease progression.
9/14/2023	Added coverage criteria for use in locally advanced or metastatic urothelial carcinoma when used in combination with Padcev (enfortumab vedotin) as a front-line therapy for patients who are not eligible for cisplatin-containing chemotherapy.
6/15/2023	• Added coverage for adjuvant use in resected NSCLC aligned with label, a newly approved FDA indication. • Updated *Table 1* for Quantity Limits: Earlier stage disease, resected or planned resection (neoadjuvant/adjuvant use) versus advanced disease (unresectable).
12/9/2022	• Deleted requirement that Keytruda (pembrolizumab) be used as monotherapy for relapsed/refractory cHL. • Updated standard language in policy.
7/14/2022	Updated Table 1 to clarify coverable duration of therapy for recurrent/metastatic TNBC and updated wording for operational ease of administration.
6/17/2022	• Added coverage for the following newly FDA approved indications: - Adjuvant use in resected renal cell carcinoma (RCC) with a clear cell component and a high risk of recurrence when there has been no prior systemic therapy. - MSI-H/dMMR endometrial carcinoma after at least one prior systemic therapy. *Note: Removed from list of investigational uses.* • Added adjuvant use in stage IIB and IIC melanoma as investigational.
3/18/2022	Added coverage criteria for high-risk, early-stage TNBC and removed it from the "Not Medically Necessary" section.

Revision Date	Revision Summary
10/15/2021	**Effective 11/15/21:** • Added coverage criteria for newly FDA approved indications: - Front-line use in advanced, HER2-positive gastric and GEJ cancer when used as an add-on to trastuzumab plus chemotherapy - Front-line use in advanced esophageal or GEJ cancer when patient not candidate for surgical resection or definitive chemoradiotherapy, PD-L1 CPS > 10, and given in combination with a platinum plus fluoropyrimidine - Advanced RCC when used in combination with Lenvima (lenvatinib). - Early-stage, high-risk TNBC will be considered 'not medically necessary' and therefore not covered because clinical benefit not yet established. • Added coverage in advanced triple negative breast cancer (TNBC) as first-line therapy in combination with chemotherapy when PD-L1 CPS > 10 based on newly available overall survival data. • Updated coverage in cervical cancer to cover in front-line setting when PD-L1 CPS > 1 when administered in combination with front-line chemotherapy based on newly available overall survival data. • Simplified criteria for endometrial carcinoma criteria to be agnostic to combination therapy. • Removed coverage for use as a third- or subsequent-line therapy for advanced gastric cancer with PD-L1 CPS > 1 because clinical benefit was not shown in confirmatory trials and the indication withdrawn by manufacturer. **Effective 2/1/22:** Change reauthorization from 'may' to 'shall.' Operationally, all approvals will be for six months. Ongoing therapy (beyond six months) will be subject to reauthorization review every six months, for documentation of disease stability or improvement and lack of disease progression.

Revision Date	Revision Summary
4/21/2021	• Added coverage criteria for cSCC, a newly approved FDA indication (effective 5/15/2021). • Added PD-L1-expressing locally advanced unresectable/metastatic TNBC to 'Not Medically Necessary' uses, given the lack of benefit over coverable treatment alternatives (effective 5/15/2021). • Simplification of criteria for cHL and CRC MSI-H criteria (new expanded FDA indications). • Simplified criteria for: GEJ, HNSCC, melanoma, PMBCL, NSCLC, UC/NMIBC, and endometrial carcinoma, for operational clarity (no change to intent). • Reformat of coverage criteria to table format. • Clarified step therapy intent for HCC to HCC-TKI, including Lenvima (lenvatinib). • Removed coverage criteria for SCLC (FDA indication withdrawn). • Updated quantity limitations for new indications. • Updated 'Investigational uses' (added SCLC).
10/28/2020	Updated policy with new TMB-H indication. This indication is considered an 'investigational use' due to the very low quality of the evidence and the lack of proven benefit.
6/15/2020	• Removed references to brand Avastin, Herceptin, and Rituxan from policy to account for upcoming changes in biosimilars policy (dru620). • Added triple-negative breast cancer (TNBC) neoadjuvant/adjuvant data to the "Investigational Uses" section.
4/22/2020	Added coverage criteria for non-muscle invasive bladder cancer (NMIBC), a new FDA indication.
1/22/2020	• Added continuation of therapy (COT) criteria. • Simplified coverage criteria for NSCLC (metastatic disease and no prior checkpoint inhibitor therapy) • Added coverage for the following new coverable uses: SCLC, esophageal cancer, use in the front-line treatment of HNSCC (previously covered only as a subsequent-line therapy), endometrial cancer [in combination with Lenvima (lenvatinib)], and anal SCC - an off-label use, based on the lack of other treatment options and emerging preliminary evidence. • Simplified coverage criteria for resectable melanoma. • Updated quantity limitation section with new indications.
7/24/2019	Updated policy with criteria for coverage in front-line RCC, a new FDA-approved indication; and removed RCC from the list of investigational conditions (effective 8/15/2019).

Revision Date	Revision Summary
4/25/2019	• Added coverage for squamous metastatic NSCLC in combination with chemotherapy, hepatocellular carcinoma (after sorafenib), and adjuvant treatment of melanoma following complete resection (new indications; effective 07/01/2019). • Updated coverage criteria for NSCLC, for ease of administration. • Updated coverage criteria for Merkel Cell Carcinoma, for consistency.
1/8/2019	• Added coverage for metastatic cervical cancer and recurrent or refractory PMBCL (new indications). • Updated quantity limits to include the new indications. • Updated formatting (no change to content/intent).
7/20/2018	• Updated criteria under urothelial carcinoma to clarify coverage in the front-line setting for cisplatin-ineligible patients only when PD-L1 expressing and any platinum-ineligible patients, regardless of PD-L1 expression.
4/20/2018	• Added coverage criteria for gastric or gastroesophageal adenocarcinoma. • Aligned coverage in Hodgkin lymphoma with Opdivo coverage criteria. • Updated quantity limits to include new indication. • Clarified authorization is valid "until disease progression" (no change to intent). • Updated list of conditions considered investigational.
10/13/2017	• Added criteria for one new indication: MSI-H colorectal cancer. • Updated covered quantity for this new indication. • Updated uses considered investigational.
6/9/2017	• Added criteria for three new indications: classical Hodgkin lymphoma, urothelial carcinoma, and combination use with chemotherapy in the front-line treatment of metastatic nonsquamous NSCLC. • Updated covered quantities and durations for these new indications.
3/10/2017	• Clarified NSCLC criteria such that prior use of a PD-L1 inhibitor precludes coverage. • A maximum of 24 months of therapy was defined for use in NSCLC based available evidence and FDA-labeling.
2/17/2017	• Added coverage criteria for metastatic NSCLC in the first-line treatment setting. • Updated quantity limits for NSCLC based on new FDA-labeled dosing.

Revision Date	Revision Summary
11/11/2016	• Added coverage criteria for recurrent or metastatic HNSCC, a newly approved indication for Keytruda (pembrolizumab). • Updated quantity limits to reflect new dosing in HNSCC. • Lowered the level of PD-L1 expression required in the subsequent-line metastatic NSCLC setting based on updated package labeling. • Added first-line use of pembrolizumab in metastatic NSCLC, a new FDA indication, as not medically necessary. • Updated uses considered investigational. • Updated Appendices and cross-referenced policies.
3/11/2016	• Added coverage criteria for metastatic NSCLC, a newly approved indication for Keytruda (pembrolizumab). • Combined several appendices and added additional information pertaining to NSCLC.
12/11/2015	• Clarified that sequential therapy of PD-1 inhibitors (Opdivo/Keytruda) is not a covered use. • Add Appendix 1, with a list of available PD-1 inhibitors. • Add Appendix 3, with a list of other targeted therapies for melanoma.
11/13/2014	New policy.

Medication Policy Manual

Policy No: dru382

Topic: Alpha-1 proteinase inhibitors:
- Aralast NP
- Glassia
- Prolastin-C
- Zemaira

Date of Origin: December 12, 2014

Committee Approval Date: June 20, 2024

Next Review Date: 2024

Effective Date: October 1, 2024

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of medication policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Alpha-1 proteinase inhibitors (Aralast NP, Glassia, Prolastin-C and Zemaira) are IV administered preparations containing alpha-1 antitrypsin (A1AT), a naturally occurring enzyme purified from human blood. They are used in the treatment of alpha-1 antitrypsin deficiency (AATD), a rare genetic disorder that can lead to disease of the lungs (emphysema).

Policy/Criteria

Most contracts require pre-authorization approval of alpha-1 proteinase inhibitors (Aralast NP, Glassia, Prolastin-C, Zemaira), prior to coverage.

I. Continuation of therapy (COT): Alpha-1 proteinase inhibitors may be considered medically necessary for COT when criterion A AND B below are met.

A. One of the following (1, 2, or 3):

1. For diagnoses NOT listed in the coverage criteria below, full policy criteria must be met for coverage.

OR

2. For diagnoses listed in the coverage criteria below, criteria a and b must be met:

a. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

b. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

3. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

AND

B. Site of care administration requirements are met [refer to Pharmacy Services Medication Policy Manual, Site of Care Review, dru408].

***Please note**: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Alpha-1 proteinase inhibitors may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes), that criteria A through D below are met.

A. The diagnosis was established by, or in consultation with, a pulmonologist.

AND

B. A confirmed diagnosis of **alpha-1 antitrypsin deficiency (AATD) outflow obstruction (emphysema)** and one of the following (1 or 2):

1. FEV_1 (post bronchodilation) between 30-65%.

OR

2. Rapid decline in lung function, defined as a FEV_1 decline of more than 120ml over 12 months.

AND

C. Pretreatment alpha-1 antitrypsin (AAT) serum level less than 11 micromol/L (less than 80 mg/dL measured by radial immunodiffusion or less than 50mg/dL measured by nephelometry).

AND

D. Are negative for the MZ genotype of alpha-1 antitrypsin deficiency.

AND

E. Site of care administration requirements are met [refer to Pharmacy Services Medication Policy Manual, Site of Care Review, dru408].

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers alpha-1 proteinase inhibitors coverable only under the medical benefit (as provider-administered medications).

B. When pre-authorization is approved, alpha-1 proteinase inhibitor doses up to 60 mg/kg every week will be authorized.

C. Authorization **may** be reviewed at least annually. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, such as disease stability or improvement.

IV. Use of an alpha-1 proteinase inhibitors is considered investigational when used for all other conditions, including but not limited to:

A. AATD without airflow obstruction (without emphysema), such as AATD-related liver disease or other AATD-related complications.

B. Use in patients with the MZ genotype of AATD.

C. Use in combination with other alpha1-proteinase inhibitor products.

Position Statement

- All alpha-1 proteinase inhibitor (alpha1-PI) products (Aralast NP, Glassia, Prolastin-C, and Zemaira) appear to be similar in biologic activity for slowing progression of emphysema in patients with alpha-1 antitrypsin deficiency (AATD).
- Although the overall net health benefit of alpha1-PI therapy is uncertain, treatment options for patients with moderate to severe emphysema are limited to symptomatic management, aside from lung transplantation.
- There is no evidence of clinically meaningful differences in safety or efficacy between alpha1-PI products. They vary in their reconstitution, time of infusion and storage, and have slight differences in protein composition and chemical structures; however, these differences have not been linked to specific clinical outcomes.
- Consensus guidelines recommend use of alpha1-PI replacement therapy ("augmentation therapy") for treatment of patients WITH airflow obstruction from AATD, but do not differentiate between products.
    * Patients with heterozygous phenotypes should not be treated with alpha1-PIs if the AAT level exceeds 11 micromol/L.
    * Patients with the MZ genotype are not recommended to be treated with alpha-PI's.
    * Guidelines recommend augmentation therapy in patients with an FEV_1 between 30% and 65% or those experiencing a rapid decline in lung function (>120ml/year).
        - There is no high-quality evidence to establish the efficacy of augmentation therapy in patients with FEV_1 less than 30% or greater than 65%, and use in this population is not currently recommended.
- All alpha1-Pis are approved for 60 mg/kg once a week dosing.

Background [1,2]

- Emphysema, from any cause, is a progressive, non-curable disease, leading to decline in lung function (FEV_1), exacerbation of symptoms, decline in ability to function, and death.
- Alpha-1 antitrypsin deficiency (AATD) is a rare inherited genetic disorder, but leads to emphysema in approximately 40,000-60,000 Americans (2-3% of all emphysema patients).
- Smoking increases the risk of emphysema in patients with AATD.
- Deficient alpha-1 antitrypsin levels (A1AT) levels can lead to uninhibited lung and liver tissue breakdown from elastase and manifestations of emphysema, as well as hepatic cirrhosis.
- The ideal A1AT level with alpha1-PI repletion is uncertain. A1AT levels alone do not predict disease, as patients with very low A1AT levels can have normal lung function.
- There are four alpha1-PI products (Aralast NP, Glassia, Prolastin-C, and Zemaira) available for repletion of A1T1 levels ("augmentation therapy"), with a goal of slowing disease progression. [1,2]

Clinical Efficacy

- Alpha1-Pis replete A1AT levels, a surrogate endpoint, and the basis for their FDA approval; however, their effect on attenuation of emphysema progression with clinically meaningful efficacy endpoints (e.g., survival, quality of life) is uncertain. [3]
- Augmentation therapy with alpha1-Pis has not yet been proven to provide benefit in reversing or decreasing outflow obstruction (emphysema) associated with AATD. [4]
- There is no evidence that there is any difference in efficacy between the alpha1-PI products.
- Although there is low certainty in the evidence that alpha1-PI therapy improves health outcomes in patients with emphysema due to AATD, the products in the class appear to be similar in biologic activity.
- Despite the insufficient evidence for health outcomes with alpha1-Pis, treatment options for patients with moderate to severe emphysema are limited to symptomatic management, aside from lung transplantation. [4,5]
- There is no evidence to support the use of doses greater than 60 units/kg weekly. One small, short-term (8-week), safety and pharmacokinetic trial of higher doses of alpha1-PI (Prolastin C) in patients with AATD resulted in higher steady state levels of alpha-1 PI concentrations. However, the effect of these higher alpha-1 PI concentrations on long-term emphysema disease progression is unknown. [6]
- Treatment guidelines recommended use of augmentation therapy with alpha1-Pis for patients **WITH** airflow obstruction from AATD and FEV_1 between 30% and 65%, but do not differentiate between products. Patients should be confirmed nonsmokers or ex-smokers and plasma AAT levels less than 11 mMol/L. Patients with a heterozygous phenotype and AAT levels that exceed 11 mMol/L should not be treated with alpha1-PI augmentation therapy. [5,7]
- There is no evidence that augmentation therapy improves outcomes in patients with the MZ or other heterozygote genotypes that include a normal M gene. Guidelines state that there is neither a biologic nor evidence rationale to support treatment these individuals.[7]
- There is no evidence that augmentation therapy with alpha1-Pis are effective for treatment of AATD-related liver disease, including, hepatic cirrhosis or post liver transplant. Guidelines recommend against the use of alpha1-PIs for AATD-related liver or other AATD-related diseases.[7]

Safety

- Adverse events with alpha1-PIs are generally mild, including headache and malaise. [8]
- There is no conclusive evidence of difference in safety or immunogenicity between alpha1-PIs. [9]

Dosing and Administration [8]

- All alpha1-PIs are dosed once weekly via intravenous infusion.
- Alpha1-PI (Glassia) and Alpha-PI (Prolastin-C) are the only liquid preparations.

Revision History

Revision Date	Revision Summary
6/20/2024	Added **A**lpha-1 proteinase inhibitors to site of care (SOC) program (effective 10/1/2024).
12/7/2023	No criteria changes with this annual review.
12/9/2022	Added criteria excluding patients with MZ genotype in line with guidelines. Clarified who is not recommended by guidelines for therapy in clinical efficacy. No change to intent.
10/15/2021	Updated benefit language in Administration section. Added Prolastin-C to Dosage and Administration section to show that it is also a liquid formulation.
4/22/2021	No criteria changes with this annual update
1/22/2020	Added continuation of therapy (COT) criteria (no change to intent of coverage criteria).
1/31/2019	Added diagnostic criteria requirements in line with clinical guidelines. Clarified documentation requirements.
2/16/2018	No criteria changes with this annual update.
12/16/2016	No criteria changes with this annual update.
12/11/2015	No criteria changes.
12/14/2014	New policy.

Medication Policy Manual | **Policy No:** dru383

Topic: Vectibix, panitumumab | **Date of Origin:** May 1, 2015

Committee Approval Date: July 22, 2020 | **Next Review Date:** July 2021

Effective Date: July 1, 2020

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Panitumumab (Vectibix) is a monoclonal antibody used to treat metastatic colorectal cancer (CRC).

Policy/Criteria

Most contracts require pre-authorization approval of panitumumab (Vectibix) prior to coverage.

I. Continuation of therapy (COT): Panitumumab (Vectibix) may be considered medically necessary for COT when there is clinical documentation (including, but not limited to chart notes) confirming that criteria A. and B. below are met.

A. The patient is established on this therapy AND one of the following situations applies (criteria 1. or 2. below):

1. Prior to current health plan membership AND the medication was covered by another health plan.

Note: If the diagnosis is not listed in the coverage criteria below, written documentation of coverage must be provided, such as an approval letter or paid claim.

OR

2. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission AND there is documented clinical benefit.

AND

B. If the diagnosis is not listed in the coverage criteria below, documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria, is provided.

***Please note**: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. Panitumumab (Vectibix) may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) confirming a diagnosis of metastatic colorectal cancer (CRC) and no RAS mutation is present (for use with KRAS and NRAS wild type tumors only).

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services does not consider panitumumab (Vectibix) to be a self-administered medication.

B. Authorization may be reviewed at least annually. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, such as disease stability or improvement.

IV. Panitumumab (Vectibix) is considered investigational when used for all other conditions, including but not limited to:

A. When used concomitantly with any other targeted therapy, including, but not limited to, bevacizumab

B. Biliary tract cancer

C. Breast cancer

D. Cervical cancer

E. Esophageal adenocarcinoma

F. Gastric cancer

G. Non-small cell lung cancer (NSCLC)

H. Ovarian cancer

I. Pancreatic cancer

J. Renal cell carcinoma

K. Head and neck squamous cell carcinoma (HNSCC)

Position Statement

- Panitumumab (Vectibix), an intravenously administered monoclonal antibody that targets epidermal growth factor receptor (EGFR), has been shown to be safe and effective when used in the treatment of metastatic colorectal cancer (CRC) when no RAS mutation is present.
- The intent of this policy is to cover panitumumab (Vectibix) for the indications, regimen, and dose for which it has been shown to be safe and effective, as detailed in the coverage criteria.
- In CRC, mutations in a specific protein, the RAS protein, are associated with resistance to panitumumab (Vectibix). Therefore, panitumumab (Vectibix) therapy is not effective in CRC when RAS mutations are present (i.e. only effective in KRAS and NRAS wild-type tumors).
- Panitumumab (Vectibix) is being studied in several other types of cancers that overexpress EGFR. However, the evidence is preliminary and larger studies are needed to establish safety and efficacy of panitumumab (Vectibix) in these cancers.

Regence Pharmacy Services performs independent analyses of oncology medication evidence. NCCN clinical practice guidelines assignment of a category 2a/b recommendation does not necessarily establish medically necessity. The Regence Pharmacy Services analysis and coverage policy may differ from NCCN clinical practice guidelines.

Clinical Efficacy

COLORECTAL CANCER

- One large, randomized trial and a high-quality systematic review have evaluated the efficacy of panitumumab (Vectibix) in colorectal cancer (CRC) in different settings.
    * No difference in overall survival was observed between patients with previously untreated (treatment naïve) KRAS wild-type metastatic CRC who received panitumumab plus chemotherapy (FOLFOX) versus chemotherapy alone (FOLFOX). [1]

    * In the second-line setting and beyond, there was no difference in overall survival (OS) observed between panitumumab (Vectibix) monotherapy and best supportive care in KRAS wild-type metastatic CRC. [2]

- A small phase II comparative study evaluated add-on panitumumab (Vectibix) versus add-on bevacizumab in treatment naïve KRAS wild-type metastatic CRC. [3]
    * There was no difference in progression-free survival reported between groups.
    * There was a trend toward improved overall survival with panitumumab (Vectibix) relative to bevacizumab; however, median overall survival has not yet been reached.
- A study comparing panitumumab (Vectibix) monotherapy with cetuximab (Erbitux) monotherapy in patients with KRAS wild-type metastatic CRC who had disease progression or intolerance to several chemotherapy regimens (fluorouracil, oxaliplatin-, and irinotecan-based regimens) detected no difference in OS between the two therapies. [4]
- Further retrospective and prospective analyses of clinical trials of panitumumab (Vectibix) in metastatic CRC demonstrated improvements in overall survival in patients with wild-type NRAS when treated with panitumumab (Vectibix) plus best supportive care compared to patients treated with best supportive care alone.
- The National Comprehensive Cancer Network (NCCN) Colon Cancer and Rectal Cancer guidelines list panitumumab (Vectibix) as an option for advanced or metastatic CRC when given in combination with FOLFOX, FOLFIRI, or irinotecan when no KRAS or NRAS mutation is present. [5,6]
- There is insufficient evidence to support the use of panitumumab (Vectibix) concomitantly with any other targeted therapy, including, but not limited to, bevacizumab.

OTHER CANCERS

- Panitumumab (Vectibix) is being studied in a variety of other cancers, including, but not limited to, non-small cell lung cancer (NSCLC), head and neck squamous cell carcinoma (HNSCC), and renal cell carcinoma (RCC). [7]
    * *NSCLC:* A small (n =19) open-label, dose-escalation phase 2 trial found that panitumumab (Vectibix) in combination with standard chemotherapy was active in the treatment of advanced NSCLC. Larger, well-controlled trials are needed to establish the safety and efficacy of panitumumab (Vectibix) for NSCLC. [8]
    * *RCC:* Panitumumab (Vectibix) demonstrated minimal activity in the treatment of metastatic renal cell carcinoma in an open-label, multicenter, dose-escalating phase 2 trial (n = 88). [8]
    * *HNSCC:* Although panitumumab (Vectibix) has been extensively evaluated in HNSCC, it should not be substituted for cetuximab (Erbitux) in HNSCC.
        o When panitumumab (Vectibix) was added to cisplatin-based chemotherapy in patients with recurrent or metastatic HNSCC (SPECTRUM study), there was no improvement in overall survival (OS) over chemo-therapy alone, and grade 3 and 4 adverse effects were more frequent. [9]

- In a study comparing panitumumab (Vectibix) plus radiotherapy with cisplatin plus radiotherapy (CONCERT-2 study) in patients with unresected, locally advanced HNSCC who had received no prior therapy, local-regional control of the disease at 2 years was inferior in the panitumumab (Vectibix) treatment arm. [10]
- A second study (CONCERT-1 study) comparing (Vectibix) plus chemoradiotherapy with chemoradiotherapy alone showed similar results. [11]
- A phase 2 trial comparing docetaxel/cisplatin with or without panitumumab (Vectibix) as a first-line therapy in patients with recurrent or metastatic HNSCC demonstrated a small numerical improvement in progression-free survival (PFS) in the panitumumab (Vectibix) treatment arm; however, there was no difference in OS. [12]
- The NCCN head and neck treatment guideline does not recommend panitumumab (Vectibix) as a treatment option for HNSCC. [13]

Safety [14]

* Panitumumab (Vectibix) labeling contains a boxed warning for dermatologic toxicity.
* Other potentially serious safety concerns with panitumumab (Vectibix) include pulmonary fibrosis/interstitial lung disease, electrolyte depletion, ocular toxicity, and increased mortality with chemotherapy.

Dosing and Administration [14]

* Panitumumab (Vectibix) is given as an intravenous infusion every 14 days.

- Empaveli, pegcetacoplan
- Fabhalta, iptacopan
- Soliris, eculizumab
- Tavneos, avacopan
- Ultomiris, ravulizumab-cwvz
- Veopoz, pozelimab
- Voydeya, danicopan
- Zilbrysq, zilucoplan

Date of Origin: January 19, 2015

Committee Approval Date: June 20, 2024

Next Review Date: 2025

Effective Date: November 1, 2024

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of medication policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Complement inhibitors are medications that bind to and inhibit the complement protein, preventing proteins from destroying red blood cells. They are used to treat specific rare blood and inflammatory disorders.

PLEASE NOTE: This policy and the coverage criteria below do **not** apply to Syfovre (pegcetacoplan intravitreal) or Izervay (avacincaptad pegol intravitreal solution).

Policy/Criteria

Most contracts require pre-authorization approval of complement inhibitors prior to coverage.

I. Continuation of therapy (COT): Complement inhibitors may be considered medically necessary for COT when criterion A, B, and C below is met.

A. One of the following (1, 2, or 3):

1. For diagnoses NOT listed in the coverage criteria below, criteria a and b must be met:

a. The patient was established on therapy prior to current health plan membership AND there is documentation that the medication was covered by another health plan. Examples of documentation include the coverage approval letter from the previous health plan or paid claim.

AND

b. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

2. For diagnoses listed in the coverage criteria below, criteria a and b must be met:

a. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

b. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

3. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

AND

B. **Soliris (eculizumab) OR Ultomiris (ravulizumab-cwvz) IV only:** Site of care administration requirements are met [refer to Pharmacy Services Medication Policy Manual, Site of Care Review, dru408].

AND

C. "Administration, Quantity Limitations, and Authorization Period" below applies, as well as "Investigational Uses" for combination therapy.

***Please note**: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Complement inhibitors (as listed in *Table 1*) may be considered medically necessary when clinical documentation (including, but not limited to chart notes) that the applicable diagnosis-based criteria below are met.

Table 1:

Diagnosis: Atypical hemolytic uremic syndrome (aHUS) (a form of complement-associated thrombotic microangiopathy [TMA])	
Coverable medication(s)	**AND the following are met:**
• Soliris IV (eculizumab) • Ultomiris IV/SC (ravulizumab-cwvz)	**1.** The diagnosis has been established by or in consultation with a specialist in hematology or nephrology. **AND** **2.** Common causes of typical hemolytic uremic syndrome have been ruled out, including both of the following (criteria i and ii): **1.** Infectious causes of HUS, including Shiga toxin-related hemolytic uremic syndrome has been ruled out. **AND** **2.** Thrombotic thrombocytopenic purpura (TTP) has been ruled out [confirmed by a disintegrin and metalloprotease with thrombospondin type 1 motif, 13 (ADAMTS13) activity ≥10%]. **AND** **3.** *For Soliris (eculizumab) only*: Ultomiris (ravulizumab) has been ineffective as documented by symptom relapse or not tolerated unless there is documented medical contraindication to use. **AND** **4.** *Soliris (eculizumab) OR Ultomiris (ravulizumab-cwvz) IV only*: Site of care administration requirements are met [refer to Pharmacy Services Medication Policy Manual, Site of Care Review, dru408].
Diagnosis: Active severe anti-neutrophil cytoplasmic autoantibody (ANCA) associated vasculitis (granulomatosis with polyangiitis [GPA] and microscopic polyangiitis [MPA])	
Coverable medication(s)	**AND the following are met:**
• Tavneos (avacopan)	**1.** The diagnosis has been established by or in consultation with a rheumatologist**.** **AND**

	2. The patient has been screened for hepatitis B virus and severe hepatic impairment and is negative for both. **AND** **3.** The patient has an EGFR ≥15ml/min and does not require dialysis or a kidney transplant. **AND** **4.** The patient will continue to receive standard of care therapy, including but not limited to, rituximab, cyclophosphamide, glucocorticoids, azathioprine, methotrexate, or mycophenolate mofetil. **AND** **5.** The patient has previously failed induction with standard therapy (rituximab or cyclophosphamide with glucocorticoids) or has relapsed since previously achieving remission within the previous 12 months.
Diagnosis: CD55-deficient protein-losing enteropathy (CHAPLE disease)	
Coverable medication(s)	**AND the following are met:**
• Soliris IV (eculizumab) • Veopoz (pozelimab)	**1.** The diagnosis has been established by a specialist (immunologist, hematologist, gastroenterologist, or medical geneticist.) **AND** **2.** Documented confirmation of the CD55 loss of function genetic mutation. **AND** **3.** *For Veopoz (pozelimab) only:* Soliris IV (eculizumab) has been ineffective (as documented by no clinical response after 3 months of treatment), or not tolerated unless there is documented medical contraindication to use. **AND** **4.** *Soliris (eculizumab) only*: Site of care administration requirements are met [refer to Pharmacy Services Medication Policy Manual, Site of Care Review, dru408].

Diagnosis: Refractory myasthenia gravis (MG)	
Coverable medication(s)	**AND the following are met:**
• Soliris IV (eculizumab) • Ultomiris IV (ravulizumab-cwvz) • Zilbrysq (zilucoplan)	**1.** The diagnosis has been established by or in consultation with a neurologist who is a sub-specialist in neuromuscular disorders. **AND** **2.** A positive serologic test for anti-acetylcholine receptor (anti-aChR) antibodies. **AND** **3.** Prior to starting complement inhibitor therapy, there is documentation of a myasthenia gravis activities of daily living (MG-ADL) score of greater than or equal to 6. **AND** **4.** Both the following (criteria i and ii) have been ineffective (lack of MG symptom control or relapse as verified by a MG scoring tool), or not tolerated unless there is documented medical contraindication to use: **i.** The patient has had a thymectomy. **AND** **ii.** At least ONE neonatal Fc receptor (FcRn) antagonist [Rystiggo (rozanolixizumab), Vyvgart/Vyvgart Hytrulo (efgartigimod)]. **AND** **5.** *Soliris (eculizumab) OR Ultomiris (ravulizumab-cwvz) IV only*: Site of care administration requirements are met [refer to Pharmacy Services Medication Policy Manual, Site of Care Review, dru408].
Diagnosis: Neuromyelitis Optica Spectrum Disorder (NMOSD)	
Coverable medication(s)	**AND the following are met:**

• Soliris IV (eculizumab) • Ultomiris IV (ravulizumab-cwvz)	**1.** The diagnosis has been established by or in consultation with a neurologist. **AND** **2.** Documentation of a positive serologic test for aquaporin-4 immunoglobulin (AQP4-IgG) antibodies. **AND** **3.** Rituximab has been ineffective as documented by symptom relapse after completion of induction (at least one month after the first dose of rituximab) or not tolerated unless there is documented medical contraindication to use. **AND** **4.** *For Soliris (eculizumab) only*: Ultomiris (ravulizumab) and Enspryng (satralizumab) and Uplizna (inebilizumab) have been ineffective as documented by symptom relapse or not tolerated unless there is documented medical contraindication to use. **AND** **5.** Site of care administration requirements are met [refer to Pharmacy Services Medication Policy Manual, Site of Care Review, dru408].
Diagnosis: Paroxysmal nocturnal hemoglobinuria (PNH)	
Coverable medication(s)	**AND the following are met:**
• Empaveli (pegcetacoplan) • Fabhalta (iptacopan) • Soliris IV (eculizumab) • Ultomiris IV/SC (ravulizumab-cwvz) • Voydeya (danicopan)	**1.** The diagnosis has been confirmed by high sensitivity flow cytometry and established by or in consultation with a specialist in hematology. **AND** **2.** The complement inhibitor will be used in one of the following two settings, based on prior therapy used (i or ii): **i.** **For complement-naïve PNH** [Empaveli, (pegcetacoplan), Soliris (eculizumab), and Ultomiris IV/SC (ravulizumab-cwvz) only]: both of the following criterion (a and b) below are met: **a.** One of the following criteria (1 or 2) below are met: **1.** Transfusion-dependence prior to initiation of complement inhibitor

	treatment. ***PLEASE NOTE:*** *Transfusion-dependence is defined as at least one transfusion in the previous 24 months due to documented hemoglobin < 9 g/dL in patients with symptoms from anemia or < 7 g/dL regardless of symptoms.* **OR** **2.** A history of a major adverse vascular event from thromboembolism, including but not limited to: deep vein thrombosis (DVT), pulmonary embolism (PE), myocardial infarction (MI), ischemic stroke, peripheral arterial disease (PAD), and/or Budd-Chiari syndrome. **AND** **b.** *For Soliris (eculizumab) only*: Ultomiris (ravulizumab) has been ineffective as documented by symptom relapse or not tolerated unless there is documented medical contraindication to use. **OR** **ii. <u>For complement-experienced PNH</u>** [*Empaveli (pegcetacoplan), Fabhalta (iptacopan), and Voydeya (danicopan) only]*, when breakthrough symptoms despite at least 6 months of C5 inhibitor [Soliris (eculizumab) or Ultomiris (ravulizumab)], defined as either criterion (a or b) below are met: **a.** Transfusion-dependence. ***PLEASE NOTE:*** *Transfusion-dependence is defined as at least one transfusion in the previous 6 months due to documented hemoglobin < 9 g/dL in patients with symptoms from anemia or < 7 g/dL regardless of symptoms.* **OR** **b.** A major adverse vascular event from thromboembolism, including but not limited to: deep vein thrombosis (DVT), pulmonary embolism (PE), myocardial

	infarction (MI), ischemic stroke, peripheral arterial disease (PAD), and/or Budd-Chiari syndrome. **AND** **3.** *Soliris (eculizumab) OR Ultomiris (ravulizumab-cwvz) IV only*: Site of care administration requirements are met [refer to Pharmacy Services Medication Policy Manual, Site of Care Review, dru408].

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers Empaveli SC (pegcetacoplan), Fabhalta oral (iptacopan), Tavneos oral (avacopan), Ultomiris SC (ravulizumab-cwvz), Voydeya oral (danicopan), and Zilbrysq SC (zilucoplan) coverable only under the pharmacy benefit (as self-administered medications).

B. Regence Pharmacy Services considers Soliris IV (eculizumab), Ultomiris IV (ravulizumab-cwvz), or Veopoz IV/SC (pozelimab) coverable only under the medical benefit (as provider-administered medications).

C. When pre-authorization is approved, complement inhibitors will be covered in quantities as follows:

1. **Initial Authorization**: Up to the dose and duration, as listed below in *Table 2*:

Table 2. Initial Authorization

Indication	Authorization Limits
PNH	**Empaveli (pegcetacoplan):** Up to **48** (1080 mg) **vials** in a **24-week period**, based on SC twice weekly dosing.
	Fabhalta (iptacopan): Up to **60 (200 mg) capsules** in a **30- day period** based on twice daily oral dosing.
	Soliris (eculizumab): Up to **18** IV infusions in a **24-week period**, based on weekly dosing for five weeks, followed by maintenance dosing every 2 weeks thereafter.
	Ultomiris (ravulizumab-cwvz): **IV**: Pediatrics (<20 kg): Up to **eight** IV infusions in a **24-week period**, based on a loading dose at week 0, followed by maintenance dosing at week 2 and every 4 weeks thereafter. **IV**: Adults and Pediatrics (≥20 kg): Up to **five** IV infusions in a **24-week period**, based on a loading dose at week 0, followed by maintenance dosing at week 2 and every 8 weeks thereafter. **SC**: Adults (≥40 kg): Up to **24 doses in a 24-week period** (not to exceed 490 mg/dose), based on dose of 490 mg SC once weekly.
	Voydeya (danicopan): up to **180 (50 mg or 100 mg) tablets** in a **30-day period** based on three times daily oral dosing.

Indication	Authorization Limits
aHUS	**Soliris (eculizumab):** Pediatrics (<10 kg): Up to **10** IV infusions in a **24-week period**, based on induction dosing weekly for two weeks, followed by maintenance dosing every 3 weeks thereafter. Pediatrics (10 kg to <20 kg): Up to **14** IV infusions in a **24-week period**, based on induction dosing weekly for two weeks, followed by maintenance dosing every 2 weeks thereafter. Pediatrics (20 kg to <40 kg): Up to **16** IV infusions in a **24-week period**, based on induction dosing weekly for three weeks, followed by maintenance dosing every 2 weeks thereafter. Adults and Pediatrics (≥40 kg): Up to **18** IV infusions in a **24-week period**, based on induction dosing weekly for five weeks, followed by maintenance dosing every 2 weeks thereafter.
	Ultomiris (ravulizumab-cwvz): **IV**: Pediatrics (<20 kg): Up to **eight** IV infusions in a **24- week period**, based on a loading dose at week 0, followed by maintenance dosing at week 2 and every 4 weeks thereafter. **IV**: Adults and Pediatrics (≥20 kg): Up to **five** IV infusions in a **24-week period**, based on a loading dose at week 0, followed by maintenance dosing at week 2 and every 8 weeks thereafter. **SC**: Adults (≥40 kg): Up to **24 doses in a 24-week period** (not to exceed 490 mg/dose), based on dose of 490 mg SC once weekly.
MG	**Soliris (eculizumab):** Up to **18** IV infusions in a **24-week period**, based on induction dosing weekly for five weeks, followed by maintenance dosing every 2 weeks thereafter.
	Ultomiris (ravulizumab-cwvz): IV: Up to **five** IV infusions in a **24- week period**, based on a loading dose at week 0, followed by maintenance dosing at week 2 and every 8 weeks thereafter.
	Zilbrysq (zilucoplan): Up to **one syringe per day for 24 weeks**, based on a weight-based dose <56kg=16.6mg; 56kg to <77kg=23 mg; or ≥77kg=32.4mg SC daily.
NMOSD	**Soliris (eculizumab):** Up to **fifteen** IV infusions in a **24-week period**, based on induction dosing weekly for five weeks, followed by maintenance dosing every 2 weeks thereafter.
	Ultomiris (ravulizumab-cwvz): Adults (≥40 kg): **IV**: Up to **five** IV infusions in a **24- week period**, based on a loading dose at week 0, followed by maintenance dosing at week 2 and every 8 weeks thereafter.
CHAPLE	**Soliris (eculizumab):** Pediatrics (<10 kg): Up to **nine** IV infusions in a **24-week period**, based on induction dosing weekly for two weeks, followed by maintenance dosing every 3 weeks thereafter. Pediatrics (10 kg to <40 kg): Up to **thirteen** IV infusions in a **24-week period**, based on induction dosing weekly for up to 3 weeks, followed by maintenance dosing every 2 weeks thereafter. Adults and Pediatrics (≥40 kg): Up to **fourteen** IV infusions in a **24-week period**, based on induction dosing weekly for five weeks, followed by maintenance dosing every 2 weeks thereafter.
	Veopoz (pozelimab): Up to **24 doses in** a **24-week period,** based on single one-time IV loading dose infusion on day 1 followed by weekly SC injections every week thereafter
ANCA-AV	**Tavneos (avacopan):** Up to 3 oral tablets twice daily (not to exceed 60mg per day) for 6 months.

2. **Continued Authorization:** Up the dose and duration listed below in *Table 3*:

Table 3. Continued Authorization

Indication	Soliris (eculizumab)
PNH	**Fabhalta (iptacopan):** Up to **60 (200 mg) capsules** in a **30-day** period based on twice daily oral dosing.
	Empaveli (pegcetacoplan): PNH (stable): Up to **104** (1080 mg) **vials** in a **52-week period,** based on SC twice weekly dosing. **PNH with breakthrough hemolysis** [LDH > 2x ULN, on twice weekly Empaveli: Up to **ten** (1080 mg) vials per 30 days over a **24-week period.**
	Soliris (eculizumab): **PNH (stable)**: Up to **26** IV infusions in a **52-week period**, based on maintenance dosing every **2 weeks**. **PNH with breakthrough hemolysis on every 2-week Soliris:** • Up to **31** IV infusions in a **52-week period**, based on a max dose of 900 mg every **12 days**
	Ultomiris (ravulizumab-cwvz): IV: Up to **seven** infusions in a **52-week period**, based on maintenance dosing every 8 weeks. **SC:** Up to **104 doses in a 52-week period** (not to exceed 490 mg/dose), based on dose of 490 mg SC once weekly.
	Voydeya (danicopan): up to **180 (50 mg or 100 mg) tablets** in a **30-day period** based on three times daily oral dosing.
aHUS	**Soliris (eculizumab):** Pediatric Patients (<10 kg): Up to **18** IV infusions in a **52-week period**, based on maintenance dosing every **3 weeks**. Adults and Pediatrics (≥10 kg): Up to **26** IV infusions in a **52-week period**, based on maintenance dosing every **2 weeks**.
	Ultomiris (ravulizumab-cwvz): IV: Pediatric Patients (<20 kg): Up to **13** IV infusions in a **52-week period**, based on maintenance dosing every **4 weeks**. **IV**: Adults and Pediatrics (≥20 kg): Up to **seven** IV infusions in a **52-week period**, based on maintenance every **8 weeks**. **SC**: Up to **104 doses in a 52-week period** (not to exceed 490 mg/dose), based on dose of 490 mg SC once weekly.
MG	**Soliris (eculizumab):** Up to **26** IV infusions in a **52-week period**, based on maintenance dosing every **2 weeks**.
	Ultomiris (ravulizumab-cwvz): IV: Up to **7** IV infusions in a **52-week period**, based on maintenance dosing every 8 weeks.
	Zilbrysq (zilucoplan): Up to one syringe per day for 52 weeks, based on a weight-based dose of <56kg=16.6mg; 56kg to <77kg=23 mg; or ≥77kg=32.4mg SC daily.

Indication	Soliris (eculizumab)
NMOSD	**Soliris (eculizumab):** Up to **26** IV infusions in a **52-week period**, based on maintenance dosing every **2 weeks**.
	Ultomiris (ravulizumab-cwvz): IV: Up to **7** IV infusions in a **52-week period**, based on maintenance every **8 weeks**.
CHAPLE	**Soliris (eculizumab):** Pediatric Patients (<10 kg): Up to **eighteen** IV infusions in a **52-week period**, based on maintenance dosing every **3 weeks**. Adults and Pediatrics (≥10 kg): Up to **26** IV infusions in a **52-week period**, based on maintenance dosing every **2 weeks**.
	Veopoz (pozelimab): Up to **52 SC injections in a 52- week period** based on weekly SC dosing
ANCA-AV	**Tavneos (avacopan):** Up to 3 tablets orally twice daily (not to exceed 60mg per day) for 12 months.

3. **Supplemental dosing** may be given according to label, as follows:

a. Soliris (eculizumab): after plasma exchange/plasmapheresis (PLEX) or fresh frozen plasma (FFP) infusion.

b. Ultomiris (ravulizumab): after plasma exchange/plasmapheresis (PLEX) or intravenous immunoglobulin (IVIG).

4. Use of doses in excess of those listed above (in *Tables 1* and *2*) are considered not medically necessary.

D. Authorization **shall** be reviewed as follows (per the authorization time frames, as specified in *Tables 1* and *2*) to confirm that current medical necessity criteria are met and that the medication is effective.

1. **For all indications**: Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met and that the medication is providing clinical benefit, including disease stability or improvement must be provided, relative to baseline symptoms.

2. **In addition, the following diagnostic-specific** clinical documentation must be provided:

a. **For MG**: A standard disease scoring tool must be included, such as the total myasthenia gravis activities of daily living (MG-ADL) score, total quantitative myasthenia gravis (QMG) score, and/or myasthenia gravis composite (MGC) scale.

b. **For NMOSD:** There must be a reduction of clinical relapse OR provider attestation has been received that patient is continuing to have clinical benefit (stability or improvement) and continued therapy is medically necessary.

c. **For CHAPLE:** There must be a reduction in baseline symptoms such as visceral and peripheral edema, diarrhea, and abdominal pain, AND/OR a reduction in the need for supportive care including infusions of albumin and/or immunoglobulin, corticosteroid use, and hospitalizations.

IV. Complement inhibitors (as listed in *Tables 1* and *2*) are considered investigational when used for all other conditions, including but not limited to:

A. Amyotrophic lateral sclerosis (ALS).

B. Delayed hemolytic transfusion reaction in sickle cell disease.

C. Deposit disease/C3 glomerulonephritis.

D. Hemolytic cold agglutinin disease.

E. Ocular myasthenia gravis.

F. Myasthenia gravis with MUSK antibodies or antibodies other than anti-ACh-R.

G. Non-exudative (dry) macular degeneration.

H. Preeclampsia with hemolysis, elevated liver enzymes and low platelets (HELLP) syndrome.

I. Prevention of delayed graft rejection.

J. Shiga toxin E. coli-related hemolytic uremic syndrome (STEC-HUS) Systemic lupus erythematosus.

K. Thrombotic thrombocytopenic purpura (TTP).

L. For NMOSD: Use of multiple targeted therapies for NMOSD, including but not limited to complement inhibitors (such as Ultomiris [ravulizumab-cwvz], Soliris [eculizumab], anti-CD20 therapy [rituximab product], anti-CD19 therapy [Uplizna (inebilizumab)], or anti-IL6 therapy [Actemra (tocilizumab)], Enspryng (satralizumab)].

M. For PNH: Combination use of the following complement inhibitors (Empaveli [pegcetacoplan], Fabhalta [iptacopan], Soliris [eculizumab], Ultomiris [ravulizumab-cwvz]).

N. Use of Fabhalta (iptacopan) in C5-inhibitor naïve PNH.

O. For gMG: Use in combination with other targeted therapies for MG, such as FcRn antagonists (Vyvgart [efgartigimod] or Rystiggo [rozanolixizumab]) or IVIG maintenance therapy.

P. Eosinophilic granulomatosis with polyangiitis (EPGA, formerly known as Churg-Strauss Syndrome).

Q. Hidradenitis Suppurativa.

R. Use of Tavneos (avacopan) for aHUS.

S. Use of Tavneos (avacopan) for non-severe ANCA- associated vasculitis.

T. Use of Veopoz (pozelimab) for aHUS, MG, NMOSD, or PNH.

Position Statement

- Complement inhibitors (as listed in *Table 1*) are monoclonal antibodies that bind to complement proteins and inhibit activation of the complement pathway.
    * Empaveli (pegcetacoplan), Fabhalta (iptacopan), and Voydeya (danicopan) are proximal complement inhibitors.
    * Soliris (eculizumab), Ultomiris (ravulizumab-cwvz), Veopoz (pozelimab), and Zilbrysq (zilucoplan) are terminal complement inhibitors, also referred to as complement 5 inhibitors ("C5 inhibitors").
    * Tavneos (avacopan) is an orally administered complement 5a (C5a) receptor antagonist that inhibits the C5a-mediated neutrophil activation and migration pathway.
- The intent of the policy is to allow for coverage of complement inhibitors for the specific diagnoses for which they have been studied (as outlined in the coverage criteria), when managed by a specialist, limit to more severe disease and encourage the use of lower cost therapies (when appropriate), and limit coverage to doses studied and shown to be safe and effective in clinical trials. For diagnoses with multiple targeted treatment options for refractory disease, including compliment inhibitors, higher cost targeted treatment options are coverable only when lower cost targeted treatments are not an option.
    * Where there is lack of proven additional benefit and/or lack of demonstrated health outcomes relative to alternative therapies, use of complement inhibitors alone or in combination with other therapies is not coverable ("not medically necessary" or "investigational").
    * It is important to note that a medication being FDA approved for a specific indication does not, in itself, make the treatment medically reasonable and necessary.
- Ultomiris (ravulizumab-cwvz) is a complement inhibitor that is a derivative of Soliris (eculizumab) with a more convenient, extended dosing regimen. It is coverable only for the indications for which it has been studied and the dose is known, as detailed in the coverage criteria.
- Tavneos (avacopan) is FDA approved for adjunctive use in severe active anti-neutrophil cytoplasmic autoantibody (ANCA)-associated vasculitis, including granulomatosis with polyangiitis (GPA) and microscopic polyangiitis (MPA) in combination with standard therapy. However, the health plan considers use in newly diagnosed patients to be non-coverable as this regimen has not adequately been demonstrated to provide any superior benefit versus the lower-cost standard of care treatment options.
- Veopoz (pozelimab) approved only for use in CD55-deficient protein-losing enteropathy, also known as CHAPLE disease is only coverable when the lower cost alternative Soliris (eculizumab) has been ineffective or not tolerated.

Paroxysmal nocturnal hemoglobinuria (PNH) summary

- PNH is a rare and life-threatening blood disorder, characterized by a reduced (type II) or deficient (type III) glycosylphosphatidylinositol (GPI)-linked proteins from the surface of red blood cells. The GPI-linked protein CD59 blocks the formation of the terminal complement

complex, preventing cell lysis. In the absence of CD59, red blood cells are susceptible to complement-mediated lysis leading to anemia, hemoglobinuria, and other complications. [1 2]

- There are few treatment options for patients with PNH.
  * Active monitoring of the patient is appropriate for those with mild disease; however, most will require palliative therapy. Treatment is not standard, as the approach to treatment is specific to the manifestations of each patient's disease. Blood transfusions, anticoagulation, and supplementation with folic acid or iron may be required. [3]
  * Allogeneic hematopoietic cell transplantation (HCT) is the only curative therapy for PNH and is typically reserved for only the most severe patients due to barriers such as high rates of morbidity and mortality, and lack of suitable donors. [4]
  * FDA-approved therapies for PNH include terminal complement inhibitors [C5 inhibitors Soliris (eculizumab) and Ultomiris (ravulizumab-cwvz)], and proximal inhibitors [Empaveli (pegcetacoplan), Fabhalta (iptacopan), Voydeya (danicopan)]. These treatments are not curative, so patients are treated indefinitely. [3]
  * C5 inhibitors, including Ultomiris (ravulizumab and Soliris (eculizumab), have become the standard of care for PNH, as clinical experience has shown their utility in reducing symptoms and thrombosis. More recently, proximal inhibitor Empaveli (pegcetacoplan) has also been shown to be safe and effective as an alternative to C5 inhibitor use in complement-naïve PNH.
  * Some patients continue to have breakthrough symptoms despite treatment with standard doses of C5 inhibitors [Ultomiris (ravulizumab and Soliris (eculizumab)]. Proximal inhibitors [Empaveli (pegcetacoplan), Fabhalta (iptacopan), or Voydeya (danicopan)] may be coverable when standard of care C5 inhibitors are ineffective or not a treatment option for complement-experienced PNH.
    - In the pivotal trials of Fabhalta (iptacopan) and Voydeya (danicopan) for treatment-experienced PNH, patients were established on at least 6 months of C5-inhibitor therapy and having breakthrough symptoms. Most patients had at least one transfusion in the 6 months prior to the study. [5-8]
    - Empaveli (pegcetacoplan) has also been studied in complement-naive PNH, as well as complement-experienced PNH.
- There is no scientific basis to prefer one FDA-approved C5 inhibitor over another (by mechanism of action); given similar efficacy and safety, most contracts consider more costly products not medically necessary. Specifically, at this time, Ultomiris (ravulizumab) is the lower cost C5 inhibitor for PNH. Therefore, higher cost C5 inhibitor, Soliris (eculizumab), is coverable only when the overall lower cost option, Ultomiris (ravulizumab), is not a treatment option.
- According to the American Society of Hematology (ASH) guidelines, complement inhibitor therapy should be considered in patients with significant symptoms from

hemolysis that are not adequately managed with transfusion. Additionally, most patients included in clinical trials received transfusions prior to enrollment=.[9]

- Thrombosis is a common manifestation of PNH and the leading cause of mortality in this population. Due to the severity of the condition, lack of treatment options, and long-term data that suggests efficacy in preventing thrombotic events, complement inhibitor therapy is appropriate for secondary prevention in patients who have experienced a cardiovascular event due to thrombosis, regardless of transfusion history. For patients with underlying bone marrow failure from aplastic anemia, therapy should target the underlying bone marrow failure, as these patients are less likely to experience benefit from complement inhibitor therapy. [3]
- Treatment with complement inhibitors (C5 inhibitors and proximal inhibitors) may be considered effective if there is a decrease in the number of transfusions or disabling symptoms, stabilization of hemoglobin levels, a reduction in thrombotic events, and/or an improvement in quality of life.
- Complement Inhibitors (*as listed in Table 1*) may be covered for PNH at the doses proven to be safe and effective in clinical trials.
- *Higher dosing for refractory PNH*: For breakthrough hemolysis with PNH, Soliris (eculizumab) can be dosed more frequently (at 900 mg every 12 days). However, higher dosing of Soliris (eculizumab) (1200 mg every 14 days) is considered 'not medically necessary," as is more costly but not proven to be safer or more effective than more frequent dosing for breakthrough PNH. In addition, there are several complement inhibitor options now available for breakthrough PNH, including Empaveli (pegcetacoplan), Fabhalta (iptacopan), and Voydeya (danicopan). For breakthrough hemolysis with PNH when LDH exceed two times the upper limit of normal (ULN), Empaveli (pegcetacoplan) can be dosed at 1080 mg every three days.

Atypical hemolytic uremic syndrome (aHUS) summary

- Hemolytic uremic syndrome (HUS) is a condition caused by the premature destruction of red blood cells and is characterized by microangiopathic hemolytic anemia, thrombocytopenia, and acute kidney injury (>95% of patients). [11] Acute presentation may also include neurological findings (including seizures), gastrointestinal symptoms, and cardiovascular involvement (including hypertensive emergency and acute coronary events. Chronic kidney disease (CKD) is the most common long-term sequelae, including the need for dialysis. [12]
    * The most common cause of HUS is infection, with most cases in the United States being associated with Shiga toxin-producing E. coli. There are no randomized, controlled trials that show complement inhibitors are safe or effective in the treatment of infectious-HUS.
    * Non-infectious HUS, known as atypical hemolytic uremic syndrome (aHUS), typically results from complement abnormalities. However, aHUS is a diagnosis of EXCLUSION, meaning the diagnosis of aHUS is made by excluding other primary thrombotic microangiopathy (TMA) syndromes, such as TTP or infectious HUS.

    * As a complement-related TMA, aHUS is also referred to as complement-related HUS. [4 11 13]

- Thrombotic thrombocytopenic purpura (TTP) is group of syndromes in which patients usually present with thrombocytopenia and microangiopathic hemolytic anemia. Despite similarities in clinical features, the underlying mechanisms of aHUS and TTP differ, altering the manner in which patients respond to different therapies.
- TTP results from mutations in the gene encoding a disintegrin and metalloprotease with thrombospondin type 1 motif, 13 (ADAMTS13). Patients who are severely ADAMTS13 deficient, defined as ADAMTS13 activity <10%, have a confirmed diagnosis of TTP and may not respond to complement-inhibitor therapy.
    * There are no randomized, controlled trials that show complement inhibitors are safe or effective in the treatment of TTP. [13 14]
- Soliris (eculizumab) and Ultomiris (ravulizumab-cwvz) are FDA-approved for complement-medicated HUS (aHUS). There are no objective biomarkers to confirm a diagnosis of aHUS; however, TTP-HUS can be ruled out if severe ADAMTS13 deficiency is not present (ADAMTS13 activity ≥ 10%). As complement inhibitors, Soliris (eculizumab) and Ultomiris (ravulizumab-cwvz) target the underlying mechanism behind aHUS, binding to the complement protein C5 and prevent the formation of proinflammatory molecules. [15] However, complement testing is not universally used, as normal complement levels do not exclude a diagnosis of aHUS. [13]
- Prior to the availability of complement inhibitors, the treatment of choice for aHUS was plasma exchange/plasmapheresis (PLEX) or transfusion plus supportive care. Patients undergoing plasma exchanges are prone to complications including fluid-imbalance, catheter-related complications, and anaphylactic reactions. While most patients respond to plasmapheresis, patients remain at risk for chronic kidney injury. [15 16]
- Evidence of efficacy of certain complement inhibitors primarily comes from positive open-label, single arm trials, retrospective reviews, and case studies.
- Despite a lack of high-quality evidence, complement inhibitors are an important treatment option for patients with aHUS. [17] However, there are still many unknowns about complement inhibitors including evidence of efficacy for meaningful clinical outcomes, such as mortality, comparative efficacy with plasmapheresis, long term safety, and validated strategies for starting and stopping therapy.
- Treatment with certain complement inhibitors may be considered effective if treatment results in a decrease in the signs of thrombotic microangiopathy (TMA), indicated by normalization of platelet counts and lactate dehydrogenase (LDH) levels.
- There is no evidence that Soliris (eculizumab) is more effective than other compliment inhibitors (targeted aHUS product), Ultomiris (ravulizumab). Among the FDA-approved agents for refractory aHUS, Ultomiris (ravulizumab) is a lower cost option with lower administration burden. There is no scientific basis to prefer one FDA-approved targeted aHUS product over another; given similar efficacy and safety, most contracts consider more costly products not medically necessary.
- Currently there is insufficient evidence to establish the safety and efficacy of Tavneos (avacopan), an oral complement antagonist, for aHUS.

Refractory myasthenia gravis (MG) summary

- Myasthenia gravis (MG) is a rare autoimmune disease arising from T cell-dependent immunologic attack of AChR, muscle-specific tyrosine kinase (MuSK), and/or other receptors found on the postsynaptic neuromuscular junction, resulting in striated muscle weakness.
- MG presents with painless, fluctuating, fatigable weakness of specific muscle groups. Initially, patients most frequently present with ocular MG of the eyelids and extraocular muscles, presenting with asymmetric ptosis and diplopia. As weakness extends beyond ocular muscles, the disease progresses into generalized MG (gMG).
- Approximately 10-15% of all MG cases consist of refractory gMG that presents with severe debilitating muscle weakness despite substantial use of long-term corticosteroids or multiple steroid-sparing immunosuppressive agents, resulting in substantial negative effects on activities of daily living and quality of life.
- Complement inhibitors, Soliris (eculizumab),Ultomiris (ravulizumab-cwvz) and Zilbrysq (zilucoplan), provide newer treatment options for refractory gMG. While the clinical data is promising, there are several limitations in the body of evidence. Use should be limited to patients who have failed other options, as detailed in the coverage criteria.
- Standard therapies recommended by treatment guidelines for management of MG include acetylcholinesterase (ACh) inhibitors (pyridostigmine), corticosteroids, various DMARDs for immunosuppressant therapy (IST), intravenous immunoglobulin (IVIG), plasmapheresis/plasma exchange (PLEX), and thymectomy. [18-23]
    * Acetylcholinesterase inhibitors are used for temporary symptomatic relief of MG symptoms, by slowing the breakdown of acetylcholine at the neuromuscular junction. However, their use is limited as an adjunct therapy to immunotherapy in those with residual or refractory MG or for treatment of ocular and mild gMG in those who cannot receive immune suppression. [20]
    * Corticosteroids are the most widely used immune modulator for MG. Corticosteroids are effective in ocular MG and in patients with gMG with unsatisfactory responses to acetylcholinesterase inhibitors; however, they are associated with significant dose-dependent adverse events and should not be used for extended durations. [21]
    * Azathioprine, cyclosporine, and mycophenolate mofetil are standard on-steroid immunosuppressant therapy (IST) and act as steroid-sparing agents. Other options include cyclophosphamide, methotrexate, and tacrolimus. [18 19 22]
        - Onset of effect is slow (up to 9-12 months). Once goals are met, steroids may be slowly tapered; however, many patients require long-term low-dose steroids for symptom control.
        - Guidelines recommend dose adjustments no more frequently than every 3 to 6 months.
        - Once treatment effective is achieved and doses are maintained for six months to two years of therapy, IST doses should be tapered to the lowest effect dose.

* Plasma exchange/plasmapheresis (PLEX) and IVIG provides short-term symptomatic relief during exacerbations for surgical preparation or in patients with septicemia through downregulating autoantibodies and/or inducing anti-idiopathic antibodies. However, IVIG may be a maintenance treatment option for patients intolerant to or not responding to an adequate course of non-steroid IST. [23]
* Patients with thymoma should undergo thymectomy. In non-thymomatous patients, thymectomy is a treatment option to minimize need for immunotherapy (either avoid, dose minimize, or use for refractory MG symptoms). However, thymectomy may not be medically possible in unstable MG patients. [18 19]
* There is no evidence that complement inhibitors are more effective than other targeted MG products such as neonatal Fc receptor (FcRn) antagonists Vyvgart (efgartigimod) or Rystiggo (rozanolixizumab). Among the FDA-approved agents for deeply refractory gMG, FcRn antagonists are lower cost options. Among the complement inhibitors, Ultomiris (ravulizumab) and Zilbrysq (zilucoplan) may represent lower cost options with lower administration burden versus Soliris (eculizumab). There is no scientific basis to prefer one FDA-approved targeted MG product over another; given similar efficacy and safety, most contracts consider more costly products not medically necessary.

- MG-ADL is a scoring tool used in clinical practice, along with MG composite score, for monitoring progression of MG and response to therapies. [24]
- Complement inhibitors have not been studied and shown to be safe or effective in patients with other antibodies, including MuSK antibodies, antibodies to the agrin receptor low-density lipoprotein receptor–related protein 4 (LRP4), or any other antibodies. In addition, they have not been studied in patients with ocular MG (without generalized MG symptoms) or those in myasthenic crisis (MGFA Class V).
- Complement inhibitors have not been studied when used in combination with one another, with chronic maintenance IVIG, or with FcRn antagonists. In clinical trials, patients were transitioned off chronic maintenance IVIG prior to initiating complement inhibitors.
- Soliris (eculizumab), Ultomiris (ravulizumab-cwvz), and Zilbrysq (zilucoplan)may be covered for refractory MG at the doses proven to be safe and effective in clinical trials, as detailed in the coverage criteria.

Neuromyelitis optica spectrum disorder (NMOSD) summary [25-28]

- NMOSD, also known as Devic disease or neuromyelitis optica (NMO), is a chronic demyelinating disease of the central nervous system dominated by inflammation of the optic nerve and spinal cord and may often be misdiagnosed as multiple sclerosis (MS).
- Stepwise deterioration due to disease relapse/attack causes an accumulation of disability. Hallmark features of NMOSD include acute nerve inflammation that led to severe visual loss, limb weakness, sensory loss, pain, paralysis, bladder dysfunction, and intractable nausea/vomiting and hiccups.
- Patients with NMOSD are treated for acute episodes/ relapse with steroids. Plasma exchange (PLEX) is used acutely for incomplete response to steroids.

- Immunosuppressive therapy (IST; corticosteroids, azathioprine, mycophenolate mofetil, or rituximab) is therapy to reduce the frequency of relapse (maintenance therapy).
- Not all patients with NMOSD test positive for AQP4-IgG. However, all patients in clinical trials of Soliris (eculizumab) and Ultomiris (ravulizumab-cwvz) for NMOSD were AQP4-IgG positive. Therefore, the safety and efficacy of Soliris (eculizumab) and Ultomiris (ravulizumab-cwvz) in AQP4-IgG negative patients is unknown.
- Neither Soliris (eculizumab) nor Ultomiris (ravulizumab-cwvz) have not been directly compared to any other IST for NMOSD. However, use of rituximab for NMOSD is supported by clinical evidence for reducing relapse rate [including a single randomized controlled trial (RCT)] [29] is recommended by guidelines, and has years of experience in clinical practice. [25 28 30-35] Therefore Soliris (eculizumab) and Ultomiris (ravulizumab-cwvz) for NMOSD is coverable only when rituximab is ineffective or not a treatment option.
- There is no evidence that Soliris (eculizumab) is more effective than other targeted treatments for refractory NMOSD, Ultomiris (ravulizumab-cwvz), Enspryng (satralizumab) and Uplizna (inebilizumab). Among the FDA-approved targeted agents for refractory NMOSD, Ultomiris (ravulizumab-cwvz), Enspryng (satralizumab) and Uplizna (inebilizumab) are lower cost options with lower administration burden. There is no scientific basis to prefer one FDA-approved targeted NMOSD product over another; given similar efficacy and safety, most contracts consider more costly products not medically necessary.
- The evidence for Soliris (eculizumab) and Ultomiris (ravulizumab-cwvz) in NMOSD is limited to a single phase 3 trials. Although these drugs reduced the frequency of NMOSD relapse, their effect on quality life (QoL) and disability are unknown.

  The safety and efficacy combination targeted therapies for NMOSD, such as rituximab, Soliris (eculizumab), Ultomiris (ravulizumab-cwvz), Enspryng (satralizumab) and Uplizna (inebilizumab), have not be studied and have not been established.

CD55-defiecent protein-losing enteropathy (CHAPLE disease)[36]

- CHAPLE disease is a recently discovered, ultra-rare, recessive disorder, caused by mutations in the CD55 gene, leading to an overactivation of the complement system, resulting in intestinal protein loss (albumin and immunoglobulins) due to damage in blood and lymph vessels along the digestive tract.
- The spectrum of severity for CHAPLE disease is not fully characterized, however it typically presents early in childhood, causing high rates of morbidity that manifest as peripheral and visceral edema (due to severe hypoalbuminemia), diarrhea, abdominal pain, hypogammaglobulinemia, malabsorption, malnutrition, infections, and impaired growth, with severe and fatal vascular occlusions being the leading cause of mortality.
- Diagnosis of CHAPLE disease is based on clinical signs and symptoms, with confirmation via positive genetic test for CD55 loss of function mutation.
- Published data on CHAPLE disease treatment is limited due to its rarity and newness. Currently there are no consensus guidelines for CHAPLE treatment, as the only guidance has been limited to case reports and small natural history studies.

- Most treatment focuses on addressing patients' symptoms with supportive care including corticosteroids, IV albumin and immunoglobulin (IVIG/SCIG), nutrition supplementation, and anticoagulation to prevent thrombosis.
- Soliris (eculizumab) has shown efficacy in CHAPLE disease in a small observational trial for which all patients reported normalization of serum albumin and improvement in symptoms. Treatment with off label Soliris (eculizumab) has since become the standard of care for patients with CHAPLE disease.
- Veopoz (pozelimab) recently received FDA approval-based efficacy results from a small single arm trial in patients with confirmed CHAPLE disease.
- Currently, there is insufficient evidence to establish therapy with Veopoz (pozelimab) is more effective or safer than the lower-cost alternative Soliris (eculizumab), which has a much more robust real world safety profile in patients with confirmed CHAPLE disease. Therefore, the use of Veopoz (pozelimab) for patients with confirmed CHAPLE disease is coverable only in patients who have had an insufficient response or intolerance to Soliris (eculizumab).
- The safety and efficacy of combining targeted therapies for CHAPLE disease, such as Soliris (eculizumab) and Veopoz (pozelimab), has not be studied; therefore, use in combination is considered investigational.

Antineutrophil cytoplasmic antibody-associated vasculitis (ANCA-AV) (MPA or GPA) [37-41]

- ANCA-AV is a rare multisystem autoimmune disease caused by inflammation and necrosis of the small and medium arteries. ANCA-AV includes microscopic polyangiitis (MPA), granulomatosis with polyangiitis (GPA, also known as Wegener's granulomatosis), and eosinophilic granulomatosis with polyangiitis (EPGA, formerly known as Churg-Strauss syndrome). However, EPGA is clinically and pathologically different from GPA and MPA, and patients with EGPA were excluded from clinical trials. Therefore, the safety and efficacy of Tavneos (avacopan) in EGPA is unknown and its use for EGPA is considered investigational.
- ANCA-AV patients usually present with nonspecific symptoms (fever, malaise, myalgias, and arthralgias) and are commonly misdiagnosed, so testing for ANCA antibody is key and tissue biopsy is confirmatory.
- The 2021 American College of Rheumatology (ACR) ANCA-AV guidelines recommend treatment based on severity of disease and organ involvement, with the goals of inducing remission and maintaining remission, as follows:
    * Non-severe active disease (<u>without</u> organ involvement or non-life-threatening):
        - First-line options for induction of remission as well as maintenance of remission include methotrexate or azathioprine in combination with glucocorticoids. Mycophenolate mofetil in combination with glucocorticoids is a second-line option if methotrexate or azathioprine is contraindicated or not tolerated.
    * Severe active disease (with organ involvement or life-threatening manifestations):

        - First-line treatment for induction of remission is rituximab in combination with low dose glucocorticoids. Cyclophosphamide (IV or oral) in combo with low dose glucocorticoids is another option for induction if previous treatment with rituximab has failed.
        - Once remission has been induced, rituximab is used as first-line treatment for the maintenance of remission. Use of oral immunosuppressants such as methotrexate, azathioprine, and mycophenolate mofetil are used as maintenance options if rituximab is not tolerated or contraindicated.
    * Tavneos (avacopan) is not included in the guidelines, which were released prior to FDA approval of Tavneos (avacopan).
- Tavneos (avacopan) received FDA approval based on a single trial as adjunctive therapy for severe ANCA-AV (MPA or GPA), in combination with standard therapy, including corticosteroids.
- Currently there is insufficient evidence to establish add-on therapy with Tavneos (avacopan) is more effective than the lower cost standard of care immunosuppressant treatment options for patients with severe active ANCA-associated vasculitis. Therefore, the use of Tavneos (avacopan) for patients diagnosed with severe ANCA-associated vasculitis will only be covered as add on therapy to the standard of care in patients who have previous failed induction therapy with standard of care options (rituximab or cyclophosphamide with glucocorticoids) or who have relapsed since previously achieving remission in the past 12 months.

Clinical Efficacy

Paroxysmal nocturnal hemoglobinuria (PNH)

- The evidence for C5 inhibitors in PNH is based on phase 3 trials showing complement inhibitors stabilize hemoglobin and reduces the need for transfusions for patients with PNH compared to placebo or standard of care. [2] Overall survival has not been evaluated in controlled, clinical trials for complement inhibitors. However, thrombosis, the main cause of permanent disability and death in PNH, is largely mitigated by existing C5 inhibitor therapies based on clinical experience.
- *Soliris (eculizumab):*
    * The TRIUMPH study is a 26 week, double-blind, randomized, placebo-controlled, multicenter trial that evaluates the efficacy and safety of Soliris (eculizumab) in PNH in 87 patients who had at least 4 transfusions during the previous 12 months.
        - At the end of the treatment period, 49% of patients treated with Soliris (eculizumab) had stabilized hemoglobin in the absence of transfusions, which was not accomplished by any patients receiving placebo ($p<0.001$).
        - Transfusion independence was achieved in 51% of patients in the Soliris (eculizumab) group and was not achieved by any patients receiving placebo ($p<0.001$).

    * In a long-term study, up to three years, patients in the analysis experienced a sustained reduction in hemolysis, measured by lactate dehydrogenase levels, and a reduction in thromboembolic events. [43]
    * Expert consensus indicates that Soliris (eculizumab) decreases hemolysis, the resultant symptoms, thrombosis, and transfusion requirements. Soliris (eculizumab) should be considered in patients with significant symptoms from hemolysis that are not adequately managed with transfusion (Grade 1A recommendation). [9]

- *Ultomiris (ravulizumab-cwvz):* The evidence for Ultomiris (ravulizumab-cwvz) is based on two trials that compared it to Soliris (eculizumab). The trials demonstrated that Ultomiris (ravulizumab-cwvz) is not worse than Soliris (eculizumab) for the treatment of PNH. [11 44-46]
    * Both trials demonstrated Ultomiris (ravulizumab-cwvz) was noninferior to Soliris (eculizumab) for measurements of hemolysis and transfusion avoidance.
    * Ultomiris (ravulizumab-cwvz) carries the same safety concerns as Soliris (eculizumab) including a REMS program and safety warning about meningitis.
    * There are ongoing clinical trials for Ultomiris (ravulizumab-cwvz) in conditions that have evidence for efficacy for Soliris (eculizumab).
- *Empaveli (pegcetacoplan):* The evidence for pegcetacoplan in PNH is primarily based on one randomized control trial (PEGASUS) in patients who were established on eculizumab and one interim phase 3 trial (PRINCE) in patients who were not on complement inhibitors at baseline.
    * The PEGASUS [47] study was a phase 3, randomized, open-label, 16-week active-control trial in 80 adults with PNH whose hemoglobin levels remained low despite treatment with eculizumab; at baseline, patients had over 6 transfusions in the 12 months prior to the study.
        - Patients in the pegcetacoplan arm demonstrated a superiority in change in hemoglobin level versus eculizumab from baseline to week 16 and noninferiority for transfusion avoidance. The benefits were sustained during the 32-week open label period. Two out of 41 patients in the pegcetacoplan group required dose escalation to 1,080 mg every 3 days.
    * The PRINCE study was a randomized, open-label, 26-week, controlled phase 3 trial in 53 adults with PNH who were not on complement inhibitors at baseline. The trial that compared pegcetacoplan with standard of care (excluding complement inhibitors).
        - Pegcetacoplan demonstrated superiority in the co-primary endpoints of hemoglobin stabilization and LDH reduction compared to standard of care. Hemoglobin stabilization was defined as less than 1g/dL decrease in hemoglobin levels in the absence of blood transfusions.

        - In addition, more patients on pegcetacoplan were transfusion-free compared to standard of care. 91% of patients on pegcetacoplan were transfusion free compared to 6% on standard of care.

- *Fabhalta (iptacopan)* was studied in two 24- week, open- label, phase III trials. APPLY-PNH compared Fabhalta (iptacopan) to C5 inhibitors in patients with residual anemia despite C5 inhibitor treatment. At baseline, a majority of patients had at least one transfusion in the 6 months prior to the trial. APPOINT-PNH was a single-arm trial that enrolled complement inhibitor-naïve patients; however, applicability is limited as a majority of patients were enrolled in China.[5 7]
    * Treatment with Fabhalta (iptacopan) resulted in statistically significant and clinically meaningful improvements in the hemoglobin level from baseline as well as greater avoidance of transfusions.
- *Voydeya (danicopan)* was studied in the ALPA trial as add-on to C5 inhibitors (eculizumab or ravulizumab) and was compared to placebo plus C5 inhibitors in patients with persistent anemia despite C5 inhibitor therapy.[6 8]
    * Treatment with add-on Voydeya (danicopan) resulted in statistically significant and clinically meaningful improvements in hemoglobin levels from baseline as well as greater avoidance of transfusions at 24 weeks versus placebo.
    * Known safety profile appears to be generally consistent with other complement inhibitors but long-term data is lacking in the setting of potential additive toxicity due to inhibition of both complement and proximal pathways.

<u>Atypical hemolytic uremic syndrome (aHUS)</u>

- The best available evidence for Soliris (eculizumab) in aHUS is limited to four phase 2, open-label, non-randomized, prospective, single-arm studies in populations. Two of the studies are not published at this time.
    * One study (n=17) in adolescent and adult patients who were resistant to plasma therapy and had impaired kidney function found a mean increase in platelet counts from baseline after treatment with Soliris (eculizumab) for a median length of 64 weeks. [17 50]
    * One study (n=20) in adolescent and adult patients with chronic renal impairment and no evidence of thrombotic microangiopathy found that 80% of patients treated with Soliris (eculizumab) achieved a thrombotic microangiopathy activity event-free status (defined as ≤ 25% decrease in platelet count and no plasma therapy, or new dialysis for ≥ 12 consecutive weeks). [17 50]
    * Two unpublished studies measured thrombotic microangiopathic (TMA) response in pediatrics (n=22) and adults (n=41), defined as hematological normalization and ≥ 25% improvement in serum creatinine from baseline. After a minimum of 26 weeks of treatment with Soliris (eculizumab), 64% of pediatric patients and 56% of adult patients achieved the primary endpoint. [17]
    * Reduction in mortality and other clinically meaningful endpoints have not yet been studied in a controlled clinical trial.

- The evidence for Ultomiris (ravulizumab-cwvz) for aHUS limited to two open-label, non-randomized, prospective, single-arm trials (one in adults, n=56; one in pediatric patients, n=16). [11]
    * Both trials assessed Complete TMA Response during the 26-week trial, defined as normalization of hematological parameters (platelet count and LDH) and ≥ 25% improvement in serum creatinine from baseline.
    * After a minimum of 26 weeks of treatment with Ultomiris (ravulizumab-cwvz), 71% of pediatric patients and 54% of adult patients achieved the primary endpoint.
    * The efficacy results are overall similar to trials of Soliris (eculizumab) for aHUS.
- Additional published studies that support the use of Soliris (eculizumab) and Ultomiris (ravulizumab-cwvz) in aHUS are limited to case studies and retrospective reviews.
- All studies of complement inhibitors in aHUS have significant limitations including an absence of control groups, open-label treatment, ambiguous recruitment techniques, and use of surrogate markers as primary endpoints. As such, the true benefit of Soliris (eculizumab) in aHUS is unclear and results should be interpreted with caution.
- There is interest in the use of higher doses of Ultomiris (ravulizumab-cwvz) for patients with incomplete control of symptoms. However, there is no data to support the safety and efficacy of dosing Ultomiris (ravulizumab-cwvz) more frequently than every 8 weeks in patients greater than 20 kg. There is insufficient evidence to establish the safety or efficacy for the use of Soliris (eculizumab) and/or Ultomiris (ravulizumab-cwvz) after kidney transplantation for patients with recurrent aHUS or other micro thrombotic condition-associated renal failure.
- There are no nationally published guidelines for the treatment of aHUS. National Health Service England has commissioned Soliris (eculizumab) for patients newly diagnosed with aHUS and for existing patients who are on dialysis and are suitable for a kidney transplant until a guideline is developed. [17]

<u>Refractory myasthenia gravis (MG)</u>

- The evidence for complement inhibitors in MG is limited. In the pivotal phase 3 trials of Soliris (eculizumab), Ultomiris (ravulizumab-cwvz), and Zilbrysq (zilucoplan), the active treatment arm improved functional scores in patients with refractory generalized MG compared to placebo [REGAIN [51] for Soliris (eculizumab), CHAMPION-MG [52] for Ultomiris (ravulizumab-cwvz), and RAISE [53] for Zilbrysq (zilucoplan)], a surrogate for MG symptoms.
    * Patients in who were included in the efficacy analyses of pivotal trials had a MG severity classification of MGFA Class II to IV, MG-ADL score 6 or higher, and positive serologic test for anti-AChR antibodies.
    * In addition, patients in REGAIN failed ≥2 ISTs or ≥1 IST and required chronic plasma exchange or IVIG for over 1 year. 98% of patients were on ≥2 ISTs and 52% of patients were on ≥3 ISTs for an average length of 2.5 to 7.3 years prior to enrollment. Patients in CHAMPION-MG and RAISE were not required to have prior therapies.

    * In REGAIN, the primary endpoint was the mean difference of scores from baseline to week 26 of MG-ADL measured by worst-rank ANCOVA, which showed Soliris (eculizumab) was not significantly better than placebo (p=0.0698). FDA-approval was based on non-primary sensitivity analysis outcomes with statistical significance but the magnitude of mean total score differences were insufficient to represent clinically meaningful improvement. However, it should be noted that several subjects left the trial for reasons unrelated to their MG, which affected the statistical analysis of the worst-rank ANCOVA.
    * The primary endpoint of change from baseline in MG-ADL score to week 26 was met in CHAMPION-MG. Ultomiris (ravulizumab-cwvz) also demonstrated improvements in MG-ADL muscle strength, and quality life, sustained through 60 weeks in an open-label extension.
    * The primary endpoint of change from baseline in MG-ADL score to week 12 was met in RAISE; the results represented both clinically meaningful and statistically significant improvements from baseline. Zilbrysq (zilucoplan) also demonstrated improvements in QMG score.
    * Soliris (eculizumab), Ultomiris (ravulizumab-cwvz), and Zilbrysq (zilucoplan) have not been studied in patients with less severe MG, including patients with MFGA Class I or those responding to IST therapy. In addition, there is no evidence for the use in patients in myasthenic crisis (Class V).

Neuromyelitis Optica Spectrum Disorder (NMOSD)

- The evidence for Soliris (eculizumab) in NMOSD is limited. One phase 3, time-to-event trial showed that Soliris (eculizumab) reduced the frequency of first adjudicated relapse compared to placebo (PREVENT).[26]
    * Patients enrolled in the trial had “highly active” disease defined as two relapses in the past year or three relapses in the past two years, with one of those in the last year; baseline annualized relapse rate was 2, median Expanded Disability Status Scale (EDSS) 4; 76% of patients were on immunosuppressive therapy at baseline and 32% had previous rituximab treatment.
    * In PREVENT, the primary endpoint of first adjudicated relapse occurred in 3% of the Soliris (eculizumab) arm versus 43% in the placebo arm, HR 0.06 [95% CI 0.02 to 0.20]. At 144 weeks, 96.5% of patients in the Soliris (eculizumab) group and 45.4% in the placebo group remained relapse- free.
    * Key secondary endpoints included change from baseline in functionality and patient-reported health outcomes as measured by EDSS as well as the modified Rankin Scale, Hauser Ambulation Index, and EQ-5D-3L. The first measure, EDSS, did not reach statistical significance. However, the remaining measures trended in favor of the treatment group.
- The evidence for Ultomiris (ravulizumab-cwvz) in NMOSD is limited to one phase 3, open-label, external control trial (N=58), CHAMPION-NMOSD[54], that demonstrated Ultomiris (ravulizumab-cwvz) reduced the frequency of first adjudicated relapse compared to historical control (placebo arm of the PREVENT trial).
    * No patients taking ravulizumab (n = 58) had an adjudicated relapse (during 84.0

patient-years of treatment) versus 20 patients with adjudicated relapses in the placebo group of PREVENT (during 46.9 patient-years; relapse risk reduction = 98.6%, 95% confidence interval = 89.7%–100.0%, p < 0.0001).

- Guidelines recommend treatment of acute episodes/ relapse and use of maintenance immunosuppressive therapy (IST), to reduce the frequency of relapse). [25 28 31 32 55]
    * Treatment of Relapse: Patients are usually treated with 1 g of intravenous (IV) methylprednisolone (IVMP) for 3–5 days. Relapses that do not respond to IV steroids may benefit from five to seven plasma exchange (PLEX) procedures over a 2-week period. Oral prednisone (1 mg/kg) for 1–6 months can be initiated after IVMP or PLEX to ensure a prolonged effect on inflammation until steroid-sparing immunosuppressants take effect.
    * Maintenance Therapy: A variety of immunosuppressive therapy (IST) are regarded by many clinicians as first-line therapy based on primarily observational or single-arm data. The most widely prescribed treatments include corticosteroids, azathioprine, mycophenolate mofetil, and rituximab. The use of azathioprine and mycophenolate mofetil has fallen out of favor due to lack of efficacy. However, if given, they are often prescribed with low doses of corticosteroids. Rituximab has evidence for reduction of relapse rates and disability in NMO, based on one RCT (n=68) and dozens of case series, including in patients who fail oral immunosuppressive treatments. [30 32-35] Paradoxical relapses may occur shortly after initiation of rituximab therapy so it is important to allow enough time for the rituximab to become effective. Complete suppression of CD19+B lymphocytes takes one month. [35]

<u>CD55-defiecent protein-losing enteropathy (CHAPLE disease)</u>

- The evidence for use of Soliris (eculizumab) in CHAPLE disease is limited to one small observational study of 16 patients with a confirmed CD55 loss of function mutation and severe CHAPLE disease manifestations requiring frequent hospitalizations, albumin, and immunoglobulin transfusions.[56]
    * Patients received Soliris (eculizumab) off label, with treatment effects observed over an average of 20 months.
    * All patient achieved normalization of their serum albumin within 2-4 weeks and remained normal for 6 months or longer.
    * The majority patients (12 of 16) no longer required any hospitalizations or transfusions, and most previous treatment interventions became unnecessary.
    * Although the evidence is of lower quality (non-controlled), Soliris (eculizumab) is the standard of care treatment option for patients with severe CHAPLE disease manifestations requiring frequent hospitalizations, albumin, and immunoglobulin transfusions.
- The evidence for Veopoz (pozelimab) obtaining FDA approval is limited to the ongoing 1878 trial (n=10), a small, phase 2/3, international, multicenter, open-label, single arm trial , of patients with confirmed, active CHAPLE disease.[36 57]

    * The trial included only patients with genetically confirmed (CD55 loss of function mutation) and symptomatic CHAPLE disease with a serum albumin of <3.2 g/dl (baseline average was 2.18 g/dl).
    * A control was generated using the patients pretreatment medical histories to compare to post-treatment with Veopoz (pozelimab).
    * Patients received a 30 mg/kg loading dose of Veopoz (pozelimab) on day 1, followed by 10 mg/kg weekly thereafter for up to 144 weeks.
    * All patients (10/10) achieved the primary efficacy endpoint of normalized serum albumin (≥3.5 g /dl) by week 12 and maintained it through week 72 at the most recent analysis.
    * Secondary endpoints supporting efficacy were the decrease in hospitalization days post treatment (268 days prior to treatment vs only 7 after treatment) and total number of albumin transfusions pre and post treatment (60 vs 1).
- Although both Soliris (eculizumab) and Veopoz (pozelimab) have shown some efficacy in CHAPLE disease, the available evidence for efficacy is of low quality for both. However, there is significantly more safety experience with Soliris (eculizumab) with years of real-world use and is significantly less costly than Veopoz (pozelimab). Therefore, the use of Veopoz (pozelimab) for patients with confirmed CHAPLE disease is coverable only in patients who have had an insufficient response or intolerance to Soliris (eculizumab).

Antineutrophil cytoplasmic antibody-associated vasculitis (ANCA-AV) (MPA or GPA) [37 39 41]

- The evidence for Tavneos (avacopan) obtaining FDA approval was based on one phase 3 trial. The trial was a double-blind active-controlled RCT (ADVOCATE) concluding that Tavneos (avacopan) was non-inferior to standard of care for induction and maintenance of remission in patients with ANCA-AV (MPA or GPA) (n=331). Given the lack of superior benefit versus the standard of care, and availability of effective lower-cost treatment options, the use of Tavneos (avacopan) is coverable only in patients with severe active ANCA-AV (GPA or MPA) who have previously failed standard induction therapy or relapsed since achieving remission in the past 12 months.
    * Patients enrolled in the trial had either newly diagnosed active severe ANCA-AV (69%) or relapsed active severe ANCA-AV (31%). Active severe ANCA-AV is defined by ACR guidelines as new, persistent, or worsening clinical signs or symptoms attributed to GPA or MPA that has organ or life-threatening manifestations.
    * In the trial these patients had to have one major Birmingham Vasculitis Activity Score (BVAS) item, 3 non-major items, or two renal items of hematuria and protein urea. BVAS is the clinical trial standard measure for ANCA-AV remission scoring with score of 0 being complete remission. The average BVAS score in both arms was 16.3, which indicates active severe disease.
    * The breakdown of patients with GPA vs MPA in the trial was 55% to 45%, respectively. Patients that had EGPA were excluded from this trial as EPGA is clinically and pathologically different and is therefore excluded from trials involving ANCA-AV.

* Patients were randomized to Tavneos (avacopan) or 20-week steroid taper in addition to investigator-choice standard of care induction therapy with rituximab or cyclophosphamide. Patients in both arms were still allowed to receive additional non-study supplied steroids. In addition, the patients who received oral or IV cyclophosphamide received standard of care maintenance therapy with azathioprine beginning at week 15 till week 52, while the rituximab patients received no standard of care maintenance treatment.
    - 36% of patients in each arm received cyclophosphamide.
    - 65% of patients in each arm received rituximab.
* Primary endpoints were remission at week 26 (BVAS of 0) and sustained remission at week 52 (BVAS of 0).
* Results of the ADVOCATE trial showed that the Tavneos (avacopan) arm of the trial was non-inferior to standard of care at inducing remission and sustaining remission at week 52. Tavneos (avacopan) only showed superiority when compared to placebo (not standard of care) at week 52. The trial failed to prove superiority and only showed non-inferiority when compared to current standard of care. As a result, the FDA approved labeled indication for Tavneos (avacopan) is for add-on therapy only.
* Factors which may impact the accuracy, applicability, and generalizability of the results for this trial include but are not limited to the following:
    - During the study, 86% of the Tavneos (avacopan) arm and 90% of the steroid arm received non-study supplied steroids.
    - The patients who received azathioprine for standard of care maintenance of remission treatment showed no difference between Tavneos (avacopan) and placebo at week 52.
    - Patients' response to Tavneos (avacopan) based on investigator BVAS scale scoring supported only non-inferiority when compared to placebo at week 52.
    - Secondary endpoints of this study included a novel glucocorticoid toxicity index scoring tool (GTI), that was determined by FDA to be not fit for its purpose and of no relevance to the benefit of avacopan in this trial. Other secondary endpoints included change in EGFR, quality of life measures (EQ-5D-5L and SF-36), and improvement of urinary albumin to creatinine ratio, all of which provide no clinical meaningful treatment benefit of Tavneos (avacopan) and were not adjusted for multiplicity.
* Sub-group analysis in patients treated with Tavneos (avacopan) who were newly diagnosed (69%) compared to the patients who had relapsed (31%), showed significant difference in the response to Tavneos (avacopan). The newly diagnosed patient's response rate of Tavneos (avacopan) compared to the prednisone arm was 66.1% vs 66.7% at week 26 and 60.9% vs 57.9% with neither being significant. Whereas the relapsed patients showed a much higher response rate to Tavneos (avacopan) compared to prednisone of 86.3% vs 78% at week 26 and 76.5% vs 48% at week 52.

- Given the lack of evidence to establish Tavneos (avacopan) is superior to placebo as add-on to current standard of care, and the availability of effective lower-cost treatment options, the use of Tavneos (avacopan) for severe active ANCA-associated vasculitis will only be coverable in patients who have previously failed standard induction therapy or have relapsed since achieving remission in the past 12 months.

Investigational Uses

- Soliris (eculizumab) has been studied in a variety of other conditions. Due to lack of published data, lack of high-quality data, or lack of positive data these conditions are considered investigational. [58-65]
- There is interest in the use of Ultomiris (ravulizumab-cwvz) for patients with recurrent IgA nephropathy. However, there is there is insufficient evidence to establish the safety or efficacy of Ultomiris for IgA nephropathy. Trials are ongoing.[65]
- One Phase 2/3 trial (PROTECT) evaluated Soliris (eculizumab) versus placebo in kidney transplant patients at high risk of delayed graft function (DGF). The trial failed to show a statistically significant difference in the incidence of DGF, death, graft loss, or discontinuation at seven days following a transplant (35.9% in Soliris (eculizumab) vs. 41.7% in placebo, p = 0.398). [65]
- Ultomiris (ravulizumab-cwvz), another complement inhibitor, is not coverable for other indications, except as listed in the coverage criteria. Despite being a derivative of Soliris (eculizumab), there is insufficient evidence at this time to establish the safety or efficacy of Ultomiris (ravulizumab-cwvz) for other indications, including MG. In addition, the dose of Ultomiris (ravulizumab-cwvz) for other indications is unknown.
- An intravitreal formulation of pegcetacoplan (Syfovre) is now available for geographic atrophy secondary to age-related macular degeneration (AMD). There is no evidence for use of IV pegcetacoplan (Empaveli) for AMD.
- Tavneos (avacopan) has been studied in a variety of other conditions including aHUS and C3 glomerulonephritis. Due to lack of published and positive data, these conditions are considered investigational. [66 67]
- Veopoz (pozelimab) is being studied in a variety of other conditions including PNH and MG. Due to lack of published and positive data, use of Veopoz (pozelimab) in these conditions is considered investigational.[36]
- Although Fabhalta (danicopan) was studied in C5-inhibitor naïve PNH, the study was of poor quality (N=40, single-arm) with limited applicability to patients in the United States (half were from China, which has different standards of care).[7]

Safety [11 57 60 68]

- Complement inhibitors (as listed in *Table 1*) all carry a boxed warning for life-threatening and fatal meningococcal infections. Patients should be immunized with a meningococcal vaccine at least 2 weeks prior to the first dose of complement inhibitors (as listed in *Table 1*) unless the risks of delaying complement inhibitor therapy outweigh the risks of developing a meningococcal infection.
- There is a Risk Evaluation and Mitigation Strategy (REMS) program in place for Empaveli (pegcetacoplan), Fabhalta (iptacopan), Soliris (eculizumab), Ultomiris

(ravulizumab-cwvz), Voydeya (danicopan), and Zilbrysq (zilucoplan). The purpose of the REMS program is to mitigate the occurrence and morbidity associated with meningococcal infections. Providers must be certified by the REMS program to prescribe complement inhibitors.

- There was one death related to Soliris (eculizumab) in clinical trials. The patient was part of the PREVENT trial for NMOSD and died due to pulmonary empyema.
- In trials, there was a higher incidence of hepatoxicity, hypersensitivity, and hepatitis B virus (HBV) reactivation with use of Tavneos (avacopan) compared to standard of care. Patients should be screened prior to initiation of treatment as well as monitored throughout treatment.

Administration and Dosing [11 60 69]

- Supplemental dosing: Some interventions such as plasma exchange/plasmapheresis (PLEX), fresh frozen plasma (FFP), and intravenous immunoglobulin (IVIg), have been shown to reduce eculizumab or ravulizumab serum levels.
    * In patients with aHUS or MG receiving concomitant PLEX or FFP, supplemental dosing, and frequency of Soliris (eculizumab) varies.
    * Supplemental dosing for Ultomiris (ravulizumab-cwvz) in the setting of PLEX and IVIG also varies, based on the most recent dose of Ultomiris (ravulizumab-cwvz) and the intervention.
    * Of note: use of ongoing maintenance IVIG therapy, in combination with maintenance complement inhibitor therapy is considered investigational, beyond a transition period.
- Soliris (eculizumab): For breakthrough hemolysis in PNH:
    * Soliris (eculizumab) dosing may be adjusted to 900 mg every 12 days instead of every 14 days. In the pivotal trial for the FDA labeled dose, 900 mg every 14 days, plus or minus 2 days, was used, such that 900 mg every 12 days is considered coverable per label, when there is breakthrough hemolysis.
    * There is also limited data that doses of 1200 mg every 14 days have been used for breakthrough; however, since it is more costly without proven benefit over 900 mg every 12 day dosing, it is considered 'not medically necessary.' [70 71]
    * No additional benefit is observed above the recommended dose.
- Empaveli (pegcetacoplan):
    * For lactate dehydrogenase (LDH) levels greater than 2 × the upper limit of normal (ULN), Empaveli (pegcetacoplan) dose may need to be adjusted to 1,080 mg every three days based on limited data. [69]

Codes	Number	Description
HCPCS	J1300	Injection, eculizumab (Soliris), 10 mg
HCPCS	J1303	Injection, ravulizumab-cwvz (Ultomiris), 10 mg

Appendix 1: Medications that may unmask or worsen myasthenia gravis *[58]
Aminoglycosides
Amantadine
Anti-arrhythmics (procainamide, propafenone, quinidine)
Antiepileptics (various, carbamazepine, gabapentin, phenytoin, etc.)
Cancer immunotherapies, including but not limited to: Anti-programmed death receptor-1 monoclonal antibodies (PD1s, PDL-1s; Opdivo [nivolumab], Keytruda [pembrolizumab], etc.) Yervoy (ipilimumab) Provenge (sipuleucel-T)
Antihistamines (diphenhydramine)
Beta-blockers
Calcium channel blockers (felodipine, verapamil)
Colchicine
Erythromycins (azithromycin, clarithromycin, clindamycin)
Plaquenil (hydroxychloroquine)
Interferons (various)
Lithium
Magnesium
Neuromuscular blockers (succinylcholine, etc.)
Opioids
Phenothiazines (haloperidol)
Proton pump inhibitors (lansoprazole, omeprazole)
Quinine
Quinolones (ciprofloxacin, levofloxacin, etc.)
Statins (pravastatin, etc.)

*Including, but not limited to this list. Medication lists will be reviewed in full versus compendium (such as DrugDex).

Revision History

Revision Date	Revision Summary
6/20/2024	• Added Fabhalta (iptacopan) and Voydeya (danicopan) for treatment-experienced PNH. • Fabhalta (iptacopan) for treatment-naïve PNH is investigational due to poor quality of evidence. • High-dose Soliris (eculizumab) modified to not medically necessary (NMN), as several options are now available for breakthrough PNH. • Removed Empaveli (pegcetaoplan) ST through Ultomiris (ravulizumab) in treatment naïve PNH to align with standard of care.
3/21/2024	Readded weight specification to *Table 2* Initial Authorization dosing for NMOSD.
12/7/2023	• Added newly FDA-approved Veopoz (pozelimab) to policy. Limits coverage to patients diagnosed with genetically confirmed CHAPLE disease by a specialist, when previous treatment with Soliris (eculizumab) has been ineffective or not tolerated. • Added Zilbrysq (zilucoplan) to policy for generalized myasthenia gravis (gMG). • Simplified coverage criteria for gMG. The baseline MG-ADL score was updated to "6 or more" to match trial criteria and the prior therapy requirement was simplified to at least ONE neonatal Fc receptor (FcRn) antagonist and thymectomy. • Authorization duration extended to 6 months for initial and 12 months for reauthorization for all medications in this policy,
9/13/2023	• Coverage criteria updated to allow for subcutaneous (SC) injection of Ultomiris (ravulizumab) for PNH and aHUS. • Coverage added for:

Revision Date	Revision Summary
	- Ultomiris (ravulizumab) IV for NMOSD. Soliris (eculizumab) will now require step therapy (ST) with Ultomiris (ravulizumab), Enspryng (satralizumab) AND Uplizna (inebilizumab). - Supplemental dosing of Ultomiris (ravulizumab) or Soliris (eculizumab) after plasma exchange or IVIG. • Use of Empaveli (pegcetacoplan) in macular degeneration remains investigational, as an intravitreal formulation, Syfovre (pegcetacoplan intravitreal) is available.
9/23/2022	Coverage criteria updated to add additional step therapy (ST) for Soliris (eculizumab) as follows: • aHUS: Ultomiris (ravulizumab) • gMG: Vyvgart (efgartigimod) AND Ultomiris (ravulizumab) • PNH: Empaveli (pegcetacoplan AND Ultomiris (ravulizumab) • NMOSD: Enspryng (satralizumab) AND Uplizna (inebilizumab)
6/17/2022	Added coverage criteria for Ultomiris (ravulizumab-cwvz) for use in generalized myasthenia gravis (gMG).
3/18/2022	• Added the newly FDA-approved Tavneos (avacopan) to policy. Limits coverage to patients with severe active ANCA-AV as adjunctive therapy with standard of care including glucocorticoids, when managed by a specialist and previous standard of care therapies (rituximab, cyclophosphamide, glucocorticoids, MTX, AZA, and MMF) were ineffective at inducing or maintaining remission. • Updated MG-ADL score to greater than or equal to 5, to match Vyvgart (efgartigimod) policy. • Added combination use with Vyvgart (efgartigimod) to investigational uses.
10/15/2021	Added the newly FDA-approved Empaveli (pegcetacoplan) to policy. Coverage for paroxysmal nocturnal hemoglobinuria (PNH) will align with current coverage criteria for Soliris (eculizumab) and Ultomiris (ravulizumab-cwvz).
7/16/2021	• Continuation of therapy (COT) language updated to align with Enspryng (satralizumab) and Uplizna (inebilizumab). • Added quantity limit (QL) for Soliris (eculizumab) when used for PNH with breakthrough hemolysis. • Clarified use of combination therapy for NMOSD as "Investigational" (removed from medical necessity criteria). No changes to intent of coverage criteria with this annual update.

Revision Date	Revision Summary
1/20/2021	• Updated COT language to new format. • Reformatted quantity limits for operational ease. No change to intent.
10/28/2020	• Added additional step with either Enspryng (satralizumab) or Uplizna (inebilizumab) for Soliris (eculizumab) in NMOSD. • Updated Soliris (eculizumab) NMOSD criteria to limit concomitant use with rituximab, Enspryng (satralizumab) or Uplizna (inebilizumab).
6/15/2020	Continuation of therapy (COT) language added. Removed references to brand Rituxan to account for preferred/non-preferred changes in biosimilars policy (dru620).
10/23/2019	Effective 11/15/2019: • Added coverage criteria for neuromyelitis optica spectrum disorder (NMOSD) for Soliris (eculizumab). • Added coverage criteria for aHUS for Ultomiris (ravulizumab-cwvz). • Updated associated investigational uses for Ultomiris (ravulizumab-cwvz).
4/24/2019	• Renamed policy "Complement Inhibitors" • Criteria added for newly-approved Ultomiris (ravulizumab-cwvz) for PNH. • Updated previous Soliris (eculizumab) criteria for HUS to add nephrology specialty and clarify coverage criteria.
3/19/2018	Effective 4/1/2018: • Added coverage criteria for myasthenia gravis. • Updated associated investigational uses. Effective 7/1/2018: Align re-authorization to biannual (every 24-weeks) for all indications.
1/13/2017	Updated quantity limit. Added additional investigational uses.
11/11/2016	Removed site of care language from the individual drug policy; however, requirements still apply. Reference to *Site of Care Review*, dru408 is provided as part of criterion I.A.
1/08/2016	Annual update, no changes to criteria.
1/19/2015	New policy.

Drug names identified in this policy are the trademarks of their respective owners.

Medication Policy Manual | **Policy No:** dru388

Topic: Blincyto, blinatumomab | **Date of Origin:** March 13, 2015

Committee Approval Date: December 12, 2024 | **Next Review Date:** 2025

Effective Date: January 15, 2025

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Blincyto (blinatumomab) is an immunotherapy used in the treatment of B-cell precursor acute lymphoblastic leukemia (ALL). It is given via continuous intravenous infusion over 28 days in six-week cycles. Hospitalization is recommended when starting the infusion to monitor for severe adverse effects.

Policy/Criteria

Most contracts require pre-authorization approval of Blincyto (blinatumomab) prior to coverage.

I. Continuation of therapy (COT): Blincyto (blinatumomab) may be considered medically necessary for COT when criterion A, B, or C below is met.

A. For diagnoses NOT listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND there is documentation that the medication was covered by another health plan. Examples of documentation include the coverage approval letter from the previous health plan or paid claim.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

B. For diagnoses listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

C. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

Please note*: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Blincyto (blinatumomab) may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) that criteria A and B below are met.

A. A diagnosis of **B-cell precursor, CD19-positive acute lymphoblastic leukemia** (ALL).

AND

B. Blincyto (blinatumomab) is administered in one of the following settings (1 or 2):

1. Refractory/relapsed: After at least one prior ALL therapy has been ineffective (relapsed or refractory disease).

OR

2. In complete remission: The ALL is in a first or second complete remission (CR).

NOTE this includes use of Blincyto as "consolidation therapy" and use for "MRD-positive disease (after induction chemotherapy)".

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers Blincyto (blinatumomab) coverable only under the medical benefit (as a provider-administered medication).

B. When pre-authorization is approved, Blincyto (blinatumomab) may be authorized in the following quantities:

1. For Relapsed or refractory B-cell ALL:

a. ***Initial Authorization:*** Five, 28-day infusions (induction and consolidation).

b. ***Reauthorization:*** If remission is achieved with the initial induction and consolidation cycles, up to four additional, 28-day infusions (maintenance) may be authorized.

2. For B-cell ALL in complete remission:

a. ***Initial Authorization:*** Up to four, 28-day infusions may be authorized.

b. ***Reauthorization:*** No additional treatment courses will be authorized beyond four, 28-day infusions

IV. Blincyto (blinatumomab) is considered investigational when used for all other conditions, including but not limited to diffuse large B-cell lymphoma.

Position Statement

- Blincyto (blinatumomab) is an immunotherapy that targets CD-19-positive B-cells (precursor B-cells). It is indicated for the treatment of CD19-positive B-cell precursor acute lymphoblastic leukemia (ALL) in several settings:
  - Relapsed after, or refractory to, prior therapy
  - After a complete remission (CR) is achieved with multiagent chemotherapy induction:
    - When minimal residual disease (MRD) is detected
    - When used in the consolidation phase, including for MRD-negative disease and/or prior to hematopoietic stem cell transplant (HSCT).
- It is not indicated for mature B-cell (CD-20-positive) ALL. Other therapies are used in treating this ALL subtype.
- *Detection of minimal residual disease*: In clinical trials of Blincyto (blinatumomab), MRD was determined based on reverse transcriptase-polymerase chain reaction (PCR) or flow cytometry. Current standard of care for determination of MRD now also includes use of FDA-approved next generation sequencing (NGS)-based assays, such as clonoSEQ, for detection of lower levels of MRD.
- Based on its mechanism of action, there is interest in using Blincyto (blinatumomab) in other cancers; however, there is currently no evidence supporting its safety and effectiveness in any other condition.
- Potentially serious and life-threatening reactions including Cytokine Release Syndrome and neurological toxicities have been reported with Blincyto (blinatumomab).

- Blincyto (blinatumomab) is given as a continuous intravenous infusion for 28 days (one cycle). A minimum of a 2-week treatment-free interval is recommended between cycles. The dosing and schedule depends on the B-cell ALL setting in which it is used. Hospitalization is recommended when initiating the first two cycles to monitor for potentially life-threatening adverse effects.

Regence Pharmacy Services performs independent analyses of oncology medication evidence, to establish coverability per the contracts with the health plan.

- Most contracts define coverability based on established clinical benefit in published, peer-reviewed literature, along with consideration of regulatory status.
- FDA approval does not in itself establish medical necessity, as unpublished, low-quality evidence, including exploratory analyses and unvalidated surrogate endpoints, may be used as the basis of approval. Regulatory approval may or may not reflect clinical benefit relative to standard of care and the recommendations of expert clinical advisors such as the Oncologic Drugs Advisory Committee (ODAC). FDA approvals generally do not consider cost compared to established therapies, or value to members.
- Likewise, NCCN clinical practice guidelines assignment of a recommendation (category 1, 2a, or 2b) does not necessarily establish medically necessity. NCCN recommendations are inconsistently supported by published, peer-reviewed literature and do not uniformly consider value of new therapies relative to existing potentially higher-value treatment options, considering effectiveness, safety, and cost.
- Medication coverage criteria are developed based on the 'medical necessity' assessment, as described above.

Regence Pharmacy Services analysis and coverage policy may differ from FDA labeled indication and/or NCCN clinical practice guidelines.

Clinical Efficacy

B-cell precursor ALL, after complete remission with chemotherapy induction

- Blincyto (blinatumomab) has been studied and shown to be effective for two B-cell precursor ALL settings after complete remission (CR/CRi) from induction therapy with multiagent chemotherapy:
    * For the eradication of MRD (treatment of MRD-positivity, after induction with multiagent chemotherapy)
    * Use of consolidation therapy (in MRD-negative patients, after induction with multiagent chemotherapy).

    Both these settings are part of the "consolidation phase," after which patients may go on to treatment with a hematopoietic stem cell transplant (HSCT).
- For this policy, "complete remission" is considered as either one of the following:
    * hematologic complete remission (CR) or
    * CR with incomplete peripheral blood count recovery (CRi)
- For patients with complete remission (CR/CRi) after induction with multiagent chemotherapy, choice of next treatment is based on presence of minimal residual disease (MRD). However, definition in clinical practice may vary from the definition used in

clinical trials. Therefore, patients who were considered MRD-negative in the context of a clinical trial may in fact be considered MRD-positive, due to the use of more sensitive testing in clinical practice (See *Detection of Minimal Residual Disease* below).

- Therefore, this policy considers Blincyto (blinatumomab) to be considered for coverage under the criteria for patients who achieved CR/CRi with induction ("complete remission after the first or second relapse"), at the treatment is used as a part of the consolidation phase of treatment, independent of the MRD-status after induction with multiagent chemotherapy.

B-cell precursor ALL in the Consolidation Phase of multiphase chemotherapy

The evidence for expansion of the FDA indication included the following two trials:

- A phase 3 multicenter, open-label, randomized controlled trial [E1910] evaluated the addition of Blincyto (blinatumomab) to standard consolidation chemotherapy in adult patients with Philadelphia chromosome-negative (*BCR::ABL1*-negative) B-cell precursor ALL who achieved a complete response after induction and intensification chemotherapy (n=224).[1]
    * All patients evaluated in the trial were MRD-negative disease after induction and intensification chemotherapy. In the initial trial design, patients with MRD-positive status also underwent randomization. After the approval of blinatumomab therapy for patients with MRD-positive status, a protocol amendment assigned all subsequent patients with MRD-positive status to the blinatumomab group (n=18). However, the primary endpoint excluded the assessment of MRD-positive patients.
    * Patients were randomized to one of the following:
        o Two cycles of Blincyto (blinatumomab), followed by four cycles of chemotherapy, then two cycles of Blincyto (blinatumomab)
        o Four cycles of consolidation chemotherapy.
    * The primary endpoint, overall survival (OS) at 3 years, was higher in the Blincyto (blinatumomab) arm (85%) than the chemotherapy arm (68%).
- A phase 3 multicenter, open-label, randomized controlled trial [Study 20120215] evaluated the addition of Blincyto (blinatumomab) to standard consolidation chemotherapy in pediatric patients with Philadelphia chromosome-negative, high-risk, first relapse B-cell precursor ALL who achieved a complete response after induction (n=108). [2]
    * All enrolled patients had completed induction chemotherapy and had a response [M1 marrow (<5% morphologic blasts or M2 marrow (>5% but <25% morphologic blasts)].
    * All enrolled patients received the first 2 cycles of standard consolidation chemotherapy, then were randomized to a treatment arm for the third (and final) consolidation treatment.
        o Blincyto (blinatumomab) 15 µg/m2 /day for 4 weeks by continuous IV infusion for one cycle

- One cycle of consolidation chemotherapy (to complete three cycles)

  Each group went on to receive HSCT (if the patient achieved a complete remission from consolidation therapy).

* The primary endpoint, event-free survival (EFS), was higher in the Blincyto (blinatumomab) arm (69%) than the chemotherapy arm (43%).

Evidence from two additional trials support the use of Blincyto (blinatumomab) in the consolidation phase:

- One open-label, single arm phase 2 trial (BLAST) in adult patients in the first or later CR, with persistent MRD (See "*MRD-positive B-cell precursor ALL*" below). [3]
- A phase 3 open-label, randomized controlled trial [COG AALL1331] evaluated the Blincyto (blinatumomab) versus standard induction chemotherapy in pediatric patients with Philadelphia chromosome-positive, high-risk, first relapse B-cell precursor ALL (n=255).[4] (This trial is also confirmatory of the "*MRD-positive B-cell precursor ALL*" indication below)
  * All enrolled patients received a 4-week reinduction standard chemotherapy course, then were randomized to a treatment arm for the consolidation treatment.
    - Two cycles of Blincyto (blinatumomab)
    - Two cycles of multiagent chemotherapy

      Each group went on to receive HSCT.
  * After two cycles of blinatumomab, 2-year OS was 71.3% with blinatumomab vs. 58.4% with chemotherapy. Due to the encouraging treatment benefit observed, the trial was terminated early by the data and safety monitoring committee based.
  * Blincyto (blinatumomab showed) a trend toward improvement in DFS and OS, as well as lower toxicity, and better MRD clearance compared with chemotherapy in pediatric patients with B-cell ALL at first relapse
  * Of note: In the relapsed "low-risk" block of the AALL1331 trial, Blincyto (blinatumomab) was non-inferior to standard chemotherapy. [5]

MRD-positive B-cell precursor ALL

- A small, single-arm trial [MT103, BLAST] evaluated Blincyto (blinatumomab) in patients who achieved a complete remission after multiagent chemotherapy, but still had minimal residual disease (MRD) [n=113]. [3] The evidence is preliminary and approval in this setting is provisional (FDA Accelerated approval).
  * All patients enrolled in the trial were in either a first (71%) or a second (29%) hematologic complete remission with MRD.
  * MRD was detected by reverse transcriptase-polymerase chain reaction (PCR) or flow cytometry at a level of > 0.1% (using an assay with a minimum sensitivity of 0.01%).
  * All patients received Blincyto (blinatumomab) 15 µg/m2/day IV for up to 4 cycles. Patients could undergo HSCT any time after cycle 1

* Efficacy was based on the proportion of patients who achieved undetectable MRD within the first cycle of Blincyto (blinatumomab), and hematologic relapse-free survival (RFS).
    - Undetectable MRD was achieved by 70 of 86 patients (81.4%).
    - The median RFS was 22.3 months.
    - The rate of undetectable MRD and RFS was higher in patients who were in first remission than in those who were in second remission.
* Because there was no comparator in the study, it is not known if Blincyto (blinatumomab) improves any clinical outcome relative to the current standard of care (e.g., allogeneic stem cell transplant).

- More recently, the COG AALL1331 [4] was published and supports the indication (as discussed above in "*B-cell precursor ALL in the Consolidation Phase of multiphase chemotherapy*").

Detection of Minimal Residual Disease (MRD)

- Of note: Current standard of care for determination of MRD now also includes use of FDA-approved next generation sequencing (NGS)-based assays, such as clonoSEQ, for detection of lower levels of MRD. For patients with MRD based on PCR and/or flow cytometry, NGS testing is used for confirmation of MRD negativity.[6]
- Given the change in testing in clinical practice (versus testing used in the clinical trials), some patients with "MRD-negative" disease in a trial setting may be "MRD positive" in the clinical setting, with use of more sensitive NGS-based assays.

Relapsed or refractory B-cell precursor ALL

Philadelphia chromosome-negative B-cell precursor ALL:

In a multicenter, open-label randomized controlled trial [TOWER], Blincyto (blinatumomab) demonstrated improved overall survival (OS) relative to investigator's choice of chemotherapy in patients with relapsed or refractory Philadelphia chromosome-negative B-cell precursor ALL. Although an early survival advantage was apparent, there appeared to be little difference in survival between groups at 15 months which indicates the potential lack of a long-term benefit.[7]

- Subjects in the trial had disease in one of the following stages: refractory to primary induction or to salvage with intensive combination therapy, first relapse with first remission lasting fewer than 12 months, second or greater relapse, or relapse at any time after an autologous hematopoietic stem cell transplant.
- Median OS was 7.7 months in the Blincyto (blinatumomab) treatment arm and 4.0 months in the chemotherapy treatment arm (HR 0.71; 95% CI [0.55, 0.93]; p = 0.01. The median duration of follow up was 11.7 months.
- Because the survival curves converged by 15 to 18 months, there is some uncertainty regarding long-term benefits of this therapy.

Philadelphia chromosome-positive B-cell precursor ALL

A small, single-arm trial [ALACANTRA] evaluated complete remission rates achieved with Blincyto (blinatumomab) in patients with relapsed or refractory Philadelphia chromosome-positive B-cell precursor ALL. The design of this study is not suitable for evaluating efficacy because it lacks a comparator and employs an unvalidated surrogate endpoint.[8]

- All subjects (n=45) in the trial had prior therapy with TKIs directed against the Philadelphia chromosome [Gleevec (imatinib), Sprycel (dasatinib), Tasigna (nilotinib), or Iclusig (ponatinib)].
- Complete remissions were achieved in approximately 36% of subjects after induction with two cycles of Blincyto (blinatumomab).
- Although disease remission is one of the goals of treatment in ALL, this endpoint has not been validated to correlate with clinical outcomes such as improved symptom control, quality of life, or survival.
- Subsequently, the authors reported long-term durability with overall survival (OS) of 9 months, with a median 25.1 month follow up. Among patients with CR, the OS was 19.8 months.[9]

Treatment guidelines

The National Comprehensive Cancer Network (NCCN) ALL guideline lists: [NCCN][6]

- Initial Induction regimens - Standard front-line therapies:
  * Ph-negative B-cell precursor ALL: Multi-agent chemotherapy regimens.
  * Ph-positive B-cell precursor ALL: with tyrosine kinase inhibitors (TKIs) directed against the Philadelphia chromosome [Gleevec (imatinib), Sprycel (dasatinib), Tasigna (nilotinib), or Iclusig (ponatinib)].
- Consolidation therapy: For patients with complete remission (CR/CRi):
  * Choice of next treatment is based on presence of minimal residual disease (MRD). However, definition in clinical practice may vary from the definition used in clinical trials.
  * Blincyto (blinatumomab) is an option for both MRD-positive and MRD-negative patients
  * Hematopoietic stem cell transplant (HSCT) is an option for patients who achieve remission and have sufficient performance status.
- Relapsed/refractory B-cell precursor ALL: Blincyto (blinatumomab) is listed as follows:
  * Ph-negative: monotherapy

Ph-positive: either alone or in combination with a tyrosine kinase inhibitor.

OTHER CANCER SETTINGS AND CONDITIONS

There is interest in using Blincyto (blinatumomab) in other B-cell-mediated cancers; however, there is currently no good evidence to support its safety and effectiveness outside of the Ph-negative B-cell precursor ALL setting.

- A small, preliminary, observational trial evaluated response rates with Blincyto (blinatumomab) in 21 subjects with relapsed or refractory diffuse large B-cell lymphoma

(DLBCL). Further studies are needed to determine the optimal treatment strategy in this population. [10]

Safety [11]

- Package labeling for Blincyto (blinatumomab) includes a boxed warning for serious and potentially life-threatening or fatal Cytokine Release Syndrome (CRS) and neurological toxicity.
- The most common adverse effects (incidence of 20% or greater) reported with Blincyto (blinatumomab) in clinical trials included pyrexia, headache, peripheral edema, febrile neutropenia, nausea, hypokalemia, tremor, rash, and constipation.
- There is a Risk Evaluation and Mitigation Strategy (REMS) communication plan for Blincyto (blinatumomab) to inform healthcare providers of the following risks: Cytokine Release Syndrome, neurological toxicities, and preparation and administration errors.

Dosing [11]

- Blincyto (blinatumomab) is administered as a continuous intravenous infusion over 28 days (one cycle). Each cycle is followed by a 2-week treatment-free interval.
    * For r/r B-cell ALL: A treatment course consists of up 9 total cycles, with to two cycles for induction, three additional cycles for consolidation, and then up to four additional cycles of continued therapy (maintenance).
    * For B-cell precursor ALL, after complete remission with chemotherapy induction: up to 4 cycles, with variation on regimen based on treatment setting and plan for HSCT.
- Premedication with dexamethasone is recommended prior to each cycle. Blincyto (blinatumomab) package labeling recommends that initial doses of cycles one and two be administered in a hospital setting.
- General dosing parameters (refer to package insert for more specific information and pediatric dosing recommendations):

Cycle	Recommended dose	
	Patients ≥45 kg	**Patients < 45 kg**
Relapsed or refractory B-cell ALL		
Induction (cycle 1) Days 1 through 7: Days 8 through 28: Days 29 through 42:	 9 mcg/day 28 mcg/day 14-day treatment-free interval	 5 mcg/m2 /day (NTE 9 mcg/day) 15 mcg/m2 /day (NTE 28 mcg/day) 14-day treatment-free interval
Induction (cycle 2) Days 1 through 28: Days 29 through 42:	 28 mcg/day 14-day treatment-free interval	 15 mcg/m2 /day (NTE 28 mcg/day) 14-day treatment-free interval
Consolidation (cycles 3 to 5) Days 1 through 28: Days 29 through 42:	 28 mcg/day 14-day treatment-free interval	 15 mcg/m2 /day (NTE 28 mcg/day) 14-day treatment-free interval
Consolidation (cycles 6 to 9) Days 1 through 28: Days 29 through 84:	 28 mcg/day 56-day treatment-free interval	 15 mcg/m2 /day (NTE 28 mcg/day) 56-day treatment-free interval
B-cell ALL in the Consolidation Phase		
Days 1 through 28: Days 29 through 42:	28 mcg/day 14-day treatment-free interval	15 mcg/m2 /day (NTE 28 mcg/day) 14-day treatment-free interval
MRD-positive B-cell ALL		
Days 1 through 28: Days 29 through 42:	28 mcg/day 14-day treatment-free interval	15 mcg/m2 /day (NTE 28 mcg/day) 14-day treatment-free interval

Revision History

Revision Date	Revision Summary
12/12/2024	Effective 1/15/2025 • Add coverage criteria for B-cell ALL in the consolidation phase (new indication) and incorporation of new evidence.
12/7/2023	• No criteria changes with this annual review. • Clarification of coverage criteria, for operational consistency: o Removed 'Relapsed and refractory' prior to 'B-cell ALL' in criterion II.A. because it contradicts criterion B.2. (this does not impact the intent of the policy). o Simplified criterion for determination of MRD (to include NGS testing).
12/9/2022	• Updated standard language in policy. • Added 'CD19-positive' to the diagnosis required for coverage based on updated package labeling. • Removed requirement that Blincyto (blinatumomab) be used as monotherapy based on updated standards of care (it is now recommended in combination with tyrosine kinase inhibitors for Philadelphia chromosome-positive ALL).
1/20/2021	Updated continuation of therapy (COT) language. No changes to coverage criteria.
1/22/2020	Added continuation of therapy (COT) criteria (no change to intent of coverage criteria).
1/31/2018	There were no criteria changes with this annual update.
10/19/2018	• Added coverage for use in B-cell precursor ALL with MRD (new indication). • Updated quantity limitations and authorization section to include parameters for the new indication. • Updated the policy with new policy language (no change to intent).
9/8/2017	• Coverage of Blincyto (blinatumomab) was expanded to include patients with relapsed or refractory Philadelphia chromosome-positive B-cell precursor ALL based on new evidence in this population (it is now covered regardless of Philadelphia chromosome status). • Dosing limitations were updated to reflect new dosing recommendations (added maintenance cycles).
9/9/2016	Added diffuse B-cell lymphoma as an investigational condition.
3/13/2015	New policy.

Drug names identified in this policy are the trademarks of their respective owners.

Medication Policy Manual | **Policy No:** dru390

Topic: Opdivo, nivolumab | **Date of Origin:** March 13, 2015

Committee Approval Date: September 19, 2024 | **Next Review Date:** 2025

Effective Date: January 1, 2025

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Opdivo (nivolumab) is an intravenously infused immunotherapy [a programmed death receptor-1 (PD-1) inhibitor] that is used in the treatment of several different types of cancers.

Policy/Criteria

Most contracts require pre-authorization approval of Opdivo (nivolumab) prior to coverage.

I. Continuation of therapy (COT): Opdivo (nivolumab) may be considered medically necessary for COT when criterion A, B, or C below is met.

A. For diagnoses NOT listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND there is documentation that the medication was covered by another health plan. Examples of documentation include the coverage approval letter from the previous health plan or paid claim.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

B. For diagnoses listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

C. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

Please note*: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Opdivo (nivolumab) may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) confirming that one of the following criterion A through L below is met.

A. A diagnosis of **urothelial carcinoma** (UC, bladder cancer) in one of the following settings (1, 2, or 3):

1. **Locally advanced (stage III) or metastatic (stage IV), subsequent-line,** when criteria a, b, and c below are met:

a. Disease progression during or following platinum-containing chemotherapy (such as cisplatin or carboplatin).

AND

b. Opdivo (nivolumab) is used as monotherapy.

AND

c. No prior use of a programmed death receptor-1 blocking antibody therapy (PD-1 inhibitor) or programmed death-ligand 1 blocking antibody therapy (PD-L1 inhibitors) [see *Appendix 1*].

OR

2. **Unresectable locally advanced or metastatic, front-line,** when criteria a, b, and c below are met:

a. No prior systemic therapy in the advanced disease setting.

AND

b. Opdivo (nivolumab) will be initiated in combination with cisplatin and gemcitabine.

AND

c. No prior therapy with PD-1/PD-L1 blocking antibody therapy (see *Appendix 1*).

OR

3. **Muscle-invasive urothelial carcinoma** (MIUC) when criteria a through d below are met:

a. The patient has undergone radical resection of the bladder.

AND

b. There is high risk of recurrence as defined by the following (i or ii):

i. Patient received no prior neoadjuvant cisplatin-based chemotherapy: Pathological stage of pT3-pT4a, or pN+.

OR

ii. Patient received prior neoadjuvant cisplatin-based chemotherapy: Pathological stage of ypT2-ypT4a, or ypN+.

AND

c. Opdivo (nivolumab) will be used as an adjuvant monotherapy.

AND

d. No prior therapy with PD-1/PD-L1 blocking antibody therapy (see *Appendix 1*).

OR

B. A diagnosis of **colorectal cancer** (CRC), locally advanced or metastatic, when criteria 1 through 4 below are met:

1. The tumor is microsatellite instability-high (MSI-H) or mismatch repair deficient (dMMR) by immunohistochemistry (IHC) or polymerase chain reaction (PCR) testing.

AND

2. Disease progression during or after standard therapy with a fluoropyrimidine (e.g., fluorouracil, capecitabine), oxaliplatin, AND irinotecan, unless all are not tolerated or there is a documented medical contraindication to all three options.

AND

3. Opdivo (nivolumab) is used as monotherapy or in combination with Yervoy (ipilimumab).

AND

4. No prior therapy with PD-1/PD-L1 blocking antibody therapy (see *Appendix 1*).

OR

C. A diagnosis of **head and neck squamous cell cancer** (HNSCC), recurrent or metastatic, when criteria 1, 2, and 3 below are met:

1. Disease progression on or after a platinum-containing chemotherapy regimen.

AND

2. Opdivo (nivolumab) is used as monotherapy.

AND

3. No prior therapy with PD-1/PD-L1 blocking antibody therapy (see *Appendix 1*).

OR

D. A diagnosis of **hepatocellular carcinoma** (HCC) when criteria 1 through 4 below are met:

1. A documented Child-Pugh score of 5 or 6 (Class A).

AND

2. There has been disease progression on, or intolerance to an HCC-active oral tyrosine kinase inhibitor (TKI) [such as Nexavar (sorafenib) or Lenvima (lenvatinib)].

AND

3. Opdivo (nivolumab) is used in combination with Yervoy (ipilimumab).

AND

4. No prior therapy with PD-1/PD-L1 blocking antibody therapy (see *Appendix 1*).

OR

E. A diagnosis of **classical Hodgkin lymphoma** (CHL) when criteria 1, 2, and 3 are met:

1. Relapse or disease progression in one of the following two settings (a or b):

a. After a hematopoietic stem cell transplant [HSCT; bone marrow transplant (BMT)] and post-transplant Adcetris (brentuximab vedotin).

OR

b. Disease progression on or after three or more lines of therapy that includes an HSCT (BMT).

AND

2. Opdivo (nivolumab) is used as monotherapy.

AND

3. No prior therapy with PD-1/PD-L1 blocking antibody therapy (see *Appendix 1*).

OR

F. A diagnosis of **malignant pleural mesothelioma** (MPM), unresectable, when criteria 1, 2, and 3 below are met:

1. No prior use of systemic therapy for advanced disease.

AND

2. Opdivo (nivolumab) is used in combination with Yervoy (ipilimumab).

AND

3. No prior therapy with PD-1/PD-L1 blocking antibody therapy (see *Appendix 1*).

OR

G. A diagnosis of **melanoma** when either criterion 1 or 2 below is met:

1. Opdivo (nivolumab) is used as monotherapy when either criterion a or b below is met:

a. The patient is diagnosed with **early-stage (IIB or IIC) melanoma** and both of the following criteria are met (i and ii):

i. The tumor is completely resected with negative margins and a negative sentinel lymph node (adjuvant setting).

AND

ii. The patient has had no prior systemic therapy, including no prior therapy with PD-1/PD-L1 blocking antibody therapy (see *Appendix 1*).

OR

b. The patient is diagnosed with **advanced (stage III or IV) melanoma** and there has been no prior therapy with PD-1/PD-L1 blocking antibody therapy (see *Appendix 1*).

OR

2. Opdivo (nivolumab) is used in combination with Yervoy (ipilimumab) when criteria a, b, and c below are met:

a. The patient is diagnosed with **advanced (stage III or IV) melanoma**.

AND

b. No prior therapy with PD-1/PD-L1 blocking antibody therapy (see *Appendix 1*).

AND

c. No prior therapy with Yervoy (ipilimumab).

OR

H. A diagnosis of **non-small cell lung cancer** (NSCLC) when criterion 1, 2, or 3 below is met:

1. Earlier-stage, resectable NSCLC, as neoadjuvant therapy, with or without adjuvant therapy, when both criteria (a, b, and c) below are met:

a. Documented stage II, IIIA, or IIIB disease (defined as tumors ≥4 cm and/or node positive)

AND

b. Opdivo (nivolumab) is used as follows (i and ii):

i. For neoadjuvant doses: In combination with platinum-containing chemotherapy in the neoadjuvant setting (prior to surgical resection) for up to four cycles.

AND

ii. If adjuvant therapy is planned: As monotherapy in the adjuvant setting (after surgical resection) for up to 13 cycles.

AND

c. No prior systemic anticancer therapy for NSCLC in any setting, including prior PD-1 inhibitors or PD-L1 inhibitors (see *Appendix 1*).

OR

2. Advanced or metastatic NSCLC, First-line setting, when criteria a, b, and c below are met.

a. Opdivo (nivolumab) is used in combination with Yervoy (ipilimumab) AND one of the following (i or ii) applies:

i. The tumor expresses PD-L1 (≥ 1%).

OR

ii. Given in combination with two cycles of platinum-doublet chemotherapy (regardless of PD-L1 status).

AND

b. No prior systemic therapy for advanced disease.

AND

c. No prior therapy with PD-1/PD-L1 blocking antibody therapy (see *Appendix 1*).

OR

3. Advanced or metastatic NSCLC, Subsequent therapy, when criteria a, b, and c below are met:

a. Opdivo (nivolumab) is used as monotherapy.

AND

b. Disease progression on or after a platinum-containing chemotherapy regimen (such as cisplatin or carboplatin).

AND

c. No prior therapy with PD-1/PD-L1 blocking antibody therapy (see *Appendix 1*).

OR

I. A diagnosis of **renal cell cancer** (RCC), unresectable locally advanced, or metastatic, with clear cell histology and no prior therapy with PD-1/PD-L1 blocking antibody therapy (see *Appendix 1*).

OR

J. A diagnosis of **squamous cell anal carcinoma** (aSCC), recurrent or metastatic when criteria 1, 2, and 3 below are met:

1. Disease progression on or after cytotoxic chemotherapy.

AND

2. Opdivo (nivolumab) will be used as monotherapy.

AND

3. No prior therapy with PD-1/PD-L1 blocking antibody therapy (see *Appendix 1*).

OR

K. A diagnosis of **esophageal cancer** when one of the following criterion 1, 2, or 3 below is met:

1. A diagnosis of **esophageal squamous cell carcinoma** (ESCC), unresectable advanced or metastatic when either criterion a or b below is met:

a. **First-line setting** when criteria i through v below are met:

i. The patient is not a candidate for surgical resection or definitive chemoradiotherapy (CRT).

AND

ii. Opdivo (nivolumab) will be used in combination with fluoropyrimidine (e.g., fluorouracil, capecitabine)- and platinum (e.g., cisplatin, carboplatin)-containing chemotherapy or ipilimumab (Yervoy).

AND

iii. The tumor expresses PD-L1 (≥ 1%).

AND

iv. No prior systemic therapy in the advanced disease setting.

AND

v. No prior therapy with PD-1/PD-L1 blocking antibody therapy (see *Appendix 1*).

OR

b. **Subsequent-line setting** when criteria i through iii below are met:

i. Disease progression on or after, or intolerance to at least one fluoropyrimidine- and platinum-containing chemotherapy regimen.

AND

ii. Opdivo (nivolumab) is used as monotherapy.

AND

iii. No prior therapy with PD-1/PD-L1 blocking antibody therapy (see *Appendix 1*).

OR

2. A diagnosis of **esophageal adenocarcinoma**, locally advanced or metastatic when criteria a through d below are met:

a. No prior systemic therapy in the advanced disease setting.

AND

b. The tumor is PD-L1 positive as defined by a Combined Positive Score of 5 or more (CPS ≥ 5).

AND

c. Opdivo (nivolumab) will be administered in combination with a fluoropyrimidine (e.g., fluorouracil, capecitabine) and platinum-containing (e.g., cisplatin, oxaliplatin) chemotherapy.

AND

d. No prior therapy with PD-1/PD-L1 blocking antibody therapy (see *Appendix 1*).

OR

3. A diagnosis of **esophageal (adenocarcinoma or ESCC) or gastro-esophageal junction (GEJ) cancer**, stage II or III **resectable**, when criteria a through e below are met:

a. Completion of prior neoadjuvant chemoradiotherapy (must have received both chemotherapy and radiation in neoadjuvant setting).

AND

b. The tumor was completely resected.

AND

c. There is residual pathologic disease (absence of complete pathological response).

PLEASE NOTE: POST OP notes required to establish absence of complete pathological response.

AND

d. Opdivo (nivolumab) will be used as monotherapy.

AND

e. No prior therapy with PD-1/PD-L1 blocking antibody therapy (see *Appendix 1*).

OR

L. A diagnosis of **gastric or gastroesophageal junction (GEJ) cancer**, **locally advanced or metastatic,** when criteria 1 through 4 below are met:

1. No prior systemic therapy in the advanced disease setting.

AND

2. The tumor is PD-L1 positive as defined by a Combined Positive Score of 5 or more (CPS $\geq$ 5).

AND

3. Opdivo (nivolumab) will be administered in combination with a fluoropyrimidine (e.g., fluorouracil, capecitabine) and platinum-containing (e.g., cisplatin, oxaliplatin) chemotherapy.

AND

4. No prior therapy with PD-1/PD-L1 blocking antibody therapy (see *Appendix 1*).

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers Opdivo (nivolumab) coverable only under the medical benefit (as a provider-administered medication).

B. When pre-authorization is approved, Opdivo (nivolumab) may be authorized as follows (as specified in the coverage criteria above):

Monotherapy or in Combination with chemotherapy:

Diagnosis	Quantity Limit	Total Duration [a]
Neoadjuvant therapy for RESECTABLE cancer (earlier stage NSCLC)	Up to 360 mg every 3 weeks, for up to four doses.	Up to four doses in three months
Adjuvant therapy for RESECTABLE cancer (esophageal cancer, GEJ cancer, muscle-invasive urothelial carcinoma, melanoma, or NSCLC)	Up to 240 mg every 2 weeks (OR 480 mg every 4 weeks)	Up to one year
Other (non-resected): NSCLC, aSCC, advanced melanoma, RCC, UC (bladder cancer), MSI-H/dMMR CRC, classical HL, HNSCC, advanced esophageal, gastric, GEJ cancer	Up to 240 mg every 2 weeks (OR 480 mg every 4 weeks)	Until disease progression

[a] Each authorization will be for up to 24 weeks at a time, or until the course is completed.

Combination therapy with Cabometyx (cabozantinib):

Diagnosis	Quantity Limit	Total Duration [a]
RCC	Up to 240 mg every 2 weeks (OR 480 mg every 4 weeks)	Until disease progression

Combination therapy with Yervoy (ipilimumab):

Diagnosis	Quantity Limit		Total Duration [a]
	Initial, in combination with Yervoy (ipilimumab)	Subsequent, as a monotherapy	
Melanoma	Up to 3 mg/kg every 3 weeks x 4 doses [based on CheckMate 511]	Up to 240 mg every 2 weeks (OR up to 480 mg every 4 weeks)	Until disease progression
HCC	Up to 1 mg/kg every 3 weeks x 4 doses		
CRC (MSI-H/dMMR), RCC	Up to 3 mg/kg every 3 weeks x 4 doses		
ESCC, NSCLC (PD-L1 ≥1)	Up to 3 mg/kg every 2 weeks	Not applicable	Until disease progression, up to 24 months
NSCLC (with 2 cycles platins), MPM	Up to 360 mg every 3 weeks		

[a] Each authorization will be for up to 24 weeks at a time, or until the course is completed.

aSCC: anal squamous cell carcinoma; CRC: colorectal cancer; dMMR: mismatch repair deficient; GEJ: gastro-esophageal junction; HL: Hodgkin lymphoma; HNSCC: head and neck squamous cell cancer; MPM: malignant pleural mesothelioma; MSI-H: microsatellite instability-high; NSCLC: non-small cell lung cancer; RCC: renal cell cancer; UC: urothelial carcinoma

C. Reauthorization: Authorization **shall** be reviewed at least every 24 weeks for documented benefit. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met. Specifically, documentation that the medication is providing clinical benefit, including disease stability or improvement, and lack of disease progression, based on an assessment of change in tumor burden. If there is documentation of potential disease progression, a shortened authorization (up to three months) may be approved to allow time for clarification of response to Opdivo (nivolumab), including clinical re-evaluation of the patient and reimaging.

PLEASE NOTE: Additional doses of Opdivo (nivolumab) will not be authorized without a documented recent assessment by the treating provider (such as oncologist) with objective evidence of response to therapy, such as by re-imaging and use of iRECIST criteria.

IV. The use of Opdivo (nivolumab) in combination with other targeted anti-cancer medications [except with Cabometyx (cabozantinib) for RCC, Yervoy (ipilimumab) for melanoma, CRC, RCC, NSCLC, and HCC, or as specified per the coverage criteria above] is considered investigational.

V. Opdivo (nivolumab) is considered investigational when used for all other conditions, including but not limited to:

- **A.** Glioblastoma multiforme.
- **B.** Microsatellite instability high (MSI-H) or mismatch repair deficient (dMMR) tumors [unless specified in the coverage criteria sections above].
- **C.** Multiple myeloma.
- **D.** Ovarian cancer.
- **E.** Small cell lung cancer (SCLC).

Position Statement

- Opdivo (nivolumab) is an intravenously administered human programmed death receptor-1 (PD-1) blocking monoclonal anti-body (immunotherapy) used in the treatment of several types of cancers.
- The intent of this policy is to cover Opdivo (nivolumab) in settings where it has been shown to be safe and effective, as detailed in the coverage criteria, with consideration for other available treatment options.
    * Where there is lack of proven additional benefit and/or lack of demonstrated health outcome (such as overall survival or improved quality of life) relative to alternative therapies, use of Opdivo (nivolumab) alone or in combination with other therapies is not coverable ("not medically necessary" or "investigational").
    * It is important to note that the fact that a medication is FDA approved for a specific indication does not, in itself, make the treatment medically reasonable and necessary.
- Many of the clinical indications for immunotherapies (PD-1, PD-L1, and others) have been approved by the FDA and endorsed by clinical guidelines based on surrogate measures such as overall tumor response rate (ORR) and progression-free survival (PFS) which are not proven to accurately predict clinically important outcomes such as improved overall survival or improved quality of life.
- *PD-L1 expression testing*: is required for coverage of many clinical indications for PD-1 and PD-L1 inhibitors.
    * There are several ways in which PD-L1 expression can be defined. In addition, how PD-L1 expression is defined varies by tumor type and setting.
    * PD-L1 expression is determined by the FDA-approved companion diagnostic testing, based on both the specific PD-1/PD-L1 inhibitor and the tumor type.
    * However, PD-L1 test results are not interchangeable across PD-1/PD-L1 inhibitors and/or indications. There is no conversion available from one type of test to another, such as combined positive score (CPS) versus tumor proportion score (TPS) versus percent of tumor cells (TC). Therefore, the correct test must be conducted for proper selection of patient populations for a given use.
- National Comprehensive Cancer Network (NCCN) guidelines recommend Opdivo (nivolumab) as a potential option in each of the treatment settings listed in the coverage criteria. In general, NCCN recommendations parallel the FDA approved indications.
- The PD-1 and PD-L1 inhibitors have the potential to cause immune-mediated adverse reactions that can result in pneumonitis, colitis, hepatitis, endocrinopathies, and nephritis.
- Opdivo (nivolumab) is coverable in doses and quantities up to those specified in the coverage criteria, until disease progression or unacceptable toxicity.
- Optimal sequencing of chemotherapy and immunotherapy in many cancers is unknown or the data is evolving. At this time, sequential use of immunotherapies is not supported by current evidence. Specifically, there is no evidence to support the sequential use of different PD-1 or PD-L1 inhibitors once there is disease progression on prior PD-1 or PD-L1 inhibitor therapy, as well as use of adjuvant PD-1/PD-L1 inhibitor after neoadjuvant PD-1/PD-L1 inhibitor therapy (unless explicitly listed in the coverage criteria). Therefore, the use of sequential courses of PD-1/PD-L1 immunotherapy is not coverable.

- Although there is interest in the use of Opdivo (nivolumab) / Yervoy (ipilimumab), a combination immunotherapy, after progression on other therapies, Opdivo (nivolumab) / Yervoy (ipilimumab) is only coverable in the settings in which it was studied and NOT as a salvage therapy. In addition, the use of Opdivo (nivolumab) / Yervoy (ipilimumab) after progression on a monotherapy PD-1/PD-L1 inhibitor therapy [e.g., Keytruda (pembrolizumab)] is also not coverable.
- There are ongoing studies using Opdivo (nivolumab) in a variety of other cancers. However, although initial evidence may be promising, the potential for clinical benefit in these conditions is still being investigated.
- The use of Opdivo (nivolumab) for small cell lung cancer (SCLC), as well as a monotherapy in HCC, is now considered investigational. The FDA indications for SCLC and HCC (monotherapy) were withdrawn after confirmatory trials failed to demonstrate an improvement in any health outcome when used in these settings.
- *Reauthorization Criteria*: When coverage criteria are met, Opdivo (nivolumab) is authorized for six months (24 weeks) of therapy, after which time documentation must be provided to establish that the medication is effective. Specifically, there must be documentation of clinical benefit, including disease stability or improvement and there is a lack of disease progression, based on an assessment of change in tumor burden. Documentation of benefit must include an assessment of the most recent imaging ("restaging scans") and/or re-biopsy by the treating oncologist.

Regence Pharmacy Services performs independent analyses of oncology medication evidence, to establish coverability per the contracts with the health plan.

- Most contracts define coverability based on established clinical benefit in published, peer-reviewed literature, along with consideration of regulatory status.
- FDA approval does not in itself establish medical necessity, as unpublished, low-quality evidence, including exploratory analyses and unvalidated surrogate endpoints, may be used as the basis of approval. Regulatory approval may or may not reflect clinical benefit relative to standard of care and the recommendations of expert clinical advisors such as the Oncologic Drugs Advisory Committee (ODAC). FDA approvals generally do not consider cost compared to established therapies, or value to members.
- Likewise, NCCN clinical practice guidelines assignment of a recommendation (category 1, 2a, or 2b) does not necessarily establish medically necessity. NCCN recommendations are inconsistently supported by published, peer-reviewed literature and do not uniformly consider value of new therapies relative to existing potentially higher-value treatment options, considering effectiveness, safety, and cost.
- Medication coverage criteria are developed based on the 'medical necessity' assessment, as described above.

Regence Pharmacy Services analysis and coverage policy may differ from FDA labeled indication and/or NCCN clinical practice guidelines.

Clinical Efficacy

UROTHELIAL CARCINOMA (BLADDER CANCER)

- Advanced (locally advanced or metastatic) UC, subsequent-line setting: Opdivo (nivolumab) received FDA Accelerated approval for unresectable or metastatic bladder cancer based on a single-arm, observational trial that evaluated tumor objective response rates (ORR) [CHECKMATE-275]. [1,2] Clinical benefit has not been established.
  * Subjects had disease that progressed during or following a platinum-containing chemotherapy regimen, or progressive disease within 12 months of treatment with a platinum-containing chemotherapy regimen administered in the adjuvant (after surgical resection) or neoadjuvant (prior to surgical resection) settings.
  * ORR was 19.6%, of which the vast majority (17%) were partial responders.
  * ORR has not been shown to accurately predict clinically relevant outcomes. Additional confirmatory studies are needed to establish a clinical benefit.
- Advanced (unresectable locally advanced or metastatic) UC, first-line setting: Opdivo (nivolumab) received FDA approval as a first-line therapy for unresectable locally advanced or metastatic bladder cancer when initiated in combination with cisplatin plus gemcitabine and then continued as monotherapy. Approval was based on a randomized, open-label trial [CheckMate-901] that compared this combination with cisplatin plus gemcitabine alone. [3]
  * Subjects were previously untreated in the advanced treatment setting; however, prior neoadjuvant or adjuvant chemotherapy was allowed as long as recurrence took place 12 or more months after completion of therapy. Patients who were not eligible for cisplatin-based chemotherapy were excluded from the study.
  * Opdivo (nivolumab) was initiated in combination with cisplatin plus gemcitabine which were given for up to six cycles, after which Opdivo (nivolumab) was continued every four weeks as monotherapy until disease progression, or for up to two years maximum from the first dose.
  * The study demonstrated a survival advantage with median OS of 21.7 months and 18.9 months in the Opdivo (nivolumab) and chemotherapy only treatment arms, respectively (HR 0.78 [95% CI: 0.63, 0.96]; p-value = 0.017).
- Adjuvant therapy for early-stage MIUC: Opdivo (nivolumab) received FDA approval as an adjuvant therapy (after complete surgical resection) for patients with early-stage muscle-invasive urothelial carcinoma (MIUC) [also known as muscle-invasive bladder cancer (MIBC)] with good performance status and a high risk of disease recurrence. Approval was based on a randomized, double-blind, placebo-controlled trial [CHECKMATE-274] that evaluated disease-free survival (DFS) as the primary endpoint. [4]
  * The population was primarily White, male, and with a median age of 66 years (generally younger than a typical patient which has a median age of 73 years at diagnosis). Forty percent had a PD-L1 $\geq$ 1%.
  * Approximately 80% of patients had tumors originating in the bladder, with the remaining 20% originating in the renal pelvis or ureter.
  * Approximately 44% of subjects had prior neoadjuvant cisplatin-based chemotherapy.

    * The DFS was 20.8 months and 10.8 months in the Opdivo (nivolumab) and placebo arms, respectively (HR 0.70; [95% CI: 0.57, 0.86]; p = 0.0008).
    * DFS has not been shown to accurately predict improvement in any clinically relevant outcome in early-stage MIUC. It is not known if adjuvant therapy will ultimately improve overall survival (OS), the outcome of interest. In addition, the ideal sequencing of agents in this clinical setting has not been determined.

- The NCCN guideline lists Opdivo (nivolumab) monotherapy for UC as follows: [5]
    * ***Locally advanced or metastatic disease:*** Opdivo (nivolumab) and Opdivo (nivolumab)-based regimens are listed among several first- and subsequent-line therapy recommendations.
    * ***Adjuvant therapy for newly diagnosed MIUC with a high risk of recurrence:*** Listed among potential therapy options.

COLORECTAL CANCER (CRC), MSI-H/dMMR

- Opdivo (nivolumab) received FDA Accelerated approval for progressive MSI-H/dMMR metastatic CRC based on tumor response from an uncontrolled, single-arm (observational) study in cohort of subjects (N = 53) whose disease had progressed during or after treatment with all standard options: fluoropyrimidine, oxaliplatin, and irinotecan [CHECKMATE-142]. [2,6] To date, there is no evidence that it provides any clinical benefit in this setting.
    * ORR was 28% (1.9% were considered to have a complete tumor response).
    * PD-L1 expression was not a condition for enrollment in the trial.
    * ORR has not been shown to accurately predict clinically relevant outcomes. Additional confirmatory studies are needed to establish a clinical benefit.
- Opdivo (nivolumab) monotherapy is listed among the treatment options for MSI-H/dMMR CRC after progression on fluoropyrimidine, oxaliplatin, and irinotecan. [5]

HEAD AND NECK SQUAMOUS CELL CANCER (HNSCC)

- Opdivo (nivolumab) received approval for recurrent or metastatic HNSCC based on improved overall survival (OS), a clinically relevant endpoint, relative to investigator's choice of Erbitux (cetuximab) or single-agent chemotherapy in an open-label randomized controlled trial (N = 361) [CHECKMATE-141]. [2,7]
    * The trial included cancer of the oral cavity, pharynx, or larynx that was not amenable to curative therapy and progressive disease within 6 months of receiving platinum-based chemotherapy.
    * Median OS was 7.5 months and 5.1 months in the Opdivo (nivolumab) and investigator's choice of therapy treatment arms, respectively. A subgroup analysis demonstrated greater improvement in median OS with Opdivo (nivolumab) when at least 1% of the cells in the tumor expressed PD-L1 (tumor proportion score of > 1%).
- The NCCN guidelines list Opdivo (nivolumab) monotherapy among treatment options for non-nasopharyngeal HNSCC when there has been disease progression on or after platinum-containing chemotherapy. [5]

HEPATOCELLULAR CARCINOMA (HCC)

- Opdivo (nivolumab) received FDA Accelerated approval for use in HCC after progression of disease on, or intolerance to, Nexavar (sorafenib) when given in combination with Yervoy (ipilimumab) based on a small, single-arm, preliminary study [CHECKMATE-040] that evaluated tumor response rate. Clinical benefit in this setting has not been demonstrated. [2,8]
    * Subjects had progressive disease while on, or had intolerance to, Nexavar (sorafenib) therapy.
    * Patients had Child-Pugh Class A disease (a score of A5 in 82%, and A6 in 18% of patients) and 80% had disease that had spread beyond the liver.
    * An ORRs of 33% was reported with this regimen. ORR has not been shown to accurately predict clinically relevant outcomes. Additionally, it is not known how Opdivo (nivolumab) plus Yervoy (ipilimumab) compares with other second-line HCC therapies.
- The Accelerated FDA indication for use of Opdivo (nivolumab) as a monotherapy in HCC after progression of disease on, or intolerance to, Nexavar (sorafenib) was withdrawn by the manufacturer in July of 2021 because clinical benefit was not demonstrated in confirmatory trials.
- The NCCN guideline lists Opdivo (nivolumab) monotherapy, or in combination with Yervoy (ipilimumab), among treatment options for progressive of disease after Nexavar (sorafenib) and the patient is Child-Pugh Class A (or B7 for monotherapy). [5]

CLASSICAL HODGKIN LYMPHOMA (CHL)

- Opdivo (nivolumab) received FDA Accelerated approval for as a monotherapy relapsed or refractory CHL based on two, small, single-arm, trials that measured tumor response rate [CHECKMATE-205 and -039]. Clinical benefit in this setting has not been established. [2,9]
    * Subjects had relapsed or refractory disease and had prior high-dose chemotherapy followed by autologous stem cell transplant rescue, and post-transplantation Adcetris (brentuximab vedotin). The median number of prior systemic regimens was four. *[Note: PD-1 inhibitors, such as Opdivo (nivolumab), should NOT be given after an allogeneic stem cell transplant as it may cause serious and potentially fatal immunologic reactions].*
    * ORR, the primary endpoint, not been shown to correlate with clinical outcomes such as improved symptom control, function, or quality of life, or prolonged OS.
- The NCCN guideline lists Opdivo (nivolumab) among several single-agent treatment options for relapsed or refractory CHL after high-dose chemotherapy with autologous stem cell rescue and Adcetris (brentuximab vedotin). [5]
- There is interest in the use of Opdivo (nivolumab) in combination with Adcetris (brentuximab vedotin) for cHL. However, there is insufficient evidence at this time to establish the safety or efficacy of this combination. The evidence for use in the relapsed/refractory setting is limited to phase 1 and 2 trial interim data. [10,11] Additional trials are ongoing. In the front-line setting in chemotherapy-ineligible patients, the primary endpoint (ORR) was not met with the use of Opdivo (nivolumab) in combination with Adcetris (brentuximab vedotin). [12]

MALIGNANT MELANOMA

First-line Advanced Melanoma Setting

- The primary evidence of efficacy for Opdivo (nivolumab) in previously untreated (first-line setting) patients with unresectable (stage IIIB) or metastatic (stage IV) melanoma is based on a phase 3, double-blind randomized controlled trial that compared Opdivo (nivolumab) monotherapy with dacarbazine [CHECKMATE-066]. [2,13]
    * All enrolled subjects were without a BRAF mutation.
    * Progression-free survival (PFS), a secondary endpoint, was 5.1 months with Opdivo (nivolumab) and 2.2 months with dacarbazine.
    * Preliminary survival rates at 1 year were 72.9% and 42.1% with Opdivo (nivolumab) and dacarbazine, respectively. In a subsequent three-year analysis, median OS was substantially longer in the Opdivo (nivolumab) group in a subsequent analysis. [14]

First-line Advanced Melanoma Setting in Combination with Yervoy (ipilimumab)

- The efficacy of Opdivo (nivolumab) when administered in combination with Yervoy (ipilimumab) for unresectable or metastatic melanoma in the first-line setting is based two RCTs, which found improved PFS relative to monotherapy with either drug alone. OS data was not yet mature at the time these trials were published. [2,15]
- A follow-on study (CheckMate 511) was conducted to determine whether adjustments in the dosing of Opdivo (nivolumab) and Yervoy (ipilimumab) might improve the tolerability of the combination. The currently approved dose is Opdivo (nivolumab) 1 mg/kg plus Yervoy (ipilimumab) 3 mg/kg IV every 3 weeks for 4 doses. The study found that Opdivo (nivolumab) 3 mg/kg plus Yervoy (ipilimumab) 1 mg/kg IV every 3 weeks for 4 doses was better tolerated without negatively impacting tumor response rate after a minimum of 12 months follow up. The median OS was not reached in either group. [16]

Opdivo (nivolumab) as Subsequent Therapy for Advanced Melanoma

- Opdivo (nivolumab) has also been evaluated in patients with advanced melanoma whose disease was refractory to therapy with Yervoy (ipilimumab) and, if BRAF mutation positive, BRAF inhibitor therapy. [17,18]
    * Efficacy was based on improved tumor response rates relative to chemotherapy. There was no information with regard to improvement in any clinically relevant outcome in this setting at the time these trials were published.
    * Confirmatory evidence of efficacy in this melanoma setting was not yet mature at the time the trial was published.

Opdivo (nivolumab) as an Adjuvant Therapy for Resectable Melanoma

- Opdivo (nivolumab) was evaluated as an adjuvant therapy in patients with resectable stage IIIB/C or stage IV (metastatic) melanoma after complete surgical resection, as compared to Yervoy (ipilimumab) [CHECKMATE-238]. [19]
    * Treatment was started within 12 weeks of tumor resection and was continued for up to one year.
    * There was a statistically significant improvement in recurrence-free survival (RFS) with Opdivo (nivolumab) relative to Yervoy (ipilimumab). However, improvement in OS, a clinically relevant endpoint, is unknown.

- Opdivo (nivolumab) was evaluated as an adjuvant therapy in patients with early-stage (IIB/C) after complete surgical resection (negative margins and negative sentinel lymph node) where it was compared with placebo (best supportive care) [CHECKMATE-76K]. [20]
    * Patients in the study were naïve to prior systemic therapy and treatment with Opdivo (nivolumab) was started within 12 weeks of tumor resection and was continued for up to one year.
    * There was a statistically significant improvement in recurrence-free survival (RFS) with Opdivo (nivolumab) relative to Yervoy (ipilimumab). However, improvement in OS, a clinically relevant endpoint, is unknown.
- The NCCN guideline lists Opdivo (nivolumab), as monotherapy or in combination with Yervoy (ipilimumab), among treatment options for metastatic or unresectable for *BRAF V600* wild-type melanoma. Opdivo (nivolumab) is also listed for second-line or subsequent therapy when used as a monotherapy as well as when used in the adjuvant setting for resected stage IIB/C, IIIB/C and stage IV disease. [5]

MALIGNANT PLEURAL MESOTHELIOMA (MPM)

The efficacy of Opdivo (nivolumab) in combination with Yervoy (ipilimumab) for unresectable MPM in the first-line setting is based on one randomized, open-label trial, which found improved OS relative to chemotherapy (platinum plus pemetrexed) alone (18.1 vs. 14.1 months) [CHECKMATE-743]. [21]

- The NCCN guideline for MPM lists both platinum-based chemotherapy [category 1] and nivolumab plus ipilimumab [category 2A] as first-line, preferred regimens. Nivolumab with or without ipilimumab (if not used in 1st-line) is also listed as a second-line, treatment option [category 2A]. However, there are no trials for the use of nivolumab with or without ipilimumab as a second-line therapy. Therefore, the use of nivolumab in the 2nd line setting is not coverable. [5]

NON-SMALL LUNG CANCER (NSCLC)

RESECTABLE DISEASE (EARLY NSCLC)

Neoadjuvant (prior to surgical resection) for earlier NSCLC:

- The efficacy of Opdivo (nivolumab) as a neoadjuvant therapy for resectable NSCLC was evaluated in an open-label randomized controlled trial that evaluated event-free survival (EFS) and pathological complete response (pCR) as surrogate endpoints. The trial compared the addition of Opdivo (nivolumab) to a platinum doublet with the platinum doublet alone. Therapy was given prior to surgical resection every three weeks for a total of 3 doses. [22]
    * Patients enrolled in the trial had resectable disease with tumors ≥ 4 cm and/or positive nodes.
    * Approximately 50% of the population had PD-L1 expression ≥ 1%.
    * The median EFS was 31.6 months and 20.8 months in the Opdivo (nivolumab)/platinum doublet and platinum doublet treatment arms, respectively [HR 0.63 (97.5% CI: 0.43, 0.91); p=0.005).
    * The rate of pCR was 24% and 2.2% in the Opdivo (nivolumab)/platinum doublet and platinum doublet treatment arms, respectively.
    * Data for overall survival (OS) were not mature in either treatment arm.

- Limitations of the study include the use of surrogate endpoints which do not accurately reflect relevant clinical outcomes, and potential undertreatment of patients in the comparator arm as standard of care neoadjuvant therapy in this setting is generally four doses of platinum doublet therapy.

Neoadjuvant therapy followed by adjuvant therapy for earlier NSCLC:

- An RCT [CHECKMATE 77T] evaluated Opdivo (nivolumab) in resectable NSCLC as an add-on to platinum-containing chemotherapy used in the neoadjuvant setting (prior to surgical resection), and then continued as a monotherapy in the adjuvant setting (after surgical resection).[23]
    * Patients had pathologically confirmed stage II, IIIA, or IIIB NSCLC [involvement of >1 ipsilateral mediastinal lymph node or subcarinal lymph node (N2 stage)], no EGFR mutations or known ALK translocations, and no prior systemic anticancer treatment.
    * Placebo or Opdivo (nivolumab) was given 360 mg every three weeks for 4 cycles (4 doses) prior to surgical resection, and then placebo or Opdivo (nivolumab) 480 mg every 4 weeks was continued until disease progression or up to a maximum of one year [up to 13 cycles (13 doses, as 360 mg every 4 weeks)] after surgical resection. All patients received neoadjuvant platinum-doublet chemotherapy every 3 weeks for 4 cycles.
    * The primary endpoint was event-free survival (EFS). The median EFS was not reached in the Opdivo (nivolumab) treatment arm and was 18.4 months in the placebo arm with a hazard ratio of 0.58 [97.63% CI: 0.42, 0.81] and p-value <0.001. OS results are not mature; however, no difference in OS has been detected to date.
- EFS is not a validated surrogate endpoint. It has not been shown to accurately predict significant improvement in clinical endpoints of interest such as OS and quality of life.
- The NCCN NSCLC guideline lists neoadjuvant therapy with Opdivo (nivolumab) among treatment options for resectable NSCLC (three cycles total). Platinum doublet therapy is also an option (four cycles total), as are various adjuvant therapies. [24]

METASTATIC DISEASE (mNSCLC)

Front-line use:

In Combination with Yervoy (ipilimumab) and Platinum-Doublet for mNSCLC

- The efficacy of Opdivo (nivolumab) when administered in combination with Yervoy (ipilimumab) and two cycles of platinum-doublet chemotherapy for recurrent or metastatic NSCLC in the first-line setting is based on one randomized, open-label trial, which found improved OS relative to chemotherapy alone [CHECKMATE-9LA]. [18]
    * Subjects received Opdivo (nivolumab) 360 mg IV every 3 weeks, Yervoy (ipilimumab) 1 mg/kg IV every 6 weeks, and platinum-doublet chemotherapy IV every 3 weeks for 2 cycles; or platinum-doublet chemotherapy administered every 3 weeks for 4 cycles. Study treatment continued until disease progression, unacceptable toxicity, or for up to 2 years.

* Patients received no prior systemic therapy for metastatic disease.
* OS was 14.1 months with the addition of nivolumab/ipilimumab versus 10.7 months with chemotherapy alone. These efficacy results are from the prespecified interim analysis when 351 events were observed (87% of the planned number of events for final analysis). With an additional 4.6 months of follow-up, the hazard ratio for overall survival was 0.66 (95% CI: 0.55, 0.80) and median survival was 15.6 months (95% CI: 13.9, 20.0) and 10.9 months (95% CI: 9.5, 12.5) for patients in the treatment arm or control arm, respectively.

In Combination with Yervoy (ipilimumab) for mNSCLC

- The efficacy Opdivo (nivolumab) with Yervoy (ipilimumab) for metastatic NSCLC in the first-line setting is based on one open-label, phase 3 trial, which found improved OS versus chemotherapy in PD-L1 expressing tumors [CHECKMATE-227]. [25]
  * Patients had received no prior systemic therapy for metastatic disease.
  * Among the patients with a PD-L1 expression level of 1% or more, the median OS was 17.1 months with nivolumab plus ipilimumab vs. 14.9 months with chemotherapy, with 2-year overall survival rates of 40.0% and 32.8%, respectively.

Monotherapy for mNSCLC:

- Front-line treatment of metastatic NSCLC with single agent Opdivo (nivolumab) was not superior to chemotherapy based on a phase 3 trial in this setting. The study failed to meet its primary endpoint of PFS [KEYNOTE-026]. [26] No information on OS has been released to date.

Subsequent-line use:

Opdivo (nivolumab) as Subsequent Therapy for Metastatic NSCLC

- The efficacy of Opdivo (nivolumab) in metastatic NSCLC is based on two RCTs, one in subjects with squamous histology and one in subjects with nonsquamous histology. [2,27,28]
  * Subjects enrolled in the trials had progression of disease during or after chemotherapy with a platinum doublet. Patients with a known EGFR mutation or ALK translocation were allowed to have one additional line of tyrosine kinase inhibitor therapy. The studies compared Opdivo (nivolumab) 3 mg/kg IV every two weeks with docetaxel 75 mg/m^2 IV every three weeks. Both were administered as monotherapy.
  * Median OS was statistically superior in the Opdivo (nivolumab) treatment arm relative to the docetaxel arm in both squamous and nonsquamous populations. The difference was considered to be clinically relevant.
  * In the population with nonsquamous histology, it was noted that there was a positive correlation between the level of PD-L1 expression and the efficacy of Opdivo (nivolumab) in metastatic NSCLC. Although Opdivo (nivolumab) therapy is currently not selected based on level of PD-L1 expression, future studies may help to clarify the role of testing in the selection of patients who are most likely to benefit from this therapy.
  * The clinical utility of nivolumab as a first-line therapy in NSCLC (nonsquamous or squamous) has not been demonstrated.

- The NCCN guideline lists Opdivo (nivolumab) monotherapy among recommended treatment options for locally advanced or metastatic squamous and nonsquamous NSCLC when used as a subsequent therapy. [5]

RENAL CELL CARCINOMA (RCC)

Front-line use:

In Combination with Yervoy (ipilimumab)

- A large, randomized, open-label trial compared the combination of Yervoy (ipilimumab) plus Opdivo (nivolumab) with Sutent (sunitinib) as initial therapy for patients with intermediate- to poor risk, unresectable or metastatic RCC [CHECKMATE-214]. [29]
  * Yervoy (ipilimumab) was initiated for four doses with Opdivo (nivolumab) then Opdivo (nivolumab) monotherapy was continued until disease progression.
  * The population included favorable-, intermediate-, or poor-risk disease; however, only patients with intermediate- or poor risk disease were evaluated for efficacy.
  * There was no statistical difference in PFS between the two treatment groups. Efficacy was based on a modest improvement in survival at 18 months (interim analysis) relative to Sutent (sunitinib). Median survival has not been reached in either group. It is too soon to make conclusions regarding its net health benefit in this setting.
- The NCCN guideline lists Opdivo (nivolumab) among the recommended front-line therapies for patients with intermediate- to poor risk advanced RCC when given in combination with Yervoy (ipilimumab). [5]

In Combination with Cabometyx (cabozantinib)

- A large, open-label, randomized active-controlled trial compared the combination of Opdivo (nivolumab) plus cabozantinib with Sutent (sunitinib) in treatment-naïve patients with locally advanced (unresectable) or metastatic RCC with clear cell histology [CHECKMATE-9ER]. [18]
  * Patients were enrolled regardless of tumor PD-L1 expression.
  * The population included patients with favorable-, intermediate-, and poor-risk disease; however, approximately 75% had intermediate- to poor-risk disease.
  * The median PFS was 16.6 months and 8.3 months in the Opdivo (nivolumab)/Cabometyx (cabozantinib) and Sutent (sunitinib) treatment groups, respectively.
  * Median OS was not reached in either group; however, early results favor the Opdivo (nivolumab)/Cabometyx (cabozantinib) treatment arm.
- A more informative comparator would have been a monotherapy Cabometyx (cabozantinib) arm.
- The NCCN guideline lists the combination of Opdivo (nivolumab) and Cabometyx (cabozantinib) among several front-line options for advanced RCC with clear cell histology.[5]

In combination with Yervoy (ipilimumab) and Cabometyx (cabozantinib)

- A large, phase 3, RCT [COSMIC-313] compared the combination of Opdivo (nivolumab)/ Yervoy (ipilimumab)/Cabometyx (cabozantinib) with Opdivo (nivolumab)/Yervoy (ipilimumab)/placebo in patients with intermediate- to poor-risk advanced or metastatic RCC with a clear cell component. An incremental improvement in PFS was noted in the 'triple therapy' group; however, there is no mature outcomes data from the study. [30]
- The risk of significant AEs was greater in the Opdivo (nivolumab)/Yervoy(ipilimumab)/ Cabometyx (cabozantinib) treatment arm with grade 3 or 4 AEs occurring in 79% of the patients in the 'triple therapy group' versus 56% in the control group.
- It is not known how Opdivo (nivolumab)/Yervoy (ipilimumab)/Cabometyx (cabozantinib) compares with Opdivo (nivolumab)/Cabometyx (cabozantinib) which is already FDA approved and coverable in this population.
- The NCCN guideline does not endorse the use of Opdivo (nivolumab)/Yervoy (ipilimumab)/Cabometyx (cabozantinib) for RCC. [24,31]

Subsequent-line use:

- The primary evidence of efficacy in RCC is based on a phase 3, double-blind randomized controlled trial that compared Opdivo (nivolumab) monotherapy with Afinitor (everolimus) in patients with refractory unresectable or metastatic RCC, after prior antiangiogenic therapy with bevacizumab or a multi-kinase inhibitor. [2,32]
    * Subjects were previously treated with at least one of the following: bevacizumab, Sutent (sunitinib), Votrient (pazopanib), Inlyta (axitinib), or Nexavar (sorafenib).
    * Efficacy was based on improved OS with Opdivo (nivolumab), a clinically relevant endpoint, relative to Afinitor (everolimus) at the time of the prespecified interim analysis (median OS of 25 months and 19.6 months, respectively).
- The NCCN guideline lists Opdivo (nivolumab) among several treatment options for subsequent therapy of unresectable or metastatic RCC after progression of disease on front-line therapy [e.g. multi-kinase inhibitors, bevacizumab]. [5]

GASTRIC, GASTROESOPHAGEAL JUNCTION (GEJ), AND ESOPHAGEAL ADENOCARCINOMA CANCER - ADVANCED

- The efficacy of Opdivo (nivolumab) in gastric, GEJ, and advanced esophageal cancer is based on a phase 3, open-label, randomized controlled trial [CheckMate-649] that compared front-line treatment with Opdivo (nivolumab) plus chemotherapy versus chemotherapy alone in patients with unresectable advanced, or metastatic gastric or GEJ cancer and esophageal adenocarcinoma. [2,33]
    * Seventy percent of the population had gastric cancer, 18% had GEJ cancer, and the remaining 12% had esophageal adenocarcinoma. Ninety-six percent of the population had metastatic disease.
    * Opdivo (nivolumab) was given in combination with fluoropyrimidine (fluorouracil or capecitabine) plus oxaliplatin chemotherapy. Patients in the comparator arm received the same chemotherapy regimen given alone.

    * The trial initially enrolled patients regardless of PD-L1 CPS status; however, a protocol amendment was made when the trial was underway which required a PD-L1 CPS of 5% or more. This resulted in an overall population of patients with tumors that had a higher-than-average PD-L1 CPS expression (the population was enriched with high PD-L1-expressing tumors).
    * Efficacy was based on the primary efficacy population of patients with tumors with a PD-L1 CPS $\geq$ 5. The median OS was 14.4 months and 11.1 months in the Opdivo (nivolumab) and comparator arms, respectively.
    * Results in the ITT population (all patients, regardless of tumor PD-L1 CPS expression) are not reliable as this population was enriched with patients whose tumors had high PD-L1 CPS expression and were more likely to respond to PD-1 inhibitor therapy.
- The NCCN guideline lists Opdivo (nivolumab) when used in combination with a fluoropyrimidine plus oxaliplatin among several treatment options for the front-line treatment of unresectable locally advanced or metastatic gastric or GEJ cancer, as well as esophageal or esophagogastric junction adenocarcinoma, with a PD-L1 combined positive score (CPS) of at least 5. [5]

ESOPHAGEAL AND GASTROESOPHAGEAL JUNCTION (GEJ) CANCER

Early-Stage (Resectable) Esophageal or GEJ Cancer – as ADJUVANT therapy

- The efficacy of Opdivo (nivolumab) in esophageal or GEJ cancer is based on a phase 3, randomized, double-blind controlled trial [CheckMate-577] that compared adjuvant treatment with Opdivo (nivolumab) versus placebo in patients with stage II or III (resectable) esophageal or GEJ. [2,34]
    * The trial included tumors with both adenocarcinoma (71%) and squamous cell carcinoma (29%) histology.
    * All patients had to have completed neoadjuvant chemoradiotherapy (CRT) followed by a complete resection where the patient was rendered free of disease.
    * Additionally, all patients had residual pathological disease (absence of pathological complete response) after their initial treatment. Patients with resectable metastatic disease were not eligible to participate in the study.
    * Patients were randomized to either nivolumab or placebo for a total duration of up to one year of adjuvant therapy.
    * Efficacy was based on disease-free survival, an unvalidated surrogate endpoint. Median DFS was 22.4 months and 11.0 months in the Opdivo (nivolumab) and placebo treatment arms, respectively. OS results are not mature.
- NCCN guideline lists Opdivo (nivolumab) among several treatment options for adjuvant use in resected esophageal or esophagogastric junction cancer with residual disease. [5]

Advanced Esophageal Squamous Cell Cancer (ESCC)

- The efficacy of Opdivo (nivolumab) in refractory, unresectable advanced, recurrent, or metastatic ESCC is based on a phase 3, open label, randomized controlled trial that compared Opdivo (nivolumab) with investigator's choice of taxane (paclitaxel or docetaxel). There was a modest OS improvement with Opdivo (nivolumab) relative to chemotherapy [ATTRACTION-3]. [35]

* Patients were refractory or intolerant to at least one fluoropyrimidine- and platinum-based regimen.
* At a minimum follow-up time (i.e., time from random assignment of the last patient to data cutoff) of 17.6 months, OS was statistically significantly improved with Opdivo (nivolumab) versus chemotherapy (median 10.9 *vs* 8.4 months).

- Opdivo (nivolumab) was also approved as a potential front-line therapy in combination with fluoropyrimidine- and platin-based chemotherapy or ipilimumab for unresectable advanced or metastatic ESCC based on a large randomized, open-label trial that demonstrated a 2- to 2.5-month improvement in median OS relative to chemotherapy alone. [36] This is likely an overestimate of expected survival benefit in the general population due to the following:
  * The trial was enriched with patients whose tumors overexpressed PD-L1 (PD-L1 ≥ 1%) and were therefore more likely to respond to this immunotherapy combination. Subgroup analyses support this analysis as there was a 6-month improvement in median OS relative to standard chemotherapy in the PD-L1 ≥ 1% population; however, there was no survival benefit relative to chemotherapy in the PD-L1 < 1% population. *(Note: 49% of the study population had PD-L1 expression ≥ 1%)*
  * Only 16% of patients in the chemotherapy arm received a PD-(L)1 inhibitor after disease progression. Follow-on therapy with a PD-(L)1 inhibitor is standard of care in the US based on current guidelines. There are currently two PD-1 inhibitors approved as monotherapy for ESCC in the second-line setting (after progression on chemotherapy).
- Optimal sequencing of therapies in esophageal carcinomas has not yet been determined.
- The NCCN guideline lists Opdivo (nivolumab) as a potential treatment option in the following advanced ESCC settings: [5]
  * ***Front-line:***
    - In combination with ipilimumab [category 2A]
    - Although the FDA approved the use of Opdivo (nivolumab) in combination with chemotherapy as a front-line therapy for ESCC, it is not routinely recommended in the guideline [category 2B].
  * ***Second-line:*** As monotherapy [category 1] among several treatment options for second- or subsequent-line therapy of advanced ESCC.

Advanced Esophageal Adenocarcinoma

- The efficacy of Opdivo (nivolumab) in advanced esophageal adenocarcinoma is based on a phase 3, open-label, randomized controlled trial [CheckMate-649] that compared front-line treatment with Opdivo (nivolumab) plus chemotherapy versus chemotherapy alone in patients with unresectable advanced, or metastatic gastric or GEJ cancer, or esophageal adenocarcinoma. [2,33]

  Note: This same trial was used for the approval of Opdivo (nivolumab) in advanced gastric and GEJ cancer. (See "GASTRIC, AND GASTROESOPHAGEAL JUNCTION (GEJ), AND ESOPHAGEAL ADENOCARCINOMA CANCER - ADVANCED") [5]

ANAL SQUAMOUS CELL CARCINOMA (aSCC)

- Although not FDA-approved for this use, Opdivo (nivolumab) and Keytruda (pembrolizumab) have been used in anal squamous cell carcinoma that is refractory to or recurs on front-line chemotherapy due to the lack of other effective therapies.
- The majority of patients with aSCC respond well to standard cytotoxic chemotherapy.
- Preliminary studies suggest these therapies have potential activity in this setting:
  * There was a reported ORR of 17% (all partial responses) in 24 patients with recurrent PD-L1-positive (> 1%) advanced anal squamous cell carcinoma who received Keytruda (pembrolizumab). [37]
  * There was a reported ORR of 24% (two complete and seven partial responses) in 37 patients with treatment refractory metastatic anal squamous cell carcinoma who received Opdivo (nivolumab). [38]
  * Additional studies are needed to establish whether there is a lasting clinical benefit with these PD-1 inhibitors in this treatment setting.
- Both Keytruda (pembrolizumab) and Opdivo (nivolumab) are listed as treatment options as subsequent therapy for recurrent anal carcinoma in the NCCN guideline. [5]
- Given the lack of treatment alternatives in a relatively small patient population, the use of Opdivo (nivolumab) is considered medically necessary and coverable in chemotherapy-refractory disease.

INVESTIGATIONAL USES

- *Small cell lung cancer (SCLC)*:
  * Opdivo (nivolumab) received Accelerated approval for in metastatic SCLC, based on a small, single-arm, open label study that evaluated tumor response rate in a cohort of patients with pretreated metastatic SCLC [CHECKMATE-032]. [39]
  * However, subsequent trials [CHECKMATE -451 and -331) failed to demonstrate a proven health benefit and the company withdrew the FDA indication. [40] Therefore, the use of Opdivo (nivolumab) for SCLC is considered investigational at this time.
- *Hepatocellular carcinoma (HCC):* A confirmatory phase 3 trial (CheckMate 459) comparing Opdivo (nivolumab) with Nexavar (sorafenib) as a front-line therapy for advanced HCC failed to show any overall survival advantage with Opdivo (nivolumab). Coverage is only provided for Opdivo (nivolumab) when it is given in combination with Yervoy (ipilimumab). [41]
- *Glioblastoma:* An open-label, phase 3 study [NCT02617589] compared Opdivo (nivolumab) plus radiotherapy with temozolomide plus radiotherapy in patients with newly diagnosed glioblastoma multiforme. Temozolomide plus radiotherapy, the standard of care, demonstrated superior overall survival relative to Opdivo (nivolumab) plus radiotherapy. [42]
- *Melanoma, adjuvant Opdivo (nivolumab) plus Yervoy (ipilimumab):* A phase 3, double-blind RCT [CheckMate 915] compared Opdivo (nivolumab) plus Yervoy (ipilimumab) with Opdivo (nivolumab) plus placebo as an adjuvant therapy for up to one year after resection (with no evidence of residual disease) of their stage IIIB-D or IV cutaneous melanoma. The trial found that the addition of Yervoy (ipilimumab) to adjuvant Opdivo (nivolumab) did not improve relapse-free survival rates; however, the risk of grade 3 or 4 adverse effects (AEs) and discontinuation of therapy due to AEs was greater. [43]

- *Other cancers*: PD-1 inhibitor medications, including Opdivo (nivolumab), are actively being studied in many different cancers. Ongoing areas of research include, but are not limited to, use in multiple myeloma, ovarian cancer, and DLBCL (other than listed in the coverage criteria). [44,45] Whether Opdivo (nivolumab) provides any clinical benefit in these settings is still being investigated. The evidence is limited to early phase trials. Larger trials are needed to establish the safety and efficacy of Opdivo (nivolumab) in these conditions.
- *Sarcoma (including osteosarcoma)*: The evidence for various soft tissue sarcomas (STS) including Ewing sarcoma, spindle cell sarcoma, and osteosarcoma, is limited to a single open-label, non-comparative phase 2 trial of Opdivo (nivolumab) with or without Yervoy (ipilimumab). The primary endpoint (ORR) was not met in the nivolumab monotherapy arm. [45] Additional trials are ongoing with combination therapy. [46,47]
- *Sequential therapy*: The study of Opdivo (nivolumab) in combination and in sequence with other immunotherapies and targeted therapies is underway. Early results appear promising; however, the optimal sequencing, patient selection, and overall benefit of combination therapies has not yet been determined.
    * There is an ongoing study of Opdivo (nivolumab) given sequentially with Yervoy (ipilimumab) in patients with advanced or metastatic melanoma [CHECKMATE-064 trial].
    * There is a phase 2 trial in progress that combines Sutent (sunitinib) plus Opdivo (nivolumab) in KIT-mutated advanced melanoma.
    * There is a study about to recruit that will compare the combination of Opdivo (nivolumab) with Tafinlar (dabrafenib) and/or Mekinist (trametinib).

REAUTHORIZATION CRITERIA:

- When coverage criteria are met, Opdivo (nivolumab) is authorized for six months (24 weeks) of therapy, after which time documentation must be provided to establish that the medication is effective. Specifically, there must be documentation of clinical benefit, including disease stability or improvement and there is a lack of disease progression, based on an assessment of change in tumor burden.
    * The standard of care for evaluation of response to cancer immunotherapy, such as Opdivo (nivolumab), is use of the iRECIST criteria for assessment of tumor burden. [6]
    * The iRECIST criteria include use of quantitative and qualitative criteria for assessment of change in tumor burden for target lesions and non-target lesions. [7]
        - Quantitative measurements for target lesions (tumor size and % change)
        - Qualitative evaluation for non-target lesions (present/disappeared/ unequivocal progression)
    * Documentation of benefit must include an assessment of the most recent imaging ("restaging scans") by the treating oncologist. Given the complexity of the evaluation, including use of the iRECIST criteria, Opdivo (nivolumab) will not be reauthorized without an assessment of response to therapy, such a partial response (iPR), complete response (iCR), or stable disease (iSD).
    * Use of immunotherapy may result in pseudoprogression, due to immune and T-cell activation, which can appear similar to tumor flare. If there is documentation of potential disease progression ["unconfirmed progressive disease (iUPD)"], a shortened authorization (up to three months) may be approved to allow time for

clarification of response to Opdivo (nivolumab), including clinical re-evaluation of the patient and reimaging. Guidelines recommend reimaging for iUPD after 4-8 weeks.

* If a patient has confirmed, unequivocal new lesions (progression of disease, iPD), additional Opdivo (nivolumab) is not coverable. If a new lesion is equivocal, iUPD reassessment by the treating oncologist with repeat imaging would apply (as noted above).

DOSING *[18]*

- As monotherapy, the dose of Opdivo (nivolumab) is 240 mg IV every 2 weeks in most all indications. Alternately, it may be given in a dose of 480 mg every 4 weeks or 360 mg every 3 weeks.
- When initially approved, Opdivo (nivolumab) dosing was based on weight; however, subsequent studies have shown that similar results are achieved with newly labeled flat dosing described above.
- The exception to flat dosing is when Opdivo (nivolumab) is administered in combination with Yervoy (ipilimumab). In this setting, lower weight-based doses (1 mg/kg or 3 mg/kg) are used and coverable doses mirror FDA-approved dosing (see *Quantity Limits* section).
- Therapy with Opdivo (nivolumab) is continued for three doses (cycles) when used as a neoadjuvant therapy for resectable NSCLC, up to one year when used in the adjuvant melanoma and esophageal cancer settings, up to two years when used in combination with Yervoy (ipilimumab) for MPM and NSCLC, and until disease progression or unacceptable toxicity when used in all other conditions (see *Quantity Limits* section).

Appendix 1: FDA- approved PD-1 and PD-L1 blocking monoclonal antibody therapies [a]
Programmed death receptor-1 (PD-1) inhibitors
Jemperli (dostarlimab)
Keytruda (pembrolizumab)
Libtayo (cemiplimab-rwlc)
Loqtorzi (toripalimab)
Opdivo (nivolumab)
Tevimbra (tislelizumab)
Zynyz (retifanlimab)
Programmed death-ligand 1 (PD-L1) inhibitor
Bavencio (avelumab)
Imfinzi (durvalumab)
Tecentriq (atezolizumab)

[a] Or as listed on the FDA.gov website

Revision History

Revision Date	Revision Summary
9/19/2024	Effective 1/1/25: Changed reauthorization from 'may' to 'shall.' Operationally, all approvals will be for 24 weeks (six months). Ongoing therapy (beyond 24 weeks) will be subject to reauthorization review every 24 weeks, for documentation of disease stability or improvement and lack of disease progression.
9/19/2024	Effective 10/15/24: • Add coverage in front-line unresectable locally advanced or metastatic urothelial carcinoma when used in combination with cisplatin/ gemcitabine (new indication). • Add coverage criteria for "neoadjuvant/adjuvant therapy for resectable earlier stage NSCLC" [combined with the existing neoadjuvant criteria]. • Remove "adjuvant therapy for resectable earlier stage NSCLC" from the list of Investigational Uses.
6/20/2024	For clarity of coverage, added 'adjuvant therapy for resectable earlier stage NSCLC' to list of Investigational Uses. No change to intent of criteria.
3/21/2024	Added criteria for coverage of adjuvant Opdivo (nivolumab) for early-stage (IIB or IIC) melanoma, when used as a monotherapy, until disease progression, or for up to one year.
12/7/2023	• Added the requirement that RCC tumors have clear cell histology so coverage of Opdivo (nivolumab) aligns with coverage of Keytruda (pembrolizumab) in this setting, which does not change criteria intent. • Updated 'Neoadjuvant therapy for resectable cancer (NSCLC)' quantity limitation to read, 'In doses up to 360 mg every 3 weeks, for

Revision Date	Revision Summary
	up to three doses **in three months**'. The prior criterion stated, 'In doses up to 360 mg every 3 weeks, for up to three doses'. The updated language allows for dose delays during therapy. There is no change to the intent of the policy. • Added glioblastoma multiforme as investigational based on the results of a failed study.
12/9/2022	• Added coverage for Opdivo (nivolumab) in combination with platinum-based chemotherapy as a neoadjuvant therapy for resectable (tumors ≥ 4 cm or node positive) NSCLC (new indication). • Updated QL for new NSCLC use and for when used in combination with Yervoy (ipilimumab) to address tolerability issues evaluated in CheckMate 511.
9/23/2022	Added coverage criteria for Opdivo (nivolumab) as a combination therapy [with chemotherapy or ipilimumab (Yervoy)] for first-line treatment of ESCC, based on new evidence and a new FDA indication.
3/18/2022	Coverage criteria were added for adjuvant use of Opdivo (nivolumab) in muscle-invasive urothelial carcinoma (MIUC) with a high risk of recurrence (new indication).
10/15/2021	• Removed coverage of Opdivo (nivolumab) as a monotherapy for progressive, advanced hepatocellular carcinoma (HCC) based on the withdrawal of this indication from package labeling (clinical benefit not established in confirmatory trials). • Added coverage of Opdivo (nivolumab) for advanced gastric cancer, GEJ cancer, and esophageal adenocarcinoma for tumors with PD-L1 CPS ≥ 5 when used in combination with chemotherapy. • Added coverage of Opdivo (nivolumab) for up to one year for resectable (stage II or III) esophageal or GEJ cancer when used as adjuvant therapy (as a single agent) after neoadjuvant therapy with complete resection when there is residual pathologic disease. • Updated quantity limitations for new indications.

Revision Date	Revision Summary
4/21/2021	• Added coverage criteria for MPM and RCC (1st line, in combination with cabozantinib), new FDA indications (effective 5/15/2021). Because the new RCC indication expands use of nivolumab in RCC, existing coverage criteria for RCC were broadened to simplify administration of this policy. • The criteria under UC were simplified for more straight-forward application of the policy. Criteria were changed from defining coverage for specific treatment settings to a slightly broader, more general statement (disease progression on or following platinum-containing therapy). • The criteria under CRC were streamlined for easier application (the criterion pertaining to prior use of systemic therapy in the adjuvant setting was removed). • The criteria under HCC were streamlined for easier application (the criterion defining coverage based on separate Child-Pugh class ratings for nivolumab monotherapy and for combination nivolumab and ipilimumab therapy were combined). • The criteria under cHL were streamlined by removing the word 'autologous' as a descriptor for HSCT. This is a simplification and not a change to intent. • The criteria under melanoma were simplified by removing language specific to use in the adjuvant setting. There is no change to the intent of the policy (use in the adjuvant setting is still covered under the more general language). • Under the NSCLC criteria the requirement for documenting that 'no EGFR and ALK genomic tumor aberrations are present' was removed. This is a simplification and does not change the intent of the policy. • Removed coverage criteria for SCLC (FDA indication withdrawn) and added use in SCLC to list of 'Investigational uses. • Updated quantity limitations for new indications. • Updated COT language (no change to policy intent).
7/22/2020	• Added coverage criteria for use in advanced hepatocellular carcinoma (HCC). • Added coverage criteria for use in front-line metastatic NSCLC. • Added coverage criteria for use in esophageal squamous cell carcinoma (ESCC) as a monotherapy in the subsequent-line setting. • Updated quantity limitations for new indications. • Updated 'Investigational uses' (removed NSCLC, first-line)
6/15/2020	Removed references to brand Avastin from policy to account for upcoming changes in biosimilars policy (dru620).

Revision Date	Revision Summary
1/22/2020	• Added coverage for use in squamous cell anal carcinoma. • Clarified step therapy requirements for hepatocellular carcinoma. • Added continuation of therapy (COT) criteria.
10/23/2019	No changes to coverage criteria with this annual update.
10/19/2018	• Added coverage for use in metastatic SCLC (new indication). • Updated quantity limitations for new indication. • Updated 'Investigational uses' (removed SCLC).
8/17/2018	• Added coverage criteria for use in MSI-H metastatic CRC and advanced RCC when used in combination with Yervoy (ipilimumab). • Updated "Investigational uses" (removed front-line use in RCC). • Updated the 'Administration, Quantity Limitations, and Authorization Period' section to include the new front-line RCC and CRC (in combination with Yervoy) indications.
4/20/2018	• Added coverage criteria for subsequent treatment of hepatocellular carcinoma, and adjuvant therapy for resectable melanoma. • Dosing and quantity limitations were updated to reflect use in the two additional settings listed above. • Clarified authorization is valid "until disease progression" (no change to intent). • The list of investigational uses was updated to include SCLC and front-line use in RCC.
3/16/2018	Update dosing (240 mg every 2 weeks or 480 mg every 4 weeks).
11/10/2017	• Coverage criteria were updated to include MSI-H/dMMR metastatic CRC. • The investigational uses and Quantity Limitation sections of the policy were also updated as they relate to MSI-H/dMMR CRC.
9/8/2017	• Coverage criteria updated for Hodgkin lymphoma (HL) to reflect currently available evidence and to make consistent with HL criteria in the pembrolizumab medication policy. • NSCLC coverage criteria regarding prerequisite therapies was clarified to reflect the standard of care and currently available evidence. In patients with EGFR or ALK mutations, front-line treatment with appropriate EGFR or ALK TKI therapy, followed by platinum-based chemotherapy, is the standard of care. This is consistent with the sequencing used in the study population.
3/10/2017	• Added criteria for coverage in HNSCC and bladder cancer. • Updated NSCLC criteria such that prior use of a PD-L1 inhibitor precludes coverage.
10/13/16	Updated QL to be in line with FDA labeling change that occurred on 9/15/16.

Revision Date	Revision Summary
9/9/2016	Add policy coverage criteria for classical Hodgkin lymphoma (CHL), a new FDA indication, and remove it as an 'investigational' use.
3/11/2016	• The coverage criteria for Opdivo in melanoma were reorganized; however, the intent of the criteria was not altered. • Several appendices were combined and then updated to include renal cell carcinoma (RCC) therapies. • The appendix describing the different NSCLC histologies was deleted.
12/11/2015	• Add policy coverage for new FDA indications: - Use in combination with Yervoy for melanoma - Use in nonsquamous NSCLC - Use in RCC • Add criteria to prevent the use of sequential therapy of PD1s (Opdivo/Keytruda). • Add Appendix 1, with a list of available PD1s. • Add Appendix 3, with a list of other targeted therapies for melanoma (modified the table of BRAF inhibitors).

Medication Policy Manual | **Policy No:** dru393

Topic: Xgeva, denosumab | **Date of Origin:** March 13, 2015

Committee Approval Date: September 19, 2024 | **Next Review Date:** 2025

Effective Date: December 1, 2024

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Xgeva (denosumab) is a medication used to prevent skeletal complications of bone metastases from solid tumor cancers and multiple myeloma. In addition, it is also used for the treatment of giant cell tumor of the bone and hypercalcemia of malignancy. It is a monoclonal antibody that targets the receptor activator of nuclear factor kappa B ligand (RANKL). Xgeva (denosumab) prevents RANKL from activating its receptor, RANK, on the surface of osteoclasts, their precursors, and osteoclast-like giant cells.

PLEASE NOTE: Denosumab is also marketed as Prolia and is used treat osteoporosis (bone loss). There is a separate medication policy for Prolia (denosumab) for these indications, specifically. See policy dru223.

Policy/Criteria

Most contracts require pre-authorization approval of Xgeva (denosumab) prior to coverage.

I. Continuation of therapy (COT): Xgeva (denosumab) may be considered medically necessary for COT when criterion A, B, or C below is met.

A. For diagnoses NOT listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND there is documentation that the medication was covered by another health plan. Examples of documentation include the coverage approval letter from the previous health plan or paid claim.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

B. For diagnoses listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

C. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

Please note*: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New Starts (treatment-naïve patients): Xgeva (denosumab) may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) that criterion A, B, or C is met.

A. Prevention of **skeletal related events** (SRE; such as fractures) in patients with:

1. Bone metastases from any solid tumor or multiple myeloma.

AND

2. Prior treatment with an IV bisphosphonate [e.g., pamidronate or Zometa (zoledronic acid)] has been ineffective, contraindicated, or not tolerated.

PLEASE NOTE: Ineffective is defined as having a skeletal related event while on bisphosphonate therapy. Cancer progression is NOT considered a lack of efficacy. A contraindication to IV bisphosphonates may include, but is not limited to, creatinine clearance of less than 35 ml/min.

OR

B. Treatment of **giant cell tumor of the bone** when:

1. The tumor is unresectable.

OR

2. The tumor is resectable, but surgical resection is documented as medically contraindicated.

OR

C. Treatment of **hypercalcemia of malignancy** when:

1. The albumin-corrected calcium is above 12.5 mg/dL (3.1 mmol/L) (see *Appendix 1).*

AND

2. Prior treatment with an IV bisphosphonate [e.g., pamidronate or Zometa (zoledronic acid)] has been ineffective, contraindicated, or not tolerated.

PLEASE NOTE: Ineffective is defined as having persistent hypercalcemia despite bisphosphonate therapy. Cancer progression is NOT considered a lack of efficacy. A contraindication to IV bisphosphonates may include, but is not limited to, creatinine clearance of less than 35 ml/min.

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers Xgeva (denosumab) coverable only under the medical benefit (as a provider-administered medication).

B. When pre-authorization is approved Xgeva (denosumab) may be authorized:

1. In quantities up to 13 of the 120 mg injections per year for the prevention of complications of bone metastases (SREs) from solid tumor cancers or multiple myeloma.

2. In quantities up to 15 of the 120 mg injections per year for the treatment of giant cell tumor of the bone and hypercalcemia of malignancy.

C. Authorization **may** be reviewed at least annually. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, such as disease stability or improvement.

IV. Xgeva (denosumab) is considered not medically necessary for the treatment of osteoporosis.

V. Xgeva (denosumab) is considered investigational when used for all other conditions.

Position Statement

Summary

- Xgeva (denosumab) is a monoclonal antibody used for the prevention of skeletal related events (SREs) in patients with bone metastases from solid tumor cancers (e.g., breast cancer, prostate cancer) or multiple myeloma. It is also used for the treatment of giant cell tumor of the bone and hypercalcemia of malignancy.
- Generic IV bisphosphonates (pamidronate and zoledronic acid) provide the best value for prevention of skeletal related events (SREs; such as fractures) in patients with solid tumors or multiple myeloma.
- There is insufficient evidence of superior safety or tolerability of Xgeva (denosumab) over bisphosphonates. Both have a risk of osteonecrosis of the jaw (ONJ).
- There is reliable evidence that Xgeva (denosumab) is a potent antiresorptive therapy for the prevention of SREs in patients with some cancers. The effect is consistent across the placebo-controlled trials and comparative, non-inferiority trials. However, there uncertainty in the evidence with regard to whether Xgeva (denosumab) is better than other available treatment options.
- Xgeva (denosumab) and zoledronic acid (generic Zometa) appear to be at least similar in delaying the time to first skeletal related event (SRE) in patients with metastases from solid tumor cancers; however, the clinical relevance of delaying the time to first SRE is uncertain relative to prevention of SREs, reduction in the number of SREs, or overall survival.
- The evidence for efficacy for Xgeva (denosumab) for the treatment of giant cell tumor of the bone comes from two open-label trials that demonstrated a decrease in tumor size in 25% of patients. Patients in the trials had e giant cell tumor of the bone that was either recurrent, unresectable, or for which planned surgery was likely to result in severe morbidity.
- The evidence for efficacy for Xgeva (denosumab) for hypercalcemia of malignancy comes from a single-arm trial in patients refractory to treatment with prior IV bisphosphonate therapy. Xgeva (denosumab) was associated with lowering corrected serum calcium 63.6% of patients treated with at day ten.
- The recommended dose of Xgeva (denosumab) for prevention of skeletal-related events in multiple myeloma and bone metastasis from solid tumors is 120 mg every four weeks. For giant cell tumor of the bone and hypercalcemia of malignancy, the recommended dose is 120 mg every four weeks with additional 120 mg doses on days 8 and 15 of the first month of therapy.

Regence Pharmacy Services performs independent analyses of oncology medication evidence, to establish coverability per the contracts with the health plan.

- Most contracts define coverability based on established clinical benefit in published, peer-reviewed literature, along with consideration of regulatory status.
- FDA approval does not in itself establish medical necessity, as unpublished, low-quality evidence, including exploratory analyses and unvalidated surrogate endpoints, may be used as the basis of approval. Regulatory approval may or may not reflect clinical benefit

relative to standard of care and the recommendations of expert clinical advisors such as the Oncologic Drugs Advisory Committee (ODAC). FDA approvals generally do not consider cost compared to established therapies, or value to members.

- Likewise, NCCN clinical practice guidelines assignment of a recommendation (category 1, 2a, or 2b) does not necessarily establish medically necessity. NCCN recommendations are inconsistently supported by published, peer-reviewed literature and do not uniformly consider value of new therapies relative to existing potentially higher-value treatment options, considering effectiveness, safety, and cost.
- Medication coverage criteria are developed based on the 'medical necessity' assessment, as described above.

Regence Pharmacy Services analysis and coverage policy may differ from FDA labeled indication and/or NCCN clinical practice guidelines.

Clinical Efficacy

CANCER-RELATED BONE METASTASES

Metastatic Breast and Prostate Cancer:

- The effectiveness of Xgeva (denosumab) for bone metastases from breast or prostate cancer relative to zoledronic acid was evaluated in two low confidence, randomized, double-blind, non-inferiority trials that included 2,046 women with bone metastases from breast cancer and 1,904 men with metastatic prostate cancer. [1,2]
    * The primary endpoint in both trials was the non-inferiority of Xgeva (denosumab) relative to zoledronic acid for time to first SRE (defined as bone pain, pathologic fractures, spinal cord compression, and bone complications that required radiation or surgery).

Breast Cancer:

- Xgeva (denosumab) was shown to be at least similar to zoledronic acid for delaying the time to first SRE in patients with metastatic breast cancer and metastatic prostate cancer. The study authors concluded that Xgeva (denosumab) was superior to zoledronic acid for delaying time to first SRE; however, the evidence is of insufficient quality to validate that conclusion. There was no difference between treatment groups for overall survival or disease progression. [2]
- The National Comprehensive Cancer Network (NCCN) Breast Cancer guideline recommends that Xgeva (denosumab), zoledronic acid, or pamidronate (all with calcium and vitamin D supplementation) should be given in addition to chemotherapy or endocrine therapy if bone metastasis is present. There is no preference given to one agent over the other, as all are considered a category 1 recommendation. [3]
- The American Society of Clinical Oncology (ASCO) guideline recognizes Xgeva (denosumab), pamidronate and zoledronic acid as treatment options for patients with breast cancer with evidence of bone metastases. Per the ASCO guideline, there is insufficient evidence to demonstrate greater efficacy of one product over another for the prevention and treatment of skeletal-related events. [4]

Prostate Cancer:

- There is low confidence in the evidence that Xgeva (denosumab) is superior to zoledronic acid because the clinical relevance of delaying the time to first SRE is uncertain, particularly in the absence of improved overall survival or disease progression. Additional concerns with the studies include high attrition and the potential for suboptimal dosing of zoledronic acid. [1]
- The NCCN Prostate Cancer guideline recommends both zoledronic acid (category 2A recommendation) and Xgeva (denosumab) (category 1 recommendation) for the prevention of skeletal-related events in patients with prostate cancer if bone metastases is present. [5] However, there is low confidence in the evidence that Xgeva (denosumab) is superior to zoledronic acid.

Other Solid Tumor Cancers and Multiple Myeloma:

- The effectiveness of Xgeva (denosumab) relative to zoledronic acid was evaluated in a low confidence, randomized, double-blind, non-inferiority trial that included 1,779 patients with bone metastases from various advanced solid tumor cancers (excluding breast or prostate cancer) or patients with multiple myeloma. [6]
    * The primary endpoint was the non-inferiority of Xgeva (denosumab) relative to zoledronic acid for time to first SRE.
    * Xgeva (denosumab) was shown to be non-inferior to zoledronic acid for time to first SRE. There was no difference between treatment groups for overall survival or disease progression.
    * The trial is considered low confidence because the clinical relevance of delaying the time to first SRE is uncertain, particularly in the absence of improved overall survival or disease progression. Additional concerns with the study include high attrition and the potential for suboptimal dosing of zoledronic acid.
    * In a subgroup analysis of patients with multiple myeloma (n = 180), an increase in mortality was observed with Xgeva (denosumab) relative to zoledronic acid. [7] A follow-up non-inferiority trial demonstrated the non-inferiority of Xgeva (denosumab) compared to zoledronic acid. No difference in mortality was observed. [7]

GIANT CELL TUMOR OF THE BONE:

- The safety and efficacy of Xgeva (denosumab) was evaluated in 282 adult or skeletally mature adolescent patients with giant cell tumor of the bone.
    * Two open-label, uncontrolled trials studied Xgeva (denosumab) in patients with giant cell tumor of the bone that was recurrent, unresectable, or for which surgery would likely result in morbidity. [8,9]
    * Objective response rate (decrease in tumor size) was evaluated as the primary efficacy endpoint. The overall objective response rate was 25%, and all responses were partial responses. [7-9]
- The NCCN Bone Cancer guideline recognizes Xgeva (denosumab) as a category 2A recommendation for giant cell bone tumors that are unresectable or are resectable with unacceptable morbidity. Interferon, peg-interferon, radiation therapy, and observation are also listed as category 2A recommendations in these treatment settings. [10]

HYPERCALCEMIA OF MALIGNANCY:

- The safety and efficacy of Xgeva (denosumab) was demonstrated in an open-label, single-arm trial in 33 patients with hypercalcemia of malignancy (with or without bone metastases). [7,11]
    - ***** Patients were refractory to treatment with IV bisphosphonate therapy. Refractory hypercalcemia of malignancy was defined as albumin-corrected calcium of > 12.5 mg/dL (3.1 mmol/L) despite treatment with IV bisphosphonate in the seven to thirty days prior to initiation of Xgeva (denosumab) therapy.
    - ***** The primary outcome measure was the proportion of patients achieving a response, defined as corrected serum calcium ≤ 11.5 mg/dL (2.9 mmol/L), within ten days after Xgeva (denosumab) administration.
    - ***** A total of 21 out of 33 patients (64%) had a response to Xgeva (denosumab) treatment within ten days.

Investigational Uses

- Denosumab is also marketed as Prolia and is indicated for the treatment of osteoporosis. Use of Xgeva for this indication is considered not medically necessary as dosage and frequency of administration differ between indications and products.
- The use of Xgeva (denosumab) for all other conditions is considered investigational.

Safety [7]

- Both bisphosphonates and Xgeva (denosumab) have labeled warnings for risk of osteonecrosis of the jaw (ONJ).
    - ***** As noted in the NCCN prostate cancer and breast cancer guidelines, ONJ is seen with both Xgeva (denosumab) and bisphosphonates.
    - ***** Poor baseline dental health or dental procedures during treatment are known risk factors for ONJ. Thus, patients should be referred for dental evaluation before starting either agent.
    - ***** A position paper from the American Association or Oral and Maxillofacial Surgeons (AAOMS) states that the risk for ONJ among cancer patients exposed to Xgeva (denosumab) is comparable to the risk of ONJ in patients exposed to zoledronic acid. [12]
- Xgeva (denosumab) can cause severe symptomatic hypocalcemia, and fatal events have occurred. All patients should be adequately supplemented with calcium and vitamin D when appropriate.

Medication Policy Manual | **Policy No:** dru408

Topic: Site of Care Review | **Date of Origin:** July 10, 2015

Committee Approval Date: September 19, 2024 | **Next Review Date:** 2025

Effective Date: January 1, 2025

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

Description

This policy is to review the requested site of care (SOC) for provider-administered medications. Many medications historically infused in hospital-based infusion centers have been evaluated and determined to be safe for infusion outside of hospital-based settings. Use of non-hospital-based infusion centers and home infusion services is an accepted standard medical practice and sometimes referred to as an "alternate site of care." These settings offer high-quality services for patients and reduce the overall cost of care, as compared to costly hospital-based infusion centers.

This policy applies to fully-insured commercial and exchange plans, and the Washington State Health Care Authority (with the exception of Uniform Medical Plan Plus), based in Washington, Oregon, Idaho, and Utah. This policy may apply to other self-insured groups [a.k.a. administrative services only (ASO), depending on the group-specific benefit]. This policy does **not** apply to Medicare plans.

Policy/Criteria

I. Under most contracts, medications included in the infusion drug site of care program (see *Appendix 1*) may be considered medically necessary when individual medication policy criteria are met (if applicable) **AND** one of the following criterion A or B below are met**:**

A. The medication is administered in an approved site of care. (No formal "Site of Care" review is required)

OR

B. The medication is administered in an unapproved site of care (see *Appendix 2*), such as an unapproved hospital-based infusion center, when at least one of the criterion below (1, 2, or 3) are met:

NOTE: Site of care review criteria will be waived for payment of the initial dose(s) of a medication given during the first 30 days (starting from the date of the first dose) after the medication has been approved for pre-authorization, to allow for adequate transition time to an approved site of care for subsequent doses.

1. An approved site of care is not accessible to the member, as documented by criteria a **AND** b, being met:

a. The provider is not aware of an approved site of care that can administer the drug. Approved sites of care include, but are not limited to provider's offices or ambulatory infusion sites.

AND

b. The member's home is not eligible for home infusion services for reasons including, but not limited to: the home is not within the service area of the home infusion provider or is deemed unsuitable for care by the home infusion provider, unless the medication is not eligible for home infusion services (see *Appendix 1*).

OR

2. Clinical documentation of at least one **long-term medical reason** (specifically, medical conditions that will not change) why an approved site of care is not an option, including, but not limited to:

a. Significant behavioral issues and/or cognitive impairment including, but not limited to, those associated with developmental delay, down syndrome, dementia, or excessive anxiety such as severe needle phobia.

b. Prior severe infusion reactions, despite standard pre-medications.

c. Presence of circulating antibodies which may increase risk of infusion reactions.

d. Documented difficult IV access.

e. Treatment of Kawasaki disease.

OR

3. Clinical documentation of <u>at least one</u> **short-term medical reason** (specifically, medical conditions/rationale that will change with time) why an approved site of care is not an option, including, but not limited to:

- **a.** The member less than 14 years of age.
- **b.** Treatment within 100 days after hematopoietic stem cell transplantation (HSCT, a.k.a. bone marrow transplant).
- **c.** Concurrent treatment with medications that require a higher level of monitoring (such as CAR T-cell therapy, intravenous cytotoxic chemotherapy, or blood products).
- **d.** Treatment of antibody-mediated rejection (a.k.a. vascular rejection, acute humoral rejection) following a solid organ transplant.
- **e.** Acute treatment of vision changes (or high-risk of, based on disease stated).

II. Limitations and Authorization Period.

A. For exceptions approved under criterion I.B.1. above **(no known approved sites of care and no home infusion option)**, authorization **<u>shall</u>** be reviewed at least annually to confirm that current medical necessity criteria are met, including that an approved site of care is still not a treatment option.

B. For exceptions approved under criteria I.B.2. above **(long-term medical reason)**, authorization **<u>may</u>** be reviewed at least annually to confirm that current medical necessity criteria are met, including that an approved site of care is still not a treatment option.

C. For exceptions approved under criteria I.B.3. above **(short-term medical reason)**, authorization will be as follows:

Medical reason	Authorization Period	Reauthorization of the SOC exception
Member is less than 14 years of age	Until date member turns 14 years of age	None. Any request after the 14th birthday will be subject to a new, full Site of Care Exception review.
Treatment within 100 days after HSCT	100 days, based on the date of HSCT	None. Any extension will be subject to a new, full Site of Care Exception review, based on the criteria listed in I.B.2.
Concurrent treatment with medications that require a higher level of monitoring	6 months	Authorization **<u>shall</u>** be reviewed at least every 6 months to confirm that current medical necessity criteria are met, including that an approved site of care is still not a treatment option.
Treatment of antibody-mediated rejection	6 months	None. Any additional treatment course will be subject to a new, full Site of Care Exception review.
Acute treatment of vision changes	3 months	None. Any additional treatment course will be subject to a new, full Site of Care Exception review.
Other short-term medical reason	3 months	Authorization **<u>shall</u>** be reviewed at least every 3 months to confirm that current medical necessity criteria are met, including that an approved site of care is still not a treatment option.

III. The medications in the infusion drug site of care program are considered not medically necessary if administered in an unapproved site of care, such as an unapproved hospital-based infusion center, when an approved site of care (e.g., physical sites or home infusion) is a treatment option.

Position Statement

- New pharmaceuticals requiring infusion therapy, may be administered safely, effectively, and much less costly outside of hospital-based infusion centers (a.k.a. hospital outpatient settings). Sites of care such as doctor's offices, infusion centers, home infusion, and approved hospital-based infusion centers are well-established, accepted by physicians, and provide the best value to patients to reduce the overall cost of care.
- A site of care exception for an infusion at an unapproved site of care location must be requested by the provider and reviewed by the health plan prior to administration of the infused medication, per the terms of the member contract with the health plan.

Site of Care Review:

- Use of non-hospital-based infusion centers and home infusion services is an accepted standard medical practice. These sites offer high-quality services for patients and reduce the overall cost of care, as compared to costly hospital-based infusion centers. [1-8]
- All medications infused outside of a hospital setting have undergone an evaluation for safe infusion and development of infusion standards, including adverse drug reaction management and reporting algorithms.
- At all sites of care, every patient undergoes an assessment during the intake process by the infusion provider, which includes evaluation of individual clinical assessment parameters. These parameters may include, but are not limited to, previous tolerance of products (such as IVIG), assessment of kidney function, risk factors for developing thromboembolic events, and venous access. [9-10]
- For use of home infusion services, an assessment is conducted to determine if the home is a safe, appropriate site of care, with adequate support for infusion in the home.
- Because providers need time to arrange for assessment and coordination of care, the first dose of provider-administered medications may be covered in a hospital-based infusion center, if needed, to allow adequate time for a seamless transition of care. This may include arranging for delivery of medications, appointment scheduling, and/or patient education, such as for self-administration of medications such as subcutaneous immune globulin (SCIG).
- Claims submitted for infusion services performed at an unapproved site of care, such as an unapproved hospital-based infusion center (such as on-campus or off-campus hospital outpatient settings, denoted by place of service codes 22 or 19; see *Appendix 3*), are considered not medically necessary when an approved site of care is a treatment option or when preauthorization for the unapproved site of care had not been requested for review. This is waived for claims given during the first 30 days (starting from the date of the first dose) after the medication has been approved for pre-authorization, to allow for adequate transition time to an approved site of care for subsequent doses.

- Pediatric patients often differ from adult patients in physiology, development, and cognitive and emotional function. They may also require doses, infusion rates, and equipment that vary and differ compared to adult patients. Special infusion training and expertise is needed. Therefore, this policy allows for patients under 14 years to obtain infusion services in approved sites of care or unapproved sites of care, such as unapproved hospital-based infusion centers.
- Clinical criteria considered for site of care exception review, aside from young age, include long-term and short-term medical reasons. Long-term medical reasons are not expected to change with time, such as behavioral issues or infusion reactions to the specific drug. Short-term medical reasons for a site of care exception would change over time; therefore, short-term medical reason requests would be re-reviewed as outlined by the authorization periods defined above in Section II.C.

[a] This policy only applies to the formulations of these medications covered under the medical benefit. Formulations for self-administration may be available through the pharmacy benefit for most members.
[b] As of the date of the policy publication.

Appendix 2: Glossary

Term	Description
Approved site of care	Location where medications are safely and effectively administered by a health care professional. Approved sites of care include: • Doctor's offices • Standalone ambulatory infusion centers • Home infusion • Approved hospital-based infusion centers
Unapproved site of care	Location where medications are administered by a professional and the facility is reimbursed for the medication and services at a much higher rate than approved sites of care. Unapproved sites of care include: • Unapproved hospital-based infusion centers (denoted by place of service codes 22 or 19; see *Appendix 3*)

Appendix 3: Place of Service Codes and Descriptions [11]

Place of Service Code	Place of Service Name	Description
11	Office	Location, other than a hospital, skilled nursing facility (SNF), military treatment facility, community health center, State or local public health clinic, or intermediate care facility (ICF), where the health professional routinely provides health examinations, diagnosis, and treatment of illness or injury on an ambulatory basis.
12	Home	Location, other than a hospital or other facility, where the patient receives care in a private residence.
19	Off Campus-Outpatient Hospital	A portion of an off-campus hospital provider-based department which provides diagnostic, therapeutic (both surgical and nonsurgical), and rehabilitation services to sick or injured persons who do not require hospitalization or institutionalization.
22	On Campus-Outpatient Hospital	A portion of a hospital's main campus which provides diagnostic, therapeutic (both surgical and nonsurgical), and rehabilitation services to sick or injured persons who do not require hospitalization or institutionalization.

Revision History

Revision Date	Revision Summary
9/19/2024	• Added Cosentyx, Tofidence, and Tyenne to policy (effective 1/1/25). • Updated Pombiliti HCPCS code in Appendix 1.
6/20/2024	Added Tezspire, Cinryze, Amvuttra, Ilaris, Ilumya, Amondys 45, Exondys 51, Viltepso, Vyondys, Elelyso, Givlaari, Onpattro, Enjaymo, Glassia, Prolastin-C, Aralast NP, Zemaira, Benlysta IV, and Trogarzo to policy (effective 10/1/2024).
3/21/2024	Added Pombiliti (cipaglucosidase alfa) to policy.
12/7/2023	Added Rystiggo (rozanolixizumab) to policy.
9/14/2023	Added Elfabrio (pegunigalsidase alfa-iwxj), Vyvgart Hytrulo (efgartigimod alfa and hyaluronidase-qvfc), and Vyjuvek (beremagene geperpavec-svdt) to policy.
6/15/2023	Updated policy numbers in Appendix 1 for Briumvi (ublituximab-xiiy) and Ocrevus (ocrelizumab) for new combination policy dru753 (effective 9/1/2023).
3/16/2023	Added Briumvi-xiiy, ublituximab-xiiy to policy effective 4/15/2023.
12/9/2022	• Modified status of administrative services only (ASO) groups. • Updated HCPCS codes in Appendix 1. • Removed the following medications from the policy (effective 1/15/2023): Crysvita (burosumab-twza), Elelyso (taliglucerase alfa), Naglazyme (galsulfase), Onpattro (patisiran), Revcovi (elapegademase-lvlr), and Vimizim (elosulfase alfa).
6/17/2022	• Added Vyvgart (efgartigimod) to policy effective 7/15/2022. • Updated HCPCS and policy numbers in Appendix 1.
3/18/2022	Added Leqvio (inclisiran) to policy (effective 6/1/2022).
10/15/2021	• Added Xolair, Vyepti, Cinqair, Nucala, Fasenra, and Saphnelo to policy effective 1/1/2022. • Clarified policy criteria. No changes to intent of criteria. • Updated dru policy numbers as needed. • Updated HCPCS code for Adakveo. • Added UMP policy numbers.
7/16/2021	Effective 8/15/2021: • Updated the lines of business impacted by this program. • Updated access requirements for administration at non-approved sites of care (Criteria B.1.). • Removed Adagen (pegademase bovine), Myozyme (alglucosidase alfa), Prolia (denosumab), and Tysabri (natalizumab) from program.
10/28/2020	• Added Avsola (infliximab-axxq) and Uplizna (inebilizumab) to policy (effective 1/1/2021). • Clarified policy criteria. No changes to intent of criteria. • Updated dru policy numbers as needed.

Revision Date	Revision Summary
7/22/2020	• Removed Trogarzo (ibalizumab-uiyk) from policy (effective 8/15/20). Trogarzo policy to be archived effective 8/15/2020.
6/1/2020	• Updated Appendix 1 with correct effective dates and HCPCS codes.
4/22/2020	• Added Adakveo (crizanlizumab), Reblozyl (luspatercept), and Tepezza (teprotumumab-trbw) to the policy.
1/22/2020	• Clarified situations where no SOC review is needed. • Added medical exception criteria for acute treatment of vision-threatening disease. • Updated exception authorization periods.
7/24/2019	Added Crysvita (burosumab) and Evenity (romosozumab) to the policy.
4/25/2019	Added Revcovi (elapegademase) and Ultomiris (ravulizumab) to the policy.
1/31/2019	• Added Onpattro (patisiran) to the policy, effective 4/1/2019. • Updated Appendix 1 HCPCS codes.
8/17/2018	No criteria changes on this annual review.
6/15/2018	• Clarified home infusion criteria I.B.1.b only applies to medications eligible for home infusion. • Updated Appendix 1 to include home infusion eligibility.
5/18/2018	• No change to intent of coverage criteria. Clarification of description, policy language, and addition of applicable J-codes. Defined approved and unapproved sites of care. • Added the following medications to the policy: o Effective 6/1/2018: Trogarzo (ibalizumab-uiyk). o Effective 9/1/2018: Elelyso (taliglucerase alfa), Ocrevus (ocrelizumab). o Effective 10/1/2018: Ixifi (infliximab-qbtx). • Clarified medical exception criteria for concurrent cancer immunotherapy, including CAR T-cell therapy, and age less than 13 years old.
8/11/2017	Updated Appendix 1.
1/17/2017	Removed Lemtrada and Exondys from site of care program.
12/16/2016	Updated Appendix 1.
11/11/2016	Updated Appendix 1.
9/23/2016	Updated Appendix 1.
9/9/2016	Select Utah plans are now included in the site of care review.
7/15/2016	Updated formatting of policy, added additional medical rationale for potential waivers to policy, noted distinction between approved and unapproved hospital outpatient settings, clarified affected members, and updated references.

Drug names identified in this policy are the trademarks of their respective owners.

Medication Policy Manual

Policy No: dru426

Topic: Enzyme Replacement Therapies

- Aldurazyme, laronidase
- carglumic acid (generic, Carbaglu)
- Elaprase, idursulfase
- Kanuma, sebelipase alfa
- Lamzede, velmanase alfa-tycv
- Lumizyme, alglucosidase alfa
- Mepsevii, vestronidase alfa
- Naglazyme, galsulfase
- Nexviazyme, avalglucosidase alfa
- nitisinone (generic, Orfadin, Nityr)
- Opfolda, miglustat
- Pombiliti, cipaglucosidase alfa
- Revcovi, elapegademase-lvlr
- Ryplazim, plasminogen, human-tvmb
- Sucraid, sacrosidase
- Vimizim, elosulfase alfa
- Xenpozyme, olipudase alfa-rpcp

Committee Approval Date: June 20, 2024

Date of Origin: November 13, 2015

Effective Date: July 15, 2024

Next Review Date: 2025

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

The medications included in this policy are used to treat rare genetic conditions caused by the deficiency of a specific enzyme. The enzyme deficiencies result in metabolic disorders, which can be fatal if left untreated. The prevalence of these diseases is rare, with many of them affecting less than one in forty thousand people.

Policy/Criteria

Most contracts require pre-authorization approval of enzyme replacement therapies (ERT) prior to coverage.

I. Continuation of therapy (COT): ERT (as listed in *Table 1*) may be considered medically necessary for COT when full policy criteria below are met, including diagnostic criteria (at baseline), quantity limit, and reauthorization criteria.

II. New starts (treatment-naïve) patients: ERT (as listed in *Table 1*) may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) that criteria A through D below are met.

A. There is documentation that confirms the medication is being used for its FDA-approved indication (as detailed in *Table 1*).

AND

B. The diagnosis has been established by or in conjunction with a specialist AND diagnostic criteria are met (as detailed in *Table 1*).

AND

C. Step therapy (if applicable for the ERT, as detailed in *Table 1*) has been ineffective, contraindicated, or not tolerated.

AND

D. For the provider administered ERT medications only (as applicable): Site of care administration requirements are met [refer to Medication Policy Manual, Site of Care (SOC) Review, dru408].

PLEASE NOTE: Not all medications in this policy are not part of the SOC program. Verify with the posted SOC policy.

Table 1. FDA Approved Indication, Specialist and Diagnostic Requirements, and Route of Administration			
Product	**Criteria II.A. FDA-approved Indication(s)**	**Criteria II.B. Specialist, Diagnostic Requirements** **Criteria II.C. Step Therapy Requirements**	**Route**
Injectable, Provider-administered			
Aldurazyme (laronidase)	MPS I (Hurler, Scheie, and Hurler-Scheie forms)	Medical genetics or metabolic specialist **AND** genetic and/or enzymatic confirmation (alpha-L-iduronidase deficiency).	IV, Provider
Elaprase (idursulfase)	MPS II (Hunter Syndrome)	Medical genetics or metabolic specialist **AND** genetic and/or enzymatic confirmation of MPS II (deficiency of I2S).	IV, Provider
Kanuma (sebelipase alfa)	Lysosomal acid lipase (LAL) deficiency	Endocrinologist, metabolic specialist, or medical geneticist/genetic specialist **AND** enzymatic confirmation (low/absent LAL levels).	IV, Provider
Lamzede (velmanase alfa-tycv)	Alpha-mannosidosis (AM)	Medical geneticist or metabolic specialist AND genetic and/or enzyme deficiency confirmation (<10% activity of alpha mannosidase enzyme).	IV, Provider
Lumizyme (alglucosidase alfa)	Pompe disease [acid α-glucosidase (GAA) deficiency]	Cardiology, medical genetics, or metabolic specialist **AND** genetic and/or enzymatic confirmation (GAA deficiency).	IV, Provider
Mepsevii (vestronidase alfa)	MPS VII (Sly syndrome)	Medical geneticist/genetic specialist **AND** enzymatic and/or genetic confirmation of MPS VII.	IV, Provider
Naglazyme (galsulfase)	MPS VI (Maroteaux-Lamy syndrome)	Medical genetics or metabolic specialist **AND** genetic and/or enzymatic confirmation (ASB deficiency).	IV, Provider
Nexviazyme (avalglucosidase alfa)	Late-onset Pompe disease (LOPD; GAA deficiency) in patients 1 year of age and older	Cardiology, medical genetics, or metabolic specialist **AND** genetic and/or enzymatic confirmation (GAA deficiency) **AND** (*in patients less than 30 kg ONLY*): treatment with Lumizyme (alglucosidase alfa) has been ineffective, contraindicated, or not tolerated.	IV, Provider

Table 1. FDA Approved Indication, Specialist and Diagnostic Requirements, and Route of Administration			
Product	**Criteria II.A. FDA-approved Indication(s)**	**Criteria II.B. Specialist, Diagnostic Requirements** **Criteria II.C. Step Therapy Requirements**	**Route**
Pombiliti (cipaglucosidase alfa)	In combination with Opfolda (miglustat) for late-onset Pompe disease (LOPD, GAA deficiency), in patients that are not improving on current ERT.	Cardiology, medical genetics, or metabolic specialist **AND** genetic and/or enzymatic confirmation (GAA deficiency) **AND T**reatment with Lumizyme (alglucosidase alfa) or Nexviazyme (avalglucosidase alfa) has been ineffective, contraindicated or not tolerated	IV, Provider
Revcovi (elapegademase-lvlr)	Adenosine deaminase severe combined immune deficiency (ADA-SCID)	Immunology or medical genetics **AND** genetic confirmation of ADA-SCID.	IV, Provider
Vimizim (elosulfase alfa)	Mucopolysaccharidosis (MPS) type IVA (Morquio A syndrome)	Medical genetics or metabolic specialist **AND** genetic and/or enzymatic confirmation (GALNS deficiency).	IM, Provider
Xenpozyme (olipudase-rpcp)	Non-central nervous system (non-CNS) manifestations of acid sphingomyelinase deficiency (ASMD)	Medical genetics or metabolic specialist **AND** genetic presence of SMPD1 mutation and/or enzymatic confirmation (acid sphingomyelin deficiency) **AND** documentation of non-CNS manifestations of ASMD (as defined in *Appendix 1).*	IV Provider
Provider-administered =OR= Self-administered ERT			
Ryplazim (plasminogen, human-tvmb)	Plasminogen deficiency (PLGD) type 1 (hypoplasminogenemia)	Dermatology, rheumatology, hematology, metabolic genetics, or metabolic specialist **AND** genetic confirmation of PLGD.	IV; Provider or self
Opfolda (miglustat)	In combination with Pombiliti (cipaglucosidase alfa) for late-onset Pompe disease (LOPD, GAA deficiency), in patients that are not improving on current	Cardiology, medical genetics, or metabolic specialist **AND** genetic and/or enzymatic confirmation (GAA deficiency) **AND** Treatment with Lumizyme (alglucosidase alfa) or Nexviazyme (avalglucosidase alfa) has been ineffective, contraindicated or not tolerated.	Oral; provider or self

Table 1. FDA Approved Indication, Specialist and Diagnostic Requirements, and Route of Administration			
Product	**Criteria II.A. FDA-approved Indication(s)**	**Criteria II.B. Specialist, Diagnostic Requirements** **Criteria II.C. Step Therapy Requirements**	**Route**
	ERT.		
Oral, Self-administered ERT			
Carglumic acid (generic, Carbaglu)	- Hyperammonemia due to N-acetylglutamate synthase (NAGS) deficiency, acute or chronic - Adjunctive therapy to standard of care for the treatment of acute hyperammonemia due to propionic acidemia (PA) or methylmalonic acidemia (MMA)	Medical genetics, or metabolic specialist. **AND** (*for NAGS only*) genetic confirmation of NAGS. **AND** (*for Brand Carbaglu*) Treatment with generic carglumic acid has been ineffective, contraindicated, or not tolerated.	Oral, self
Nitisinone (generic, Orfadin, Nityr)	Hereditary tyrosinemia type 1 (HT-1)	Medical genetics or metabolic specialist **AND** biochemical confirmation (presence of succinylacetone in the urine or plasma) **AND** treatment with generic nitisinone has been ineffective, contraindicated, or not tolerated (such as in patients unable to swallow generic capsules).	Oral, self
Sucraid (sacrosidase)	Congenital sucrose-isomaltase deficiency (CSID)	Gastroenterologist, endocrinologist, metabolic specialist, or medical genetics **AND** biochemical confirmation (low/absent sucrase activity on small bowel biopsy Note: Sucrase activity is considered abnormal when it is below the 10th percentile (<25 U per gram of protein, or <25 μM of sucrose converted per minute per gram of protein).	Oral, self

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers oral ERTs (as listed in *Table 1*, except Opfolda [miglustat]) coverable only under the pharmacy benefit (as self-administered medications).

B. Regence Pharmacy Services considers injectable ERTs [as listed in *Table 1*, except Ryplazim (plasminogen, human-tvmb)] coverable only under the medical benefit (as provider-administered medications).

C. Regence Pharmacy Services considers Ryplazim (plasminogen, human-tvmb) and Opfolda (miglustat) coverable under the pharmacy benefit (as a self-administered medication) OR coverable under the medical benefit (as a provider-administered medication).

D. When pre-authorization is approved, the ERT will be authorized using the following dosing schedules in *Table 2* below, using a current documented patient weight:

Table 2: ERT Quantity Limits (QL)

Product	Dosing schedule
Provider Administered	
Lumizyme (alglucosidase alfa)	Up to 26 IV infusions per year; ≤ 20 mg/kg every two weeks.
Nexviazyme (avalglucosidase alfa)	*Patients weighing 30 kg or more:* Up to 26 IV infusions per year; ≤ 20 mg/kg every two weeks. *Patients weighing less than 30 kg:* Up to 26 IV infusions per year; ≤ 40 mg/kg every two weeks.
Pombiliti (cipaglucosidase alfa)	Up to 26 IV infusions per year; ≤ 20 mg/kg every two weeks. **Please note:** Pombiliti (cipaglucosidase alfa) must be administered in combination with Opfolda (miglustat).
Revcovi (elapegademase-lvlr)	Up to 104 intramuscular injections per year.
Vimizim (elosulfase alfa)	Up to 52 IV infusions per year; ≤ 2 mg/kg every week.
Naglazyme (galsulfase)	Up to 52 IV infusions per year; ≤ 1 mg/kg every week.
Elaprase (idursulfase)	Up to 52 IV infusions per year; ≤ 0.5 mg/kg every week.
Aldurazyme (laronidase)	Up to 52 IV infusions per year; ≤ 0.58 mg/kg every week.
Xenpozyme (olipudase alfa-rpcp)	Up to 26 IV infusions per year, ≤ 3 mg/kg every 2 weeks.
Ryplazim (plasminogen, human-tvmb)	Up to 162 IV infusions per year; 6.6 mg/kg every 2 to 4 days.

Product	Dosing schedule
Kanuma (sebelipase alfa)	*Patients presenting in the first 6 months of life:* Up to 52 IV infusions per year; 5 mg/kg every week. *Adult and pediatric patients presenting after the first 6 months of life:* Up to 26 IV infusions per year, as follows: - Initial dosing: up to 1 mg/kg every two weeks. - For documented persistent symptoms (such as poor growth, liver/lipid abnormalities; See *Clinical Efficacy* section for details): up to 3 mg/kg every two weeks.
Lamzede (velmanase alfa-tycv)	Up to 52 IV infusions per year; ≤1 mg/kg every week.
Mepsevii (vestronidase alfa)	Up to 26 IV infusions per year; ≤ 4 mg/kg every two weeks.
Oral, self-administered	
Carglumic acid (generic, Carbaglu)	*Hyperammonemia due to NAGS Deficiency:* - Acute: 100-250 mg/kg/day by mouth, for up to 30 days; adjust dose to maintain normal plasma ammonia levels. After 30 days, chronic QL applies. - Chronic: 10-100 mg/kg/day by mouth; adjust dose to maintain normal plasma ammonia. - Authorization will be for up to 1 year. *Hyperammonemia due to PA or MMA – acute management* - ≤15 kg: 150 mg/kg/day, for up to 7 days. - >15 kg: 3.3 g/m^2 /day, for up to 7 days. - Coverable until ammonia level is less than 50 micromol/L, for up to a maximum duration of 7 days.
Nitisinone (Orfadin, Nityr)	- Initial dosing: Up to 1 mg/kg/day, by mouth. - For persistent succinylacetone in serum and/or urine: Up to 2 mg/kg/day, by mouth. - Authorization will be for up to 1 year.
Opfolda 65 mg capsule, (miglustat)	- Up to eight of the 65 mg capsules per 28 days. - Authorization will be for up to 1 year. **Please note:** Opfolda (miglustat) must be administered in combination with Pombiliti (cipaglucosidase alfa) and can be provider administered also
Sucraid (sacrosidase)	- ≤15 kg: 1mL per meal or snack, by mouth. - >15 kg: 2mL per meal or snack, by mouth. - Authorization will be for up to 1 year.

E. Authorization **shall** be reviewed at least annually. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, such as disease stability or improvement, the patient is on the lowest effective dose, and a current weight, verified with clinical documentation such as a chart note from a clinic visit or a nurse infusion record. Criteria must be met for any dose escalation (as detailed in *Table 2*).

IV. The ERT included in this policy are considered investigational when used for any condition other than their FDA approved indications and when used in quantities greater than those listed above (in *Table 2*).

Position Statement

- The intent of this policy is to limit coverage of enzyme replacement therapies (ERTs, as listed in *Table 1*) in the diseases for and up to the doses for which they have been shown to be safe and effective in trials. The diagnosis for each product must have been established by a specialist in the given disease state.
- Only approximately half of the ERTs in this policy have safety and efficacy evidence from randomized, controlled trials to support use in their FDA approved indications (as detailed in the Clinical Efficacy below). The FDA approvals of the other ERTs were based on data from small, lower-quality, non-randomized trials. The medications included in this policy replace or replenish the deficient enzyme related to their respective FDA-approved indication and are the only pharmacologic treatment options available that treat the underlying cause of the disease.
- Drugs included in the policy are indicated for rare conditions for which a specialist is needed to confirm the diagnosis. Extensive diagnostic testing, including genetic testing or specialized laboratory testing, is required to confirm the diagnosis in most cases. In the absence of documented diagnostic testing, the associated therapies are not coverable.
- When lower cost options are available for a given disease, the higher cost ERT is coverable only when the lower cost ERT is not a treatment option.
    * In patients with late-onset Pompe disease who weigh 30 kg or less, Lumizyme (alglucosidase alfa) provides the best value to members. In patients weighing less than 30 kg, Nexviazyme (avalglucosidase alfa) is dosed two times higher has a longer infusion time and is significantly more costly than Lumizyme (alglucosidase alfa). Therefore, Nexviazyme (avalglucosidase alfa) is coverable only when Lumizyme (alglucosidase alfa) if not a treatment option.
    * Among the ERTs with generics, the branded formulations are coverable only when the less costly generic formulations are not an option. Current available generic formulations include generic carglumic acid and generic nitisinone.

- Guidelines for the use of ERTs for the treatment of these rare diseases (where available) generally align with the labeled use and coverage criteria, and may include use of other therapies, when feasible.
- Efficacy and safety of ERT doses exceeding the maximum dosage in the FDA-labeling have not been established in clinical trials.
- Efficacy and safety in other conditions (those not included in the FDA-labeling) have not been established in clinical trials.
- There is little potential for off-label use of these ERTs; however, the extremely high treatment costs, warrant confirmation of use for their FDA approved indications only.

Clinical Efficacy

Pompe Disease

- Pompe disease is an inherited disease caused by the deficiency or lack of the enzyme acid alpha-glucosidase (GAA), which is essential for normal muscle development and function. Damage to muscle is irreversible and patients die of respiratory failure. There are two phenotypes of Pompe disease, based on endogenous enzyme activity: [1]
    * Infantile onset Pompe disease (IOPD): no, or very low endogenous enzyme activity, onset early in life, progresses rapidly. Cardiac symptoms predominate, followed by respiratory failure. IOPD is almost always fatal before 1 year of age.
    * Late onset Pompe disease (LOPD): at least a small amount of residual GAA activity (< 40% normal), onset later in life (> 12 mo), slower disease progression. Respiratory symptoms predominate, due to progressive muscle weakness leading to gait disturbances and eventually die from respiratory failure.
- Lumizyme (alglucosidase alfa) is indicated for patients with Pompe disease. It was previously marketed as Myozyme (alglucosidase alfa) by the same manufacturer. The two formulations differ in the bioreactor used for production but not in pharmacologic effect.
- Lumizyme (alglucosidase alfa) has been shown to improve ventilator-free survival in patients with infantile-onset Pompe disease (IOPD), compared to an untreated historical control. Three open-label controlled studies evaluated alglucosidase alfa in 57 treatment naïve patients aged 0.2 months to 3.5 years with IOPD treated for 52-104 weeks. [2 3]
    * Primary outcomes assessed were death and need for invasive ventilator support.
    * All studies demonstrated a significant survival benefit compared to historical controls.
    * The precision of the study results is uncertain due to the absence of a control group in two of the studies, and the use of a historical control group in one of the studies.
- One high-quality systematic review of the available controlled trial evidence evaluated the use of alglucosidase alfa in patients with IOPD. Only one small randomized controlled trial (n=18) met inclusion criteria.[4]
    * The trial compared two dosing regimens (20 mg/kg every two weeks and the 40 mg/kg every two weeks) over 52 weeks, with a long-term extension to three years. There was no clear difference between the higher and lower doses for clinical

outcomes of cardiac function, motor development, proportion of children free of invasive ventilation; however, long-term use of alglucosidase alfa was effective for IOPD, with improvement of ventilator-free and overall survival, as well as for cardiac dysfunction.

* The review noted that there is a comparative lack of evidence to precisely conclude benefit of Lumizyme (alglucosidase alfa) for IOPD.
* Of note, the pivotal trial for the FDA approval of alglucosidase alfa in IOPD was excluded from the systematic review, given the lack of comparator arm.

- One high-quality systematic review of 19 randomized and observational studies evaluated the use of alglucosidase alfa in a total of 438 patients with late-onset Pompe disease (LOPD). [5]
  * Outcomes of interest were mortality, percent predicted forced vital capacity (% FVC), the 6-min walk test (6MWT), and ventilator use.
  * The top four outcomes with the most data included reduction in mortality, increased motor performance as measured by the six-minute walk test, improved respiratory status as measured by forced vital capacity, and the reduction in need for ventilator support (n=66).
  * With alglucosidase alfa therapy:
    - Mortality was lower (5-fold) [reported in most studies].
    - Respiratory function did not deteriorate as rapidly. FVC initially increased, then fell to baseline. However, FVC was higher relative to the loss seen in untreated patients with LOPD [n=298 in 11 studies].
    - 6MWT improved over the first 20 months, then stabilized over the following years, whereas 6MWT did not improve in untreated patients. [n=201 in 8 studies].
    - Ambulation status and the need for ventilator support was reported in 12 and 13 studies, respectively. However, quantification of treatment effect is not reliable due to heterogeneity of the available data.
  * RCTs, extension trials, single-arm trials, and observation trials (prospective and retrospective) were included. Only one trial of the 19 included was a randomized controlled trial.
  * Similar to previous meta-analyses,[6] the studies included in the review were of low quality as study populations were small (n<90), most studies evaluated surrogate endpoints, and retrospective studies were included in the systematic review (case series, uncontrolled single-arm trials, observational studies, and statistical analyses) undermining the certainty in the evidence of clinical benefit.
- Nexviazyme (avalglucosidase alfa) is indicated for patients 1 year of age or older with late-onset Pompe disease (LOPD). [7]
- It is not indicated for infantile-onset Pompe disease (IOPD).
- Nexviazyme (avalglucosidase alfa) was non-inferior to Lumizyme (alglucosidase alfa) in patients with LOPD, based on one randomized controlled study (n=100). [7]

    * Patients were randomized to Nexviazyme (avalglucosidase alfa) versus Lumizyme (alglucosidase alfa).
    * All patients were 1 year of age or older.
    * Results showed that Nexviazyme (avalglucosidase alfa) was non-inferior for the primary endpoint of change in predicted forced vital capacity (FVC).
- Pombiliti (cipaglucosidase alfa) in combination with Opfolda (miglustat) is indicated for the treatment of adults with late-onset Pompe disease (LOPD), who are not improving on their current ERT.[8 9]
- Pombiliti (cipaglucosidase alfa) with Opfolda (miglustat) is not indicated for IOPD.
- Pombiliti (cipaglucosidase alfa) with Opfolda (miglustat) demonstrated improvements in six-minute walk test (6-MWT) and pulmonary function (FVC) compared to alglucosidase alfa within the subset of ERT experienced patients in one small phase 3 randomized, double blind comparator trial (PROPEL, n=123).[10 11]
    * Patients were randomized 2:1 to Pombiliti (cipaglucosidase alfa) with Opfolda (miglustat) versus alglucosidase alfa with placebo.
    * Patients were 18 years of age or older having confirmed LOPD with 77% of patients being ERT experienced.
    * The primary endpoint was change from baseline in 6-MWT at 52 weeks, with a change of 5 meters that favored Pombiliti (cipaglucosidase alfa) plus Opfolda (miglustat) across the entire trial population, however the result was not significant (p=0.608).
    * Post-hoc analysis that excluded one extreme outlier in the alglucosidase alfa arm reported a change of 14 meters, which was still not significant (p=0.10) but considered clinically meaningful by the FDA.
    * In addition, subgroup analysis reported a significant difference of 16 meters favoring Pombiliti (cipaglucosidase alfa) with Opfolda (miglustat) in patients that were ERT experienced (P=0.047).
    * The key secondary endpoint of change from baseline in FVC across all participants was 2.3% (p=0.05) significantly favoring of Pombiliti (cipaglucosidase alfa) with Opfolda (miglustat).
- Use of Pombiliti in combination with Opfolda (miglustat) will therefore only be authorized in patients with LOPD who are not improving on their current ERT, in accordance with the FDA labeled indication.
- Due to small sample size in the ERT naïve patient population, conclusions were not able to be drawn in regard to efficacy, therefore use in this patient population is considered investigational.
- The use of Pombiliti (cipaglucosidase alfa) with Opfolda (miglustat) in IOPD or in combination with other ERT's has not been studied and use will also be considered investigational.
- Miglustat (generic, Zavesca) had previously been approved for use in Gaucher disease, however the indication, dosage, and frequency differs from that of Opfolda (miglustat).[10]

- Therefore, the use of Opfolda (miglustat) in any other indication outside of the coverage criteria outlined above will be considered investigational, and use of miglustat (generic, Zavesca) in LOPD will also be considered investigational.
- Dose escalation: There is interest in the use of higher doses of ERT in both early and late onset Pompe disease (IOPD, LOPD). However, there is insufficient evidence at this time to conclude additional benefit from higher doses of Lumizyme (alglucosidase alfa), in excess of 20 mg/kg every 2 weeks. The available evidence is limited to various case reports and retrospective analyses, as well as one exploratory trial. [12-14]
- An open label exploratory trial (2015) randomized 13 patients to standard versus escalated dose alglucosidase alfa (20 mg/kg/week or 40 mg/kg/2 weeks). [12]The authors concluded there may be some benefit of higher ERT dosing in some patients with motor decline. However, larger, controlled trials are needed to establish a superior efficacy, as well as risks, of higher doses of ERT in patients with Pompe disease.
- A 2020 retrospective review of patients with IPD (n=7) and LOPD (n=4) and dose escalation observed benefit from higher doses of Lumizyme (alglucosidase alfa) (40 mg/kg weekly). However, given the absence of a comparator arm and the retrospective, uncontrolled nature of the trial, conclusion of a relative benefit of higher dosing of Lumizyme (alglucosidase alfa) is not possible. [13]
- More recently (2022), a multicentre observational cohort study report various outcomes with a variety of Lumizyme (alglucosidase alfa) dosing strategies (39 dosing regimens in 124 patients). [14] There was a non-statistically significant difference between standard dosage (20 mg/kg every other week), intermediate dosage (20 mg/kg per week, or higher 40 mg/kg every other week), and high dosage (40 mg/kg per week) for health outcomes, such as walking. Therefore, the use of Lumizyme (alglucosidase alfa) in doses of more than 20 mg/kg per week is considered investigational, with an unproven health outcome from higher dosing.

  Guidelines: Based on the available evidence and consensus recommendations of specialists, guidelines for the treatment of late-onset Pompe disease recommend: [1 15]
- Initiating treatment with ERT at the onset of symptoms and to re-evaluate annually to reassess whether treatment should continue.
- Newborn genetic screening is recommended, along with leukocyte GAA enzyme activity, to confirm a diagnosis of Pompe.

Carglumic acid (generic, Carbaglu) for NAGS, PA, and MMA

- Carglumic acid is indicated for the following diagnoses, to normalize ammonia levels: [16]
  * Adjunctive therapy for the treatment of acute hyperammonemia due to the deficiency of hepatic enzyme N-acetylglutamate synthase (NAGS).
  * For maintenance therapy for the treatment of chronic hyperammonemia due to the deficiency of the hepatic enzyme NAGS.
  * Adjunctive therapy to standard of care for the acute treatment of hyperammonemia due to propionic acidemia (PA) or methylmalonic acidemia (MMA).
- FDA approval of carglumic acid for NAGS was based on a retrospective, unblinded, and uncontrolled review of patients with NAGS deficiency. Short-term impact on plasma

ammonia levels was evaluated in 23 patients over three days, while long-term impact was evaluated in 13 patients over a mean length of 8 years (range 1 to 16 years). [16]

  * After 3 days, mean ammonia levels dropped from 157 umol/L to 27 umol/L.
  * After a mean of 6 years, the mean ammonia level was 23 umol/L in 13 patients.
  * Acute hyperammonemia was controlled in all patients by Day 3. Therefore, higher doses of carglumic acid (up to 250 mg/kg/day) for acute hyperammonemia is coverable for a maximum of 30 days, after which time chronic dosing (up to 100 mg/kg/day) is coverable as maintenance therapy.

- Subsequently, approval for PA or MMA was based on a randomized, controlled trial in patients with genetically confirmed late-onset CPS1 deficiency (CPSD) and late-onset Ornithine transcarbamylase deficiency (OTCD), for acute hyperammonemia. [16]
  * All patients received standard of care therapy, including a combination of protein restriction, intravenous glucose, insulin, and/or L-carnitine.
  * All patients had a baseline ammonia level of ≥ 70 mmol/L. carglumic acid was given until ammonia level was ≤ 50 mmol/L, or until hospital discharge, up to a maximum of 7 days.
  * Addition of carglumic acid to standard treatment resulted in a more rapid normalization of plasma ammonia levels compared to placebo, administered for a maximum of seven days.
- NAGS, PA, and MMA are extremely rare conditions and evidence-based treatment guidelines are not available. However, genetic testing is required to definitively diagnosis NAGS, CPSD, and OTCD, an inherited autosomal recessive disorders. [17]

Revcovi (elapegademase-lvlr)for ADA-SCID [18 19]

- Elapegademase is indicated in patients with adenosine deaminase severe combined immunodeficiency (ADA-SCID). ADA-SCID is a rare, inherited condition caused by a lack of functional ADA, which results in severe T-lymphopenia.
- Efficacy was demonstrated in two small studies in a total of ten patients. The studies demonstrated that elapegademase is able to improve of serum adenosine deaminase activity and immune status while reducing the concentration of toxic metabolites. Improvements in these measures have been associated with long-term survival. [19]
- The diagnosis of ADA-SCID is confirmed by genetic testing (bi-allelic mutations in the ADA gene), to confirm ADA deficiency. Hematopoietic stem cell transplant (HSCT) is the definitive treatment for ADA-SCID. Guidelines for recommend ERT in patients who are not candidates for a bone marrow transplant or if gene therapy is not available (Note: gene therapy for ADA-SCID is not currently available in the US). [20]

Nitisinone (Orfadin, Nityr) for HT-1

- Nitisinone is indicated as an adjunct to dietary restriction of tyrosine and phenylalanine in the treatment of hereditary tyrosinemia type 1 (HT-1), an autosomal recessive genetic condition characterized by progressive liver disease and renal tubular dysfunction. [21 22]
- Nitisinone is available as a less costly generic, as a 2 mg, 5 mg, and 10 mg capsule, relative to the branded formulations of nitisinone (Orfadin, Nityr). Only branded nitisinone (Orfadin) is available as an oral suspension and is therefore coverable for

patients unable to swallow generic capsules.

- Efficacy of nitisinone, in combination with dietary controls, was established in one open-label, uncontrolled study of 207 patients with HT-1, aged 0 to 21.7 years old. [22]
    * Efficacy was assessed by comparison of survival and incidence liver transplant relative to historical controls.
    * The median duration of treatment was 22 months.
    * For patients ≤ 2 years of age, the 2- and 4- year survival probabilities were 88%. Patients ≤ 2 years of age who had been treated with dietary restriction alone had 2- and 4- year survival probabilities of 29%.
    * For patients presenting between 2 and 6 years of age, 2- and 4-year survival probabilities were 94%. Patients between 2 and 6 years of age who had been treated with dietary restriction alone had 2- and 4-year survival probabilities of 74% and 60%, respectively.
- Evidence-based treatment guidelines are not available for HT-1. However, based on standard of care as well as the available clinical trials of nitisinone: [22 23]
    * HT-1 is diagnosed by presence of by the presence of succinylacetone in the urine or plasma. Genetic testing for the autosomal recessive trait is available, but not required for diagnosis of HT-1.
    * Patients are typically managed through dietary restriction of protein. Nitisinone is considered the treatment of choice, as the only pharmacotherapy that can limit the formation of toxic compounds present in HT-1. Dosing is initiated at 1 mg/kg/day. The dose may be titrated based on biochemical and/or clinical response to a maximum of 2 mg/kg/day, such as based on serum and/or urine succinylacetone levels.
    * Liver transplantation is considered an option for patients who do not respond to nitisinone.
- *INVESTIGATIONAL USES*: One clinical trial evaluated the efficacy of nitisinone in alkaptonuria, an off-label use. While some clinical trials had shown that nitisinone was effective in reducing urinary homogentisic acid, a confirmatory randomized trial was conducted to evaluate clinical benefit in patients with alkaptonuria. At the end of the 36-month evaluation period, no benefit was observed in primary or secondary parameters. Measures of clinical efficacy included change in total range of motion in the worse hip, change in spinal flexion, 6-minute walk times, and functional reach. [24]

Xenpozyme (olipudase alfa-rpcp) for ASMD

- Xenpozyme (olipudase alfa-rpcp) is indicated for the treatment of non-central nervous system (non-CNS) manifestations of acid sphingomyelinase deficiency (ASMD) in adult and pediatric patients.[25]
- ASMD, historically known as Niemann-Pick disease A and B, is characterized by a deficiency in the acid sphingomyelin enzyme, due to a mutation in the SMPD1 gene. The deficiency leads to a buildup of sphingomyelin in multiple major organ systems, causing CNS neurodegeneration, hepatosplenomegaly, lung alterations, thrombocytopenia, lipid abnormalities, short stature, and osteopenia.[26]

- ASMD is considered a disease spectrum that is divided based on onset, clinical presentation, severity, and rate of progression described below:[27]
    * Type A: most severe form with infant onset, presents with rapidly progressing neurodegeneration, hepatosplenomegaly, and pathologic alterations in lungs; often fatal by age 3 due to respiratory failure.
    * Type B: later onset with less severe disease, manifests with hepatosplenomegaly and lung alterations, but no CNS involvement; patients frequently live into adulthood.
    * Type A/B: an intermediated form with presentation and progression rate varying greatly but most have some CNS symptoms.
- Efficacy of Xenpozyme (olipudase alfa-rpcp) in adults was established in the ASCEND trial (n=31), a phase 2/3 randomized, double blind placebo-controlled trial in patients with type B or type A/B confirmed ASMD.[26 28]
    * Patients aged 18-66, were randomized to Xenpozyme (olipudase alfa-rpcp) titrated up to 3 mg/kg every two weeks or placebo for 52 weeks.[26]
    * All patients had the diagnosis confirmed with a documented deficiency of ASM, defined by either enzyme assay and/or genotyping.
    * Patients with type A were excluded from the trial.
    * There were two primary efficacy outcomes, the first being the mean percent change from baseline in diffusing capacity of the lung for carbon monoxide (DL_{co}), a validated clinical tool used to measure progression in interstitial lung disease (ILD), which has never been used as an endpoint in a clinical trial and meaningful impact on quality of life or overall survival is unknown. [26]
    * The second primary endpoint was a composite endpoint of average percent change in spleen volume from baseline and a novel unvalidated patient reported outcome, the splenomegaly related score (SRS).[26]
    * Xenpozyme (olipudase alfa-rpcp) significantly improved DL_{co} and spleen volume compared to placebo (24.0 vs 2.98 and -38.8 vs 0.40, respectively), however there was no change in SRS quality of life measure. Secondary endpoints also showed statistical improvement in liver volume, additional pulmonary function markers, platelet count, and lipid panel.[28]
- Safety and efficacy of Xenpozyme (olipudase alfa-rpcp) in pediatric patients was established in the ASCEND-Peds trial (n=8), a phase 1/2 open label single arm trial in patients with confirmed type A/B or type B ASMD.[26 29]
    * Patients aged 1-12 received Xenpozyme (olipudase alfa-rpcp) titrated up to 3 mg/kg every two weeks for 64 weeks.
    * Trial design was to evaluate safety and tolerability of Xenpozyme (olipudase alfa-rpcp), and the efficacy endpoints were exploratory.
    * Xenpozyme (olipudase alfa-rpcp) demonstrated similar efficacy shown in the ASECND adult population with improvement in mean percent change from baseline of lung function, hepatosplenomegaly, and thrombocytopenia, however these results are from an extremely small sample size and true efficacy is unknown.[26]

- FDA approval was based on the results from the trials above showing improvements in DL_{CO}, spleen volume, liver volume as well as pharmacodynamic biomarker results of a consistent reduction of sphingomyelin in the trials when compared to placebo. Clinically meaningful benefit, such as survival, improvement in quality of life or disease burden has yet to be demonstrated.
- No treatment guidelines for ASMD are available and there are no treatment alternatives. Xenpozyme (olipudase alfa-rpcp) is the only FDA-approved treatment. Documentation of acid sphingomyelin enzyme deficiency or presence of a SMPD1 gene mutation was required for trial entry and is considered diagnostic for ASMD.[27]
- Xenpozyme (olipudase alfa-rpcp) does not cross the blood brain barrier, therefore it is not FDA approved to treat CNS manifestations for ASMD.[26] The use of Xenpozyme (olipudase alfa) is limited to patients presenting with non-CNS manifestations of ASMD. Use of Xenpozyme (olipudase alfa-rpcp) in patients presenting with only CNS symptoms is considered investigational.

Ryplazim (plasminogen, human-tvmb) for PLGD [30-32]

- Ryplazim (plasminogen, human-tvmb) in indicated for the treatment of patients with plasminogen deficiency (PLGD) type 1.
- PLGD is characterized by the development of thick growths, or lesions, throughout the body that may be painful and can cause severe and potentially life-threatening complications. These lesions are caused by inflammation and the deposition of fibrin. Ryplazim (plasminogen, human-tvmb) acts as replacement plasminogen therapy, which allows for the clearance of fibrin.
- Approval of plasminogen was based on a single-arm, open-label phase 2/3 study in 15 patients with genetically-confirmed PLGD with biallelic mutations in the plasminogen (PLG) gene. Treatment with plasminogen normalized plasminogen levels and improved lesion size and severity.
- There is currently no screening test available for PLGD; molecular genetic testing can only confirm a diagnosis. Diagnosis relies on clinical symptoms, family medical history, and confirmatory testing.

Sucraid (sacrosidase) for CSID

- Sucrase-isomaltase deficiency can be congenital or acquired (often secondary to damage to the enteric brush border membrane from other chronic GI conditions such as celiac disease, Crohn's disease, and H. pylori).
- Sacrosidase is indicated for the treatment of *congenital* sucrose-isomaltase deficiency (CSID), also known as genetically determined sucrase deficiency. It is not intended for use in acquired sucrase-isomaltase deficiency.[33]
- CSID is a rare, genetic condition which impairs ability to digest sugars (sucrose and maltose). Patients with CSID have GI symptoms (stomach cramping, excessive gas, bloating, explosive diarrhea, vomiting) after ingestion of sugar. In infants, CSID may lead to malnutrition and failure to thrive. [34]
- CSID is caused by a mutation in the SI gene. The diagnosis of CSID is confirmed with a small intestinal biopsy, to confirm a deficiency of sucrase activity.

- Efficacy of sacrosidase in *congenital* sucrose-isomaltase deficiency was established in a randomized, double-blind, controlled trial consisting of two phases: 1) a comparative phase, evaluating placebo, sacrosidase, and sacrosidase plus milk and 2) a dose-response phase with various concentrations of sacrosidase. 28 patients aged 5 months to 11 years were enrolled. [33-35]
    * Criteria for inclusion were a history of chronic watery diarrhea with an acid pH, a small intestinal biopsy specimen with measurement of tissue disaccharidase levels showing sucrase activity of less than 10% of control specimens with normal lactase levels and normal or decreased maltase activity, normal villous architecture of the small intestine, and a normal result in a lactose breath hydrogen test.
    * Breath hydrogen excretion decreased significantly in patients receiving sacrosidase, with or without milk.
    * In the dose-response phase, higher concentrations of sacrosidase were associated with fewer stools and a greater number of formed or hard stools compared to baseline.
- A prior study of similar design evaluated different concentrations of sacrosidase in the dose-response phase in patients with *congenital* sucrose-isomaltase deficiency. (n=14). [33 36]
    * Diagnostic criteria for inclusion were similar (chronic watery diarrhea with an acid pH, a small intestinal biopsy specimen with measurement of tissue disaccharidase levels showing complete or near absence of sucrase activity, normal villous architecture of the small intestine, a normal lactose breath hydrogen test, and no other cause of chronic diarrhea).
    * Although the effective on stool-related outcomes were inconsistent with the subsequent trial, this trial supported the other trial finding that breath hydrogen excretion decreased significantly with sacrosidase.
- No treatment guidelines for CSID are available. However, a 2020 review of CSID diagnosis and management (sponsored by the manufacturer of Sucraid) affirmed that endoscopic small intestinal biopsy assayed for disaccharidase activity (usually lactase, maltase, isomaltase/palatinase, and sucrase) is the gold standard diagnostic to confirm a deficiency of sucrase activity, [37] along with a retrospective review of physician diagnostic practice [38] as well as the FDA Medical Review for Sucraid. [34] Sucrase levels greater than 25 U/g (uM/min/ g protein) are considered normal.[39 40] Less-invasive tests, such as breath testing, sucrose challenge, and use of a ERT (Sucraid) trial, may support a diagnosis of CSID, but are not confirmatory for the diagnosis and are prone to error. [41] Of note, the pivotal trials for the approval of Sucraid (sacrosidase) only enrolled patients with a history of chronic diarrhea and confirmation of CSID with intestinal biopsy. Therefore, the use of Sucraid (sacrosidase) in the absence of a biopsy-confirmed diagnosis of CSID is considered “not medically necessary.” Dietary restriction of sucrose, isomaltose, and maltose and enzyme replacement therapy with sacrosidase are the only available treatment options. Of note, negative genetic testing does not exclude the diagnosis of CSID. Therefore, genetic testing is not specifically recommended as standard of care. In addition, although growing evidence suggests disease in SI heterozygous or homozygous variants, these patients often have less severe

presentations and patients may be getting diagnosed later in life. Evidence for use of sacrosidase in these patients is lacking.

- There are no clinical trials to establish the safety and efficacy of sacrosidase in *acquired* sucrose-isomaltase deficiency, such as deficiency secondary to other chronic GI conditions such as celiac disease, Crohn's disease, and H. pylori.

Kanuma (sebelipase alfa) for lysosomal acid lipase (LAL) Deficiency

- Sebelipase alfa is indicated for the treatment of LAL deficiency in infants, pediatric patients, and adults. [42]
- Disease Background: [43 44]
    * LAL catalyzes breakdown of cholesterol esters and triglycerides within lysosomes of cells. Deficiency of LAL results in accumulation of cholesterol esters and triglycerides in vital tissues and organs.
    * The clinical severity depends on the severity of the LAL deficiency. Patients with little to no LAL activity typically present at 2 to 4 months and rarely survive to 12 months (median survival historically is ~ 1.3 months). Typical presentation is characterized by malabsorption, growth failure, and liver failure. Less severe LAL deficiencies present as a widely variable clinical course, with involvement of multiple organs, dyslipidemia, and liver disease as the most prominent feature. LAL deficiency may lead to hepatic steatosis, fibrosis, and progressive cirrhosis. Historically, patients were treated with HMG CoA-reductase inhibitors ("statins"). While improvements in serum lipids and hepatic steatosis have been shown, the effect on liver fibrosis or other clinical endpoints is not known.
- Efficacy of sebelipase alfa in infants presenting within the first 6 months of life was established in an open label phase 2/3 trial comparing survival in nine patients vs. historical controls (LAL-CL03; VITAL). [43 44]
    * Patients were treated with sebelipase alfa 0.35 mg/kg once weekly, with dose escalation to 1mg/kg. The trial protocol was later amended to allow escalation up to 5mg/kg, or every-other week infusions for stable patients. The initial FDA labeling allowed for up to 3 mg/kg once weekly.
    * Six of nine patients in the study group survived to 12 months of age vs. zero of 21 historical controls.
- A phase 3 study compared sebelipase alfa to placebo in pediatric and adult patients aged 4 to 58 years of age in a double-blind, placebo-controlled trial (LAL-CL02; ARISE). [45]
    * Patients were randomized to sebelipase alfa 1 mg/kg every two weeks or placebo.
    * The primary efficacy outcome was normalization of alanine amino transferase (ALT) levels. The FDA determined this endpoint was not clinically meaningful.
    * FDA approval was based on the secondary endpoint of reduction in LDL cholesterol levels. No clinically meaningful benefit, such as clinically meaningful endpoints such as survival, QOL, or disease burden, has been demonstrated.
- Long-term (5-year) survival data was published for three open-label extension trials, which allowed dose escalation in patients with a suboptimal clinical response. [46 47]
    * In children with onset within the first 6 months of life:

    - The trial enrolled patients who completed the phase 2/3 LAL-CL03/VITAL and 10 from the phase 2 LAL-CL08. Doses of Kanuma (sebelipase alfa) were escalated up to 5 mg/kg once weekly "at the discretion of the investigator" (4 of 19 patients).
    - Dose escalation was considered within the first three months for failure to grow (weight and height), low albumin, persistent ALT elevation, and ongoing transfusions. Beyond three months, additional dose escalation could be considered for persistent poor growth, low albumin, persistent ALT elevation, hepatomegaly, splenomegaly, or lymphadenopathy.
  * In pediatric and adult patients (CL04):
    - The trial enrolled patients who completed the phase 2 CL01 dose-escalation trial. Doses of Kanuma (sebelipase alfa) were escalated up to 3 mg/kg every other week (3 of 9 patients).
    - A suboptimal clinical response was defined as any of the following that did not improve from baseline or failed to normalize within 12 months: poor growth, deteriorating biochemical markers (such as liver function tests, lipid profile, liver biopsy), or persistent or worsening organomegaly (such as liver fibrosis/cirrhosis, splenomegaly).
  * The long-term extension trials found a survival benefit with use of Kanuma (sebelipase alfa). However, the number of patients on escalated doses was very small relative to the total treated patients, as well as the available phase 3 data. Therefore, the benefit of escalated dosing relative to lower dosing remains uncertain.
- No treatment guidelines for LAL deficiency are available. If the disease presents in the first year of life, it is rapidly fatal and there are no treatment alternatives. Disease that presents later in life has a varying clinical course. Sebelipase alfa is the only FDA-approved treatment. Documentation of LAL deficiency was required for sebelipase alfa trial entry and is considered diagnostic for LAL deficiency.

Lamzede (velmanase alfa-tycv) for AM

- Lamzede (velmanase alfa-tycv) is indicated for the treatment of non-central nervous system (non-CNS) manifestations of alpha-mannosidosis (AM) in adult and pediatric patients.[48]
- AM is characterized by a deficiency in the alpha mannosidase enzyme, due to mutations in the MAN2B1 gene. The deficiency leads to an accumulation of oligosaccharides in lysosomes that affect multiple organ systems, causing immune deficiency, skeletal abnormalities (scoliosis), distinctive facial features, pain, hearing and speech impairment, progressive impairment of mental function, muscular weakness leading to ataxia with most patients losing independence and requiring use of a wheelchair.[49]
- AM is considered a disease spectrum that may not be clearly distinguishable due to the broad heterogeneity of the disease and clinical manifestations.[49]
- Efficacy of Lamzede (velmanase alfa-tycv) was established in the rhLAMAN-05 trial (n=35), a phase 3 international, multicenter, randomized, double-blind, placebo-controlled trial in patients with AM.[50 51]

    * Patients aged 5-35 were randomized to Lamzede (velmanase alfa-tycv) at 1 mg/kg weekly or placebo for 52 weeks.
    * All patients had AM diagnosis confirmed via alpha mannosidase enzyme deficiency (defined as <10% enzyme activity).
    * All subtypes of AM could be included in trial with the only exclusion being unable to walk without support (however limited assistance or wheelchair use was allowed for long distances).
    * There were two primary efficacy outcomes, the first being the change from baseline at week 52 of the serum oligosaccharide concentration, an unvalidated surrogate marker that is thought to be physiologically relevant and is a disease specific biomarker, however its meaningful impact on quality of life or overall survival is unknown.
    * The second primary efficacy endpoint was change in baseline in the 3-minute stair climb test (3-MSCT), a surrogate endpoint used to measure functional activity that has previously been used in other enzyme replacement trials, but a minimal clinical important difference has yet to be determined.
    * Lamzede (velmanase alfa-tycv) significantly reduced the serum oligosaccharide concentration compared to placebo (-5.1 vs -1.6), while also improving 3-MSCT score from baseline (0.6 vs -2.4), although not significantly.
    * Secondary endpoints included change in baseline of forced vital capacity (a measure of lung function) as well as the six-minute walk test (6-MWT), a measure of daily functioning, both validated surrogate endpoints that favored treatment with Lamzede (velmanase alfa-tycv), but not significantly.
- FDA approval was based on the efficacy results from the rhLAMAN-05 trial showing a significant reduction in serum oligosaccharide concentration as well as improvement in pulmonary and mobility functional measures when compared to placebo, which was supported by results of smaller, phase 2 trials as well as a phase 3 integrated long term efficacy trial that all showed similar results to the primary trial.[50 52]
- However, these surrogate markers are not directly related to clinically meaningful benefit on outcomes such as improved overall survival, quality of life measures, or disease burden.
- No treatment guidelines for AM are available and there are no other treatment alternatives.[50]
- Documentation of alpha mannosidase enzyme deficiency (< 10%) was required for trial entry and is considered diagnostic for AM. MAN2B1 gene mutations are also considered diagnostic but were not required for trial entry.
- The use of Lamzede (velmanase alfa-tycv) for any other indication is considered investigational.

Mucopolysaccharidoses - types I II, III (A to D), IV (A or B), VI, VII, and IX [1 53]

- Mucopolysaccharidoses (MPS) are lysosomal storage disorders caused by the deficiency of enzymes required for the stepwise breakdown of glycosaminoglycans (GAGs). Fragments of partially degraded GAGs accumulate in the lysosomes, resulting in cellular dysfunction and clinical abnormalities.

- The MPS disorders are classified as types I II, III (A to D), IV (A or B), VI, VII, and IX. MPS V (formerly Scheie syndrome) and MPS VIII are no longer recognized. The MPS disorders are differentiated clinically by their clinical features and age of presentation and biochemically by their associated enzyme deficiency. They can be grouped into four broad categories according to their dominant clinical features:
    * Soft tissue storage and skeletal disease with or without brain disease (MPS I, II, VII)
    * Soft tissue and skeletal disease (MPS VI)
- Primarily skeletal disorders (MPS IV A and B)
    * Primarily CNS disorders (MPS III A to D)
- MPS affects many other systems and other complications of the disease including recurrent hernias (due to hepatosplenomegaly), chronic ear infections, chronic respiratory infections, poor vision, poor hearing, communicating hydrocephalus, and sleep apnea. Growth height is also significantly less than normal. [54]
- Demonstration of a specific enzyme deficiency, usually in peripheral blood leukocytes, although fibroblasts or dried blood spots, is needed for confirmation of diagnosis. Enzyme analysis is available for all types of MPS.
- FDA-approved ERT is available for: MPS I, II, IVA, VI, VII. ERT is generally used in patient with moderate to severe disease. ERT has only been shown to slow the progression of the disease.

Vimizim (elosulfase alfa) for MPS IVA

- Elosulfase alfa is indicated for patients with Mucopolysaccharidosis type IV A (MPS IVA; also known as Morquio A syndrome). [55] This condition affects roughly 1 per 100,000 individuals. Patients lack the enzyme N-acetylgalactosamine-6-sulfatase (GALNS), which results in skeletal abnormalities. [53] Symptoms may also include visual, splenic, cardiac, and auditory.
- FDA approval was based on a randomized, double-blind, placebo-controlled, trial of 176 patients with MPS IVA, ranging from 5 to 57 in age. Patients received elosulfase alfa or placebo. [55 56]
    * The primary end point was the change from baseline in the distance walked in six minutes (six-minute walk test, 6-MWT) at week 24.
    * The mean difference in 6-MWT between elosulfase alfa and placebo was 23 meters (95% CI 2.9, 43.1).
    * No additional improvement was observed in a 48-week follow-up extension study.
- Guidelines recommend initiating ERT as soon as the diagnosis has been confirmed by an enzyme activity test (reduced GALNS). Genetic testing may be used for confirmation. [57]

Naglazyme (galsulfase) for MPS VI

- Galsulfase is indicated for patients with Mucopolysaccharidosis VI (MPS VI; also known as Maroteaux-Lamy syndrome). This condition affects roughly 1 per 300,000 individuals.
- MPS VI is caused by mutation on the ARSB gene, which leads to a deficiency of the enzyme arylsulfatase B (ASB; N-acetylgalactosamine-4-sulfatase). The ASB deficiency results in skeletal deformities and respiratory difficulties, as well as cardiac abnormalities. [1 53 58]

- In a randomized, double-blind, placebo-controlled trial, 38 patients with MPS VI received galsulfase or placebo for 24 weeks. [59] Patients ranged in age from 5 to 29 years old.
    * The primary endpoint was the change from baseline in the distance walked in 12 minutes (12-minute walk test, 12-MWT).
    * Patients treated with galsulfase saw a greater difference in the 12-MWT than those treated with placebo (mean difference of 83 meters).
- Treatment guidelines recommend ERT with galsulfase as a first-line treatment option for patients with MPS VI, when the diagnosis has been confirmed by an enzyme activity test (reduced ASB). Genetic testing may be used for confirmation. [58]

Elaprase (idursulfase) for MPS II

- Idursulfase is indicated for patients with Mucopolysaccharidosis II (MPS II; also known as Hunter Syndrome). This condition affects roughly 1 per 150,000 individuals. [60]
- MPS II is caused by a deficiency of iduronate 2-sulfatase (I2S), due to mutations in the I2S gene, which results in various symptoms (coarse facial features, severe skeletal disease, joint abnormalities, respiratory disease, and cardiac abnormalities, obstructive sleep apnea and pulmonary hypertension, vision, and hearing disorders, and/or hydrocephalus).
- In a randomized, double-blind, placebo-controlled trial, 96 patients with MPS II received idursulfase or placebo for 53 weeks. Patients ranged in age from 5 to 31 years old. [61]
    * The primary endpoint was the change from baseline in the distance walked in 6 minutes (6-minute walk test, 6-MWT).
    * The mean difference in 6-MWT between idursulfase and placebo was 37 meters.
- Although evidence is limited in patients less than 5 years old, European guidelines recommend that ERT with idursulfase be initiated for any patient with a biochemically confirmed diagnosis of MPS II, including those younger than 5. [60]
- Treatment guidelines for Mucopolysaccharidoses II recommend idursulfase, as a first-line treatment options for patients with a confirmed diagnosis. Gold standard is documentation of iduronate 2-sulfatase (I2S) deficiency. Screening urinary glycosaminoglycans I diagnostic for MPS II with confirmation by measuring I2S activity and analyzing I2S gene mutations. [1 60 62]

Aldurazyme (laronidase) for MPS I

- Laronidase is indicated for patients with Mucopolysaccharidosis I (MPS I), specifically for Hurler and Hurler-Scheie forms of the disease, and for patients with the Scheie form who have moderate to severe symptoms.[63] MPS I is due to a gene mutation which leads to a deficiency of alpha-l-iduronidase (IDUA). Clinical manifestations include respiratory and cardiovascular complications, skeletal manifestations, arthropathy, loss of hearing and vision, gastrointestinal symptoms, and hydrocephalus. This condition affects roughly 1 per 100,000 individuals. [64]
- Approval was based on a randomized, double-blind, placebo-controlled trial in 45 patients, aged 6 to 43 years old. [65]

    * One patient had the Hurler form, 37 the Hurler-Scheie form, and 7 the Scheie form. Patients received laronidase or placebo for 26 weeks.
    * The primary endpoints were percent predicted forced vital capacity (FVC) and the change from baseline in the distance walked in 6 minutes (6-minute walk test, 6-MWT).
    * Respiratory and physical improvements were achieved in patients receiving laronidase.
    * The mean difference in % of predicted normal FVC was 4 (p=0.02); the mean difference in 6-MWT was 39 meters (p=0.07), comparing laronidase to placebo.
    * The improvement in percent predicted FVC and 6-MWT was maintained after 182 weeks, as evaluated in an open-label in a long-term extension study.
- Treatment guidelines for MPS I highlight the significance of individualized treatment based on the clinical picture of each patient. Enzymatic analysis [alpha-l-iduronidase (IDUA) deficiency] is diagnostic; however, genetic analysis is required for confirmation of phenotype, which is predictive of disease severity. Considerations such as needs patient age, developmental quotient, disease phenotype, severity of disease, and potential for growth should be evaluated before pursuing a hematopoietic stem cell transplant or ERT. [1 64]

Mepsevii (vestronidase alfa)for MPS VII

- Mepsevii (vestronidase alfa), (recombinant human beta-glucuronidase [rhGUS]), is indicated for the treatment of MPS VII (Sly syndrome) in pediatric and adult patients. [66] MPS VII is due to a gene mutation which leads to a deficiency of beta-glucuronidase.
- Patients with MPS VII experience significant development issues. Development slows by 1 to 3 years of age, which is then followed by a regression of skills until death. [54]
- Approval for Mepsevii (vestronidase alfa) was based on one phase 3, randomized, placebo-controlled trial in twelve patients with a diagnosis of MPS VII, based on leukocyte or fibroblast glucuronidase enzyme assay or genetic testing, as well as the clinical history of patients who received treatment with Mepsevii (vestronidase alfa) in phase 1 trials and expanded access programs [67] While the body of evidence for Mepsevii (vestronidase alfa) is of low quality due to the rarity of the condition and the nature of the disease, patients experienced improvement in several parameters that suggest clinical efficacy of the drug.
- No treatment guidelines for MPS VII (Sly syndrome) are available. Mepsevii (vestronidase alfa) is the only FDA-approved treatment. Diagnosis is confirmed with testing for enzyme levels (beta-glucuronidase deficiency). [53]

Safety

- ERTs for Pompe disease have black box warnings for anaphylactic reactions during infusions, and in patients with compromised cardiac or respiratory function, a risk of serious acute exacerbations due to fluid overload. Patients should be observed closely during and after administration.
- Elosulfase alfa, laronidase, and olipudase alfa each have a boxed warning for anaphylactic reactions during infusions. Pre-treatment with antihistamines, antipyretics, and/or corticosteroids is recommended, but not required. [25]

Dosing

- The safety and efficacy of doses higher doses than listed in *Table 2* have not been established. Many of the FDA-approved label for injectable ERTs recommends rounding up the dose to the vial size for calculation of the number of vials needed for a given dose. [2 18 30 42 66 68] However, all of the FDA-approved labels for injectable ERTs recommend to "discard any unused product," which would mean to NOT administer the entire rounded vial. [2 7 18 30 42 55 59 63 66 68]

Appendix 1: Non- CNS clinical symptoms of ASMD[27]	
Gastrointestinal symptoms	Hepatosplenomegaly with splenomegaly preceding it, diarrhea, abnormal liver function tests, portal hypertension and liver fibrosis.
Pulmonary symptoms	Interstitial lung disease on imaging, radiographic findings very abnormal with no apparent symptoms, and declining pulmonary function tests.
Cardiac symptoms	Cardiac valve disease, dyslipidemia, and early onset coronary artery disease.
Musculoskeletal symptoms	Bone and joint pain, reduced bone density and pathologic fractures, delayed bone maturation, and growth restriction in childhood.
Hematologic symptoms	Thrombocytopenia with bleeding tendencies.

Revision History

Revision Date	Revision Summary
6/20/2024	• Updated Opfolda (miglustat) to include medical OR pharmacy benefit (previously only pharmacy benefit). • Updated criteria for Sucraid (sucrasidase) to clarify biopsy levels indicative of CSID.
03/21/2024	Added coverage criteria for Pombiliti (cipaglucosidase alfa) with Opfolda (miglustat).
9/14/2023	Removed "Clarified wording on Lumizyme vs. Nexviazyme (switch for partial response) based on provider feedback" from revision summary. Change was not made in during annual review.
6/15/2023	• Added coverage criteria for Lamzede (velmanase alfa-tycv). • Clarified wording on Lumizyme vs. Nexviazyme (switch for partial response) based on provider feedback.
12/9/2022	Added coverage criteria for Xenpozyme (olipudase alfa-rpcp).
6/17/2022	• Added generic carglumic acid to the policy. • Added criteria for confirmation of diagnosis for all ERTs, with biochemical, genetic, and/or enzymatic testing. • Added step therapy with generics (carglumic acid, nitisinone) prior to coverage of brands (Carbaglu, Orfadin, Nityr). • Updated Quantity limits (QL): - Updated QL for Kanuma (sebelipase alfa). - Clarified QL for oral ERTs, including acute versus chronic use of carglumic acid. • Clarified COT and reauthorization criteria to include review for use of the lowest effective dose.
11/14/2021	Added Nexviazyme (avalglucosidase alfa) to Site of Care.
10/15/2021	Added coverage criteria for Ryplazim (plasminogen, human-tvmb) and Nexviazyme (avalglucosidase alfa).
7/16/2021	• Clarified that documentation of current weight is required for re-authorization. • Added quantity limits for the use of Carbaglu (carglumic acid) in patients with hyperammonemia due to propionic acidemia (PA) and methylmalonic acidemia (MMA), two newly FDA approved indications. • Removed mentions of Adagen (pegademase bovine) in main criteria, but left in policy backend as it still in appears in prescribing information for Revcovi (elapegademase-lvlr).
7/22/2020	• Added continuation of therapy (COT) criteria.

Revision Date	Revision Summary
	• Removed Myozyme (alglucosidase alfa) and Adagen (pegademase bovine) from the policy. Both products have been discontinued. • Removed Strensiq (asfotase) from policy and created a new policy: dru639 Strensiq, asfotase alfa. • Added new criteria stating that each product must be prescribed by or in conjunction with a specialist for its given disease state.
7/24/2019	• Removed Fabrazyme (agalsidase beta) from policy and added it to dru575 Fabry Disease. • No change to intent of other coverage criteria. Clarification of policy language.
1/31/2019	• Added Revcovi (elapegademase-lvlr) to policy. • Clarified documentation requirements (no change to intent).
11/16/2018	No changes to criteria with this annual update.
3/19/2018	Added Mepsevii (vestronidase alfa) to policy.
1/19/2018	Added Nityr, a new formulation of nitisinone, to policy.
11/11/2016	Removed site of care language from the individual drug policy; however, requirements still apply. Reference to Site of Care Review, dru408 is provided as part of criterion IB.
6/10/2016	Added Kanuma (sebelipase alfa) to policy.
2/12/2016	Added Fabrazyme and Strensiq to policy.
11/13/2015	New policy.

Drug names identified in this policy are the trademarks of their respective owners.

Medication Policy Manual | **Policy No:** dru440

Topic: Yondelis, trabectedin | **Date of Origin:** January 8, 2016

Committee Approval Date: September 19, 2024 | **Next Review Date:** 2025

Effective Date: December 1, 2024

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Yondelis (trabectedin) is a cytotoxic chemotherapy medication used for the treatment of certain types of soft tissue sarcoma. Yondelis (trabectedin) is given intravenously as a 24-hour infusion through a central line.

Policy/Criteria

Most contracts require pre-authorization approval of Yondelis (trabectedin) prior to coverage.

I. Continuation of therapy (COT): Yondelis (trabectedin) may be considered medically necessary for COT when criterion A, B, or C below is met.

A. For diagnoses NOT listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND there is documentation that the medication was covered by another health plan. Examples of documentation include the coverage approval letter from the previous health plan or paid claim.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

B. For diagnoses listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

C. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

Please note: *Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Yondelis (trabectedin) may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) that criterion A, B, or C below is met.

A. A diagnosis of **liposarcoma** (LPS) when criteria 1 and 2 below are met:

1. The LPS is unresectable or metastatic.

AND

2. At least one prior anthracycline-based chemotherapy regimen for LPS has been ineffective (see *Appendix 1*).

OR

B. A diagnosis of **leiomyosarcoma** (LMS) when criteria 1 and 2 below are met:

1. The LMS is unresectable or metastatic.

AND

2. At least one prior anthracycline-based chemotherapy regimen for LMS has been ineffective (see *Appendix 1*).

OR

C. A diagnosis of **translocation-related sarcoma** (TRS) including, but not limited to, synovial sarcoma when criteria 1 and 2 below are met:

1. The TRS is unresectable or metastatic.

AND

2. At least one prior chemotherapy regimen for TRS has been ineffective.

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers Yondelis (trabectedin) coverable only under the medical benefit (as a provider-administered medication).

B. When pre-authorization is approved, Yondelis (trabectedin) may be authorized for up to one 24-hour infusion every 21 days, until disease progression.

C. Authorization **may** be reviewed at least every six months. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, such as disease stability or improvement.

IV. Yondelis (trabectedin) is considered not medically necessary when used for the treatment of ovarian cancer.

V. Yondelis (trabectedin) is considered investigational when used for all other conditions, including, but not limited to, soft tissue sarcomas other than listed in Sections I to IV and uterine cancers other than listed in sections I to IV.

Position Statement

Summary

- Yondelis (trabectedin) is a cytotoxic chemotherapy medication used in the treatment of unresectable or metastatic liposarcoma (LPS) or leiomyosarcoma (LMS), or translocation related sarcoma (TRS) after disease progresses on prior cytotoxic chemotherapy.
- The intent of this policy is to cover Yondelis (trabectedin) for the indications, regimen, and dose for which it has been studied, as detailed in the coverage criteria.
- It has not yet been determined if Yondelis (trabectedin) provides clinically meaningful benefit in any of the conditions in which it has been approved. Although Yondelis (trabectedin) demonstrated a progression-free survival (PFS) advantage over standard dose dacarbazine for LPS and LMS, there was no difference in overall survival between groups. Improvement in PFS, a surrogate endpoint, has not been shown to correlate with improvement in any clinically relevant outcome (e.g., symptom control or quality of life).
- *For LPS and LMS*: Standard front-line therapy for unresectable or metastatic soft tissue sarcoma (STS), including LPS and LMS, is anthracycline-based (e.g., doxorubicin) chemotherapy, given either as a single agent or in combination with other cytotoxic agents, because it has been shown to improve survival relative to non-anthracycline-based regimens.
- *For TRS*: Yondelis (trabectedin) has also shown promise in translocation-related sarcomas, including synovial sarcoma. TRSs are rare forms of STS that typically affect younger populations, and for which there are very few treatment options. Patients with advanced disease whose disease has progressed on standard chemotherapy are potential candidates for Yondelis (trabectedin).
- All subjects in the Yondelis (trabectedin) clinical study had progression of disease on prior anthracycline-based chemotherapy. There is no evidence for Yondelis (trabectedin) when given after non-anthracycline-based regimens.
- Yondelis (trabectedin) is a palliative therapy, meaning it is not given with curative intent. National treatment guidelines list Yondelis (trabectedin) among several other therapy options for the palliative treatment of metastatic STS. No one chemotherapy has been shown to be superior to another in this setting.
- Yondelis (trabectedin) is administered as a 24-hour continuous infusion via a central line once every 21 days until progression of disease.
- Yondelis (trabectedin) was evaluated in metastatic ovarian cancer as an add-on to liposomal doxorubicin; however, no difference in OS was demonstrated in the trial. Additionally, there is greater toxicity when these two agents are used together.
- Yondelis (trabectedin) has been evaluated in small numbers of patients with other subtypes of STS; however, data is of extremely low-quality, so the benefit is unknown.
- There are no clinical trials that Yondelis (trabectedin) provides any benefit for patients with uterine cancers other than for leiomyosarcomas and liposarcomas; evidence is limited to scant case reports.

Regence Pharmacy Services performs independent analyses of oncology medication evidence, to establish coverability per the contracts with the health plan.

- Most contracts define coverability based on established clinical benefit in published, peer-reviewed literature, along with consideration of regulatory status.
- FDA approval does not in itself establish medical necessity, as unpublished, low-quality evidence, including exploratory analyses and unvalidated surrogate endpoints, may be used as the basis of approval. Regulatory approval may or may not reflect clinical benefit relative to standard of care and the recommendations of expert clinical advisors such as the Oncologic Drugs Advisory Committee (ODAC). FDA approvals generally do not consider cost compared to established therapies, or value to members.
- Likewise, NCCN clinical practice guidelines assignment of a recommendation (category 1, 2a, or 2b) does not necessarily establish medically necessity. NCCN recommendations are inconsistently supported by published, peer-reviewed literature and do not uniformly consider value of new therapies relative to existing potentially higher-value treatment options, considering effectiveness, safety, and cost.
- Medication coverage criteria are developed based on the 'medical necessity' assessment, as described above.

Regence Pharmacy Services analysis and coverage policy may differ from FDA labeled indication and/or NCCN clinical practice guidelines.

Clinical Efficacy [1 2]

Liposarcoma and leiomyosarcoma

- The efficacy of Yondelis (trabectedin) is based on a single, published, phase 3 trial in patients with metastatic or recurrent liposarcoma or leiomyosarcoma. These are two of the most common forms of soft tissue sarcoma (STS).
    - All patients in the Yondelis (trabectedin) clinical trial had prior cytotoxic chemotherapy, with the majority having received anthracycline-based regimens, the current front-line standard of care.
    - The study evaluated Yondelis (trabectedin) as a monotherapy in a dose of 1.5 mg/m^2 intravenously as a 24-hour infusion given every 21 days until disease progression. Subjects in the comparator arm received a standard dose of dacarbazine as monotherapy.
    - There was a 2.7-month advantage in progression-free survival (PFS) with Yondelis (trabectedin) versus dacarbazine; however, there was no difference in median overall survival (OS).
    - It is not known if improved PFS correlates with improvements in other clinically relevant outcomes such as symptom control or quality of life.
    - The median duration of response in the Yondelis (trabectedin) and dacarbazine treatment arms was 6.5 months and 4.2 months, respectively. This difference was not statistically significant.
    - There is currently no evidence that Yondelis (trabectedin) is superior to dacarbazine or any other therapy used for the salvage treatment of liposarcoma or leiomyosarcoma with regard to any clinically relevant endpoint.

- Subsequently, Yondelis (trabectedin) was studied as first-line systemic therapy in combination with doxorubicin for chemotherapy-naïve patients with metastatic or unresectable leiomyosarcoma in an open-label phase 3 trial (n=150).[3]
    * The trial compared doxorubicin for up to 6 cycles versus doxorubicin/ Yondelis (trabectedin) for up to 6 cycles induction followed by Yondelis (trabectedin) as maintenance for a maximum of 12 months.
    * The trial enrolled patients with both uterine leiomyosarcoma (n=67) and soft tissue leiomyosarcoma (n=83).
    * Despite a 6-month advantage in PFS with combination Yondelis (trabectedin)/doxorubicin versus doxorubicin alone, overall survival (OS) data was not yet available. It is not known if Yondelis (trabectedin) improved PFS correlates with improvements in overall survival or other clinically relevant outcomes such as symptom control or quality of life.
    * Patients in the combination arm had a higher incidence of grade 3-4 adverse events compared to doxorubicin alone (96% versus 52%, respectively).
    * Several study concerns were identified including open-label design, baseline imbalances favoring the combination therapy arm, and limited generalizability to a healthy population.

<u>Translocation-related sarcomas (TRSs)</u>

- Yondelis (trabectedin) is also being evaluated in advanced translocation-related sarcomas (TRSs), including advanced synovial sarcomas. These rare forms of STS affect younger populations and have few effective treatment options.
    * A pooled analysis of small trials that included patients with different histological subtypes of TRS reported that Yondelis (trabectedin) had anti-tumor effects and prolonged disease control in patients with advanced disease who had a median of one prior therapy regimen. [4]
    * A second study evaluated Yondelis (trabectedin) in patients with metastatic synovial sarcoma who had been treated with prior chemotherapy. A tumor control rate (partial response or stable disease) of 50% was reported. [5]

Guidelines

- The National Comprehensive Cancer Network (NCCN) STS guideline lists Yondelis (trabectedin) as a therapy option as a palliative therapy for liposarcoma (LPS) and leiomyosarcoma (LMS). It is also listed as a therapy option for other subtypes of STS with non-specific histologies as well as for use in the neoadjuvant/adjuvant setting for myxoid liposarcoma. [6]

Not Medically Necessary Uses

- A phase 3 study evaluating Yondelis (trabectedin) plus pegylated liposomal doxorubicin (PLD) versus PLD alone demonstrated improved tumor response rates and progression-free survival (PFS) in the combination arm; however, there was no statistical difference in overall survival based on the mature data set. [7 8]

Investigational Uses

- The safety and effectiveness of Yondelis (trabectedin) in soft tissue sarcomas (STS) other than LPS or LMS have not been adequately assessed. Available studies are in early phases and contain mixed subtypes of STSs with small numbers of any given subtype. [9]
- Yondelis (trabectedin) had no activity in patients with metastatic pancreatic cancer or triple-negative, HER2-overexpressing metastatic breast cancer based on small, preliminary studies. [10 11]
- The safety and effectiveness of Yondelis (trabectedin) in uterine cancer is limited to patients with leiomyosarcoma and liposarcoma histologies; safety and efficacy for use in other uterine cancer histologies have not been adequately assessed. There is no clinical trial evidence for use of Yondelis (trabectedin) in other histologies; data is limited to three case reports in recurrent/ metastatic adenosarcoma. [12]

Safety and Administration [1 2]

- Serious adverse events (AEs) reported with Yondelis (trabectedin) include severe neutropenia, rhabdomyolysis, hepatotoxicity, and cardiomyopathy.
- Yondelis (trabectedin) has only been directly compared with single-agent dacarbazine.
- The incidence of nearly all AEs was numerically higher for Yondelis (trabectedin) than for dacarbazine. Discontinuations due to AEs occurred in 12.6% and 7.7% in the Yondelis (trabectedin) and dacarbazine treatment arms, respectively.
- Yondelis (trabectedin) is administered via a 24-hour continuous infusion. It must be administered via a central line because extravasation can cause tissue necrosis requiring tissue debridement.
- Premedication with dexamethasone is required prior to administration of Yondelis (trabectedin) to prevent or minimize infusion reactions.

Appendix 1: Anthracycline medications
daunorubicin (generics, Cerubidine) doxorubicin (generics, Adriamycin) doxorubicin, liposomal (Doxil, Lipodox) epirubicin (generics, Ellence)

Revision History

Revision Date	Revision Summary
9/19/2024	No criteria changes with this annual review.
9/14/2023	No criteria changes with this annual review.
9/23/2022	No coverage criteria changes with this annual update.
10/15/2021	- Continuation of therapy (COT) language updated for standardization. - No coverage criteria changes with this annual update.
10/28/2020	- Continuation of therapy (COT) language added. - Updated investigational indications to explicitly call out uterine cancers other than what is covered in criteria but no change to intent. - No coverage criteria changes with this annual update.
10/23/2019	No coverage criteria changes with this annual update.
10/19/2018	- Updated policy with standard language, including clarifying the Authorization Period to state 'until disease progression' (no change to policy intent) - Added coverage for TRS (few other options)
1/13/2017	- No coverage criteria changes. - Updated references for package labeling and NCCN guideline, and added documentation for two additional populations where trabectedin was not found to have activity.
1/8/2016	New policy.

Medication Policy Manual

Policy No: dru443

Topic: Onivyde, irinotecan liposome injection

Date of Origin: January 8, 2016

Committee Approval Date: March 6, 2025

Next Review Date: 2026

Effective Date: May 1, 2025

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Onivyde (liposomal irinotecan) is an intravenous formulation of generic irinotecan HCL. It is a nanoliposomal encapsulation of irinotecan HCL molecules. Liposomal irinotecan (Onivyde) is indicated for patients with metastatic pancreatic cancer who have progressed on prior gemcitabine-based chemotherapy. It is given in combination with fluorouracil and leucovorin.

PLEASE NOTE: This policy and the criteria below do not apply to non-liposomal forms of intravenous irinotecan (generic, Camptosar). Non-liposomal generic irinotecan and brand Camptosar IV solution do not require pre-authorization.

Policy/Criteria

Most contracts require pre-authorization approval of Onivyde (liposomal irinotecan) prior to coverage.

I. Continuation of therapy (COT): Onivyde (liposomal irinotecan) may be considered medically necessary for COT when criterion A, B, or C below is met.

A. For diagnoses NOT listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND there is documentation that the medication was covered by another health plan. Examples of documentation include the coverage approval letter from the previous health plan or paid claim.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

B. For diagnoses listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

C. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

Please note*: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Onivyde (liposomal irinotecan) may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) that criteria A, B, and C below are met.

A. A diagnosis of **metastatic pancreatic cancer**.

AND

B. There has been disease progression following gemcitabine-based chemotherapy.

AND

C. Onivyde (liposomal irinotecan) will be given in combination with fluorouracil and leucovorin.

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers Onivyde (liposomal irinotecan) coverable only under the medical benefit (as a provider-administered medication).

B. When pre-authorization is approved, Onivyde (liposomal irinotecan) may be authorized in doses up to 70 mg/m^2 every two weeks until disease progression.

C. Authorization **may** be reviewed at least every six months. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, such as disease stability or improvement.

IV. Onivyde (liposomal irinotecan) is considered not medically necessary when used in the following settings:

A. As monotherapy for metastatic pancreatic cancer.

B. As front-line therapy for metastatic pancreatic cancer (e.g., as part of the NALIRIFOX chemotherapy regimen).

V. Onivyde (liposomal irinotecan) is considered investigational when used for all other conditions, including but not limited to:

A. Colorectal cancer.

B. Gastric cancer.

C. High grade glioma.

D. Lung cancer.

E. Osteosarcoma.

F. Soft tissue sarcoma.

Position Statement

Summary

- Onivyde (liposomal irinotecan) is an intravenously administered medication for the treatment of metastatic pancreatic cancer.
- For progressive metastatic pancreatic cancer:
  * Onivyde (liposomal irinotecan) has only been studied in the post-gemcitabine setting (i.e., as a second-line therapy following progression of disease on gemcitabine-based chemotherapy).
  * Although the pivotal trial for the approval of Onivyde (liposomal irinotecan) included a monotherapy arm, use of Onivyde (liposomal irinotecan) without fluorouracil and leucovorin did not demonstrate improvements in overall survival (OS) compared to the combination, therefore Onivyde (liposomal irinotecan) monotherapy is considered not medically necessary.
- The FDA labeling states that Onivyde (liposomal irinotecan) is not indicated as a single agent for the treatment of patients with metastatic pancreatic cancer.
- Front-line metastatic pancreatic cancer: Although Onivyde (liposomal irinotecan) was evaluated as part of a front-line regimen (NALIRIFOX) for metastatic pancreatic cancer it is not known whether it is superior to more cost-effective, standard-of-care front-line regimens such as FOLFIRINOX.
- The recommended dose of Onivyde (liposomal irinotecan) is 70 mg/m^2 every two weeks until disease progression or unacceptable toxicity. The safety and effectiveness of higher doses or more frequent dosing have not been established. [1]
- There is currently no published data that evaluates the safety and efficacy of Onivyde (liposomal irinotecan) in any other cancer setting.

Regence Pharmacy Services performs independent analyses of oncology medication evidence, to establish coverability per the contracts with the health plan.

- Most contracts define coverability based on established clinical benefit in published, peer-reviewed literature, along with consideration of regulatory status.
- FDA approval does not in itself establish medical necessity, as unpublished, low-quality evidence, including exploratory analyses and unvalidated surrogate endpoints, may be used as the basis of approval. Regulatory approval may or may not reflect clinical benefit relative to standard of care and the recommendations of expert clinical advisors such as the Oncologic Drugs Advisory Committee (ODAC). FDA approvals generally do not consider cost compared to established therapies, or value to members.
- Likewise, NCCN clinical practice guidelines assignment of a recommendation (category 1, 2a, or 2b) does not necessarily establish medically necessity. NCCN recommendations are inconsistently supported by published, peer-reviewed literature and do not uniformly consider value of new therapies relative to existing potentially higher-value treatment options, considering effectiveness, safety, and cost.
- Medication coverage criteria are developed based on the 'medical necessity' assessment, as described above.

Regence Pharmacy Services analysis and coverage policy may differ from FDA labeled indication and/or NCCN clinical practice guidelines.

Clinical Efficacy

Progressive metastatic pancreatic cancer:

- The effectiveness of Onivyde (liposomal irinotecan) was evaluated in a single, open-label, randomized clinical trial in patients with metastatic pancreatic cancer with documented disease progression, after gemcitabine or gemcitabine-based therapy. [2] Patients with locally advanced disease were not included in the study population.
    * The primary endpoint of the pivotal trial was overall survival (OS). Combination treatment with Onivyde (liposomal irinotecan) and fluorouracil and leucovorin resulted in a two-month improvement in median OS compared to fluorouracil and leucovorin alone.
    * In the Onivyde (liposomal irinotecan) monotherapy arm, there was no statistically significant difference is median OS compared to fluorouracil and leucovorin alone.
- There is currently no established standard of care for the treatment of metastatic pancreatic cancer in the second-line setting; participation in a clinical trial is the preferred when available. The National Comprehensive Cancer Network (NCCN) Pancreatic Adenocarcinoma guideline recommends Onivyde (liposomal irinotecan), gemcitabine-based chemotherapy or fluoropyrimidine-based chemotherapy, depending on the agents used in the first-line setting. Onivyde (liposomal irinotecan) is considered a category 1 recommendation for patients previously treated with gemcitabine-based therapy. [3]

Front-line setting, metastatic pancreatic cancer:

- Subsequently, Onivyde (liposomal irinotecan) was evaluated in an open-label, randomized controlled trial (NAPOLI 3) where it was shown to incrementally improve OS relative to gemcitabine plus nab-paclitaxel when given as part of the NALIRIFOX regimen [Onivyde (liposomal irinotecan), oxaliplatin, leucovorin, and fluorouracil]. However, it is unknown how NALIRIFOX compares with other front-line, standard-of-care regimens for metastatic pancreatic cancer, such as FOLFIRINOX, which provides a better value. [4] Furthermore, a meta-analysis comparing NALIRIFOX and FOLFIRINOX in the front-line treatment of metastatic pancreatic cancer found these two regimens to be similar with regard to OS benefit suggesting there is no efficacy advantage in substituting Onivyde (irinotecan liposomal) for standard irinotecan in this treatment setting. [5]
- The NCCN pancreatic cancer guideline lists gemcitabine plus nab-paclitaxel, FOLFIRINOX, and NALIRIFOX among first-line, preferred recommendations for advanced pancreatic cancer. The guideline notes that the Onivyde (irinotecan liposomal)-based regimen (NALIRIFOX) adds considerable expense over FOLFIRINOX without any apparent advantages in this setting. [3]

Investigational Uses

- Onivyde (liposomal irinotecan) is being studied in a variety of other cancers such as colorectal cancer, gastric cancer, high grade glioma, lung cancer, osteosarcoma, and soft tissue sarcoma. [6]

- Although Onivyde (liposomal irinotecan) is being studied for the treatment of various cancers, there is currently no published evidence supporting its safety or efficacy in these settings.
- A phase 3 study (RESILIENT) comparing Onivyde (liposomal irinotecan) with topotecan in patients with advanced small cell lung cancer that had progressed on or after front-line platinum-based chemotherapy failed to meet its endpoint of improved OS. [7]
- There is interest in using Onivyde (liposomal irinotecan) in metastatic biliary tract cancer (including in intra- and extrahepatic cholangiocarcinoma) based on a small trial (NIFTY study) conducted at five study sites in South Korea. [8]
    * The trial compared the addition of Onivyde (liposomal irinotecan) to fluorouracil plus leucovorin and compared it with fluorouracil/leucovorin alone.
    * Authors reported a 3-month OS advantage in the Onivyde (liposomal irinotecan) treatment arm. However, there are many uncertainties in the data including the statistical methods, and the choice of comparator.
    * FOLFOX (oxaliplatin/fluorouracil/leucovorin) is the standard of care in the U.S., so the clinical relevance of the results is unknown.
    * The NCCN lists the use of Onivyde (liposomal irinotecan) in biliary tract cancer as a category 2B recommendation.

Revision History

Revision Date	Revision Summary
3/6/2025	No changes to coverage criteria with this annual review.
9/19/2024	• No changes to coverage criteria with this ad hoc review [the use of Onivyde (irinotecan liposomal) as part of the NALIRIFOX regimen is already considered not medically necessary based on a prior annual review].
12/7/2023	• Changed front-line use of Onivyde (liposomal irinotecan) from 'Investigational' to 'Not Medically Necessary' based on new evidence in the front-line metastatic pancreatic cancer setting. Although Onivyde (liposomal irinotecan) appears to have efficacy as part of a front-line therapy regimen in this setting other more established front-line regimens such as FOLFIRINOX provide a better value.
12/9/2022	• Updated standard language in policy. • No changes to coverage criteria with this annual update.
1/20/2021	Updated continuation of therapy (COT) language. No changes to coverage criteria.
1/22/2020	Added continuation of therapy (COT) criteria (no change to intent of coverage criteria).
1/31/2018	No criteria changes with this annual update.
11/10/2017	No criteria changes with this annual review.
1/13/2017	No criteria changes with this annual review.
1/8/2016	New policy

Policy No: dru444

Topic: Drugs for chronic inflammatory diseases

Date of Origin: January 8, 2016

- adalimumab (Humira; biosimilars: Abrilada, Amjevita, Cyltezo, Hadlima, Hulio, Hyrimoz, Idacio, Simlandi, Yuflyma, Yusimry; unbranded: adalimumab-adaz, adalimumab-adbm, adalimumab-ryvk)
- Adbry, tralokinumab-ldrm
- Bimzelx, bimekizumab-bkzx
- Cibinqo, abrocitinib
- Cimzia, certolizumab pegol
- Cosentyx, secukinumab
- Entyvio, vedolizumab
- etanercept (Enbrel; biosimilars Erelzi, Eticovo)
- golimumab (Simponi, Simponi Aria)
- Ilumya, tildrakizumab-asmn
- Kevzara, sarilumab
- Litfulo, ritlecitinib
- Olumiant, baricitinib
- Omvoh, mirikizumab-mrkz
- Orencia, abatacept
- Otezla, apremilast
- Siliq, brodalumab
- Skyrizi, risankizumab-rzaa
- Sotyktu, deucravacitinib
- Spevigo, spesolimab-sbzo
- Stelara, ustekinumab
- Taltz, ixekizumab
- tocilizumab (Actemra; biosimilars Tofidence, Tyenne)
- tofacitinib (Xeljanz, Xeljanz XR)
- upadacitinib (Rinvoq, Rinvoq LQ)
- Tremfya, guselkumab
- Velsipity, etrasimod

Committee Approval Date: June 20, 2024

Next Review Date: 2025

Effective Date: October 1, 2024

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of medication policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Administration of Contract

Coverage for cosmetic purposes, including removal, inhibition, or stimulation of hair growth, is defined by benefit contract language.

Description

Medications included in this policy are used to treat a group of diseases that may be caused or worsened by an overactive immune system. Administration may be a subcutaneous injection (SC), intravenous injection (IV), or administered by mouth.

Policy/Criteria

Most contracts require prior authorization approval of medications used to treat chronic inflammatory diseases prior to coverage.

I. Continuation of therapy (COT): Medications in this policy may be considered medically necessary for COT when criterion A, B, or C, **AND** D **AND** E below is met.

A. For diagnoses NOT listed in the coverage criteria below, full policy criteria must be met for coverage.

OR

B. For diagnoses listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

C. With exception of Olumiant (baricitinib) use for coronavirus-19 (COVID-19), the medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

AND

D. **For Provider-administered drugs only (as applicable):** Site of care administration requirements are met [refer to Medication Policy Manual, Site of Care Review, dru408].

AND

E. **"Administration of Contract" is met.**

***Please note**: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Medications in this policy may be considered medically necessary when the criteria below are met.

A. Acute Graft Versus Host Disease (aGVHD), Prophylaxis
Orencia (abatacept) IV may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) that criteria 1, 2, and 3 below are met. **1.** Abatacept will be used for **prophylaxis of acute graft versus host disease (aGVHD)**. **AND** **2.** Patient will undergo a hematopoietic cell transplant (HCT) from an unrelated donor (either 8/8 HLA matched or 7/8 HLA mismatch). **AND** **3.** Abatacept will be used in combination with methotrexate and a calcineurin inhibitor (cyclosporine or tacrolimus).

B. Alopecia areata (AA)

Note: medications for cosmetic purposes, including, but not limited to the stimulation of hair growth is dictated by benefit contract language.

1. **Diagnostic Criteria:** The diagnosis of alopecia areata (AA) has been established by or in conjunction with a specialist in dermatology.
2. **Severity Criteria:** Criteria a, b, and c below are met.
   a. Severe AA as indicated by a severity of alopecia tool (SALT) score of ≥ 50 or ≥ 50% scalp hair loss.

   AND

   b. No evidence of terminal hair regrowth within 6 months.

   AND

   c. Both the following have been ineffective or not tolerated, unless all are contraindicated:
      i. At least 6 months of a conventional oral immunosuppressant (methotrexate, cyclosporine, or azathioprine)

      AND

      ii. Either A or B below:

      A. At least 6 weeks of topical or oral corticosteroid therapy.

      OR

      B. At least 6 months of topically immunotherapy (diphenylcyclopropenone [DPCP] or squaric acid dibutyl ester [SADBE]).

Product Group	Products	Criteria Requirements
Level 1	- Litfulo (ritlecitinib) - Olumiant (baricitinib)	**1.** Diagnostic Criteria **2.** Severity Criteria

C. Ankylosing Spondylitis (AS) – Self-administered Products		
1. <u>Diagnostic Criteria</u>: A diagnosis of **axial SpA**, including **ankylosing spondylitis** (AS), when established by or in consultation with a specialist in rheumatology.		
Product Group	**Products**	**Criteria Requirements**
Level 1	- Cosentyx (secukinumab) - Enbrel (etanercept) - Hadlima (adalimumab-bwwd) - Humira (adalimumab) - Simlandi (adalimumab-ryvk)	**1.** Diagnostic Criteria
Level 2	- Rinvoq (upadacitinib) - Xeljanz/Xeljanz XR (tofacitinib)	**1.** Diagnostic Criteria **2.** There is clinical documentation that treatment with **at least ONE Level 1** TNF-inhibitor was not effective after at least a 12-week treatment course unless all were not tolerated or are contraindicated.
Level 3	- Cimzia (certolizumab pegol) syringes - Simponi (golimumab) SC - Taltz (ixekizumab)	**1.** Diagnostic Criteria **2.** There is clinical documentation that treatment with **at least TWO Level 1 or Level 2** therapies was not effective after at least a 12-week treatment course unless all were not tolerated or are contraindicated.
Non-Preferred Adalimumab Products	- Adalimumab biosimilars (Abrilada, Amjevita, Cyltezo, Hulio, Hyrimoz, Idacio, Yuflyma, Yusimry)	**1.** Diagnostic Criteria **2.** There is a documented intolerance or contraindication to **Humira (adalimumab), Hadlima (adalimumab-bwwd), and Simlandi (adalimumab-ryvk).**
Non-Preferred Etanercept Products	- Etanercept biosimilars (Erelzi, Eticovo)	**1.** Diagnostic Criteria **2.** There is a documented intolerance or contraindication to **Enbrel (etanercept)**.

D. Ankylosing Spondylitis (AS) – Provider-administered Products		
1. **Site of Care Requirements:** For provider-administered therapies, site of care administration requirements are met [refer to Medication Policy Manual, Site of Care Review, dru408]. **2.** **Diagnostic Criteria:** A diagnosis of **axial SpA**, including **ankylosing spondylitis** (AS), when established by or in consultation with a specialist in rheumatology.		
Product Group	**Products**	**Criteria Requirements**
Level 1	- Cosentyx (secukinumab) IV - Simponi Aria (golimumab) IV	**1.** Site of Care Requirements **2.** Diagnostic Criteria
	- Avsola, Inflectra (infliximab)	Refer to Medication Policy Manual, Products with Therapeutically Equivalent Biosimilars/Reference Products, dru620
Level 2	- Cimzia (certolizumab pegol) vials	**1.** Site of Care Requirements **2.** Diagnostic Criteria **3.** There is clinical documentation that treatment with **at least TWO Level 1** therapies was not effective after at least a 12-week treatment course unless all were not tolerated or are contraindicated.
Non-Preferred Infliximab Products	- Infliximab biosimilars (Renflexis, Ixifi) - Remicade (infliximab) - Unbranded Janssen infliximab product	Refer to Medication Policy Manual, Products with Therapeutically Equivalent Biosimilars/Reference Products, dru620

E. Antibody Mediated Rejection (AMR) of Transplant (Solid Organ)		
Tocilizumab IV may be considered medically necessary when criteria 1 and 2 below are met. **1.** **Diagnostic Criteria:** Criterion a or b below are met. **a.** **Prevention of antibody (Ab)-mediated rejection:** Prior to solid organ transplant and in the peri-operative period, for patients at high risk for Ab-mediated rejection, including highly sensitized patients, and those receiving an ABO-incompatible organ. **OR** **b.** **Treatment of antibody-mediated rejection** (a.k.a. vascular rejection, humoral rejection): Following solid organ transplant and confirmed by either biopsy or presence of panel reactive antibodies (PRAs). **AND** **2.** **Severity Criteria:** Treatment with immunoglobulin (IVIG), plasma exchange/pheresis (PLEX), and rituximab has been ineffective or is contraindicated.		
Product Group	**Products**	**Criteria Requirements**
Level 1	- Actemra (tocilizumab) IV - Tyenne (tocilizumab-aazg) IV	**1.** Diagnostic Criteria **2.** Severity Criteria
Non-Preferred Tocilizumab Products	- Tocilizumab biosimilar (Tofidence) IV	**1.** Diagnostic Criteria **2.** Severity Criteria **3.** There is a documented intolerance or contraindication to **all Level 1** therapies.

F. Atopic Dermatitis (AD) – Self-administered Products

1. **Diagnostic Criteria:** The medication is being prescribed by or in conjunction with a specialist in dermatology, allergy, or pulmonology.
2. **Severity Criteria:** All the following criteria a, b, and c below are met.
   - **a.** The patient is age 12 or older for Rinvoq (upadacitinib), Cibinqo (abrocitinib), or Adbry (tralokinumab-ldrm).

   AND

   - **b.** The patient has a diagnosis of moderate to severe atopic dermatitis.

   AND

   - **c.** Both the following (i and ii) have been ineffective or not tolerated, unless all are contraindicated:
     - **i.** A medium to very high-potency corticosteroid (see *Appendix 1*), for at least 14 days.

     AND

     - **ii.** Topical tacrolimus, for at least 28 days, unless one of the following apply (criterion a or b below):
       - **a.** Atopic dermatitis affects a body surface area (BSA) greater than or equal to 10% or involvement of a hairy area of the body (such as the scalp) such that use of topical tacrolimus is not feasible.

       OR

       - **b.** Systemic immunosuppressants (such as oral cyclosporine, methotrexate, azathioprine, mycophenolate mofetil, or a biologic) for at least two months have been ineffective, not tolerated, or all are contraindicated.

PLEASE NOTE: Ineffectiveness for topical agents is defined as failure to achieve and maintain remission or a low disease activity state despite treatment with a daily regimen, applied for ≥ 28 days or for the maximum duration recommended by the product prescribing information (e.g., 14 days for high or very-high potency topical corticosteroids).

Product Group	Products	Criteria Requirements
Level 1	- Adbry (tralokinumab-ldrm) - Cibinqo (abrocitinib) - Rinvoq (upadacitinib)	**1.** Diagnostic Criteria **2.** Severity Criteria
	- Dupixent (dupilumab)	Refer to Medication Policy Manual, Dupixent, dupilumab, dru493

G. Non-Radiographic Axial Spondyloarthritis (Nr-axSpA) – Self-administered Products		
1. <u>Diagnostic Criteria</u>: A diagnosis of **non-radiographic axial spondyloarthritis** (Nr-axSpA) when established by or in consultation with a specialist in rheumatology.		
Product Group	**Products**	**Criteria Requirements**
Level 1	- Cimzia (certolizumab pegol) syringes - Cosentyx (secukinumab)	**1.** Diagnostic Criteria
Level 2	- Rinvoq (upadacitinib)	**1.** Diagnostic criteria **2.** There is clinical documentation that treatment with **at least ONE level 1 TNF** inhibitor was not effective after at least a 12-week treatment course unless all were not tolerated or are contraindicated.
Level 3	- Taltz (ixekizumab)	**1.** Diagnostic Criteria **2.** There is clinical documentation that treatment with **at least TWO Level 1 or Level 2** therapies was not effective after at least a 12-week treatment course unless all were not tolerated or are contraindicated.

H. Non-Radiographic Axial Spondyloarthritis (Nr-axSpA) – Provider-administered Products		
1. **Site of Care Requirements:** For provider-administered therapies, site of care administration requirements are met [refer to Medication Policy Manual, Site of Care Review, dru408]. **2.** **Diagnostic Criteria:** A diagnosis of **non-radiographic axial spondyloarthritis** (Nr-axSpA) established by or in consultation with a specialist in rheumatology.		
Product Group	**Products**	**Criteria Requirements**
Level 1	- Cimzia (certolizumab pegol) vials - Cosentyx (secukinumab) IV	**1.** Site of Care Requirements **2.** Diagnostic Criteria

I. Behçet's Disease (BD)		
1. **<u>Diagnostic Criteria</u>:** The diagnosis of **Behçet's Disease** (BD) has been established by or in conjunction with a specialist in rheumatology, dermatology, or immunology. **2.** **<u>Severity Criteria</u>:** All the following criteria a, b, and c below are met. **a.** There is documentation of mucocutaneous ulcers (including, but not limited to, oral, genital, or cutaneous ulcers). **AND** **b.** Documentation confirming functional impairment due to BD, which may include, but is not limited to, limitation of activities of daily living (ADLs), such as infections, severe pain, or sleep disturbances. **AND** **c.** Treatment with colchicine, azathioprine, cyclosporine, methotrexate, a topical corticosteroid (e.g., triamcinolone dental paste), or other immunomodulator (see *Appendix 3*) for at least four weeks has been ineffective or not tolerated, unless all are contraindicated.		
Product Group	**Products**	**Criteria Requirements**
Level 1	- Otezla (apremilast)	**1.** Diagnostic Criteria **2.** Severity Criteria

J. Chronic Plaque Psoriasis (PsO) – Self-administered Products

1. **Diagnostic Criteria:** A diagnosis of **chronic plaque psoriasis** (PsO) when established by or in consultation with a specialist in dermatology or rheumatology.
2. **Severity Criteria:** At least one of the following criterion a, b, or c below are met.
   - **a.** There is involvement of ≥ 10% of the body surface (BSA) area OR there is significant functional disability due to PsO.

     OR
   - **b.** Treatment with phototherapy (for example, UVB) or photochemotherapy was not effective, not tolerated, or is contraindicated (such as lesions on the face, scalp, hands, feet, nailbeds, or groin area; see *Appendix 2*).

     OR
   - **c.** Treatment with at least one oral/topical conventional medication therapy was not effective after 12 weeks, not tolerated, or all are contraindicated. Conventional medication therapies for the treatment of PsO include: acitretin, anthralin, calcipotriene, calcitriol, coal tar products, cyclosporine, methotrexate, pimecrolimus, tacrolimus, tazarotene, or a topical corticosteroid.

Product Group	Products	Criteria Requirements
Level 1	- Cosentyx (secukinumab) - Enbrel (etanercept) - Hadlima (adalimumab-bwwd) - Humira (adalimumab) - Otezla (apremilast) - Simlandi (adalimumab-ryvk) - Skyrizi (risankizumab) - Stelara (ustekinumab) - Tremfya (guselkumab)	**1.** Diagnostic Criteria **2.** Severity Criteria
Level 2	- Sotyktu (deucravacitinib)	1. Diagnostic Criteria 2. Severity Criteria 3. There is clinical documentation that treatment with **at least ONE Level 1 therapy** was not effective after at least a 12-week treatment course unless all were not tolerated or are contraindicated. 4.
Level 3	- Cimzia (certolizumab pegol) syringes	**1.** Diagnostic Criteria **2.** Severity Criteria **3.** There is clinical documentation that treatment with **at least TWO Level 1 therapies** was not effective after at least a 12-week treatment course unless all were not tolerated or are contraindicated.

J. Chronic Plaque Psoriasis (PsO) – Self-administered Products		
Product Group	**Products**	**Criteria Requirements**
Level 4	- Bimzelx (bimekizumab-bkzx) - Siliq (brodalumab) - Taltz (ixekizumab)	**1.** Diagnostic Criteria **2.** Severity Criteria **3.** There is clinical documentation that treatment with **at least THREE Level 1** therapies was not effective after at least a 12-week treatment course unless all were not tolerated or are contraindicated.
Non-Preferred Adalimumab Products	- Adalimumab biosimilars (Abrilada, Amjevita, Cyltezo, Hulio, Hyrimoz, Idacio, Yuflyma, Yusimry)	**1.** Diagnostic Criteria **2.** Severity Criteria **3.** There is a documented intolerance or contraindication to **Humira (adalimumab), Hadlima (adalimumab-bwwd), and Simlandi (adalimumab-ryvk).**
Non-Preferred Etanercept Products	- Etanercept biosimilars (Erelzi, Eticovo)	**1.** Diagnostic Criteria **2.** Severity Criteria **3.** There is a documented intolerance or contraindication to **Enbrel (etanercept)**.

K. Chronic Plaque Psoriasis (PsO) – Provider-administered Products

1. **Site of Care Requirements:** For provider-administered therapies, site of care administration requirements are met [refer to Medication Policy Manual, Site of Care Review, dru408].
2. **Diagnostic Criteria:** A diagnosis of **chronic plaque psoriasis** (PsO) when established by or in consultation with a specialist in dermatology or rheumatology.
3. **Severity Criteria:** At least one of the following criterion a, b, or c below are met.
   - **a.** There is involvement of ≥ 10% of the body surface (BSA) area OR there is significant functional disability due to PsO.

   OR

   - **b.** Treatment with phototherapy (for example, UVB) or photochemotherapy was not effective, not tolerated, or is contraindicated (such as lesions on the face, scalp, hands, feet, nailbeds, or groin area; see *Appendix 2*).

   OR

   - **c.** Treatment with at least one oral/topical conventional medication therapy was not effective after 12 weeks, not tolerated, or all are contraindicated. Conventional medication therapies for the treatment of PsO include: acitretin, anthralin, calcipotriene, calcitriol, coal tar products, cyclosporine, methotrexate, pimecrolimus, tacrolimus, tazarotene, or a topical corticosteroid.

Product Group	Products	Criteria Requirements
Level 1	- Stelara (ustekinumab)	**1.** Diagnostic Criteria **2.** Severity Criteria
	- Avsola, Inflectra (infliximab)	Refer to Medication Policy Manual, Products with Therapeutically Equivalent Biosimilars/Reference Products, dru620
Level 2	- Cimzia (certolizumab pegol) vials - Ilumya (tildrakizumab-asmn)	**1.** Site of Care Requirements (*Cimzia vials only*) **2.** Diagnostic Criteria **3.** Severity Criteria **4.** There is clinical documentation that treatment with **at least TWO Level 1** therapies was not effective after at least a 12-week treatment course unless all were not tolerated or are contraindicated.
Non-Preferred Infliximab Products	- Infliximab biosimilars (Renflexis, Ixifi) - Remicade (infliximab) - Unbranded Janssen infliximab product	Refer to Medication Policy Manual, Products with Therapeutically Equivalent Biosimilars/Reference Products, dru620

L. Crohn's Disease (CD) – Self-administered Products

1. **Diagnostic Criteria:** A diagnosis of **Crohn's disease** (CD) established by or in consultation with a specialist in gastroenterology.
2. **Severity Criteria:** Either criterion a or b below are met.
   - **a.** At least one of the following criterion (i through vi) below are met.
     - **i.** Fistulizing Crohn's disease.
     - **ii.** Previous hospitalization for Crohn's disease.
     - **iii.** Extensive anatomic involvement.
     - **iv.** Deep ulcers.
     - **v.** Prior surgical resection.
     - **vi.** Stricturing and/or penetrating behavior.

   OR

   - **b.** Acute treatment of an exacerbation when at least one of criterion (i, ii, or iii) below is met.
     - **i.** Treatment with an adequate course of corticosteroids (for example, prednisone 40 to 60 mg/day, oral budesonide 9 mg/day, or budesonide rectal for 7 to 14 days) has been ineffective or is contraindicated.

     OR

     - **ii.** The patient has been unable to taper an adequate course of corticosteroids without experiencing worsening of disease.

     OR

     - **iii.** The patient is experiencing breakthrough disease (e.g., active disease flares) while stabilized for at least 8 weeks on a conventional immunomodulator. Conventional immunomodulators for CD include azathioprine, mercaptopurine, methotrexate, balsalazide, mesalamine, cyclosporine, and sulfasalazine.

Product Group	Products	Criteria Requirements
Level 1	- Hadlima (adalimumab-bwwd) - Humira (adalimumab) - Simlandi (adalimumab-ryvk) - Skyrizi (risankizumab-rzaa) - Stelara (ustekinumab)	**1.** Diagnostic Criteria **2.** Severity Criteria
Level 2	- Upadacitinib (Rinvoq)	**1.** Diagnostic Criteria **2.** Severity Criteria **3.** Treatment with adalimumab was not effective after at least a 12-week treatment course unless not tolerated or contraindicated.
Level 3	- Cimzia (certolizumab pegol) syringes - Entyvio (vedolizumab) SC	**1.** Diagnostic Criteria **2.** Severity Criteria **3.** Treatment with **TWO Level 1 or 2 therapies** were not effective after at least 12 weeks of treatment each, unless not tolerated or contraindicated. For members established on Entyvio (vedolizumab) IV therapy, this criterion may be waived.

L. Crohn's Disease (CD) – Self-administered Products		
Product Group	**Products**	**Criteria Requirements**
Non-Preferred Adalimumab Products	- Adalimumab biosimilars (Abrilada, Amjevita, Cyltezo, Hulio, Hyrimoz, Idacio, Yuflyma, Yusimry)	**1.** Diagnostic Criteria **2.** Severity Criteria **3.** There is a documented intolerance or contraindication to **Humira (adalimumab), Hadlima (adalimumab-bwwd), and Simlandi (adalimumab-ryvk).**
Non-Preferred Infliximab Products	- Infliximab products (Zymfentra)	Refer to Medication Policy Manual, Products with Therapeutically Equivalent Biosimilars/Reference Products, dru620

M. Crohn's Disease (CD) – Provider-administered Products

1. **Site of Care Requirements:** For provider-administered therapies, site of care administration requirements are met [refer to Medication Policy Manual, Site of Care Review, dru408].
2. **Diagnostic Criteria:** A diagnosis of **Crohn's disease** (CD) established by or in consultation with a specialist in gastroenterology.
3. **Severity Criteria:** Either criterion a or b below are met.
   - **a.** At least one of the following criteria (I through vi) below are met.
     - **i.** Fistulizing Crohn's disease.
     - **ii.** Previous hospitalization for Crohn's disease.
     - **iii.** Extensive anatomic involvement.
     - **iv.** Deep ulcers.
     - **v.** Prior surgical resection.
     - **vi.** Stricturing and/or penetrating behavior.

   OR

   - **b.** Acute treatment of an exacerbation when at least one of criterion (i, ii, or iii) below, is met.
     - **i.** Treatment with an adequate course of corticosteroids (for example, prednisone 40 to 60 mg/day, oral budesonide 9 mg/day, or budesonide rectal for 7 to 14 days) has been ineffective or is contraindicated.

     OR

     - **ii.** The patient has been unable to taper an adequate course of corticosteroids without experiencing worsening of disease.

     OR

     - **iii.** The patient is experiencing breakthrough disease (e.g., active disease flares) while stabilized for at least 8 weeks on a conventional immunomodulator. Conventional immunomodulators for CD include azathioprine, mercaptopurine, methotrexate, balsalazide, mesalamine, cyclosporine, and sulfasalazine.

Product Group	Products	Criteria Requirements
Level 1	- Entyvio (vedolizumab) - Skyrizi 21isankizumabb-rzaa) - Stelara (ustekinumab)	**1.** Site of Care Requirements *(Entyvio only)* **2.** Diagnostic Criteria **3.** Severity Criteria
	- Avsola, Inflectra (infliximab)	Refer to Medication Policy Manual, Products with Therapeutically Equivalent Biosimilars/Reference Products, dru620
Level 2	- Cimzia (certolizumab pegol) vials	**1.** Site of Care Requirements **2.** Diagnostic Criteria **3.** Severity Criteria **4.** Treatment with **at least TWO Level 1** therapies was not effective after at least a 12-week treatment course unless all were not tolerated or are contraindicated.

M. Crohn's Disease (CD) – Provider-administered Products		
Product Group	**Products**	**Criteria Requirements**
Non-Preferred Infliximab Products	- Infliximab biosimilars (Renflexis, Ixifi) - Remicade (infliximab) - Unbranded Janssen infliximab product	Refer to Medication Policy Manual, Products with Therapeutically Equivalent Biosimilars/Reference Products, dru620

N. Cytokine-release Syndrome (CRS)		
Tocilizumab IV may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) that criterion 1 below is met. **1. Product will be used for cytokine release syndrome** (CRS)**.**		
Product Group	**Products**	**Criteria Requirements**
Level 1	- Actemra (tocilizumab) IV - Tyenne (tocilizumab-aazg) IV	**1.** Diagnostic Criteria
Non-Preferred Tocilizumab Products	- Tocilizumab biosimilar (Tofidence IV)	**1.** Diagnostic Criteria **2.** There is a documented intolerance or contraindication to **all Level 1** therapies.

O. Enthesitis-related Arthritis (ERA)		
1. <u>Diagnostic Criteria</u>: A diagnosis of enthesitis-related arthritis (ERA) when established by or in consultation with a specialist in rheumatology.		
Product Group	**Products**	**Criteria Requirements**
Level 1	- Cosentyx (secukinumab) - Enbrel (etanercept) - Hadlima (adalimumab-bwwd) - Humira (adalimumab) - Simlandi (adalimumab-ryvk)	**1.** Diagnostic Criteria
Non-Preferred Adalimumab Products	- Adalimumab biosimilars (Abrilada, Amjevita, Cyltezo, Hulio, Hyrimoz, Idacio, Yuflyma, Yusimry)	**1.** Diagnostic Criteria **2.** There is a documented intolerance or contraindication to **Humira (adalimumab), Hadlima (adalimumab-bwwd), and Simlandi (adalimumab-ryvk).**
Non-Preferred Etanercept Products	- Etanercept biosimilars (Erelzi, Eticovo)	**1.** Diagnostic Criteria **2.** There is a documented intolerance or contraindication to **Enbrel (etanercept)**.

P. Generalized Pustular Psoriasis (GPP) – Self-administered Products

Spevigo (spesolimab-sbzo) SC may be considered medically necessary when criteria 1 and 2 below are met.

1. **Diagnostic Criteria:** A diagnosis of **generalized pustular psoriasis (GPP)** when established by or in consultation with a specialist in dermatology.
2. **Severity Criteria: Maintenance treatment for GPP (SC formulation only)** when criteria a, b, and c below are met.
   - **a.** History of at least two moderate-to-severe flares with at least one associated with fever, elevated C-reactive protein level, elevated white blood cell count, asthenia, or myalgia.

   AND

   - **b.** Currently not experiencing a flare.

   AND

   - **c.** Treatment with acitretin and methotrexate for at least eight weeks has been ineffective or not tolerated, unless both are contraindicated.

Product Group	Products	Criteria Requirements
Level 1	- Spevigo (spesolimab-sbzo)	**1.** Diagnostic criteria. **2.** Severity criteria.

Q. Generalized Pustular Psoriasis (GPP) – Provider-administered Products

Spevigo (spesolimab-sbzo) IV or SC may be considered medically necessary when criteria 1 and 2 below are met.

1. **Diagnostic Criteria:** A diagnosis of **generalized pustular psoriasis (GPP)** when established by or in consultation with a specialist in dermatology.
2. **Severity Criteria:** Criterion a or b below are met.
   - **a. Treatment of GPP flare (IV formulation only)** when all of the following are met:
     - **i.** Documentation of disease progression despite usual treatment with cyclosporine OR infliximab unless not tolerated, or both are contraindicated.
     - **ii.** There is involvement of ≥ 5% of body surface area (BSA) with erythema and the presence of pustules.

   OR

   - **b. Maintenance treatment for GPP (SC formulation for loading dose only)** when all of the following are met:
     - **i.** History of at least two moderate-to-severe flares, with at least one associated with fever, elevated C-reactive protein level, elevated white blood cell count, asthenia, or myalgia
     - **ii.** Currently not experiencing a flare
     - **iii.** Treatment with acitretin and methotrexate for at least eight weeks has been ineffective or not tolerated, unless both are contraindicated.

Product Group	Products	Criteria Requirements
Level 1	- Spevigo (spesolimab-sbzo)	**1.** Diagnostic criteria. **2.** Severity criteria.
	- Avsola, Inflectra (infliximab)	Refer to Medication Policy Manual, Products with Therapeutically Equivalent Biosimilars/Reference Products, dru620
Non-Preferred Infliximab Products	- Infliximab biosimilars (Renflexis, Ixifi) - Remicade (infliximab) - Unbranded Janssen infliximab product	Refer to Medication Policy Manual, Products with Therapeutically Equivalent Biosimilars/Reference Products, dru620

R. Giant Cell Arteritis (GCA)

1. **Site of Care Requirements:** For provider-administered therapies, site of care administration requirements are met [refer to Medication Policy Manual, Site of Care Review, dru408].
2. **Diagnostic Criteria:** A diagnosis of **giant cell arteritis** (GCA) when established by or in consultation with a specialist in rheumatology (see *Appendix 6*).
3. **Severity Criteria:** Requested medication will be given in combination with high-dose corticosteroids (prednisone 20 to 60 mg per day or equivalent) unless contraindicated or not tolerated.

Product Group	Products	Criteria Requirements
Self-administered Products	- Actemra (tocilizumab) SC	**1.** Diagnostic Criteria **2.** Severity Criteria
Preferred Provider-administered Products	- Actemra (tocilizumab) IV - Tyenne (tocilizumab-aazg) IV	**1.** Site of Care Requirements **2.** Diagnostic criteria **3.** Severity Criteria
Non-Preferred Provider-Administered Products	- Tofidence IV (tocilizumab-bavi)	**1.** Diagnostic Criteria **2.** Severity Criteria **3.** There is a documented intolerance or contraindication to all preferred provider-administered therapies.

S. Hidradenitis Suppurativa (HS) – Self-administered Products		
1. **Diagnostic Criteria:** A diagnosis of **hidradenitis suppurativa** (HS) established by or in consultation with a specialist in dermatology. **2.** **Severity Criteria:** Treatment with at least one conventional agent was not effective after 12 weeks, not tolerated, or all are contraindicated. Conventional agents for the treatment of HS include topical antibiotics, systemic antibiotics (e.g., oral tetracyclines, clindamycin, rifampin, moxifloxacin, metronidazole), intralesional corticosteroids (e.g., triamcinolone), hormonal therapies (e.g., oral contraceptives, spironolactone), cyclosporine, finasteride, metformin, or oral retinoids.		
Product Group	**Products**	**Criteria Requirements**
Level 1	- Cosentyx (secukinumab) - Hadlima (adalimumab-bwwd) - Humira (adalimumab) - Simlandi (adalimumab-ryvk)	**1.** Diagnostic Criteria **2.** Severity Criteria
Non-Preferred Adalimumab Products	- Adalimumab biosimilars (Abrilada, Amjevita, Cyltezo, Hulio, Hyrimoz, Idacio, Yuflyma, Yusimry)	**1.** Diagnostic Criteria **2.** Severity Criteria **3.** There is a documented intolerance or contraindication to **Humira (adalimumab), Hadlima (adalimumab-bwwd), and Simlandi (adalimumab-ryvk).**

T. Hidradenitis Suppurativa (HS) – Provider-administered Products		
1. <u>Site of Care Requirements</u>: For provider-administered therapies, site of care administration requirements are met [refer to Medication Policy Manual, Site of Care Review, dru408]. **2. <u>Diagnostic Criteria</u>:** A diagnosis of **hidradenitis suppurativa** (HS) established by or in consultation with a specialist in dermatology. **3. <u>Severity Criteria</u>:** Treatment with at least one conventional agent was not effective after 12 weeks, not tolerated, or all are contraindicated. Conventional agents for the treatment of HS include topical antibiotics, systemic antibiotics (e.g., oral tetracyclines, clindamycin, rifampin, moxifloxacin, metronidazole), intralesional corticosteroids (e.g., triamcinolone), hormonal therapies (e.g., oral contraceptives, spironolactone), cyclosporine, finasteride, metformin, or oral retinoids.		
Product Group	**Products**	**Criteria Requirements**
Level 1	- Avsola, Inflectra (infliximab)	Refer to Medication Policy Manual, Products with Therapeutically Equivalent Biosimilars/Reference Products, dru620
Non-Preferred Infliximab Products	- Infliximab biosimilars (Renflexis, Ixifi) - Remicade (infliximab) - Unbranded Janssen infliximab product	Refer to Medication Policy Manual, Products with Therapeutically Equivalent Biosimilars/Reference Products, dru620

U. Immune-Mediated Colitis		
1. **Diagnostic Criteria:** A diagnosis of **colitis** due to Yervoy (ipilimumab) or an anti-PD1/PD-L1 agent [such as Tecentriq (atezolizumab), Bavencio (avelumab), Libtayo (cemiplimab), Imfinzi (durvalumab), Opdivo (nivolumab), or Keytruda (pembrolizumab)]. 2. **Severity Criteria:** Treatment with an adequate course of corticosteroids (for example, prednisone 40 to 60 mg/day, oral budesonide 9 mg/day, or budesonide rectal for 7 days) has been ineffective or is contraindicated.		
Product Group	**Products**	**Criteria Requirements**
Level 1	- Entyvio (vedolizumab)	**1.** Diagnostic Criteria **2.** Severity Criteria
	- Avsola, Inflectra (infliximab)	Refer to Medication Policy Manual, Products with Therapeutically Equivalent Biosimilars/Reference Products, dru620
Non-Preferred Infliximab Products	- Infliximab biosimilars (Renflexis, Ixifi) - Remicade (infliximab) - Unbranded Janssen infliximab product	Refer to Medication Policy Manual, Products with Therapeutically Equivalent Biosimilars/Reference Products, dru620

V. Polyarticular Juvenile Idiopathic Arthritis (PJIA) – Self-administered Products		
1. **Diagnostic Criteria:** A diagnosis of **polyarticular juvenile idiopathic arthritis** (PJIA) established by or in consultation with a specialist in rheumatology. **2.** **Severity Criteria:** Treatment with a csDMARD (such as leflunomide, methotrexate, or sulfasalazine) was ineffective after at least 6 weeks, unless not tolerated or all are contraindicated.		
Product Group	**Products**	**Criteria Requirements**
Level 1	- Enbrel (etanercept) - Hadlima (adalimumab-bwwd) - Humira (adalimumab) - Simlandi (adalimumab-ryvk)	**1.** Diagnostic Criteria **2.** Severity Criteria
Level 2	- upadacitinib (Rinvoq, Rinvoq LQ) - Xeljanz (tofacitinib)	**1.** Diagnostic Criteria **2.** Severity Criteria **3.** Treatment with **ONE Level 1 TNF inhibitor** was not effective after at least a 12-week treatment course unless not tolerated or contraindicated.
Level 3	- Actemra (tocilizumab) SC	**1.** Diagnostic Criteria **2.** Severity Criteria **3.** Treatment with **adalimumab** was not effective after at least a 12-week treatment course unless not tolerated or contraindicated.
Level 4	- Orencia (abatacept) SC	**1.** Diagnostic Criteria **2.** Severity Criteria **3.** There is clinical documentation that treatment with **at least TWO** of the following treatments was not effective after at least a 12-week treatment course unless all were not tolerated or are contraindicated: **a. Humira (adalimumab), Hadlima (adalimumab-bwwd), or Simland (adalimumab-ryvk)** **b. Enbrel (etanercept)** **c. Actemra (tocilizumab) SC**
Non-Preferred Adalimumab Products	- Adalimumab biosimilars (Abrilada, Amjevita, Cyltezo, Hulio, Hyrimoz, Idacio, Yuflyma, Yusimry)	**1.** Diagnostic Criteria **2.** Severity Criteria **3.** There is a documented intolerance or contraindication to **Humira (adalimumab), Hadlima (adalimumab-bwwd), and Simlandi (adalimumab-ryvk).**

Non-Preferred Etanercept Products	- Etanercept biosimilars (Erelzi, Eticovo)	**1.** Diagnostic Criteria **2.** Severity Criteria **3.** There is a documented intolerance or contraindication to **Enbrel (etanercept)**.

W. Polyarticular Juvenile Idiopathic Arthritis (PJIA) – Provider-administered Products		
1. **Site of Care Requirements:** For provider-administered therapies, site of care administration requirements are met [refer to Medication Policy Manual, Site of Care Review, dru408]. **2.** **Diagnostic Criteria:** A diagnosis of **polyarticular juvenile idiopathic arthritis** (PJIA) established by or in consultation with a specialist in rheumatology. **3.** **Severity Criteria:** Treatment with a csDMARD (such as leflunomide, methotrexate, or sulfasalazine) was ineffective after at least 6 weeks, unless not tolerated or all are contraindicated.		
Product Group	**Products**	**Criteria Requirements**
Level 1	- Actemra (tocilizumab) IV - Orencia (abatacept) IV - Simponi Aria (golimumab) IV - Tyenne (tocilizumab-aazg) IV	**1.** Site of Care Requirements **2.** Diagnostic Criteria **3.** Severity Criteria
	- Avsola, Inflectra (infliximab)	Refer to Medication Policy Manual, Products with Therapeutically Equivalent Biosimilars/Reference Products, dru620
Non-Preferred Infliximab Products	- Infliximab biosimilars (Renflexis, Ixifi) - Remicade (infliximab) - Unbranded Janssen infliximab product	Refer to Medication Policy Manual, Products with Therapeutically Equivalent Biosimilars/Reference Products, dru620
Non-Preferred Tocilizumab Products	- Tofidence (tocilizumab-bavi) IV	**1.** Site of Care Requirements **2.** Diagnostic Criteria **3.** Severity Criteria **4.** There is a documented intolerance or contraindication to Actemra (tocilizumab) IV and Tyenne (tocilizumab-aazg) IV.

X. Polymyalgia Rheumatica (PMR)
Kevzara (sarilumab) may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) that criteria 1 and 2 below are met. **1.** Kevzara (sarilumab) will be used for treatment of **polymyalgia rheumatica** (PMR) when established by or in consultation with a specialist in rheumatology. **AND** **2.** One of the following criteria (a or b) are met: **a.** Treatment with an adequate course of corticosteroids (prednisone 15 to 25 mg /day or equivalent) over 4- 6 weeks has been ineffective or is contraindicated. **OR** **b.** The patient has been unable to taper an adequate course of corticosteroids without experiencing worsening of disease.

Y. Psoriatic Arthritis (PsA) – Self-administered Products		
1. <u>Diagnostic Criteria</u>: A diagnosis of **psoriatic arthritis** (PsA) established by or in consultation with a specialist in dermatology or rheumatology.		
Product Group	**Products**	**Criteria Requirements**
Level 1	- Cosentyx (secukinumab) - Enbrel (etanercept) - Hadlima (adalimumab-bwwd) - Humira (adalimumab) - Otezla (apremilast) - Simlandi (adalimumab-ryvk) - Skyrizi (risankizumab-rzaa) - Stelara (ustekinumab) - Tremfya (guselkumab)	**1.** Diagnostic Criteria
Level 2	- Tofacitinib (Xeljanz/Xeljanz XR) - Upadacitinib (Rinvoq, Rinvoq LQ)	**1.** Diagnostic Criteria **2.** Treatment with **ONE Level 1 TNF inhibitor** was not effective after at least a 12-week treatment course unless not tolerated or contraindicated.
Level 3	- Cimzia (certolizumab pegol) syringes - Orencia (abatacept) SC - Simponi (golimumab) SC - Taltz (ixekizumab)	**1.** Diagnostic Criteria **2.** There is clinical documentation that treatment with **at least TWO Level 1 or Level 2** self-administered therapies was not effective after at least a 12-week treatment course unless all were not tolerated or are contraindicated.
Non-Preferred Adalimumab Products	- Adalimumab biosimilars (Abrilada, Amjevita, Cyltezo, Hulio, Hyrimoz, Idacio, Yuflyma, Yusimry)	**1.** Diagnostic criteria **2.** There is a documented intolerance or contraindication to **Humira (adalimumab), Hadlima (adalimumab-bwwd), and Simlandi (adalimumab-ryvk).**
Non-Preferred Etanercept Products	- Etanercept biosimilars (Erelzi, Eticovo)	**1.** Diagnostic criteria **2.** There is a documented intolerance or contraindication to **Enbrel (etanercept)**.

Z. Psoriatic Arthritis (PsA) – Provider-administered Products		
1. **<u>Site of Care Requirements</u>:** For provider-administered therapies, site of care administration requirements are met [refer to Medication Policy Manual, Site of Care Review, dru408]. **2.** **<u>Diagnostic Criteria</u>:** A diagnosis of **psoriatic arthritis** (PsA) established by or in consultation with a specialist in dermatology or rheumatology.		
Product Group	**Products**	**Criteria Requirements**
Level 1	- Cosentyx (secukinumab) IV - Simponi Aria (golimumab) IV - Stelara (ustekinumab)	**1.** Site of Care Requirements **2.** Diagnostic Criteria
	- Avsola, Inflectra (infliximab)	Refer to Medication Policy Manual, Products with Therapeutically Equivalent Biosimilars/Reference Products, dru620
Level 2	- Cimzia (certolizumab pegol) vials - Orencia (abatacept) IV	**1.** Site of Care Requirements **2.** Diagnostic Criteria **3.** There is clinical documentation that treatment with **at least TWO Level 1** therapies was not effective after at least a 12-week treatment course unless all were not tolerated or are contraindicated.
Non-Preferred Infliximab Products	- Infliximab biosimilars (Renflexis, Ixifi) - Remicade (infliximab) - Unbranded Janssen infliximab product	Refer to Medication Policy Manual, Products with Therapeutically Equivalent Biosimilars/Reference Products, dru620

AA.	Rheumatoid Arthritis (RA) – Self-administered Products	
1. **<u>Diagnostic Criteria</u>:** A diagnosis of **rheumatoid arthritis** (RA) when established by or in consultation with a specialist in rheumatology (see *Appendix 4*). **2.** **<u>Severity Criteria</u>:** Treatment with a conventional synthetic DMARD (csDMARD) for at least 6 to 12 weeks was ineffective, not tolerated, or all csDMARDs are contraindicated. csDMARDs for RA include hydroxychloroquine, leflunomide, methotrexate, and sulfasalazine.		
Product Group	**Products**	**Criteria Requirements**
Level 1	- Enbrel (etanercept) - Hadlima (adalimumab-bwwd) - Humira (adalimumab) - Simlandi (adalimumab-ryvk)	**1.** Diagnostic Criteria **2.** Severity Criteria
Level 2	- Rinvoq (upadacitinib) - Tofacitinib (Xeljanz/Xeljanz XR)	**1.** Diagnostic Criteria **2.** Severity Criteria **3.** Treatment with **ONE Level 1 TNF inhibitor** was not effective after at least a 12-week treatment course unless not tolerated or contraindicated.
Level 3	- Actemra (tocilizumab) SC	**1.** Diagnostic Criteria **2.** Severity Criteria **3.** Treatment with **adalimumab** was not effective after at least a 12-week treatment course unless not tolerated or contraindicated.
Level 4	- Cimzia (certolizumab pegol) syringes - Kevzara (sarilumab) - Olumiant (baricitinib) - Orencia (abatacept) SC - Simponi (golimumab) SC	**1.** Diagnostic Criteria **2.** Severity Criteria **3.** There is clinical documentation that treatment with **at least TWO Level 1 or 2** therapies was not effective after at least a 12-week treatment course unless all were not tolerated or are contraindicated.
	- Kineret (anakinra)	Refer to Medication Policy Manual, Interleukin-1 Antagonists, dru677
Non-Preferred Adalimumab Products	- Adalimumab biosimilars (Abrilada, Amjevita, Cyltezo, Hulio, Hyrimoz, Idacio, Yuflyma, Yusimry)	**1.** Diagnostic Criteria **2.** Severity Criteria **3.** There is a documented intolerance or contraindication to **Humira (adalimumab), Hadlima (adalimumab-bwwd), and Simlandi (adalimumab-ryvk).**

Non-Preferred Etanercept Products	- Etanercept biosimilars (Erelzi, Eticovo)	**1.** Diagnostic Criteria **2.** Severity Criteria **3.** There is a documented intolerance or contraindication to **Enbrel (etanercept)**.

BB. Rheumatoid Arthritis (RA) – Provider-administered Products		
1. **Site of Care Requirements:** For provider-administered therapies, site of care administration requirements are met [refer to Medication Policy Manual, Site of Care Review, dru408]. **2.** **Diagnostic Criteria:** A diagnosis of **rheumatoid arthritis** (RA) when established by or in consultation with a specialist in rheumatology (see *Appendix 4*). **3.** **Severity Criteria:** Treatment with a conventional synthetic DMARD (csDMARD) for at least 6 to 12 weeks was ineffective, not tolerated, or all csDMARDs are contraindicated. csDMARDs for RA include hydroxychloroquine, leflunomide, methotrexate, and sulfasalazine.		
Product Group	**Products**	**Criteria Requirements**
Level 1	- Simponi Aria (golimumab) IV	**1.** Site of Care Requirements **2.** Diagnostic Criteria **3.** Severity Criteria
	- Avsola, Inflectra (infliximab)	Refer to Medication Policy Manual, Products with Therapeutically Equivalent Biosimilars/Reference Products, dru620
Level 2	- Actemra (tocilizumab) IV - Cimzia (certolizumab pegol) vials - Orencia (abatacept) IV - Tyenne (tocilizumab-aazg) IV	**1.** Site of Care Requirements **2.** Diagnostic Criteria **3.** Severity Criteria **4.** There is clinical documentation that treatment with **at least TWO Level 1** therapies was not effective after at least a 12-week treatment course unless all were not tolerated or are contraindicated.
Non-Preferred Infliximab Products	- Infliximab biosimilars (Renflexis, Ixifi) - Remicade (infliximab) - Unbranded Janssen infliximab product	Refer to Medication Policy Manual, Products with Therapeutically Equivalent Biosimilars/Reference Products, dru620
Non-Preferred Tocilizumab Products	- Tofidence (tocilizumab-bavi) IV	**1.** Site of Care Requirements **2.** Diagnostic Criteria **3.** Severity Criteria **4.** There is a documented intolerance or contraindication to Actemra (tocilizumab) IV and Tyenne (tocilizumab-aazg) IV.

CC. Systemic Juvenile Idiopathic Arthritis (SJIA; Still's disease)

1. **Site of Care Requirements:** For provider-administered therapies, site of care administration requirements are met [refer to Medication Policy Manual, Site of Care Review, dru408].
2. **Diagnostic Criteria:** A diagnosis of **systemic juvenile idiopathic arthritis** (SJIA; Still's disease) when established by or in consultation with a specialist in rheumatology.
3. **Severity Criteria:** Both criteria a and b below are met.
   a. There is disease activity greater than 6 weeks.
   AND
   b. One of the following are met (i or ii):
      i. Treatment with at least one oral conventional agent was not effective after 12 weeks, not tolerated, or is contraindicated. Conventional agents for the treatment of SJIA include azathioprine, cyclosporine, leflunomide, methotrexate, systemic corticosteroids, or tacrolimus.
      OR
      ii. Treatment with at least one NSAID (such as ibuprofen, celecoxib) was not effective after 4 weeks, not tolerated, or all are contraindicated.

Product Group	Products	Criteria Requirements
Preferred Provider-administered products	- Actemra (tocilizumab) IV - Tyenne (tocilizumab-aazg) IV	**1.** Site of Care Requirements **2.** Diagnostic Criteria **3.** Severity Criteria
Non-Preferred Provider-Administered Products	- Tofidence IV (tocilizumab-bavi)	**1.** Diagnostic Criteria **2.** Severity Criteria **3.** There is a documented intolerance or contraindication to all preferred provider-administered therapies.
Self-administered Products	- Actemra (tocilizumab) SC	**1.** Diagnostic Criteria **2.** Severity Criteria
	- Kineret (anakinra)	Refer to Medication Policy Manual, Interleukin-1 Antagonists, dru677

DD. Systemic Sclerosis-Associated Interstitial Lung Disease (SSc-ILD)

1. **Diagnostic Criteria:**
   - **a.** The diagnosis has been established by or in consultation with a pulmonologist or rheumatologist.

   AND

   - **b.** Documentation of fibrosis of at least 10% of the lungs on high-resolution computed tomographic scan (HRCT).
2. **Severity Criteria:** Documentation of disease progression despite usual treatment, including both of the following criteria a and b below are met.
   - **a.** At least one immunomodulator/anti-inflammatory used chronically for ILD (such as azathioprine, cyclosporine, tacrolimus, rituximab, cyclophosphamide, mycophenolate mofetil, and/or glucocorticoids) was ineffective, not tolerated, or all are contraindicated.

   AND

   - **b.** Documented disease progression (including but not limited to) one of the following: a decline in forced vital capacity (FVC) of at least 10% in one year, worsening respiratory symptoms, decreased exercise capacity, decline in diffusing capacity of the lungs for carbon monoxide (DLCO) of >15% in one year, worsening on high-resolution computed tomography (HRCT), increased in acute medical care, such as hospitalization, and/or need for supplemental oxygen.

Product Group	Products	Criteria Requirements
Self-administered Products	- Actemra (tocilizumab) SC	**1.** Diagnostic Criteria **2.** Severity Criteria

EE. Takayasu Arteritis

1. **Site of Care Requirements:** For provider-administered therapies, site of care administration requirements are met [refer to Medication Policy Manual, Site of Care Review, dru408].
2. **Diagnostic Criteria:** The diagnosis of **Takayasu arteritis** has been established by or in consultation with a specialist in rheumatology or immunology.
3. **Severity Criteria:** One of following criterion a or b below are met.
   - **a.** The patient has been unable to taper corticosteroids without experiencing worsening of disease (e.g., unable to achieve doses of 15 to 20 mg per day or less of prednisone or equivalent after 8 weeks).

   OR

   - **b.** The patient is experiencing breakthrough disease (for example, relapses or active disease flares) while stabilized on a csDMARD (such as methotrexate, leflunomide, mycophenolate mofetil, azathioprine or cyclophosphamide) for at least 8 weeks.

Product Group	Products	Criteria Requirements
Preferred Provider-administered products	- Actemra (tocilizumab) IV - Tyenne (tocilizumab-aazg) IV	**1.** Site of Care Requirements **2.** Diagnostic Criteria **3.** Severity Criteria
	- Avsola, Inflectra (infliximab)	Refer to Medication Policy Manual, Products with Therapeutically Equivalent Biosimilars/Reference Products, dru620
Non-Preferred Provider-Administered Products	- Tofidence IV (tocilizumab-bavi)	**1.** Diagnostic Criteria **2.** Severity Criteria **3.** There is a documented intolerance or contraindication to Actemra (tocilizumab) IV and Tyenne (tocilizumab-aazg) IV.
Non-Preferred infliximab Products	- Infliximab biosimilars (Renflexis, Ixifi) - Remicade (infliximab) Unbranded Janssen infliximab product	Refer to Medication Policy Manual, Products with Therapeutically Equivalent Biosimilars/Reference Products, dru620
Self-administered Products	- Actemra (tocilizumab) SC	**1.** Diagnostic Criteria **2.** Severity Criteria

FF. Transplant (Solid Organ), antibody-mediated rejection (AMR)

Tocilizumab IV may be considered medically necessary when criteria 1 and 2 below are met.

1. **Diagnostic Criteria:** When either criterion a or b below are met.
   a. **Prevention of antibody (Ab)-mediated rejection:** Prior to solid organ transplant and in the peri-operative period, for patients at high risk for Ab-mediated rejection, including highly sensitized patients, and those receiving an ABO-incompatible organ

   OR

   b. **Treatment of antibody-mediated rejection** (a.k.a. vascular rejection, humoral rejection): following solid organ transplant and confirmed by either biopsy or presence of panel reactive antibodies (PRAs).

AND

2. **Severity Criteria:** Treatment with immunoglobulin (IVIG), plasma exchange/pheresis (PLEX), and rituximab has been ineffective or is contraindicated.

Product Group	Products	Criteria Requirements
Level 1	- Actemra (tocilizumab) IV - Tyenne (tocilizumab-aazg) IV	**1.** Diagnostic Criteria **2.** Severity Criteria
Non-Preferred Tocilizumab Products	Tocilizumab biosimilar (Tofidence IV)	**1.** Diagnostic Criteria **2.** Severity Criteria **3.** There is a documented intolerance or contraindication to **all Level 1** therapies.

GG. Ulcerative Colitis (UC) – Self-administered Products		
1. **Diagnostic Criteria:** A diagnosis of **ulcerative colitis** (UC) when established by or in consultation with a specialist in gastroenterology. **2.** **Severity Criteria:** At least one of criterion a, b, or c below, are met. **a.** Treatment with an adequate course of corticosteroids (for example, prednisone 40 to 60 mg/day, oral budesonide 9 mg/day, or budesonide rectal for 7 to 14 days) was ineffective or is contraindicated. **OR** **b.** The patient has been unable to taper an adequate course of corticosteroids without experiencing worsening of disease. **OR** **c.** The patient is experiencing breakthrough disease (for example, active disease flares) while stabilized on a conventional immunomodulators, for at least two months. Conventional immunomodulators for UC include azathioprine, balsalazide, cyclosporine, mercaptopurine, mesalamine, and sulfasalazine.		
Product Group	**Products**	**Criteria Requirements**
Level 1	- Hadlima (adalimumab-bwwd) - Humira (adalimumab) - Simlandi (adalimumab-ryvk) - Stelara (ustekinumab)	**1.** Diagnostic Criteria **2.** Severity Criteria
Level 2	- Simponi (golimumab) SC - Rinvoq (upadacitinib) - Tofacitinib (Xeljanz/Xeljanz XR)	**1.** Diagnostic Criteria **2.** Severity Criteria **3.** Treatment with **adalimumab** was not effective after at least a 12-week treatment course unless not tolerated or contraindicated.
Level 3	- Zeposia (ozanimod)	Refer to Medication Policy Manual, Zeposia, ozanimod, dru674
	- Entyvio (vedolizumab) SC	**1.** Diagnostic Criteria **2.** Severity Criteria **3.** Treatment with **TWO Level 1 or 2 therapies** was not effective after at least a 12-week treatment course unless not tolerated or contraindicated. For members established on Entyvio (vedolizumab) IV therapy, this criterion may be waived.

	- Omvoh (mirikizumab-mrkz) - Velsipity (etrasimod)	**1.** Diagnostic Criteria **2.** Severity Criteria **3.** Treatment with at least **THREE** of the following therapies (i.e., any options listed in a or b below) was not effective after at least a 12-week treatment course unless not tolerated or contraindicated: a. Level 1 options: Hadlima (adalimumab-bwwd), Humira (adalimumab), Simlandi (adalimumab-ryvk) Stelara (ustekinumab) **OR** b. Level 2 options: Rinvoq (upadacitinib), tofacitinib (Xeljanz/Xeljanz)
Non-Preferred Adalimumab Products	- Adalimumab biosimilars (Abrilada, Amjevita, Cyltezo, Hulio, Hyrimoz, Idacio, Yuflyma, Yusimry)	**1.** Diagnostic Criteria **2.** Severity Criteria **3.** There is a documented intolerance or contraindication to **Humira (adalimumab), Hadlima (adalimumab-bwwd), and Simlandi (adalimumab-ryvk).**
Non-Preferred Infliximab Products	- Infliximab products (Zymfentra)	Refer to Medication Policy Manual, Products with Therapeutically Equivalent Biosimilars/Reference Products, dru620

HH. Ulcerative Colitis (UC) – Provider-administered Products

1. **Site of Care Requirements:** For provider-administered therapies, site of care administration requirements are met [refer to Medication Policy Manual, Site of Care Review, dru408].
2. **Diagnostic Criteria:** A diagnosis of **ulcerative colitis** (UC) when established by or in consultation with a specialist in gastroenterology.
3. **Severity Criteria:** At least one of criterion a, b, or c below, are met.
   - **a.** Treatment with an adequate course of corticosteroids (for example, prednisone 40 to 60 mg/day, oral budesonide 9 mg/day, or budesonide rectal for 7 to 14 days) was ineffective or is contraindicated.

   OR

   - **b.** The patient has been unable to taper an adequate course of corticosteroids without experiencing worsening of disease.

   OR

   - **c.** The patient is experiencing breakthrough disease (for example, active disease flares) while stabilized on a conventional immunomodulators, for at least two months. Conventional immunomodulators for UC include azathioprine, balsalazide, cyclosporine, mercaptopurine, mesalamine, and sulfasalazine.

Product Group	Products	Criteria Requirements
Level 1	- Entyvio (vedolizumab) - Stelara (ustekinumab)	**1.** Site of Care Requirements *(Entyvio only)* **2.** Diagnostic Criteria **3.** Severity Criteria
	- Avsola, Inflectra (infliximab)	Refer to Medication Policy Manual, Products with Therapeutically Equivalent Biosimilars/Reference Products, dru620
Level 2	- Omvoh (mirikizumab-mrkz)	Refer to coverage criteria for ulcerative colitis (UC) – self-administered products
Non-Preferred Infliximab Products	- Infliximab biosimilars (Renflexis, Ixifi) - Remicade (infliximab) - Unbranded Janssen infliximab product	Refer to Medication Policy Manual, Products with Therapeutically Equivalent Biosimilars/Reference Products, dru620

II. Uveitis – Self-administered Products

1. **Diagnostic Criteria:** A diagnosis of **uveitis** when established by or in consultation with a specialist in ophthalmology.
2. **Corticosteroid Criteria:** Treatment with corticosteroids (oral, periocular, or intravitreal injections) has been:
   a. Ineffective after two weeks of therapy.
   OR
   b. Unable to be tapered following an adequate course without worsening of disease.
   OR
   c. Not tolerated or all are contraindicated.
3. **Severity Criteria:** Treatment with at least one conventional immunomodulator was not effective after a 6-week treatment course, not tolerated, or all are contraindicated. Conventional immunomodulators for treatment of uveitis include azathioprine, cyclosporine, methotrexate, mycophenolate, or tacrolimus.

Product Group	Products	Criteria Requirements
Level 1	- Hadlima (adalimumab-bwwd) - Humira (adalimumab) - Simlandi (adalimumab-ryvk)	**1.** Diagnostic Criteria **2.** Corticosteroid Criteria **3.** Severity Criteria
Non-Preferred Adalimumab Products	- Adalimumab biosimilars (Abrilada, Amjevita, Cyltezo, Hulio, Hyrimoz, Idacio, Yuflyma, Yusimry)	**1.** Diagnostic Criteria **2.** Corticosteroid Criteria **3.** Severity Criteria **4.** There is a documented intolerance or contraindication to **Humira (adalimumab), Hadlima (adalimumab-bwwd), and Simlandi (adalimumab-ryvk).**

JJ. Uveitis – Provider-Administered Products

1. **Site of Care Requirements:** For provider-administered therapies, site of care administration requirements are met [refer to Medication Policy Manual, Site of Care Review, dru408].
2. **Diagnostic Criteria:** A diagnosis of **uveitis** when established by or in consultation with a specialist in ophthalmology.
3. **Corticosteroid Criteria:** Treatment with corticosteroids (oral, periocular, or intravitreal injections) has been:
   a. Ineffective after two weeks of therapy.

   OR

   b. Unable to be tapered following an adequate course without worsening of disease.

   OR

   c. Not tolerated or all are contraindicated.
4. **Severity Criteria:** Treatment with at least one conventional immunomodulator was not effective after a 6-week treatment course, not tolerated, or all are contraindicated. Conventional immunomodulators for treatment of uveitis include azathioprine, cyclosporine, methotrexate, mycophenolate, or tacrolimus.

Product Group	Products	Criteria Requirements
Level 1	- Avsola, Inflectra (infliximab)	Refer to Medication Policy Manual, Products with Therapeutically Equivalent Biosimilars/Reference Products, dru620
Non-Preferred Infliximab Products	- Infliximab biosimilars (Renflexis, Ixifi) - Remicade (infliximab) - Unbranded Janssen infliximab product	Refer to Medication Policy Manual, Products with Therapeutically Equivalent Biosimilars/Reference Products, dru620

KK. Other Immunologic Conditions: Pyoderma gangrenosum, Sarcoidosis		
1. <u>Site of Care Requirements</u>: For provider-administered therapies, site of care administration requirements are met [refer to Medication Policy Manual, Site of Care Review, dru408]. **2. <u>Diagnostic Criteria</u>:** The diagnosis has been established by or in consultation with a specialist in pulmonology, rheumatology, immunology, or other specialist for the disease state. **3. <u>Severity Criteria</u>:** Treatment with a conventional immunomodulator (such as methotrexate, azathioprine, cyclosporine, hydroxychloroquine, leflunomide, or mycophenolate; see *Appendix 3*) was not effective or not tolerated.		
Product Group	**Products**	**Criteria Requirements**
Provider-administered products	- Avsola, Inflectra (infliximab)	Refer to Medication Policy Manual, Products with Therapeutically Equivalent Biosimilars/Reference Products, dru620
Non-Preferred infliximab Products	- Infliximab biosimilars (Renflexis, Ixifi) - Remicade (infliximab) - Unbranded Janssen infliximab product	Refer to Medication Policy Manual, Products with Therapeutically Equivalent Biosimilars/Reference Products, dru620

III. Administration, Quantity Limitations, and Authorization Periods

A. Regence Pharmacy Services considers medications in this policy to be self-administered, provider-administered, or either, as listed in **Table 1.**

B. When prior authorization is approved, each drug will be covered in the following quantities and for the following authorization periods outlined in **Table 2.**

C. Unless specifically noted in Table 2, authorization **may** be reviewed at least annually to confirm that current medical necessity criteria are met and that the medication is effective, with documented disease stability or improvement.

Table 1. Administration

Drug	Route	Pharmacy Services considers to be:
Oral administered medications	Oral (PO)	Coverable only under the pharmacy benefit (as a self-administered medication).
Intravenously (IV) administered medications	IV	Coverable only under the medical benefit (as a provider-administered medication).
Subcutaneously (SC) administered medications *(except for those listed below)*	SC	Coverable only under the pharmacy benefit (as a self-administered medication).
Exceptions for the following SC medications:		
Adbry (tralokinumab-ldrm)	SC	Coverable under the pharmacy benefit (as a self-administered medication) OR coverable under the medical benefit (as a provider-administered medication).
Cimzia (certolizumab pegol) lyophilized powder vials	SC	Coverable only under the medical benefit (as a provider-administered medication).
Cimzia (certolizumab pegol) prefilled syringes and pens	SC	Coverable only under the pharmacy benefit (as a self-administered medication).
Cosentyx (secukinumab) prefilled syringes and pens	SC	Coverable only under the pharmacy benefit (as a self-administered medication).
Ilumya (tildrakizumab-asmn)	SC	Coverable only under the medical benefit (as a provider-administered medication).
Skyrizi (risankizumab-rzaa)	SC	Coverable under the pharmacy benefit (as a self-administered medication) OR coverable under the medical benefit (as a provider-administered medication).
Spevigo (spesolimab-sbzo)	SC	Coverable only under the medical benefit (as a provider-administered medication) for GPP **loading dose only** OR coverable under the pharmacy benefit (as a self-administered medication) for GPP **maintenance only.**
Stelara (ustekinumab)	SC	Coverable under the pharmacy benefit (as a self-administered medication) OR coverable under the medical benefit (as a provider-administered medication).

Table 2. Authorization Limits

Product	Route	Authorization Limit
Adbry (tralokinumab-ldrm)	SC	- **AD:** Up to 25 doses (fifty-two 150 mg syringes) in a 48-week period based on dosing of 600 mg at week 0 then 300 mg every other week thereafter (up to fifty-two 150 mg syringes in the first 12-month period followed by forty-eight 150 mg syringes per 12-month period thereafter). - **Pediatric AD (Patients 12 to 17 years):** Up to 25 doses (twenty-six 150 mg syringes) in a 48-week period based on dosing of 300 mg at week 0 then 150 mg every other week thereafter (up to twenty-six 150 mg syringes in the first 12-month period followed by twenty-four 150 mg syringes per 12-month period thereafter).
Tocilizumab (Actemra; biosimilars Tofidence, Tyenne)	IV	- **AMR/Transplant (solid-organ):** Up to 7 infusions (up to 8 mg/kg with an 800 mg per infusion maximum) in a 6-month period based on a recommended infusion interval of every 4 weeks. Authorization shall be reviewed at least every 6 months to confirm that current medical necessity criteria are met, and the medication is effective. - **CRS:** Up to 4 infusions (up to 12 mg/kg). No additional doses will be authorized. - **PJIA:** Up to 13 infusions (up to 10 mg/kg) in a 12-month period based on a recommended infusion interval of every 4 weeks. - **GCA:** Up to 13 infusions (up to 6 mg/kg) in a 12-month period based on a recommended infusion interval of every 4 weeks. - **RA and Takayasu Arteritis:** Up to 13 infusions (up to 8 mg/kg) in a 12-month period based on a recommended infusion interval of every 4 weeks. - **SJIA:** Up to 26 infusions (up to 12 mg/kg) in a 12-month period based on a recommended infusion interval of every 2 weeks.
	SC	- **GCA and Takayasu Arteritis:** Up to 52 syringes in a 1-year period based on a recommended injection interval of 162 mg every week. - **PJIA:** Up to 26 syringes in a 1-year period based on a recommended injection interval of up to 162 mg every two weeks. - **RA:** Up to 52 syringes in a 1-year period based on a recommended injection interval of 162 mg once weekly or every other week. - **SJIA:** Up to 52 syringes in a 1-year period based on a recommended injection interval of 162 mg once weekly. - **SSc-ILD:** Up to 52 syringes in a 1-year period based on a recommended injection interval of 162 mg once weekly.

Product	Route	Authorization Limit
Adalimumab (Humira, biosimilars: Abrilada, Amjevita, Cyltezo, Hadlima, Hulio, Hyrimoz, Idacio, Simlandi, Yuflyma, Yusimry), unbranded: adalimumab-adaz, adalimumab-adbm, adalimumab-ryvk)	SC	- **AS, ERA, PJIA, PsA, RA:** Up to 40 mg every 2 weeks (up to 26 doses in a one-year period). - **HS:** Up to eight 40 mg syringes in the first month based on an initial dose of 160 mg followed by 80 mg on day 15 then 40 mg every week beginning on day 29 (54 syringes in the first 12-month period followed by up to 52 syringes per 12-month period, thereafter). Initial authorization shall be reviewed at 12 weeks to confirm that medication is effective. Thereafter, authorization may be reviewed annually to confirm that current medical necessity criteria are met, and that the medication is effective. - **PsO and Uveitis:** Up to 160 mg (four 40 mg syringes) in the first month based on an initial dose of 80 mg followed by 40 mg every other week (30 syringes in the first 12-month period followed by up to 26 syringes per 12-month period, thereafter). - **CD:** ▪ Up to 12 of the 40 mg syringes in the initial 3-month period; based on a dose of up to 160 mg on day 1, followed by 80 mg on day 15, then 40 mg every other week (31 syringes in the first 12-month period followed by up to 26 syringes per 12-month period, thereafter). ▪ *CD Dose Escalation*: Up to 40 mg every week may be considered medically necessary when there is clinical documentation that current treatment with adalimumab 40 mg every 2 weeks has had an inadequate response after at least a 12-week treatment course (up to 52 syringes per 12-month period). - **UC:** Up to 12 of the 40 mg vials in the initial 3-month period (induction period, per manufacturer labeling), then 40 mg every 2 weeks thereafter (31 syringes in the first 12-month period followed by up to 26 syringes per 12-month period, thereafter). - **Pediatric UC (Patients 5 to 17 years):** Up to 18 of the 40 mg syringes in the initial 3-month period; based on an initial dose of 160 mg on day 1, followed by 80 mg on days 8 and 15, then 80 mg every other week or 40 mg every week beginning on day 29 (58 syringes in the first 12-month period followed by up to 52 syringes per 12-month period, thereafter).
Bimzelx (bimekizumab)	SC	- **PsO:** Up to 320mg (two 160mg syringes/autoinjectors) at weeks 0, 4, 8, 12, and 16, then every 8 weeks thereafter (up to 20 syringes in the first 12-month period followed by up to 14 syringes/autoinjectors per 12-month period thereafter). For patients weighing 120kg or more: up to 320mg (two 160mg syringes/autoinjectors) at weeks 0, 4, 8, 12, and 16, then *every 4 weeks* (up to 28 syringes in the first 12-month period followed by up to 26 syringes/autoinjectors per 12-month period thereafter).[1]
Cibinqo (abrocitinib)	PO	**AD:** Up to 30 tablets per 30 days.
Cimzia (certolizumab pegol)	SC	- **CD, RA, PsA, AS, NR-axSpA:** Up to 3 doses (six 200 mg syringes/vials) in the first month based on an initial dose of 400 mg SC at weeks 0, 2, and 4 followed by 200 mg every two weeks or 400 mg every four weeks for maintenance (27 doses in the first 12-month period followed by up to 26 doses per 12-month period, thereafter). - **PsO:** Up to 400 mg (two 200 mg syringes/vials) every other week (up to 26 doses per 12-month period).

Product	Route	Authorization Limit
Cosentyx (secukinumab)	IV	- **AS, NR-axSpA, and PsA:** Up to 13 infusions (with loading dose: 6 mg/kg at week 0, followed by 1.75 mg/kg every 4 weeks thereafter; without loading dose: 1.75 mg/kg every 4 weeks; both dosing regimens with a maximum maintenance dose 300 mg per infusion).
	SC	- **AS:** Up to 5 doses (five 150 mg syringes or pens) in the first 4 weeks based on a loading dose of 150 mg at weeks 0, 1, 2, 3, and 4, followed by up to 300 mg every 4 weeks thereafter (16 doses in the first 12-month period followed by up to 13 doses per 12-month period, thereafter). - **Nr-axSpA:** Up to 5 doses (five 150 mg syringes or pens) in the first 4 weeks based on a loading dose of 150 mg at weeks 0, 1, 2, 3, and 4, followed by up to 150 mg every 4 weeks thereafter (16 doses in the first 12-month period followed by up to 13 doses per 12-month period, thereafter). - **ERA:** Up to 5 doses (five 150 mg syringes or pens for patients > 50 kg or five 75 mg syringes for patients < 50 kg) in the first four weeks based on dose given at weeks 0, 1, 2, 3, and 4, then every 4 weeks thereafter (150 mg/ dose for patients > 50 kg or 75 mg /dose for patients < 50 kg; 16 doses in the first 12-month period followed by up to 13 doses per 12-month period, thereafter). - **HS:** Up to 5 doses (five 300 mg syringes or pens) in the first 4 weeks based on a loading dose of 300 mg at weeks 0, 1, 2, 3, and 4, followed by up to 300 mg every 4 weeks thereafter (16 doses in the first 12-month period followed by up to 13 doses per 12-month period, thereafter). A dosing interval of every 2 weeks (up to 26 doses per 12-month period) may be considered medically necessary in patients who have had an inadequate response to every 4-week dosing. - **PsA:** ▪ Up to 5 doses (five 150 mg syringes or pens) in the first four weeks based on a loading dose of 150 mg at weeks 0, 1, 2, 3, and 4, then 150 to 300 mg every 4 weeks thereafter (16 doses in the first 12-month period followed by up to 13 doses per 12-month period, thereafter). ▪ Pediatric PsA (Patients 2 to 17 years): Up to 5 doses (five 150 mg syringes or pens for patients > 50 kg or five 75 mg syringes for patients < 50 kg) in the first four weeks based on dose given at weeks 0, 1, 2, 3, and 4, then every 4 weeks thereafter (150 mg/ dose for patients > 50 kg or 75 mg /dose for patients < 50 kg; 16 doses in the first 12-month period followed by up to 13 doses per 12-month period, thereafter). ▪ For patients with both PsA and PsO, dosing for PsO should be used. - **PsO:** ▪ Up to 5 doses (ten 150 mg syringes or pens) in the first four-week period based on dosing of 300 mg at weeks 0, 1, 2, 3, and 4, then up to 300 mg every 4 weeks thereafter (16 doses in the first 12-month period followed by up to 13 doses per 12-month period, thereafter). ▪ Pediatric PsO (Patients 6 to 17 years): Up to 5 doses (five 150 mg syringes or pens for patients > 50 kg or five 75 mg syringes for patients < 50 kg) in the first four weeks based on dose given at weeks 0, 1, 2, 3, and 4, then every 4 weeks thereafter (150 mg/ dose for patients > 50 kg or 75 mg /dose for patients < 50 kg; 16 doses in the first 12-month period followed by up to 13 doses per 12-month period, thereafter).

Product	Route	Authorization Limit
Entyvio (vedolizumab)	IV induction followed by IV maintenance	- **CD and UC:** ▪ Up to 6 doses (six 300 mg infusions) in a 6-month period based on a recommended starting interval of 300 mg infusions at zero, two and six weeks, then every eight weeks thereafter (9 infusions in the first 12-month period followed by up to 7 infusions per 12-month period, thereafter). ▪ Dose escalation: A dosing interval of every 4 weeks (up to 13 infusions per 12-month period) may be considered medically necessary in patients who have had an inadequate response to every 8-week dosing given for at least 24 weeks. Dosing more frequent than every 4 weeks is considered investigational (Table 5 *Investigational Uses: Dosing or Dose Escalation* for more information). ▪ Authorization may be reviewed at least annually and clinical documentation indicating that there is disease stability or improvement must be provided. - **Immune-Mediated Colitis:** Up to 6 doses (six 300 mg infusions) in a 6-month period based on a recommended starting interval of 300 mg infusions at zero, two and six weeks, then every eight weeks thereafter.
	IV induction followed by SC maintenance	- **CD and UC:** Up to 2 doses (two 300 mg infusions) in a 2-month period based on a recommended starting interval of 300 mg infusions at zero and two weeks, then up to 26 doses (twenty-six 108 mg injections) per 12-month period based on maintenance dosing of 108 mg SC every 2 weeks.
Etanercept (Enbrel, biosimilars)	SC	- **AS, ERA, PJIA, PsA, RA:** Up to 50 mg per week given as a single 50 mg dose weekly or 25 mg twice weekly. - **PsO:** Up to 50 mg twice per week for the first 3 months (per manufacturer labeling), then 50 mg per week thereafter given as a single 50 mg dose weekly or 25 mg twice weekly.
Ilumya (tildrakizumab-asmn)	SC	**PsO:** Up to two doses (two 100 mg syringes) in the initial four-week period followed by one dose (one 100 mg syringes) every 12 weeks thereafter based on an initial dose of 100 mg at weeks 0 and 4 followed by maintenance dosing of 100 mg every 12 weeks (up to five 100 mg syringes in the first 12-month period followed by four 100 mg syringes per 12-month period thereafter).
Kevzara (sarilumab)	SC	**PMR, RA:** Up to twenty-six 200 mg syringes in a one-year period based on a dose of 200 mg subcutaneously every two weeks.
Litfulo (ritlecitinib)	PO	**AA:** Up to twenty-eight capsules per 28 days.
Olumiant (baricitinib)	PO	**AA, RA:** Up to thirty 2 mg tablets per 30 days. - *AA Dose Escalation*: Up to 4 mg daily may be considered medically necessary when there is clinical documentation that current treatment with baricitinib 2 mg daily has had an inadequate response (defined as not achieving a SALT score of ≤20 or at least 80% scalp hair coverage) after at least a 9-month treatment course.

Product	Route	Authorization Limit
Omvoh (mirikizumab-mrkz)	IV	**UC:** Up to 3 doses (three 300 mg infusions) in the first 8-week period based on a recommended starting interval of 300 mg infusions at zero, four, and 8 weeks, then up to 12 doses (twenty-four 100 mg SC injections) in the first 12-month period based on a maintenance dose of 200 mg SC given at week 12 and every 4 weeks thereafter.
	SC	**UC:** Up to 13 doses (twenty-six 100 mg injections) per 12- month period based on maintenance dosing of 200 mg SC every 4 weeks.
Orencia (abatacept)	IV	- **aGVHD:** Up to 4 infusions (up to 10 mg/kg) in a 4-week period based on a dose of 10 mg/kg/ dose given on days −1, +5, +14, and +28 post-transplant. - **RA, PJIA PsA:** Up to 3 infusions (up to 1000 mg) in the first 4-week period, based on weight-based loading doses at weeks 0, 2 and 4, followed by maintenance dosing of up to 13 infusions in a 12-month period, based on a dose of one infusion (up to 1000 mg) every 4 weeks (14 infusions in the first 12-month period followed by up to 13 infusions per 12-month period, thereafter).
	SC	- **PJIA:** Up to 52 doses (52 syringes) in a 12-month period, based on a weight-based dose of 50 mg to 125 mg every week. - **PsA:** Up to 52 doses (52 syringes) in a 12-month period, based on a dose of 125 mg every week. - **RA:** Up to 52 doses (52 syringes) in a 12-month period, based on a dose of 125 mg every week. A single IV loading dose (up to 1000 mg) may be authorized, if required.
Otezla (apremilast)	PO	**PsO, PsA, BD:** Up to 60 tablets per 30 days.
Siliq (brodalumab)	SC	**PsO:** Up to 3 doses (210 mg syringes) in the first month based on an initial dose of 210 mg subcutaneously at weeks 0, 1, and 2 followed by 210 mg every 2 weeks thereafter (27 doses in the first 12-month period followed by up to 26 doses per 12-month period, thereafter).
Simponi (golimumab)	SC	- **AS, PsA, RA:** Up to 12 doses (twelve 50 mg syringes) in a 1-year period based on a recommended injection interval of once monthly. - **UC:** Up to 2 doses in the initial four-week period based on a dose of 200 mg at week 0 and 100 mg at week 2, followed by maintenance therapy of 100 mg every four weeks (14 doses in the first 12-month period followed by up to 13 doses per 12-month period, thereafter).

Product	Route	Authorization Limit
Simponi Aria (golimumab)	IV	- **AS, PsA, RA:** Up to 2 infusions (up to 2 mg/kg) in the first 4-week period, based on weight-based loading doses at weeks 0 and 4, followed by maintenance dosing of up to 7 infusions in a 12-month period, based on a dose of one infusion (up to 2 mg/kg) every 8 weeks (8 infusions in the first 12-month period followed by up to 7 infusions per 12-month period, thereafter). - **PJIA:** Up to 2 infusions (up to 80 mg/m2) in the first 4-week period, based on body-surface-area-based loading doses at weeks 0 and 4, followed by maintenance dosing of up to 7 infusions in a 12-month period, based on a dose of one infusion (up to 80 mg/m2) every 8 weeks (8 infusions in the first 12-month period followed by up to 7 infusions per 12-month period, thereafter). - **Dose escalation:** Dosing interval of up to every 6 weeks may be considered medically necessary in patients who have had an inadequate response to every 8-week dosing given for at least 24 weeks. - Authorization may be reviewed at least annually to confirm that current medical necessity criteria are met, and the medication is effective.
Skyrizi (risankizumab-rzaa)	SC (PsA, PsO)	**PsA, PsO:** Up to 2 doses (four 75 mg syringes or two 150 mg syringes) in the initial four-week period followed by 150 mg (two 75 mg syringes or one 150 mg syringe) every 12 weeks based on dosing of 150 mg SC at weeks 0 and 4 followed by maintenance dosing of 150 mg every 12 weeks (up to twelve 75 mg syringes or six 150 mg syringes in the first 12-month period followed by up to ten 75 mg syringes or five 150 mg syringes per 12-month period, thereafter).
	IV Induction (CD)	**CD:** Up to 3 doses (three 600 mg infusions) in the first 8-week period based on a recommended starting interval of 600 mg infusions at zero, four, and 8 weeks, then up to 6 (six 180 mg or 360 mg cartridges) in the first 12-month period based on a maintenance dose of 180 mg or 360 mg given at week 12 and every 8 weeks thereafter.
	SC Maintenance dosing for CD	- **CD:** Up to 7 doses (seven 180 mg or 360 mg cartridges) per 12- month period based on maintenance dosing of 180 mg or 360 mg SC every 8 weeks. - Authorization may be reviewed at least annually to confirm that current medical necessity criteria are met, and the medication is effective.
Sotyktu (deucravacitinib)	PO	**PsO:** Up to thirty tablets per 30 days based on a recommended dose of 6 mg daily.
Spevigo (spesolimab-sbzo)	IV	- **GPP flare:** Up to two 900 mg infusions given within a 4-week approval period, based on a single dose of 900 mg. A second additional 900 mg dose, given one week after the initial dose, may be given once if symptoms persist, within the 4-week approval period. **NOTE:** *No more than two doses are coverable for any one flare.* - For consideration of treatment of a <u>new flare</u> (after at least 4 weeks): Authorization shall be reviewed to confirm that current medical necessity criteria are met, including flare criteria, and that the medication was effective for the previously treated flare. Each additional flare authorization is for a maximum of two 900 mg doses over a 4-week approval period.

<table>
<tr><th>Product</th><th>Route</th><th>Authorization Limit</th></tr>
<tr><td></td><td>SC</td><td>- GPP maintenance when <u>not</u> experiencing a flare: One 600 mg dose (four pre-filled 150 mg syringes) in the initial four-week period followed by 300 mg (two pre-filled 150 mg syringes) every four weeks thereafter.
- GPP maintenance after IV treatment of a flare: Four weeks after treatment with IV Spevigo (spesolimab), up to one 300 mg dose (two 150 mg prefilled syringes) every four weeks thereafter.
- Authorization may be reviewed at least every 6 months to confirm that current medical necessity criteria are met, and the medication is effective.</td></tr>
<tr><td rowspan="3">Stelara (ustekinumab)</td><td>SC (PsO and PsA)</td><td>PsO and PsA:
- For all patients regardless of weight, up to five doses (five 45 mg syringes or vials) in a 48-week period based on dosing of 45 mg at week 0 and 4, then 45 mg every 12 weeks thereafter (up to five 45 mg syringes or vials in the first 12-month period followed by four 45 mg syringes or vials per 12-month period thereafter).
- <u>Dose escalation</u>: For patients in whom the 45 mg dose has shown benefit, but who have not achieved clinical remission after at least a 12-week trial, doses of up to 90 mg every 12 weeks may be considered medically necessary. Dosing more frequent than 90 mg every 12 weeks is considered investigational (see <u>Table 5 Investigational Uses: Dosing or Dose Escalation for more information</u>).</td></tr>
<tr><td>IV Induction (CD and UC Only)</td><td>- CD and UC Only: A single, weight-based IV infusion initially (vials, see chart below for details), then up to 6 doses (six 90 mg syringes or twelve 45 mg vials) based on maintenance dosing of 90 mg SC every 8 weeks. Initial IV dosing is as follows:
<table>
<tr><th>Weight</th><th>Dose</th></tr>
<tr><td>55 kg or less</td><td>260 mg (2 x 130 mg vial)</td></tr>
<tr><td>More than 55 kg to 85 kg</td><td>390 mg (3 x 130 mg vial)</td></tr>
<tr><td>More than 85 kg</td><td>520 mg (4 x 130 mg vial)</td></tr>
</table>
- <u>Additional IV induction courses</u> doses may be considered medically necessary in patients who have previously had an inadequate response to every 8-week dosing given for at least 24 weeks or who have had a break in therapy.</td></tr>
<tr><td>SC Maintenance dosing for CD and UC</td><td>- CD and UC:
▪ Up to 7 doses (seven 90 mg syringes or fourteen vials) in a one-year based on maintenance dosing of 90 mg SC every 8 weeks.
▪ <u>Dose escalation/Re-induction</u>: A dosing interval of up to every 4 weeks be or additional IV doses may be considered medically necessary in patients who have had an inadequate response to every 8-week dosing given for at least 24 weeks. Authorization may be reviewed at least annually to confirm that current medical necessity criteria are met, and the medication is effective.</td></tr>
<tr><td>Taltz (ixekizumab)</td><td>SC</td><td>- PsO: Up to 7 doses (eight 80 mg syringes) in the initial 12-week period based on a dose of 160 mg</td></tr>
</table>

Product	Route	Authorization Limit
		initially at week 0, followed by 80 mg at weeks 2,4, 6, 8, 10, and 12, followed by maintenance dosing of 80 mg every four weeks (up to eighteen 80 mg syringes in the first 12-month period followed by up to thirteen 80 mg syringes per 12-month period, thereafter). - **AS, PsA:** ▪ Up to 13 doses (fifteen 80 mg syringes) in a one-year period based on 160 mg initially at week 0, followed by maintenance dosing of 80 mg every 4 weeks (up to fifteen 80 mg infusions in the first 12-month period followed by up to thirteen 80 mg syringes per 12-month period, thereafter). ▪ For patients with both PsA and PsO, dosing for PsO should be used. - **NR-axSpA:** Up to 13 doses (thirteen 80 mg syringes) in a one-year period a dose 80 mg every 4 weeks.
Tofacitinib (Xeljanz, Xeljanz XR)	PO	- **AS, PsA, RA:** ▪ Xeljanz: Up to sixty 5 mg tablets per 30 days, based on a recommended dose of 5 mg twice daily. ▪ Xeljanz XR: Up to thirty 11 mg tablets per 30 days, based on a recommended dose of 11 mg once daily. - **PJIA:** ▪ Xeljanz Oral Solution: Up to 300 mL of 1 mg/mL oral solution per 30 days, based on a recommended dose of up to 5 mg (5 mL of oral solution) twice daily. ▪ Xeljanz: Up to sixty 5 mg tablets per 30 days, based on a recommended dose of 5 mg twice daily. - **UC:** ▪ Xeljanz: Up to sixty 5 mg or 10 mg tablets per 30 days based on a recommended dose of 5-10 mg twice daily. ▪ Xeljanz XR: Up to thirty 22 mg tablets per 30 days, based on a recommended dose of 22 mg once daily.
Tremfya (guselkumab)	SC	**PsA, PsO:** Up to 2 doses (two 100 mg syringes) in the first 4-week period based on an initial dose of 100 mg SC at weeks 0 and 4, followed by maintenance dosing of 100 mg every 8 weeks (up to eight doses in the first 12-month period followed by up to seven doses thereafter).
Upadacitinib (Rinvoq, Rinvoq LQ))	PO	- **PsA, RA, AS, PJIA, NR-axSpA:** Up to thirty 15 mg tablets per 30 days, based on a recommended dose of 15 mg once daily. - **PsA/PJIA** oral solution 1 mg/mL: up to 360ml per 30 days (based on up to 6 mg twice daily). - **AD:** Up to 30 mg daily per 30 days, based on a recommended dose of up to 30 mg once daily. - **CD:** Up to 45 mg daily per 30 days for 12 weeks, then up to 30 mg daily, based on a recommended dose of up to 30 mg once daily for maintenance. - **UC:** Up to 45 mg daily per 30 days for 8 weeks then up to 30 mg daily, based on a recommended dose of up to 30 mg once daily for maintenance.
Velsipity (etrasimod)	PO	**UC:** Up to 30 tablets per 30 days.

Key: aGVHD: acute graft versus host disease; AD: atopic dermatitis; AMR: antibody mediated rejection; AS: ankylosing spondyloarthritis; BD: Behçet's

disease; CD: Crohn's disease; CRS: cytokine-release syndrome; ERA: enthesitis-related arthritis; GCA: giant cell arteritis; GPP: generalized pustular psoriasis; HS: hidradenitis suppurativa; PJIA: polyarticular juvenile idiopathic arthritis; PMR: polymyalgia rheumatica; NR-axSpA: non-radiographic axial spondyloarthritis; PsA: psoriatic arthritis; PsO: plaque psoriasis; RA: rheumatoid arthritis; SJIA: systemic juvenile idiopathic arthritis; SpA: spondyloarthritis; SSc-ILD: systemic sclerosis-associated interstitial lung disease; UC: ulcerative colitis

IV. Not Medically Necessary Uses

Medications included in this policy are not considered medically necessary when used according to Table 3.

Table 3. Not medically Necessary Uses

Adalimumab	Maintenance doses > 40 mg every 2 weeks for RA	Adalimumab is considered not medically necessary when used in maintenance doses exceeding 40 mg every 2 weeks for rheumatoid arthritis (RA). The benefit of increasing the dose of adalimumab for the treatment of RA from 40 mg every other week to 40 mg weekly as monotherapy is uncertain. [2] - One study reported a modest improvement in ACR50; however, there were not significant improvements in ACR20 or ACR70. - Because the study was not designed to evaluate the comparative effectiveness of higher doses, the comparison between weekly and every other week dosing is exploratory. - As the added benefit of increasing the dose of adalimumab is uncertain, the use of 40 mg weekly is considered not medically necessary.
Unbranded adalimumab-adbm, adalimumab-adaz, adalimumab-ryvk	All uses	The unbranded biosimilars adalimumab-adbm and adalimumab-ryvk manufactured by Quallent Pharmaceuticals and adalimumab-adaz manufactured by Cordavis are considered not medically necessary for all uses.
Etanercept	Maintenance doses > 50 mg per week	Etanercept is considered not medically necessary when used in maintenance doses exceeding 50 mg per week. - There is no data available establishing that therapy with etanercept at a dose of 50 mg twice weekly (beyond 3 months of initial therapy) offers a significant advantage over continued therapy with 50 mg of etanercept weekly. [3 4]
Ilumya (tildrakizumab-asmn)	Doses > 100 mg every 12 weeks	Ilumya (tildrakizumab-asmn) is considered not medically necessary when used in doses exceeding 100 mg every 12 weeks. - Ilumya (tildrakizumab-asmn) is FDA approved for PsO at a dose of 100 mg every 12 weeks. While clinical trials of in PsO evaluated doses 100 mg and 200 mg every 12 weeks, both doses appeared to have similar efficacy. Therefore, the use of doses higher than 100 mg every 12 weeks is considered

		not medically necessary. [5]
Stelara (ustekinumab)	Initial doses of 90 mg for PsO/PsA	Stelara (ustekinumab) is considered not medically necessary at initial doses of 90 mg per every 12 weeks, regardless of weight. - Given that more than half of all patients respond to the 45 mg dose, and the significantly higher cost of 90 mg dosing, a trial of 45 mg for all patients, regardless of weight, represents the best treatment value for PsO/PsA. - When treatment with 45 mg has resulted in some benefit, but has not a clinical remission after at least a 12-week trial, up to 90 mg every 12 weeks may be considered medically necessary. - Dosing was established through a post-hoc analysis of the results of the Phoenix 1 and Phoenix 2 trials. The recommended weight-based dosing scheme was not studied in a prospective manner. [6 7] Patients greater than 100 kg were found to have, on average, a better response to treatment when receiving a dose of 90 mg every 12 weeks compared with 45 mg every 12 weeks. ▪ In Phoenix 1, 68.5% and 54.0% of patients greater than 100 kg achieved PASI75 in the 90 mg and 45 mg groups, respectively. ▪ In Phoenix 2, 71.1% and 49.1% of patients greater than 100 kg achieved PASI75 in the 90 mg and 45 mg groups, respectively. - There is no evidence to support the need for re-induction when the dose is escalated from 45 mg to 90 mg is made.
Olumiant (baricitinib)	Doses > 2 mg daily in rheumatoid arthritis (RA)	Olumiant (baricitinib) is considered not medically necessary when used in doses exceeding 2 mg daily for RA. - Olumiant (baricitinib) is FDA approved for 2 mg daily in RA. - While doses of 4 mg have been shown to be effective, a signal of thromboembolic risk was identified, and the dose was not approved in RA. Further controlled-studies, including a comparative study between the 2 mg and 4 mg, are needed to clarify the risk-benefit profile of the higher dose in RA. [8]
	COVID-19, outpatient use	Olumiant (baricitinib) is considered not medically necessary when used for COVID-19 in the *outpatient* setting. - Olumiant (baricitinib) is FDA approved for the treatment of COVID-19 in *hospitalized* adults requiring supplemental oxygen, non-invasive or invasive mechanical ventilation, or extracorporeal membrane oxygenation (ECMO) - When used to treat COVID-19, dosing is limited to 14 days or until hospital discharge, whichever occurs first.[9] - There is no available safety and efficacy data supporting the use of baricitinib for COVID-19 in the outpatient setting.

V. Investigational Uses

A. Combination use of targeted DMARDs.

B. Unless otherwise specified in the coverage criteria above, medications included in this policy are considered investigational when used for all other conditions, due to lack of published data, lack of high-quality data, or lack of positive data. Details of select 'Investigational Uses' are listed below in tables 4 and 5.

C. Unless specified in the Administration, Quantity Limitations, and Authorization Periods or as 'Not Medically Necessary Uses' above, all dose escalations above the quantity limit are considered investigational (Additional details are in Table 5).

Table 4: Investigational Uses: Indications

Blau's Syndrome	- There is no reliable evidence to establish the efficacy or safety of targeted DMARDs in the treatment of Blau's syndrome. - No randomized, controlled trials have been published evaluating the use of adalimumab in patients with Blau's syndrome.
Extraintestinal complications of IBD: Arthritis (IBD-associated arthropathy)	- Arthritis is a common extraintestinal complication of IBD (either UC or CD). However, there is no reliable evidence to establish the efficacy or safety of targeted DMARDs in patients with arthritis associated with IBD who do not otherwise require targeted therapy. - The evidence is limited to small, short-term, open-label trials and case studies with infliximab. Given the lack of blinding and lack of control arm, the incremental benefit of infliximab therapy is uncertain. [10] - There are no reliable published clinical trials with any other biologic DMARDs for treatment of arthritis associated with IBD (in the absence of active bowel disease). - Of note: patients with IBD and a confirmed diagnosis of CD or UC with active bowel disease may be covered per the coverage criteria for management of IBD symptoms (active bowel disease). However, the isolated arthritis symptoms (in the absence of active bowel disease) are not coverable.
Graft Versus Host Disease (GVHD)	- There is no reliable evidence to establish the efficacy or safety of targeted DMARDs in the treatment of GVHD. - In one open-label clinical trial (n=62) incidences of GVHD-related mortality, non-relapse mortality, and overall survival were not different between patients treated with infliximab or placebo. [11]
Granuloma Annulare	- There is no reliable evidence to establish the efficacy or safety of targeted DMARDs in the treatment of granuloma annulare. - While case reports have been published describing the treatment of granuloma annulare with etanercept, other reports have been published describing no effect, or an association with the formation of granuloma annulare and treatment with TNF-alfa inhibitors, including etanercept. Additional information is necessary to the benefit of etanercept in this population. [12]
Guttate Psoriasis	- Guttate psoriasis is a type of cutaneous psoriasis. It is characterized by the presence of small, erythematous papules whereas plaque psoriasis is characterized itchy, red, scaly, raised lesions on the skin. Guttate psoriasis is typically managed with topical agents or UV light therapy. - There is no evidence to establish the efficacy or safety of targeted DMARDs in the treatment of guttate psoriasis.
Immune-mediated reactions (other than colitis or CRS with CAR-T cell therapy) due to immunotherapy	- There is no reliable evidence to establish the efficacy of safety of targeted DMARDs in the treatment of immune-mediated reactions, including but not limited to pneumonitis, hepatitis, or arthritis, due to PD-1, PDL-1, or CTLA4 inhibitors. - PD-1, PDL-1, and CTLA4 inhibitors contain warnings for immune-mediated hepatitis. In clinical trials, patients who experienced immune-mediated hepatitis were managed with systemic corticosteroids and mycophenolate. - For immune-mediated hepatitis, NCCN guidelines state that mycophenolate is recommended instead of infliximab due to the concern for hepatotoxicity with infliximab.

Reactive Arthritis/Reiter's Syndrome	- There is no reliable evidence to establish the efficacy or safety of targeted DMARDs in the treatment of reactive arthritis/Reiter's Syndrome.
Sciatica	- There is no reliable evidence to establish the efficacy or safety of targeted DMARDs in the treatment of sciatica. - Evidence for infliximab in the treatment of sciatica is limited to a randomized controlled trial in 40 patients. At 52 weeks, 67% of patients who received infliximab reported no pain compared with 63% of patients who received placebo (p = 0.72). This difference was not statistically significant. [13 14] - There are no randomized controlled trials that evaluate the efficacy and safety of a commercially available formulation of etanercept in the treatment of sciatica. - Evidence for adalimumab in the treatment of sciatica in limited to a small randomized, controlled trial evaluated adalimumab in 61 patients. There was a modest improvement in pain as measured by a 10-point visual analog scale and at three years, the need for back surgery was reduced in adalimumab-treated patients; however, larger clinical trials are needed to confirm the benefit of adalimumab in this population. [15 16]
Scleroderma	- There is insufficient evidence to support the use of tocilizumab for scleroderma. The evidence is limited to one small, placebo-controlled, phase 2 trial using subcutaneous tocilizumab (n=88). The trial found a change in modified Rodan skin score, but no significant difference in skin thickening, disability, fatigue, itching, or patient or clinician global disease severity. Larger Phase 3 trials are needed to establish the safety and efficacy of tocilizumab for scleroderma. [17]
Sjögren's Syndrome	- There is no reliable evidence to establish the efficacy or safety of targeted DMARDs in the treatment of Sjögren's syndrome. - Evidence for etanercept in Sjögren's syndrome is limited a small trial, in which there were no significant differences in the subjective measures of disease severity. [18]
Systemic Lupus Erythematous (SLE)	- There is no reliable evidence to establish the efficacy or safety of targeted DMARDs in the treatment of SLE. - A small uncontrolled clinical trial reported modest efficacy with infliximab in patients with systemic lupus erythematosus, though larger, better designed trials are needed to confirm these results. [19] - A small preliminary study assessing the use of tocilizumab in patients with SLE found promising signs of response, but larger, controlled studies will be needed to establish the efficacy and safety in this population. [20] - One small randomized, placebo-controlled trial evaluated the use of abatacept in patients with non–life-threatening SLE and polyarthritis. The primary endpoint (proportion of patients with a new flare of SLE) was not met but was suggestive of a positive effect in certain exploratory measures. Further study is needed to establish the safety and efficacy of abatacept in SLE. [21] - One 24-week, phase 2 study evaluated the use of baricitinib in patients with SLE. Results demonstrated that baricitinib 4 mg once may reduce SLE disease activity; however, results for the 2 mg dose were not significant. Larger, longer-term studies are needed to clarify the benefit of baricitinib in SLE. [22]

Wegener's Granulomatosis	- There is no reliable evidence to establish the efficacy or safety of targeted DMARDs in the treatment of Wegener's Granulomatosis. - Evidence for infliximab is limited to one small clinical trial in 17 patients. Both infliximab and rituximab appeared to provide benefit in achieving complete or partial response; however, there was a trend favoring rituximab. Additionally, rituximab was better able to maintain remission during the long-term follow-up.

Table 5: Investigational Uses: Dosing or Dose Escalation

Combination use of targeted immunomodulators	- The use of combination (more than one) targeted DMARD therapy, such as Humira (adalimumab), Otezla (apremilast), tofacitinib (Xeljanz/Xeljanz XR), Sotyktu (deucravacitinib), or Entyvio (vedolizumab), is considered investigational (includes all medications included in this policy). *Combination use of apremilast and other targeted immunomodulators:* - There is no reliable evidence to establish the efficacy or safety of the combined use of apremilast and other targeted DMARDs (such as biologics) in the treatment of PsO or PsA. - There are no randomized, controlled trials evaluating the combined use of apremilast and any other targeted DMARD. The evidence is limited to retrospective studies in small numbers of patients. Additional studies are needed to establish long-term efficacy and the overall risk-benefit profile of combination use.
Secukinumab – Maintenance doses higher than 300 mg every 4 weeks for PsA or PsO	- There is insufficient evidence to support the use of secukinumab at maintenance doses higher than 300 mg every 4 weeks for PsO. - Phase 3 clinical trials of secukinumab for PsA and PsO evaluated maintenance dosing regimens of 150 mg or 300 mg every 4 weeks. Higher or more frequent doses have not been evaluated. It is uncertain if there is any additional benefit with increased dosing and the safety profile has not been evaluated.
Secukinumab – Maintenance doses higher than 150 mg every 4 weeks for AS	- There is insufficient evidence to support the use of secukinumab at maintenance doses higher than 150 mg every 4 weeks for AS. - Phase 3 clinical trials of secukinumab for AS evaluated maintenance dosing regimens of 150 mg every 4 weeks. Higher or more frequent doses have not been evaluated. It is uncertain if there is any additional benefit with increased dosing and the safety profile has not been evaluated.
Ustekinumab – Doses higher than 90 mg every 12 weeks for PsO or PsA	- There is insufficient evidence to support the use of ustekinumab at maintenance doses higher than 90 mg every 12 weeks for PsO or PsA. - There are no randomized, controlled trials to support doses higher than 90 mg every 12 weeks in PsO or PsA.
Vedolizumab - Doses higher than 300 mg every 4 weeks	- There is insufficient evidence to support the use of vedolizumab at maintenance doses higher than 300 mg every 4 weeks for CD and UC. - In phase 3 clinical studies of vedolizumab in CD and UC the highest dose of vedolizumab used was 300 mg every four weeks. Higher or more frequent doses have not been evaluated.

Position Statement

- There are many treatments for chronic inflammatory conditions that are effective, have known long-term safety profiles, and are recommended by national treatment guidelines.
- The intent of this policy is to allow coverage of each medication in settings where it has been safe and effective, with coverage after use of lower cost standard of care therapies, including preferred targeted DMARD options.
- Non-medical therapies, such as prescribed exercise therapy, physical therapy, weight loss, and smoking cessation are important treatment plan components for patients suffering from many chronic inflammatory conditions.
- When a systemic medication therapy is needed to manage a chronic inflammatory condition, generic oral therapies usually offer the best value.
- When non-medical therapies and oral medications are inadequate, a targeted DMARD or immunomodulator [conventional synthetic DMARD (csDMARD)] may be appropriate and use is supported by guidelines. Targeted DMARDs include non-biologics and biologics. Biologics include both anti-TNF and non-anti-TNF options.
- When there is no demonstrated difference in safety or efficacy among the studied targeted DMARDs, the medication with the lowest cost often provides the best value for members.
- Individual responses and tolerability of targeted DMARDs, including biologics, are unpredictable and may vary between patients. If one targeted DMARD provides an inadequate response, another targeted DMARD may yet be effective.
- Due to the potential for development of antibodies with anti-TNF therapies which may result in loss of efficacy, clinical practice guidelines generally recommend a trial with one to two anti-TNF therapies. [23-27] For those who have an inadequate response or intolerance to a TNF inhibitor, it is reasonable to consider a targeted treatment with an alternative mechanism of action and proven efficacy for the patient's diagnosis.
- All DMARDs, conventional and targeted, are immunosuppressants and carry a risk of increased infection. Risk and infection type varies by mechanism of action and medication.
- 2021 JAK1/2/3 inhibitors label updates placed their usage after other systemic therapies for the indications in which they have FDA approval due to safety concerns (which include major cardiovascular events and mortality among other concerns).
- There is significant variation in recommended dosing across indications for individual medications, particularly with targeted agents; therefore, when multiple dosage forms of a targeted agent are available, coverage can be provided for those indications where the dosage form has been evaluated in randomized controlled trials, the dosage form has been proven safe and effective, and for which the dosage form has an established dose. For all other indications, the specific dosage form will be considered investigational.
- Inflectra (infliximab-dyyb) and Avsola (infliximab-axxq) are the preferred infliximab products. The reference products and other biosimilars such as Renflexis (infliximab-abda) and Ixifi (infliximab-qbtx) are considered non-preferred. While they share most indications with each other, they are not the preferred formulation of infliximab. Hadlima (adalimumab-bwwd), Humira and

Simlandi (adalimumab-ryvk) are the preferred adalimumab products. The other adalimumab biosimilars such as Abrilada (adalimumab-afzb), Amjevita (adalimumab-atto), Hulio (adalimumab-fkjp), Hyrimoz (adalimumab-adaz), Idacio (adalimumab-aacf), Yuflyma (adalimumab-atty), Yusimry (adalimumab-aqhv), and Cyltezo (adalimumab-adbm) are considered non-preferred. The unbranded biosimilars adalimumab-adbm, adalimumab-ryvk (Quallent Pharmaceuticals), and adalimumab-adaz (Cordavis) are considered not medically necessary. Biosimilars for Enbrel (etanercept) have been approved but none are the preferred formulations for etanercept.

- The medications in this policy, including loading doses, are coverable for the lowest effective doses, aligned with how they were studied in clinical trials, including use of loading doses.

Evidence summary:

Rheumatic Conditions – Background

- Treatments for rheumatic conditions may include non-medical therapies, medications for the management of symptoms, medications that modify the disease course such as conventional synthetic or targeted disease modifying anti-rheumatic drugs (DMARDs).
- Medications to control inflammation such as nonsteroidal anti-inflammatory medications (NSAIDs, e.g., ibuprofen, indomethacin, and naproxen) and glucocorticoids (oral or injected into the joint) are effective for the management of symptoms, particularly during the early stages of disease.
- Generic, conventional synthetic DMARDs (csDMARDs), including methotrexate (MTX), hydroxychloroquine, leflunomide, and sulfasalazine are effective for decreasing symptoms and slowing disease progression, and are recommended by current guidelines.
    * MTX is generally the initial csDMARD for rheumatoid arthritis (RA) and juvenile idiopathic arthritis (JIA).
    * csDMARDs have known risks. The management of these risks is well established.
- Targeted DMARDs can also decrease symptoms, help preserve joint functioning, and slow the progression of the disease.
- In RA, the best response is seen when targeted DMARDs are used in combination with MTX. ACR Guidelines for the treatment of RA recommend that biologic therapy should be used in combination with methotrexate, when possible, due to increased efficacy over biologic monotherapy. Infliximab and golimumab have been shown to be effective only when used with MTX.
- In JIA, combination therapy with a csDMARD is strongly recommended for infliximab to reduce the risk of anti-drug antibodies against infliximab. [28]

Rheumatic Conditions – Axial Spondyloarthritis (SpA)

- Axial spondylarthritis (SpA) is a form of inflammatory arthritis that includes ankylosing spondylitis (AS) and non-radiographic axial spondylarthritis (nr-axSpA).
- Several targeted DMARDs (as listed in the coverage criteria) have been shown to be effective in the treatment of AS or nr-axSpA.
- There is moderate quality evidence to support the use of targeted DMARDs, particularly TNF inhibitors, in SpA. Clinical trials have consistently shown that treatment with TNF inhibitors reduced disease activity in this population.

- 2019 ACR guidelines for both AS and nr-axSpA recommend TNF inhibitors as the first-line targeted agent. They do not recommend any one TNF inhibitor over another except in patients who also have inflammatory bowel disease or iritis in which case adalimumab or infliximab would be recommended over etanercept. Secukinumab and ixekizumab are recommended as second-line options in patients who have active symptoms without response to a previous TNF inhibitor. TNF inhibitors, secukinumab, or ixekizumab are recommended over tofacitinib in patients with AS. [29]
- Because of similar efficacy among the studied targeted DMARDs, non-preferred/non-formulary options are coverable when preferred/formulary options are ineffective, as detailed in the coverage criteria.

Rheumatic Conditions – Enthesitis-related Arthritis (ERA)

- ERA is a type of juvenile idiopathic arthritis (JIA) that causes swelling or inflammation of the entheses (tendon-to-bone insertion sites).
- 2019 ACR guidelines for Juvenile Idiopathic Arthritis recommend NSAIDs as initial therapy for patients with ERA followed by TNF inhibitors. Methotrexate or sulfasalazine may be used if TNF inhibitors are contraindicated. ACR guidelines have not been updated to include secukinumab.[28]
- There is little comparative evidence to distinguish among the biologic options for ERA due to the lack of head-to-head comparisons.
- The evidence for secukinumab in ERA is based on one small placebo-controlled phase III withdrawal trial that demonstrated a reduced time to disease flare for people on secukinumab versus placebo.[30]

Rheumatic Conditions – Polyarticular Juvenile Idiopathic Arthritis (PJIA); Juvenile Rheumatoid Arthritis (JRA)

- Several targeted DMARDs (as listed in the coverage criteria) have been shown to be effective in the treatment of JIA.
- 2019 ACR guidelines for JIA recommend methotrexate, leflunomide, or sulfasalazine as initial therapy for patients with JIA. Methotrexate is recommended over leflunomide and sulfasalazine due to a larger body of evidence. Biologic agents are recommended in patients who have disease activity despite treatment with methotrexate, sulfasalazine, or leflunomide or in patients with high disease activity or have disease in high-risk joints. [28]
- Combination therapy with a biologic and a csDMARD is recommended to prevent the formation of anti-drug antibodies.
- There is little comparative evidence to distinguish among the targeted options for JIA. Guidelines state that there are mostly equivalent data for safety and efficacy between the biologics and there are lack of head-to-head comparisons between them.
- In patients who have had an inadequate response to a TNF inhibitor, switching to a non-TNF biologic is preferred over a second TNF inhibitor. However, a second TNF inhibitor may be appropriate if patients had a good response to the initial TNF inhibitor. [28]

Rheumatic Conditions – Polymyalgia Rheumatica (PMR)

- The ACR/EULAR guidelines for treatment of PMR recommend treatment with corticosteroids for flare with a long, slow taper. Prior trials in anti TNFI's have been unsuccessful, and trials with treatment with conventional DMARDs have yielded mixed results.

- Sarilumab has demonstrated modest improvement in the ability of patients to maintain sustained remission at one year compared to placebo with a steroid taper.

Rheumatic Conditions – Psoriatic Arthritis (PsA)

- Several targeted DMARDs (as listed in the coverage criteria) have been shown to be effective in the treatment of PsA.
- ACR Guidelines recommend TNF inhibitors as the first-line treatment for PsA. However, other mechanisms can be used in patients with contraindications to TNF inhibitors. The guidelines do not specify the use of any one TNF inhibitor over another. [31]
- In patients who have failed a TNF inhibitor, a second TNF inhibitor is recommend over switching to a different mechanism of action (e.g., an IL-12/23 inhibitor, biologic, IL-17 inhibitors, abatacept, or JAK inhibitor). However, a different mechanism of action may be used in cases of primary TNF inhibitor failure (no response) or a serious adverse event due to a TNF inhibitor. [31]
- Because of similar efficacy among the studied targeted DMARDs, non-preferred/non-formulary options are coverable when preferred/formulary options are ineffective, as detailed in the coverage criteria.

Rheumatic Conditions – Rheumatoid Arthritis (RA)

- Several targeted DMARDs (as listed in the coverage criteria, as well as rituximab) have been shown to be effective in the treatment of RA.
- The efficacy of these targeted DMARDs in the treatment of RA is similar. Guidelines do not recommend one specific targeted DMARD. The initial choice of therapy includes biologic DMARDs (TNF inhibitors or a non-TNF biologic) or targeted synthetic DMARDs (e.g., JAK inhibitors). However, 2021 ACR guidelines have not accounted for recent drug safety communications regarding the risk of serious heart-related events with JAK inhibitors. [32 33]
- In patients who have had an inadequate response to targeted therapy, guidelines recommend switching to a targeted DMARD of a different class rather a different DMARD of the same class. [32]
- Guidelines have recommendations for specific patient populations including non-TNF inhibitors over TNF inhibitors for patients with New York Heart Association (NYHA) class III or IV heart failure. This recommendation is based on the risk of worsening heart failure observed in RCTs of TNF inhibitors in patients with heart failure. [32]
- Because of similar efficacy among the studied targeted DMARDs, non-preferred/non-formulary options are coverable when preferred/formulary options are ineffective, as detailed in the coverage criteria.

Rheumatic Conditions – Systemic Juvenile Idiopathic Arthritis (SJIA)

- Systemic JIA is a subtype of juvenile idiopathic arthritis that is associated with systemic inflammation. [34]
- Systemic JIA is defined as arthritis in at least one joint for at least 6 weeks in patients less than 16 years of age that is accompanied for other systemic manifestation such as erythematous rash, lymphadenopathy, hepatomegaly, or splenomegaly, and serositis. [34]
- Several targeted agents (as listed in the coverage criteria) have been shown to be effective or are recommended by clinical practice guidelines in the treatment of SJIA. [24]

- Due to lack of high-quality data, the comparative efficacy for these agents in the treatment of SJIA is uncertain.
- The efficacy of these targeted DMARDs (as listed in the coverage criteria) in the treatment of SJIA is similar. However, there is a significant difference in the cost between these treatment options. Therefore, the costlier treatment options are coverable only when the less costly options are ineffective.

Rheumatic Conditions – Giant Cell Arteritis (GCA)

- Data evaluating the use of biologic agents in the treatment of GCA is limited; however, there are few treatment options for this condition, which can result in serious complications.
- Subcutaneous tocilizumab in combination with prednisone has been shown to improve remission rates compared to prednisone alone in patients with *newly diagnosed or relapsing* GCA. [35]
- Intravenous tocilizumab is approved for the treatment of GCA; evidence is based primarily on pharmacokinetic exposure data and extrapolation to the efficacy established for subcutaneous tocilizumab in patients with GCA.[36]
- Evidence for the use of TNF inhibitors is lacking, as several small trials have not shown benefit in the treatment of GCA.

Rheumatic Conditions – Behçet's disease

- Evidence for efficacy of apremilast for Behçet's disease (BD) was based on one phase 3, randomized, controlled trial. [37 38] The study included patients who were previously treated with at least one non-biologic therapy and were candidates for systemic therapy. Patients had to have at least two oral ulcers at screening and at least two oral ulcers at randomization. Patients with active major organ involvement were excluded and concomitant treatment for Behçet's disease was not allowed (such as with oral csDMARDs).
- Endpoints were the number of oral ulcer and pain from oral ulcers (rated from 0 to 100).
- At week 12, apremilast significantly improved the daily average number of oral ulcers and reduced pain from oral ulcers. Additionally, higher rates of patients who received apremilast were oral ulcer-free at 12 weeks compared to placebo (53% vs. 22%).

Skin conditions - Atopic Dermatitis (AD)

- AD is a chronic, pruritic inflammatory skin disease. It is often associated with elevated serum immunoglobulin (IgE) levels and a personal or family history of type I allergies, allergic rhinitis, and asthma.
- Treatment guidelines recommend the use of topical corticosteroids and topical calcineurin inhibitors in a step-wise approach, as well as systemic immunosuppressants, such as oral cyclosporine, including when topical therapies are insufficient.
- Clinical studies with systemic biologics were conducted in patients with atopic dermatitis who were not adequately controlled with topical medications.[39-41]
- Based on a recent long-term safety study with tofacitinib there is concern that increases in cardiovascular events, venous thromboembolism, and cancer may be class effects of all JAK inhibitors. Additional long-term controlled safety studies are needed to evaluate these concerns further.

- In comparative trials versus Dupixent (dupilumab), Rinvoq (upadacitinib) showed modest improvements in itchiness and skin clearance[42] but the benefit may be outweighed by potential long-term safety concerns.
- While there are two topical calcineurin inhibitors currently available, topical tacrolimus is indicated for moderate to severe AD whereas Elidel (pimecrolimus) is indicated for mild to moderate disease.
- Goals of treatment include clearance of skin lesions, control of itch, prevention of adverse events and triggers associated with various treatment modalities and preventing future exacerbations.

Skin Conditions – Chronic Plaque Psoriasis (PsO)

- There are many treatments for chronic plaque psoriasis (PsO) that are effective, have known long-term safety profiles, and are recommended by national treatment guidelines.
- Light therapy, including UVB and PUVA, is effective and safe, and PUVA may result in long-term remission. When patients are not able to receive office-administered light therapy, light units for home use may be an appropriate alternative (see Appendix 2 for absolute and relative contraindications for phototherapy/photochemotherapy).
- AAD guidelines (2014) recommend phototherapy after failure of first-line treatment (emollients, topical steroids, and topical calcineurin inhibitors). Most patients with mild-to-moderate psoriasis can achieve adequate control with topical medications or phototherapy.
- When systemic therapy is needed to manage psoriasis, csDMARDs often provide the best value. [43]
    * Conventional synthetic DMARDS (csDMARDs), including MTX, cyclosporine, and Soriatane (acitretin), have a proven track record and have been the standard of care for many years.
    * csDMARDs typically take effect with 6 weeks though some patients may require 12 weeks to have full effect. Among these options, cyclosporine is known to work rapidly.
    * Like all immunosuppressants, including targeted DMARDs, the csDMARDs have known risks. The management of these risks is well established.
- Targeted DMARD may be appropriate for patients with moderate to severe psoriasis (e.g., at least 10% BSA and/or significant pain or functional impairment due to the PsO or when conventional topical or oral therapies, or phototherapy have been inadequate).
- Several targeted DMARDs (as listed in the coverage criteria) have been shown to be effective in the treatment of moderate to severe PsO.
- Within each drug class, efficacy among drugs is similar. In general, when comparing different classes, agents directed against both IL-17A and IL-17F (bimekizumab), IL-17A (ixekizumab and secukinumab) and IL-23 (risankizumab) are more effective at producing skin clearance than TNF inhibitors and other mechanisms of action (PDE-4 inhibitors and tyrosine kinase inhibitors). [43] However, safety is also considered. Despite bimekizumab's head-to-head superiority data compared to ustekinumab, secukinumab and adalimumab, there are concerns for potential for suicidal ideation and behavior and long-term data is lacking. There are several other

agents with good efficacy and established safety.

Skin conditions – Generalized Pustular Psoriasis[44-47]

- GPP is a rare subtype of psoriasis. Flares are characterized by an abrupt onset of widespread painful pustules which can coalesce into larger, "lakes of pus" overlying painful erythema. Significant flares are often accompanied by systemic symptoms, notably fever, general malaise, and extracutaneous manifestations such as arthritis, uveitis, and neutrophilic cholangitis, and may be associated with life-threatening complications,
- Acute flares may be idiopathic or may be triggered by infection, withdrawal, or administration of certain medications (including those used in the treatment of GPP such as corticosteroids, methotrexate, or tumor necrosis factor [TNF] inhibitors), pregnancy, or stress.
- Treatment guidelines recommend the identification and management of potential triggers.
- Choice of therapy depends on disease acuity. Acitretin and methotrexate are the preferred initial treatments for adults with relatively stable GPP due to their relatively slow onset of action. They can be used for long-term maintenance treatment.
- Cyclosporine and infliximab are used for more severe, acute GPP. Cyclosporine or infliximab are often considered first line for severe GPP due to their rapid onset of action. Once control of acute disease is achieved, patients may be maintained on fast-acting therapies or transitioned to acitretin or methotrexate for long-term treatment. There is no comparative data regarding relative efficacies of agents used for GPP.

Skin Conditions – Hidradenitis Suppurativa

- High-quality data evaluating the use of targeted DMARDs in the treatment of hidradenitis suppurativa (HS) are limited; however, there are relatively few treatment options for this condition.
- Although adalimumab is FDA approved for the treatment of HS, infliximab also has data to support use in this indication. [48]
    * A high-quality systematic review showed that weekly-dosed adalimumab improved quality of life in HS compared to placebo; although, the effect size was approximately equal to what is considered a minimally clinically important difference.
    * In the same systematic review, infliximab also improved quality of life compared to placebo, with an effect size well above the threshold for a minimally clinically important difference.
- Trials of adalimumab and secukinumab in HS only included patients with more severe disease, defined as Hurley Stage II or III disease and with at least three abscesses or inflammatory nodules.
- Trials showed that adalimumab significantly improved the hidradenitis suppurativa response rate after 12 weeks of treatment; however, efficacy and safety beyond 12-weeks of treatment has not been established. [49 50]
- Trials showed that secukinumab significantly improved the hidradenitis suppurativa response rate by 16 weeks of treatment.[30]
- Additional long-term randomized controlled trials are needed to understand relative efficacy of other treatments, the safety associated with weekly-dosed adalimumab, and role of oral, non-biologic/non-targeted DMARD treatments for HS.

- Evidence-based guidelines for hidradenitis suppurativa are not available, primarily due to lack of data. However, standard of care therapy reviews suggest the following:
  * Patients may benefit from non-pharmacologic interventions such as good personal hygiene, smoking cessation, and weight-loss.
  * For mild to moderate HS, topical clindamycin and tetracyclines have a proven track record of safety and have been the standard of care.
  * When systemic therapy is needed to manage refractory hidradenitis suppurativa, oral therapies often provide the best value. Options include systemic antibiotics (e.g., oral tetracyclines, clindamycin, rifampin, moxifloxacin, metronidazole), hormonal therapies (e.g., oral contraceptives, spironolactone), cyclosporine, finasteride, metformin, or oral retinoids.

Gastrointestinal conditions –Crohn's Disease (CD) and Ulcerative Colitis (UC)

- There are many treatments for Crohn's disease (CD) and ulcerative colitis (UC) that are effective, have known long-term safety profiles, and are recommended by national treatment guidelines. [51 52]
- Several targeted DMARDs (as listed in the coverage criteria) have been shown to be effective in the treatment of CD and/or UC, for inducing and maintaining remission compared to placebo.
- Due to a lack of head-to head comparative studies, the overall comparative efficacy for these targeted DMARDs in the treatment of CD is uncertain. There is also a lack of comparative evidence for treatment of UC. Therefore, non-preferred/non-formulary options are coverable when preferred/formulary options are ineffective, as detailed in the coverage criteria.
- Although studied in UC, there are no controlled trials of golimumab in CD. Likewise, although studied in CD, there are no controlled trials of certolizumab pegol or natalizumab in UC.
- Restorative proctocolectomy with ileal pouch–anal anastomosis (IPAA) is routinely performed in patients with UC who undergo colectomy. Idiopathic inflammation of the pouch — referred to as pouchitis — is the most common long-term complication of IPAA. Retrospective, uncontrolled studies suggest that TNF antagonists, vedolizumab, or ustekinumab may be effective in the treatment of pouchitis that is refractory to antibiotics.[52]
- Safety considerations:
  * Due to an increased risk of mortality and thrombosis with JAK inhibitors, JAK inhibitors only indicated for patients who have previously had an inadequate response or intolerance to TNF inhibitors.
  * Use of JAK inhibitors should be limited to the shortest duration, with consideration of the benefits and risks for the individual patient. The prescribing information states that the lowest effective dose needed to maintain response should be used.[39 53]

Guidelines: [51] [52 54]

- Lifestyle interventions, such as smoking cessation and diet modification, are important components of a comprehensive treatment plan for patients suffering from CD.

- When medication therapy is needed to manage CD and UC, oral and topical (administered rectally) therapies often provide the best value.
- First-line therapies to induce remission for CD/UC vary, based on severity and anatomic distribution, but may include:
  * Oral corticosteroids, “topical” steroids (enteric-coated budesonide), oral aminosalicylates (5ASAs, such as sulfasalazine or mesalamine). Steroids are used over csDMARDs for induction of remission in moderate to severe UC. Several product formulations are specific to anatomic location of the disease, such as enteric-coated (EC) budesonide or EC mesalamine, or rectal 5ASAs.
  * In addition, topical mesalamine may be used for UC, depending on the extent and location of disease.
  * The use of conventional corticosteroids, such as prednisone, is generally reserved for patients with moderate-to-severe CD/UC refractory to first-line therapies, given the adverse events. Use is generally limited to one to two weeks.
  * Corticosteroids, such as prednisone (40 - 60 mg/day or 1 mg/kg/day), are effective for induction of remission for CD and UC.
- Once remission is induced with corticosteroids, maintenance csDMARD therapy should be initiated. Choice of therapy varies between CD and UC, as well as response to induction therapy(s). Antimetabolite csDMARDs [such as methotrexate (MTX), 6-mercaptopurine (6MP), azathioprine] are slow acting and can take 8 to 12 weeks to have full effect. They are also used to decrease immunogenicity in combination with targeted DMARDs.
- First-line therapies to maintain remission include:
  * CD: 6-mercaptopurine, azathioprine, and methotrexate.
  * UC: oral 5ASAs (e.g., sulfasalazine), topical mesalamine or corticosteroids, or oral corticosteroids, depending on the extent and location of disease.
- When non-medical therapies and oral/topical medications (steroids or aminosalicylates) are inadequate, a targeted DMARD may be appropriate for induction and/or maintenance of disease remission.
- Guidelines for CD list multiple targeted DMARDs as effective treatment options. [51]
  * TNF inhibitors, including infliximab and adalimumab, are recommended in patients who are resistant to corticosteroids or whose disease is refractory to csDMARDs such as azathioprine or 6-mercaptopurine.
  * Ustekinumab is an option for moderate-to-severe CD patients who failed previous treatment with corticosteroids, thiopurines, methotrexate, or anti-TNF inhibitors or who have had no prior exposure to anti-TNF inhibitors.
  * Vedolizumab is also listed as an effective option for the induction and maintenance of remission in CD.
  * Due to the risk of progressive multifocal leukoencephalopathy (PML), a serious (sometimes fatal) adverse event, natalizumab is only recommended after other treatment options have failed.
  * Patients with fistulizing disease and severely active disease may be candidates for initial targeted DMARD. Definitions for

severe disease include the following previous hospitalization for Crohn's disease, extensive anatomic involvement, deep ulcers, prior surgical resection, stricturing and/or penetrating behavior.

- Clinical practice guidelines for the treatment of UC indicate that for patients who initially respond to infliximab but lose response, an increase in dose or shortening of the interval between infusions may improve the likelihood of successful treatment. These guidelines acknowledge that these strategies have not been evaluated in a controlled manner.
- Lack of response and loss of response to TNF inhibitors is common in both CD and UC. The choice of subsequent agent after failure of a TNF inhibitor is typically guided by serum levels. ACG guidelines state that, in patients with adequate serum levels of anti-TNF antibodies switching to another TNF is unlikely to be of benefit.

Gastrointestinal conditions – Immune-mediated Colitis

- Serious or steroid-refractory colitis is a known adverse event associated with checkpoint inhibitors such as ipilimumab, nivolumab, pembrolizumab, atezolizumab, avelumab, cemiplimab, and durvalumab. NCCN guidelines recommend prednisone or methylprednisolone as the first-line treatment for moderate colitis. Infliximab or vedolizumab may be considered if there has been no improvement within 2-3 days of initiating glucocorticoids. [55]
- NCCN guidelines state that the duration of therapy with TNF-inhibitors is not clearly defined but is usually a single dose though a second dose may be required. [55]
- There is not an FDA approved dose for vedolizumab when used for immune-mediate colitis. However, a retrospective analysis identified that most patients required between one and four doses to achieve resolution. [56 57]

Gastrointestinal conditions – Collagenous Colitis

- The European Guidelines on Microscopic Colitis (including lymphocytic colitis and collagenous colitis) recommend budesonide as front line for both induction as well as maintenance in some cases. Evidence for use of second-line therapies in patients with microscopic colitis is scarce and based primarily on case reports. Guidelines support the use of TNF inhibitors and vedolizumab for refractory microscopic colitis. TNF inhibitors, including infliximab and adalimumab, have been reported to induce remission. Vedolizumab has been associated with clinical remission based on case reports; almost all patients were refractory to prior TNF inhibitors; however, no randomized control trials have been published to date.[58]

<u>Other Immunologic Conditions</u>

Acute Graft Versus Host Disease (aGVHD)[59]

- Graft versus host disease (GVHD) is a common complication of allogeneic hematopoietic cell transplant (HCT) that occurs when the graft (donor) cells identify the transplant recipient cells (host) as foreign and initiates an immune reaction that may lead to organ damage or death.
- The risk for GVHD is higher when receiving a HCT from an unrelated donor.

- There are no standard guidelines for prophylaxis of acute GVHD, protocols vary by transplant center. The choice of therapy may depend on the underlying disease, degree of HLA disparity, conditioning regimen, and patient characteristics. Several regimens include a calcineurin inhibitors (tacrolimus, cyclosporine) given with either methotrexate or mycophenolate mofetil. Post-transplantation with cyclophosphamide or T-cell depletion is also used.
- At 6 months post-transplant, abatacept was shown to increase acute GVHD free survival as well as improve overall survival when used for patients with 8/8 HLA matched or 7/8 HLA mismatched unrelated donor HCT when used in combination with a calcineurin inhibitor plus methotrexate.[60]

Alopecia areata (AA)

- Alopecia areata (AA) is a chronic, autoimmune disorder that targets hair follicles, leading to nonscarring hair loss; it causes both hair shedding and inhibition of hair regrowth. The condition most commonly presents on the scalp but may also occur in other hair-bearing areas, such as the eyebrows, eyelashes, beard, and extremities.[61]
- The evidence for baricitinib in AA is based on two double-blind, randomized, placebo-controlled trials in patients with at least 50% scalp hair loss for more than 6 months. In both trials, the proportion of patients who achieved at least 80% scalp hair coverage at week 36 (the primary endpoint) in the baricitinib arms were significantly more than the placebo arms.[9]
- The evidence for ritlecitinib in AA is based on one randomized, double-blind, placebo-controlled trial. Only patients with at least 50% scalp hair loss with no signs of terminal hair regrowth within 6 months were included in the trial. The proportion of patients who achieved at least 80% scale hair coverage at week 24 (primary endpoint) was significantly more in the ritlecitinib arm than placebo arm.[62]
- The Alopecia Areata Consensus Expert guidelines support the use of corticosteroids, topical immunotherapy and conventional (which may include diphenylcyclopropenone [DPCP] or squaric acid dibutyl ester [SADBE]), or oral immunosuppressants (methotrexate, azathioprine, cyclosporine), noting time to effect may take several weeks to months.[63]
- Coverage for stimulation of hair growth is defined by contract language.

Antibody Mediated Rejection of Transplant (solid-organ)[64 65]

- Acute allograft (organ) rejection may be cellular (T-cell mediated) or humoral (antibody-mediated) (AHR, AMR).
- Pre-treatment (desensitization) may reduce the risk of AMR in highly sensitized renal transplant patients.
- Acute humoral rejection (AHR) is also an AMR and can occur outside of the peri-operative period, but most commonly within 6 months after transplant. The diagnosis is confirmed by a renal biopsy.
- The goal of therapy is early antibody elimination with IVIG, pheresis, or a combination of modalities. However, evidence for therapies used in AMR are generally of low quality and protocols vary between transplant centers. PLEX and IVIG are generally regarded as a standard of care for acute active AMR. Rituximab has also been suggested as a treatment option by KDIGO guidelines.[64]

- One study assessed the use of tocilizumab as rescue therapy in 36 kidney transplant patients with chronic AMR who failed standard-of-care treatment with IVIG and rituximab, with or without plasma exchange. Tocilizumab was administered as 8 mg/kg monthly, with a maximal dose of 800 mg for 6 to 25 months. Graft- and patient- survival rates were 80% and 91% at six years post treatment, respectively.[66]
- In a small pilot study (N=10), patients who did not respond to desensitization with IVIG and rituximab (+/- plasma exchange) who were given tocilizumab 8 mg/kg on day 15 then monthly for 6 months with IVIG had a decrease in donor specific antibodies.[67]

Coronavirus-19 (COVID-19)[68 69]

- Baricitinib is FDA-approved for the treatment of COVID-19 in hospitalized adults requiring supplemental oxygen, non-invasive or invasive mechanical ventilation, or extracorporeal membrane oxygenation (ECMO) when used to treat COVID-19. Dosing is limited to 14 days or until hospital discharge, whichever occurs first.[9]
- The evidence for baricitinib in COVID-19 is based primarily on two, large, randomized control trials in hospitalized COVID-19 patients requiring oxygen support. Although the compositive endpoint of progression and mortality was no different between baricitinib or placebo when added to standard of care, there was a statistically significant difference in mortality between groups. When compared to remdesivir alone, baricitinib plus remdesivir reduced the time to recovery as well as composite endpoint of progression or death. However, applicability is limited as patients were not on standard of care corticosteroids. Patients in the trial stopped baricitinib upon discharge or after 14 days, whichever occurred first.
- There is no available safety and efficacy data supporting the use of baricitinib in COVID-19 in the outpatient setting.

Cytokine Release Syndrome (CRS)

- Tocilizumab IV is FDA-approved for the treatment of cytokine release syndrome associated with the use of chimeric antigen receptor (CAR) T cell therapy, such as Kymriah (tisagenlecleucel) and Yescarta (axicabtagene ciloleucel). It is given as a one-time weight-based dose but up to three additional doses may be administered if there is no clinical improvement.
- Subcutaneous tocilizumab and sarilumab, another IL-6 inhibitor, have not been studied in cytokine release syndrome.

Pyoderma Gangrenosum [70 71]

- Pyoderma gangrenosum (PG) is a rare ulcerative skin condition that is often associated with underlying systemic disease.
- First-line options for PG typically are systemic corticosteroids, cyclosporine, or tacrolimus. Infliximab is considered a second-line option when there has been an inadequate response to first-line therapy.
- Infliximab or other targeted DMARD therapy may be used when there is an underlying co-diagnosis of an inflammatory condition, such as ulcerative colitis.

Sarcoidosis

- Sarcoidosis is a multisystem granulomatous disorder characterized by the presence of granulomas in involved organs. It most commonly impacts the lungs and lymph nodes but may manifest in other organs. [72]

- Corticosteroid therapy is used as the primary treatment. Second-line medication options are considered for patients with corticosteroid-refractory disease, and include csDMARDs such as azathioprine, methotrexate, and leflunomide. Targeted DMARD therapy with infliximab is reserved for patients who have not responded to prior csDMARDs. [72 73]

Systemic Sclerosis-Associated Interstitial Lung Disease (SSc-ILD)

- SSc-ILD is an autoimmune condition characterized by immune dysregulation, vasculopathy, and overproduction of collagen. This leads to leading to skin and internal organ fibrosis and thickening of the pulmonary interstitium.
- Establishing an accurate diagnosis of ILD is very important, since misdiagnosis can lead to inappropriate therapy. In general, the diagnosis of interstitial lung disease (idiopathic or due to underlying lung disease) can be made with a high degree of confidence in patients with a compatible clinical presentation and typical high-resolution computed tomography (HRCT) findings.
- Cyclophosphamide, mycophenolate, and other immunomodulators are recommended as initial therapy. Mycophenolate mofetil is often preferred in practice as it has comparable benefit to cyclophosphamide but has a better toxicity profile. Escalation of therapy to biologic or targeted therapy is recommended if there is an inadequate treatment response to initial therapies.[74 75]
- Actemra (tocilizumab) has been shown to slow the rate of decline in pulmonary function in patients with SSc-ILD. While promising, additional data on survival, hospitalization, and quality of life is needed.[36]
- Intravenous administration of Actemra (tocilizumab) is not approved for SSc-ILD. [36]

Takayasu arteritis

- Takayasu arteritis is a rare type of vasculitis where inflammation damages the aorta. Takayasu arteritis is complex and requires specialist management to accurately diagnosis and manage the condition.
- High dose corticosteroids in combination with csDMARDs are recommend as the initial treatment. Targeted DMARD therapy with tocilizumab or infliximab is recommended as second-line options in patients with persistent symptoms despite combination therapy of corticosteroids with a csDMARD, as well as for patients who are unable to taper off corticosteroids. [76]
- Tocilizumab has been evaluated at doses of 8 mg/kg intravenously every 4 weeks or 162 mg subcutaneously weekly. There is limited information on the efficacy of higher doses. [76-79]

Uveitis [80]

- Corticosteroids are the mainstay of therapy in uveitis. Guidelines recommend a high dose course (prednisone 1 mg/kg/day or up to 60-80 mg per day) for up to one month.
- A csDMARD is recommended if there is no response, or worsening, after two to four weeks of steroids. American Academy of Ophthalmology (AAO) guidelines recommend mycophenolate mofetil, azathioprine, methotrexate, cyclosporine, or tacrolimus. There is insufficient comparative evidence to conclude superiority of one csDMARD over another.

- Targeted DMARDs are recommended in patients who have had an inadequate response to corticosteroids and csDMARDs.
    * Adalimumab is FDA approved for uveitis and recommended as a treatment option in AAO guidelines. Adalimumab has been shown to lower flare rates and loss of visual acuity in two phase 3 RCTs in patients with active uveitis despite high-dose corticosteroids.
    * Infliximab is also a recommended treatment option for uveitis based on evidence from several comparative, open-label trials.

Safety Considerations

- In general, the overall safety profiles of targeted DMARDs for chronic inflammatory diseases is favorable. However, several have warnings related to infection risk and hypersensitivity reactions. [51 81-83] All are immunosuppressants and increase the risk of infection, though some drugs may increase the risk more than others.
- Certain products have unique safety concerns that should be factored into the overall risk-benefit profile.
- Oral JAK1/2/3 inhibitors (tofacitinib, upadacitinib, baricitinib, and abrocitinib) contain a boxed warning for increased risk of serious infections, mortality, malignancies, major adverse cardiovascular events, and thrombosis. In a post-marketing safety study, tofacitinib did not meet its primary endpoint of non-inferiority for risk of cardiovascular events and malignancy. Results showed that patients who received tofacitinib at either 5 mg or 10 mg twice daily had a higher rate of cardiovascular events and malignancy compared to patients who received a TNF inhibitor. Though the study only evaluated tofacitinib the warning has been extended to other JAK1/2/3 inhibitors used in the treatment of RA and other inflammatory diseases. [33 53 84-86]
    * The boxed warning is based on a safety study designed to evaluate the safety of tofacitinib relative to TNF inhibitors. The study included patients aged 50 or older with at least one CV risk factor and all patients received background MTX. Patients were randomized to one of three groups: tofacitinib 5 mg twice daily, tofacitinib 10 mg twice daily, or a TNF inhibitor.
    * The study failed to meet its pre-specified safety endpoint of non-inferiority to TNF inhibitors for risk of cardiovascular events and malignancy.
    * The prescribing information for each JAK1/2/3 inhibitor has been updated to clarify that each JAK1/2/3 inhibitor is only indicated for to certain patients who have not responded or cannot tolerate one or more TNF blockers.[53]
    * The FDA continues to investigate these safety concerns and will provide updates as additional information becomes is available.
    * The risks and benefits of JAK1/2/3 inhibitors in patients at risk for venous thromboembolism should be carefully considered when choosing treatment strategies.
- JAK1/2/3 inhibitors have boxed warnings describing an increased risk of thrombosis. Due to this risk, the use of JAK1/2/3 inhibitors is limited to patients who have failed prior treatment options. There are several alternative targeted agents for the treatment of RA that do not carry a risk for VTE and have longer records of safety experience with comparable or better efficacy than baricitinib. [33]

- While newer agents such as IL-23 inhibitors and IL-17 inhibitors, have demonstrated favorable risk-benefit profiles in clinical studies there is limited long-term safety experience. Additionally, there is limited evidence directly comparing to existing standards of care. [51 81-83]
- New or worsening heart failure is listed as a warning and precaution for TNF inhibitors. A clinical trial evaluating etanercept for the treatment of heart failure was terminated early due to lack of efficacy and suggested higher morality in etanercept-treated patients compared to placebo. Post-market, new or worsening heart failure have been reported with TNF inhibitors.

Dose Escalation

- There are no randomized, controlled trials to support dose escalation of ustekinumab from every 8 to 12 weeks to every four-week dosing in any condition. It is uncertain if there is any additional benefit with increased dosing and there is limited long-term safety data.
  * The evidence supporting the use of every four-week dosing in CD is limited to retrospective, observational studies. [87 88] While some patients experienced disease remission, high-quality, prospective studies are needed to identify the ideal population and clarify the risk-benefit profile. Due to limited evidence supporting use, more frequent dosing of ustekinumab for CD is limited to patients who have had an inadequate response to every 8-week dosing.
  * There are no high-quality studies evaluating the use of every 4-week dosing of ustekinumab in PsO.
  * Additional studies are also needed to clarify the role of dose escalation versus standard dosing or other mechanisms of action.
- Guidelines do not currently support the use of therapeutic drug monitoring of ustekinumab to guide dose escalation.
  * There is very limited evidence on the efficacy of different maintenance troughs for ustekinumab. [89 90]
  * While therapeutic drug monitoring may play a role in the management of TNF inhibitors, the same concepts may not apply to ustekinumab due to its different mechanism of action and pharmacokinetic properties.
- Phase 3 clinical trials of vedolizumab for UC and CD included maintenance dosing intervals of every 4 weeks and every 8 weeks (with a dose of 300 mg). The results demonstrated that the two maintenance doses produce similar response rates. In long-term extension studies some patients who had an inadequate response to every 8-week dosing were able to achieve a response or regain response after increasing to every 4-week dosing. Therefore, the use of every 4-week dosing is limited to patients who have lost response or have had an inadequate response to every 8-week dosing.
- In PsO, there was no statistically significant difference in response for patients who were dose escalated to secukinumab 300 mg every 2 weeks vs every 4 weeks in patients who had suboptimal response to standard dosing at 16 weeks. After 16 weeks, most patients who continued with a 4-week dosing interval were able achieve response.[91]
- Pharmacokinetic and exposure-response modeling suggest shortening the dosing interval for golimumab IV to every 6 weeks may ameliorate waning efficacy toward the end of the standard 8-week dosing interval experienced by a small proportion of patients.[92]

Appendix 1: Relative Potencies of Topical Corticosteroids [93]

Class	Drug	Dosage Form	Strength (%)
Very High Potency	Augmented betamethasone dipropionate	Ointment	0.05
	Clobetasol propionate	Cream, foam, ointment	0.05
	Diflorasone diacetate	Ointment	0.05
	Halobetasol propionate	Cream, ointment	0.05
High Potency	Amcinonide	Cream, lotion, ointment	0.1
	Augmented betamethasone dipropionate	Cream	0.05
	Betamethasone dipropionate	Cream, foam, ointment, solution	0.05
	Desoximetasone	Cream, ointment	0.25
	Desoximetasone	Gel	0.05
	Diflorasone diacetate	Cream	0.05
	Fluocinonide	Cream, gel, ointment, solution	0.05
	Halcinonide	Cream, ointment	0.1
	Mometasone furoate	Ointment	0.1
	Triamcinolone acetonide	Cream, ointment	0.5
Medium Potency	Betamethasone valerate	Cream, foam, lotion, ointment	0.1
	Clocortolone pivalate	Cream	0.1
	Desoximetasone	Cream	0.05
	Fluocinolone acetonide	Cream, ointment	0.025
	Flurandrenolide	Cream, ointment	0.05
	Fluticasone propionate	Cream	0.05
	Fluticasone propionate	Ointment	0.005
	Mometasone furoate	Cream	0.1
	Triamcinolone acetonide	Cream, ointment	0.1
Lower Medium Potency	Hydrocortisone butyrate	Cream, ointment, solution	0.1
	Hydrocortisone probutate	Cream	0.1
	Hydrocortisone valerate	Cream, ointment	0.2
	Prednicarbate	Cream	0.1
Low Potency	Alclometasone dipropionate	Cream, ointment	0.05
	Desonide	Cream, gel, foam, ointment	0.05
	Fluocinolone acetonide	Cream, solution	0.01
Lowest Potency	Dexamethasone	Cream	0.1
	Hydrocortisone	Cream, lotion, ointment, solution	0.25, 0.5, 1
	Hydrocortisone acetate	Cream, ointment	0.5-1

Appendix 2: Absolute and Relative Contraindications for Phototherapy/Photochemotherapy

History of melanoma or squamous-cell carcinoma
History of photosensitivity
Increased risk of photosensitivity due to concomitant disease state (e.g., porphyria, systemic lupus erythematosus) or chronic medication use (e.g., tetracycline or sulfonamide antibiotics)
Physical inability to stand for the required exposure time
Presence of premalignant lesions (e.g., actinic keratosis)
Presence of psoriatic arthritis
Treatment of facial or scalp lesions
Treatment of lesions in the groin area
Treatment of lesions on the palms of the hands or soles of the feet, or on nail beds
Type 1 or type 2 skin

Appendix 3: Select List of Conventional Synthetic Disease Modifying Anti-Rheumatic Drugs (csDMARDs)

csDMARDS for Rheumatic, Skin Conditions, and Uveitis	
Azathioprine (AZA; Imuran)	Methotrexate (oral, injectable)*
Cyclosporine (CSA; Gengraf, Neoral, Sandimmune)*	Mycophenolate (MMF; CellCept, Myfortic)
Hydroxychloroquine (HCQ; Plaquenil)	Sulfasalazine (SSZ; Azulfidine)
Arava (leflunomide)	Soriatane (acitretin) *
csDMARDs for Gastrointestinal conditions	
Azathioprine (AZA; Imuran)	Mercaptopurine (6-MP; Purinethol)
Balsalazide (Colazal, Giazo)	Mesalamine (Apriso, Asacol HD, Delzicol, Lialda, Pentasa)
Cyclosporine (CSA; Gengraf, Neoral, Sandimmune)	Sulfasalazine (SSZ; Azulfidine)

*: Medications used in the treatment of dermatologic conditions

Appendix 4: American College of Rheumatology (ACR) Classification Criteria for Establishing the Diagnosis of Rheumatoid Arthritis (RA) [94 95]

Diagnosis of RA requires the presence of at least 4 of 7 criteria below:	
1.	Morning stiffness in and around joints lasting more than 1 hour.
2.	Arthritis in at least 1 area in a wrist or proximal interphalangeal (PIP) joint (hands or fingers) for > 6 weeks.
3.	Simultaneous swelling or fluid accumulation in 3 or more joints for > 6 weeks.
4.	Symmetric (bilateral joint) involvement for > 6 weeks.
5.	Presence of rheumatoid nodules.
6.	Positive serum rheumatoid factor.
7.	Radiographic changes typical of RA (erosion or unequivocal bony decalcification in or adjacent to the involved joint) on hand and wrist present.

Appendix 5: American College of Rheumatology (ACR) Assessment Components for Improvement in Rheumatoid Arthritis (RA) [96]

-	Tender joint count.
-	Swollen joint count.
-	Patient's assessment of pain.
-	Patient's global assessment of disease activity.
-	Physician's global assessment of disease activity.
-	Patient's assessment of physical function.
-	Acute phase reactant measures (erythrocyte sedimentation rate or C-reactive protein levels).

Appendix 6: American College of Rheumatology (ACR) Classification Criteria for Establishing the Diagnosis of Giant Cell Arteritis (GCA)

Diagnosis of GCA requires the presence of at least 3 of 5 criteria below:	
1.	Morning stiffness in and around joints lasting more than 1 hour.
2.	New onset of localized headache.
3.	Temporal artery tenderness or decreased temporal artery pulse.
4.	Erythrocyte sedimentation rate of 50 mm per hour or greater.
5.	Abnormal temporal artery biopsy.

Revision History

Revision Date	Revision Summary
6/20/2024	Effective 10/1/2024 • Added new Spevigo (spesolimab) SC formulation for maintenance treatment of generalized pustular psoriasis (GPP). • Added biosimilar Simlandi (adalimumab-ryvk) to policy as preferred. • Added unbranded products adalimumab-adbm, adalimumab-ryvk (Quallent Pharmaceuticals), and adalimumab-adaz (Cordavis) to policy as not medically necessary. • Added Tofidence IV (tocilizumab-bavi) to policy as non-preferred. • Added Tyenne IV (tocilizumab-aazg) to policy as preferred. • Added Entyvio SC (vedolizumab) to policy as non-preferred (Level 3) self-administered option for Crohn's disease (CD). • Updated Entyvio SC (vedolizumab) criteria for ulcerative colitis (UC) after two Level 1 or 2 alternatives (previously required three Level 1 or 2 alternatives). • Added Rinvoq (upadacitinib) as a Level 2 product for polyarticular juvenile idiopathic arthritis (PJIA), a new FDA indication. • Added Rinvoq LQ (upadacitinib) new oral solution to policy at parity with Rinvoq.
3/21/2024	Effective 7/1/2024 • Changed Amjevita (adalimumab-atto) [all NDCs] from preferred to non-preferred adalimumab product. • Changed Sotyktu (deucravacitinib) from a Level 3 to a Level 2 self-administered option for chronic plaque psoriasis. • Added Omvoh (mirikizumab-mrkz), Velsipity (etrasimod), and Entyvio SC (vedolizumab) to policy as non-preferred (Level 3) self-administered options for ulcerative colitis (UC). The provider-administered loading doses for Omvoh will follow coverage of the self-administered product. • Added Bimzelx (bimekizumab-bkzx) to policy as a non-preferred (Level 4) self-administered option for chronic plaque psoriasis. • Updated to reflect Avsola (infliximab-axxq) as a preferred infliximab product and Zymfentra (infliximab-dyyb) as a non-preferred infliximab product (for Crohn's disease and ulcerative colitis). • Updated background to include pouchitis and collagenous colitis. • Added Cosentyx (secukinumab) for treatment of hidradenitis suppurativa. • Updated Adbry (tralokinumab) atopic dermatitis age restriction from 18 years of age to 12 years of age based on FDA age expansion. • Updated cross references to include Medications for multiple sclerosis, dru753 and removed both Zeposia (ozanimod), dru674 and Tysabri (natalizumab), dru111 which were both moved to dru753.

Revision Date	Revision Summary
12/7/2023	Effective 1/1/2024 • Added Litfulo (ritlecitinib) to policy for alopecia areata (AA). • Modified criteria for Olumiant (baricitinib) to allow coverage for alopecia areata (AA) • Added new Cosentyx (secukinumab) IV formulation to policy criteria and QL for AS, nrSpA, and PsA. • Removed Cosentyx (secukinumab) lyophilized powder vials for subcutaneous administration as these vials were discontinued. • Made Cibinqo (abrocitinib) a Level 1 treatment option for atopic dermatitis at parity with Adbry (tralokinumab-ldrm) and Rinvoq (upadacitinib)
09/14/2023	Effective 12/1/2023: • Added non-preferred biosimilar Yuflyma (adalimumab-aaty) to the policy. • Modified the QL for SC Actemra (tocilizumab) for treatment of SJIA.
6/1/2023	Effective 7/1/2023: • Modified Cibinqo (abrocitinib) coverage in atopic dermatitis to include ages down to 12 years. • Add preferred adalimumab biosimilars: Hadlima (adalimumab-bwwd), and the Amjevita (adalimumab-atto) biosimilars with NDCs beginning with 55513. • Added Kevzara (sarilumab) to policy for polymyalgia rheumatica (PMR) as a level 1 option. • Added Rinvoq (upadacitinib) to policy for Crohn's disease as a level 2 option.
12/9/2022	Effective 1/19/2023: • Added Spevigo (spesolimab-sbzo) to the policy for generalized pustular psoriasis (GPP) as a provider-administered option. • Added Sotyktu (deucravacitinib) to policy for plaque psoriasis (PsO) as a level 3 self-administered option. • Skyrizi (risankizumab-rzaa) quantity limit updated to include new 180 mg maintenance dose for Crohn's Disease (CD). • Rinvoq (upadacitinib) added to policy for non-radiographic axial spondyloarthritis (Nr-axSpA) as a level 2 self-administered option. Taltz (ixekizumab) product group renamed level 3 (previously named level 2) in Nr-axSpA.
8/29/2022	Effective 10/1/2022: • Modified Rinvoq (upadacitinib) and Xeljanz/Xeljanz XR (tofacitinib) for ulcerative colitis (UC) to be level 2 self-administered options. • Added Skyrizi (risankizumab-rzaa) to policy for Crohn's Disease (CD) as a level 1 self-administered and provider-administered option. • Modified step therapy criteria for level 2 self-administered options for Crohn's Disease (CD). • Added Olumiant (baricitinib) to policy for COVID-19 as not medically necessary (NMN) when used in the outpatient setting. • Added Olumiant (baricitinib) to policy for alopecia areata (AA) as a cosmetic contract exclusion.

Revision Date	Revision Summary
5/23/2022	Effective 6/14/2022: • Removed Kineret (anakinra) and infliximab products from Table 2. • Updated policy formatting and added HCPCS codes for provider-administered products. • Added Rinvoq (upadacitinib) to policy for ulcerative colitis (UC) as a level 3 option. • Added Rinvoq (upadacitinib) to policy for ankylosing spondylitis (AS) as a level 2 option. • Added Adbry (tralokinumab-ldrm) to policy for atopic dermatitis (AD) as a level 1 option. • Added Cibinqo (abrocitinib) to policy for atopic dermatitis (AD) as a level 2 option. • Added Actemra (tocilizumab) IV to policy for Giant Cell Arteritis (GCA). • Updated policy to allow dosing escalation of Simponi Aria (golimumab) to every 6 weeks. • Updated Entyvio (vedolizumab) for Crohn's Disease (CD) to a level 1 option.
2/22/2022	Effective 3/13/2022: • Added Rinvoq (upadacitinib) to policy for psoriatic arthritis (PsA) as a level 2 option. • Added Skyrizi (risankizumab-rzaa) to policy for psoriatic arthritis (PsA) as a level 1 option. • Added tofacitinib (Xeljanz/ Xeljanz XR) to policy for ankylosing spondylitis (AS) as a level 2 option. Cimzia (certolizumab pegol) syringes. • Simponi (golimumab) SC, and Taltz (ixekizumab) were moved to level 3. • Added coverage criteria for Rinvoq (upadacitinib) for atopic dermatitis (AD). • Added coverage criteria for Enbrel (etanercept), Humira (adalimumab), Cosentyx (secukinumab), and Simponi (golimumab) for enthesitis-related arthritis (ERA). • Added coverage criteria for intravenous Actemra (tocilizumab) for solid organ transplant, antibody mediated rejection (AMR). • Added criteria to allow coverage of intravenous Orencia (abatacept) for prophylaxis of graft versus host disease (GVHD). • Yusimry (adalimumab-aqvh) added to policy as a non-preferred adalimumab product. • Wording for intravenous Actemra (tocilizumab) criteria for cytokine release syndrome (CRS) was modified to allow for coverage as part of CAR-T treatment plan. • Updated position statement to clarify that non-TNFs may be an option for New York Heart Association (NYHA) class III/IV heart failure (HF) based on guidelines and post-market reports of new or worsening HF with TNF inhibitors.

Revision Date	Revision Summary
10/15/2021	Effective 1/1/2022: • Revised nomenclature for preferred and non-preferred products. • Updated step therapy requirements for Rinvoq (upadacitinib) and Xeljanz (tofacitinib) for rheumatoid arthritis. • Clarified dosing of Cosentyx (secukinumab). • Added coverage criteria for Actemra (tocilizumab) for Systemic Sclerosis-Associated Interstitial Lung Disease (SSc-ILD). • Updated step therapy requirements for Siliq (brodalumab). • Updated preferred infliximab products. • Added Janssen (infliximab) to policy as non-preferred. • Clarified dosing and uses for Cosentyx (secukinumab) vials.
7/19/2021	Effective 10/1/2021: • Moved Kineret (anakinra) from this policy to new combination Interleukin-1 Antagonists policy (dru677). • Simplified severity criteria for rheumatoid arthritis (RA). Removed specific ineffectiveness requirements. • Updated diagnostic requirements for systemic juvenile idiopathic arthritis (SJIA). Now require disease activity for at least 6 weeks instead of 6 months. • Updated Skyrizi (risankizumab-rzaa) quantity limits for newly available 150 mg syringes.
4/21/2021	• Reformatted policy. • Added Otezla (apremilast) to the policy and archived its standalone policy (dru342 Otezla, apremilast). • Added coverage criteria for Kineret (anakinra) for Deficiency of the Interleukin-1–Receptor Antagonist (DIRA). • Added coverage criteria for sarcoidosis and Takayasu Arteritis. • Clarified that combination therapy with any targeted immunomodulator is considered investigational. • Updated investigational uses. • Updated quantity limits for pediatric ulcerative colitis.
1/20/2021	• Added coverage criteria for Xeljanz (tofacitinib) in PJIA. Updated quantity limits to include Xeljanz (tofacitinib). • Added coverage criteria for Entyvio (vedolizumab) in immune-mediated colitis. • Clarified definition of investigational uses. • Remove term “Preferred” in criterion “P” table to limit confusion with trade. • Split “non-preferred” criteria for self-administered UC drugs into separate criterion for Xeljanz and Simponi.

Revision Date	Revision Summary
10/28/2020	Effective 1/1/2021: • Revised step therapy requirements: - Taltz (ixekizumab) no longer requires a trial of Cimzia (certolizumab pegol) for AS. - Tremfya (guselkumab) is now considered a preferred product for PsA. - Actemra (tocilizumab) now requires step therapy with adalimumab for PJIA and RA. - Enbrel (etanercept) is now considered a preferred medication for chronic plaque psoriasis (PsO). - Stelara (ustekinumab) is now considered a preferred product for UC (self-administered and provider-administered). - Entyvio (vedolizumab) is now considered a preferred provider-administered product for UC. • Added Hulio (adalimumab-fkjp) to policy. • Added Simponi Aria as a preferred provider-administered option for polyarticular juvenile idiopathic arthritis (PJIA), a newly approved FDA indication. • Increased authorization limit for infliximab in immune-mediated colitis to two infusions.

8/25/2020	Effective 10/1/2020: • Separated AS, HS, PJIA, and uveitis sections into separate provider-administered and self-administered sections. • Revised clinical documentation requirements. • Updated quantity limits for Cimzia (certolizumab pegol), Taltz (ixekizumab), and Cosentyx (secukinumab) based on newly FDA approved indications. • Removed references to appendix 3 in policy criteria and listed requirements for prior conventional therapies directly in criteria. • Ankylosing spondylitis: - Cimzia and Simponi will continue to require step therapy through two preferred products. - Taltz will now require step therapy through three preferred products. • Non-Radiographic Axial Spondyloarthritis: - New diagnosis category in policy. - Non-preferred products (e.g., Taltz) will require step therapy through two preferred products. • Chronic Plaque Psoriasis: - Non-biologic-step-therapy requirements changed from "BSA ≥ 10% AND phototherapy AND conventional DMARD" to "BSA ≥ 10% OR phototherapy OR conventional agent." - Conventional agent list expanded from just DMARDs to also include treatments such as topical corticosteroids. - Enbrel will no longer be a preferred product and will require step therapy with Humira (unless the patient is under 18 years of age). - Siliq and Cimzia will now only require step therapy with two preferred products. • **Crohn's Disease:** Self-administered Cimzia will require step therapy with Humira specifically. • Hidradenitis Suppurativa - Removed requirement for disease severity. - Removed requirement for functional impairment. - Expanded list of acceptable step therapies from only antibiotics to also include corticosteroids, hormonal therapies, metformin, and retinoids. • Polyarticular Juvenile idiopathic Arthritis - Actemra SC will require step therapy with Humira specifically. - Orencia SC will require step therapy with Humira, Enbrel, and Actemra specifically. • Psoriatic Arthritis: - Xeljanz will now be a preferred product. - Added Tremfya as a non-preferred product. • **Rheumatoid Arthritis:** Actemra and Xeljanz will now be preferred products. • **Systemic juvenile idiopathic arthritis:** Expanded list of acceptable step therapies from only conventional DMARDs to

Revision Date	Revision Summary
	also include NSAIDs. • **Ulcerative Colitis:** Self-administered Stelara will no longer be a preferred product and will require step therapy with Humira. • **Uveitis:** Expanded list of acceptable step therapies from only systemic corticosteroids to also include periocular intravitreal corticosteroids.
4/22/2020	• Added continuation of therapy (COT) criteria. • Added Avsola (infliximab-axxq) and Abrilada (adalimumab-afzb) to policy. • Updated quantity limits for Cosentyx (secukinumab) in axial Spondyloarthritis/ankylosing spondylitis. • Updated dosing for Xeljanz XR (tofacitinib) in ulcerative colitis. • Clarified criteria for preferred provider-administered options for ulcerative colitis.
10/23/2019	• Rinvoq (upadacitinib) has been added as a preferred self-administered option for RA (new FDA approval). • Simponi (golimumab) has been changed to a non-preferred product for AS, PsA, RA, and UC. • Taltz (ixekizumab) has been added as a non-preferred option for axial Spondyloarthritis/ankylosing spondylitis (new FDA indication). • Stelara (ustekinumab) has been added as a preferred option for UC. • Actemra (tocilizumab) subcutaneous and intravenous dosing has been revised to match the prescribing information. • Removed site of care requirements for immune-mediated colitis, as an acute management indication. • Clarified Olumiant (baricitinib) quantity limits to state 30 tablets per 30 days.
7/24/2019	• Dosing and quantity limits have been simplified and reformatted. • Skyrizi (risankizumab-rzaa) has been added as a preferred self-administered option for plaque psoriasis. • Tremfya (guselkumab) is now preferred for psoriasis. • Entyvio (vedolizumab) now requires prior of one preferred option instead of two when used for CD. • Clarified timeframe for an adequate trial of csDMARDs in multiple indications. • Added atopic dermatitis as an investigational use for Olumiant (baricitinib). • Clarified requirements for Humira (adalimumab) and Enbrel (etanercept) biosimilars. • Simplified requirements for Actemra (tocilizumab) in GCA. • Removed requirement that csDMARDs are given with targeted agents for RA. • Reformatted investigational and NMN use sections (no changes to intent).
5/7/2019	Removed Xeljanz (tofacitinib) step therapy for psoriatic arthritis (PsA) and rheumatoid arthritis (RA). Added to list of non-preferred options for PsA and RA.

Revision Date	Revision Summary
11/16/2018	• Clarified investigational dosing for Cosentyx (secukinumab). • Added coverage criteria for Cimzia (certolizumab pegol) as non-preferred, provider-administered option for PsO. • Clarified that any dose escalation above the quantity limit is considered investigational, unless listed in coverage criteria.
8/17/2018	• Updated indications for Cimzia (certolizumab pegol), Taltz (ixekizumab), and tofacitinib (Xeljanz/Xeljanz XR). • Updated Actemra (tocilizumab) dosage forms and indications to match prescribing information. • Added coverage criteria for Ilumya (tildrakizumab-asmn) as a non-preferred, provider-administered option for PsO. • Added coverage criteria for Olumiant (baricitinib) as a non-preferred, self-administered option for RA. • Updated coverage criteria for infliximab biosimilars to state that they must meet all criteria for the reference product and there must be a documented contraindication or intolerance to the reference product. • Added additional criteria for severe CD. • Clarified reauthorization requirements for adalimumab when used for HS. • RA: Clarified that targeted agents must initially be administered with a csDMARD. • UC: Aligned criteria for steroids and csDMARDs for provider-administered and self-administered sections. • Updated nomenclature for each drug class. • Clarified that provider-administered medications may be reviewed for continued authorization. • Added coverage criteria for pyoderma gangrenosum.
3/1/2018	Added Cimzia (certolizumab pegol) to the site of care program.
2/1/2018	• Updated indications for Simponi Aria (golimumab) and Orencia (abatacept). • Revised dosing intervals for Entyvio (vedolizumab). • Added coverage Actemra (tocilizumab) for cytokine release syndrome due to with chimeric antigen receptor T cell therapy. • Clarified that use of Stelara (ustekinumab) every four weeks is considered investigational. • Clarified that the use of multiple courses of Stelara (ustekinumab) IV loading doses for Crohn's disease is considered investigational.
1/1/2018	• Updated preferred and non-preferred products for all indications. • Removed Otezla (apremilast) from policy. • Clarified Cosentyx (secukinumab) dosing.

Revision Date	Revision Summary
8/11/2017	• Added coverage criteria for Kevzara (sarilumab), as a non-preferred self-administered option for RA. • Added coverage criteria for subcutaneous Actemra (tocilizumab) for GCA. • Added coverage criteria for Orencia (abatacept) for PsA and updated JIA coverage criteria to include SC dosing. • Added coverage criteria for Tremfya (guselkumab), as a non-preferred self-administered option for PsO. • Added Renflexis (infliximab-abda) to policy. • UC: revised step therapy requirements for Entyvio (vedolizumab).
5/12/2017	• Added coverage criteria for Siliq (brodalumab), as a non-preferred self-administered option for PsO. • Clarified step therapy for "self-administered UC treatments." • Updated dose and quantity limits for Taltz (ixekizumab) and Cosentyx (secukinumab). • Added the following as investigational uses: - Scleroderma (any branded medication). - Use of Otezla (apremilast) in combination with targeted immunomodulators for any indication.
12/16/2016	• Updated preferred and non-preferred products for all indications. • Added Inflectra (infliximab-dyyb) to policy. • Updated investigational uses. • CD: Added Stelara (ustekinumab) and revised quantity limits for infliximab. • UC: Revised quantity limits for infliximab.
4/8/2016	• AS: added Cosentyx (secukinumab), changed to diagnosis to axial SpA. • PsO: added Taltz (ixekizumab), updated step therapy requirements nonpreferred drugs. • Added criteria for Giant Cell Arteritis and Hidradenitis Suppurativa. • PsA: Updated step therapy requirements for non-preferred drugs, added secukinumab. • Updated language for combination uses with an oral DMARD for infliximab and golimumab (IV). • Added Xeljanz XR to policy. • Updated investigational uses.
1/8/2016	Updated formatting of biologics policies, consolidating into a single policy for chronic inflammatory diseases.

Drug names identified in this policy are the trademarks of their respective owners.

Medication Policy Manual | **Policy No:** dru445

Topic: Imlygic, talimogene laherparepvec | **Date of Origin:** February 12, 2016

Committee Approval Date: September 14, 2023 | **Next Review Date:** 2024

Effective Date: December 1, 2023

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Imlygic (talimogene laherparepvec) is an oncolytic immunotherapy indicated for the treatment of unresectable melanoma lesions in patients with recurrent melanoma after initial surgery. Imlygic (talimogene laherparepvec) is injected directly into melanoma lesions by a healthcare provider in a clinic setting.

Policy/Criteria

Most contracts require pre-authorization approval of Imlygic (talimogene laherparepvec) prior to coverage.

I. Continuation of therapy (COT): Imlygic (talimogene laherparepvec) may be considered medically necessary for COT when criterion A, B, or C below is met.

A. For diagnoses NOT listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND there is documentation that the medication was covered by another health plan. Examples of documentation include the coverage approval letter from the previous health plan or paid claim.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

B. For diagnoses listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

C. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

***Please note**: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Imlygic (talimogene laherparepvec) may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) that criteria A through D below are met.

A. A diagnosis of recurrent, unresectable, advanced melanoma (stage III or stage IV-M1a). If disease is metastatic (stage IV-M1a), the metastases only involve sites on the skin, subcutaneous tissue, or lymph nodes.

AND

B. The patient is not immunocompromised (including chronic use of antivirals, systemic corticosteroids at doses of >10 mg prednisone or equivalent, or any medications causing bone marrow suppression).

AND

C. Imlygic (talimogene laherparepvec) is used after initial surgical treatment for melanoma.

AND

D. Imlygic (talimogene laherparepvec) will be used as monotherapy.

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers Imlygic (talimogene laherparepvec) coverable only under the medical benefit (as a provider-administered medication).

B. When pre-authorization is approved, Imlygic (talimogene laherparepvec) will be covered in quantities as follows:

1. **Initial Authorization:** Imlygic (talimogene laherparepvec) may be covered in quantities up to 48 mL per 6 months.

2. **Continued Authorization:** Imlygic (talimogene laherparepvec) may be covered in quantities up to 48 mL per 6 months.

C. Authorization shall be reviewed as follows to confirm that the current medical necessity criteria are met, and that the medication is effective.

1. Initial authorization shall be reviewed at 6 months.

2. Continued authorization or re-authorization (after the initial 6-month period) shall be reviewed every 6 months. Clinical documentation (including, but not limited to chart notes) must indicate that there is a partial or complete tumor response (reduction in lesion size) and the absence of visceral organ metastases.

IV. Imlygic (talimogene laherparepvec) is considered not medically necessary when used for all other conditions, including but not limited to:

A. Early-stage melanoma (stage I or II).

B. Cosmetic indications.

V. Imlygic (talimogene laherparepvec) is considered investigational when used for all other conditions, including but not limited to:

A. Metastatic melanoma with systemic disease or visceral metastases (stage IV-M1b or stage IV-M1c).

B. Breast cancer.

C. Squamous cell carcinoma of the head and neck (SCCHN).

D. Pancreatic cancer.

E. Use in combination with any other anticancer therapies.

Position Statement

Summary

- Imlygic (talimogene laherparepvec) is used for the treatment of melanoma lesions when there is recurrence of the melanoma after initial resection. It is injected directly into the lesion by a trained healthcare provider.
- The intent of this policy is to cover Imlygic (talimogene laherparepvec) for the indication and regimen for which it has been shown to be safe and effective, as detailed in the coverage criteria.
- One study found that patients (stage IIIB, IIIC, and IV-M1a) treated with Imlygic (talimogene laherparepvec) had a decrease in melanoma lesion size compared to patients treated with granulocyte macrophage colony-stimulating factor (GM-CSF). [1]
- Imlygic (talimogene laherparepvec) has not been shown to improve overall survival or prevent metastasis of disease. Additionally, it has not been shown to provide any benefit in patients with disease that has spread to internal organs.
- Patients who have problems with their immune system or are required to use medications that affect their immune system should not take Imlygic (talimogene laherparepvec). Since Imlygic (talimogene laherparepvec) has not been studied in these patients, the safety in this population is uncertain and there is an increased risk of severe infection. [2]
- Imlygic (talimogene laherparepvec) has not been studied in combination with other therapies. The safety and effectiveness of combination treatment is uncertain.
- The safety and effectiveness of Imlygic (talimogene laherparepvec) in conditions other than melanoma has not been studied.
- The recommended dose of Imlygic (talimogene laherparepvec) is an initial dose of up to 4 mL of a 10^6 PFU/mL injection, followed by a second dose of up to 4 mL of a 10^8 PFU/mL injection in three weeks. Subsequently, the recommended dose is up to 4 mL of a 10^8 PFU/mL injection every two weeks. The safety and effectiveness of higher doses has not been established. [2]

Regence Pharmacy Services performs independent analyses of oncology medication evidence, to establish coverability per the contracts with the health plan.

- Most contracts define coverability based on established clinical benefit in published, peer-reviewed literature, along with consideration of regulatory status.
- FDA approval does not in itself establish medical necessity, as unpublished, low-quality evidence, including exploratory analyses and unvalidated surrogate endpoints, may be used as the basis of approval. Regulatory approval may or may not reflect clinical benefit relative to standard of care and the recommendations of expert clinical advisors such as the Oncologic Drugs Advisory Committee (ODAC). FDA approvals generally do not consider cost compared to established therapies, or value to members.
- Likewise, NCCN clinical practice guidelines assignment of a recommendation (category 1, 2a, or 2b) does not necessarily establish medically necessity. NCCN recommendations

are inconsistently supported by published, peer-reviewed literature and do not uniformly consider value of new therapies relative to existing potentially higher-value treatment options, considering effectiveness, safety, and cost.

- Medication coverage criteria are developed based on the 'medical necessity' assessment, as described above.

Regence Pharmacy Services analysis and coverage policy may differ from FDA labeled indication and/or NCCN clinical practice guidelines.

Clinical Efficacy

- The safety and efficacy of Imlygic (talimogene laherparepvec) was investigated in one open-label trial (OPTiM trial) in patients with stage IIIB, IIIC, or IV, unresectable melanoma. Patients were randomized to receive either Imlygic (talimogene laherparepvec) or GM-CSF (Leukine [sargramostim]) for 24 weeks, or until there were no remaining lesions that qualified for continued treatment. [1,3]
    * Among Imlygic (talimogene laherparepvec)-treated patients, 16% achieved durable response (complete or partial response maintained continuously for at least 6 months), compared to 2.1% among GM-CSF-treated patients. [1,2]
    * Efficacy is based on shrinking cutaneous lesions, a surrogate endpoint.
    * Imlygic (talimogene laherparepvec) failed to show improvement in overall survival based on pre-specified primary analysis in the clinical trial. [1,3]
- The National Comprehensive Cancer Network (NCCN) guidelines for melanoma lists Imlygic (talimogene laherparepvec) as a recommended option for the local treatment of lesions in patients with stage III and stage IV-M1a disease. [4]

Not Medically Necessary Uses

- There is a lack of evidence that Imlygic (talimogene laherparepvec) is safer or more effective than other treatments for stage I and II melanoma such as chemotherapies, systemic immunotherapies, or targeted therapies.
- The use of Imlygic (talimogene laherparepvec) for cosmetic indications is considered not medically necessary.

Investigational Uses

- A subgroup analysis of the open-label OPTiM trial found no difference in DRR or OS for patients who were treated with Imlygic (talimogene laherparepvec) compared to patients in the control arm if they had stage IV-M1b and stage IV-M1c melanoma. There is no evidence that Imlygic (talimogene laherparepvec) has an effect on systemic disease or visceral metastases. [1]
- A small, phase 2 study evaluated Imlygic (talimogene laherparepvec) as a neoadjuvant therapy (prior to surgical resection) in patients with resectable stage IIIB/IIIC-IVM1a cutaneous melanoma. The primary endpoint was relapse-free survival (RFS). RFS has not been shown to positively correlate with clinically relevant outcomes such as overall

survival or quality of life. Use of Imlygic (talimogene laherparepvec) in the neoadjuvant setting is considered investigational. It is currently approved for use and covered in this population in the adjuvant setting (after surgery). [5]

- Imlygic (talimogene laherparepvec) has not been studied in patients with less common types of melanoma, including primary ocular or mucosal melanoma. [2]
- Imlygic (talimogene laherparepvec) is currently being studied in other cancers. There is no reliable evidence (well-designed, randomized, double-blinded trials) supporting its use in cancers other than melanoma.
- Although Imlygic (talimogene laherparepvec) is being studied for the treatment of breast cancer, pancreatic cancer, and SCCHN, there is currently no published evidence supporting its safety or efficacy in this setting. [6]
- The safety and efficacy of Imlygic (talimogene laherparepvec) in combination with other therapies is uncertain and is therefore considered investigational.
    * A randomized, double-blind study evaluated Imlygic (talimogene laherparepvec) as an add-on therapy to Keytruda (pembrolizumab) in patients with unresectable, advanced-stage melanoma. There was no improvement in PFS or OS with Imlygic (talimogene laherparepvec) plus Keytruda (pembrolizumab) relative to Keytruda (pembrolizumab) alone. [7]

Safety [2]

- Safety information is primarily derived from the pivotal OPTiM trial. Median duration of treatment was 23 weeks (range 0.1-78.9 weeks) among patients treated with Imlygic (talimogene laherparepvec).
- The most commonly reported AEs (> 20% incidence) include: flu-like symptoms, fatigue, chills, pyrexia, nausea, injection site pain, and vomiting. An overwhelming majority (90%) of patients treated with Imlygic (talimogene laherparepvec) experienced flu-like symptoms. These reactions were more frequent in the first 3 cycles of treatment and resolved within 3 days of onset.
- Severe AEs included cellulitis, impaired wound healing, and immune-mediated disease (e.g., glomerulonephritis).
- Imlygic (talimogene laherparepvec) is contraindicated in immunocompromised patients, including those with a history of primary or acquired immunodeficient states, leukemia, lymphoma, AIDS, or other clinical manifestations of infection with human immunodeficiency viruses, and those on immunosuppressive therapy, due to the risk of life-threatening disseminated herpetic infection.
- The safety and efficacy of Imlygic (talimogene laherparepvec) has not been studied in patients requiring chronic use of antivirals, systemic corticosteroids at doses of >10 mg prednisone or equivalent, or any medications causing bone marrow suppression.

Revision History

Revision Date	Revision Summary
9/14/2023	No criteria changes with this annual review.
9/23/2022	There were no changes to coverage criteria with this annual review.
10/15/2021	• COT language updated (no change to intent). • No changes to the coverage criteria with this annual review.
10/28/2020	• Continuation of care language was added to the policy. • There were no changes to the intent of the existing coverage criteria.
10/23/2019	No changes to coverage criteria with this annual update.
09/21/2018	No changes to coverage criteria with this annual update.
08/11/2017	No changes to coverage criteria with this annual update.
02/17/2017	Added coverage for stage IV-M1a disease, clarified reauthorization criteria. Moved stage IV-M1b-M1c to investigational from NMN.
02/11/2016	New policy

Medication Policy Manual **Policy No:** dru463

Topic: Tecentriq, atezolizumab **Date of Origin:** July 15, 2016

Committee Approval Date: September 19, 2024 **Next Review Date:** 2025

Effective Date: January 1, 2025

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Tecentriq (atezolizumab) is an intravenously administered immunotherapy used in the treatment of various cancers. It belongs to a class of medications called programmed death-ligand (PD-L1) blocking antibodies.

Policy/Criteria

Most contracts require pre-authorization approval of Tecentriq (atezolizumab) prior to coverage.

I. Continuation of therapy (COT): Tecentriq (atezolizumab) may be considered medically necessary for COT when criterion A, B, or C below is met.

A. For diagnoses NOT listed in the coverage criteria below, criteria 1 and 2 below must be met:

1. The patient was established on therapy prior to current health plan membership AND there is documentation that the medication was covered by another health plan. Examples of documentation include the coverage approval letter from the previous health plan or paid claim.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

B. For diagnoses listed in the coverage criteria below, criteria 1 and 2 below must be met:

1. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

C. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

Please note*: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Tecentriq (atezolizumab) may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) that one of the following criterion A through E below is met.

A. A diagnosis of **non-small cell lung cancer** (NSCLC) when criterion 1 or 2 below are met:

1. **NSCLC, metastatic (stage IV) disease**, when criteria a and b below are met.

a. One of the following criteria are met (i or ii):

i. There is either no prior use of PD-1 inhibitors or PD-L1 inhibitors (see *Appendix 1*).

OR

ii. Documented prior use of Tecentriq (atezolizumab) with NO progression of disease while on Tecentriq (atezolizumab) adjuvant therapy.

AND

b. Tecentriq (atezolizumab) will be used in one of the following settings (i, ii, or iii):

i. As **monotherapy in the first-line setting** when the tumor has high PD-L1 expression. High PD-L1 expression is defined as PD-L1 stained ≥ 50% of tumor cells [TC ≥ 50%] or PD-L1 stained tumor-infiltrating immune cells [IC] covering ≥ 10% of the tumor area [IC ≥ 10%]).

OR

ii. As **combination-therapy in the first-line setting** when criteria 1 and 2 below are met:

1. The tumor is an adenocarcinoma (non-squamous).

AND

2. Use is initiated in combination with chemotherapy, such as a platin and taxane.

OR

iii. As **monotherapy in the recurrent setting** when there has been disease progression on or after a platin-containing chemotherapy regimen.

OR

2. **NSCLC, stage II-IIIA disease, as adjuvant therapy,** when all criteria (a through e) below are met.

a. Used in the adjuvant setting, after complete tumor resection.

AND

b. Used as a monotherapy.

AND

c. Documentation of PDL1 expression is provided. PD-L1 expression is defined as PD-L1 stained ≥1% of tumor cells [TC ≥1%]

AND

d. There is clinical documentation of previous adjuvant platinum-containing chemotherapy, unless the patient is ineligible for any platinum-containing chemotherapy (such as cisplatin or carboplatin).

AND

e. There is either no prior use of PD-1 inhibitors or PD-L1 inhibitors (see *Appendix 1*), including but not limited to use of Opdivo (nivolumab) in the neoadjuvant setting.

PLEASE NOTE: Any platinum ineligibility may include poor kidney function, poor performance status (Eastern Cooperative Oncology Group [ECOG] score ≥2), heart failure, other comorbidities, etc.).

OR

B. A diagnosis of **small cell lung cancer** (SCLC), extensive-stage (ES), when criteria 1, 2, and 3 below are met:

1. No prior systemic treatment for extensive-stage SCLC (not including any systemic treatment for early/limited-stage SCLC).

AND

2. Use will be initiated in combination with carboplatin and etoposide.

AND

3. No prior use of PD-1 inhibitors or PD-L1 inhibitors (see *Appendix 1*).

OR

C. A diagnosis of **hepatocellular carcinoma** (HCC), unresectable or metastatic, when criteria 1, 2, and 3 below are met:

1. Patient has a Child-Pugh score of 5 to 6 (class A) [provider attestation].

AND

2. No prior systemic therapy for HCC.

AND

3. No prior use of PD-1 inhibitors or PD-L1 inhibitors (see *Appendix 1*).

OR

D. A diagnosis of **cutaneous melanoma**, unresectable or metastatic, when criteria 1, 2, and 3 below are met:

1. The cancer is BRAF V600 mutation-positive.

AND

2. Tecentriq (atezolizumab) will be administered in combination with Zelboraf (vemurafenib) and Cotellic (cobimetinib).

AND

3. No prior use of PD-1 inhibitors or PD-L1 inhibitors (see *Appendix 1*).

OR

E. A diagnosis of **alveolar soft part sarcoma (ASPS)**, unresectable or metastatic, when criteria 1, 2, and 3 below are met:

1. Prior surgical resection, unless the tumor is unresectable (attestation).

AND

2. Tecentriq (atezolizumab) will be used as a monotherapy.

AND

3. No prior use of PD-1 inhibitors or PD-L1 inhibitors (see *Appendix 1*).

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers Tecentriq (atezolizumab) coverable only under the medical benefit (as a provider-administered medication).

B. When pre-authorization is approved, Tecentriq (atezolizumab) will be authorized in quantities as follows in Table 1 below:

Table 1. QL and Authorization Period

Diagnosis	Dose	Total Coverable Duration of Therapy
Adjuvant NSCLC	Up to a maximum of 420 mg per 7 days (as 840 mg every 14 days, 1200 mg every 21 days, or 1680mg every 28 days)	For 24 weeks, until disease progression, up to 12 months
All other covered diagnoses	Up to a maximum of 420 mg per 7 days (as 840 mg every 14 days, 1200 mg every 21 days, or 1680mg every 28 days)	For 24 weeks, until disease progression

Key: NSCLC: non-small cell lung cancer

C. Reauthorization: Authorization **shall** be reviewed at least every 24 weeks for documented benefit. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met. Specifically, documentation that the medication is providing clinical benefit, including disease stability or improvement, and lack of disease progression, based on an assessment of change in tumor burden. If there is documentation of potential disease progression, a shortened authorization (up to three months) may be approved to allow time for clarification of response to Tecentriq (atezolizumab), including clinical re-evaluation of the patient and reimaging.

PLEASE NOTE: Additional doses of Tecentriq (atezolizumab) will not be authorized without a documented recent assessment by the treating provider (such as oncologist) with objective evidence of response to therapy, such as by re-imaging and use of iRECIST criteria.

IV. Tecentriq (atezolizumab) is considered not medically necessary when used for, EGFR- or ALK-mutated NSCLC as a second-line therapy, after progression on EGFR-or ALK-directed therapy.

V. Tecentriq (atezolizumab) is considered investigational when administered concomitantly with other anti-cancer immuno-, targeted-, and chemotherapies with the exception of those specifically addressed in the coverage criteria above.

VI. Tecentriq (atezolizumab) is considered investigational when used for all other conditions, including but not limited to:

A. Renal cell carcinoma (RCC).

B. Breast cancer (including TNBC and HER-2 positive).

C. Urothelial carcinoma (bladder cancer).

D. Prostate cancer.

E. Ovarian cancer.

F. Soft tissue sarcoma (STS), other than specifically listed above in the coverage criteria.

Position Statement

Summary

- Tecentriq (atezolizumab) is an intravenously (IV) administered programmed death-ligand 1 (PD-L1) blocking antibody (immunotherapy) used in the treatment of several types of cancers.
- The intent of this policy is to cover Tecentriq (atezolizumab) in settings where it has been shown to be safe and effective, as detailed in the coverage criteria, with consideration for other available treatment options.
    * Where there is lack of proven additional benefit and/or lack of demonstrated health outcome (such as overall survival or improved quality of life) relative to alternative therapies, use of Tecentriq (atezolizumab) alone or in combination with other therapies is not coverable ("not medically necessary" or "investigational").
    * It is important to note that the fact that a medication is FDA approved for a specific indication does not, in itself, make the treatment medically reasonable and necessary.
- Many of the clinical indications for immunotherapies (PD-1, PD-L1, and others) have been approved by the FDA and endorsed by clinical guidelines based on surrogate measures such as overall tumor response rate (ORR), disease-free survival (DFS), and progression-free survival (PFS) which are not proven to accurately predict clinically important outcomes such as improved overall survival or improved quality of life.
- *PD-L1 expression testing*: is required for coverage of many clinical indications for PD-1 and PD-L1 inhibitors.
    * There are several ways in which PD-L1 expression can be defined. In addition, how PD-L1 expression is defined varies by tumor type and setting.
    * PD-L1 expression is determined by the FDA-approved companion diagnostic testing, based on both the specific PD-1/PD-L1 inhibitor and the tumor type.
- However, PD-L1 test results are not interchangeable across PD-1/PD-L1 inhibitors and/or indications. There is no conversion available from one type of test to another, such as combined positive score (CPS) versus tumor proportion score (TPS) versus percent of tumor cells (TC). Therefore, the correct test must be conducted for proper selection of patient populations for a given use. National Comprehensive Cancer Network (NCCN) guidelines recommend Tecentriq (atezolizumab) as a potential option in each of the treatment settings listed in the coverage criteria. In general, NCCN recommendations parallel the FDA approved indications.
- The PD-1 and PD-L1 inhibitors have the potential to cause immune-mediated adverse reactions that can result in pneumonitis, colitis, hepatitis, endocrinopathies, and nephritis.

- Tecentriq (atezolizumab) is IV administered as a 1200 mg dose every three weeks. Alternative dosing regimens include 840 mg IV every two weeks or 1680mg IV every four weeks.
- Optimal sequencing of chemotherapy and immunotherapy in many cancers is unknown or the data is evolving. At this time, sequential use of immunotherapies is not supported by current evidence. Specifically, there is no evidence to support the sequential use of different PD-1 or PD-L1 inhibitors once there is disease progression on prior PD-1 or PD-L1 inhibitor therapy, as well as use of adjuvant PD-1/PD-L1 inhibitor after neoadjuvant PD-1/PD-L1 inhibitor therapy (unless explicitly listed in the coverage criteria). Therefore, the use of sequential courses of PD-1/PD-L1 immunotherapy is not coverable.
- There are ongoing studies using Tecentriq (atezolizumab) in a variety of other cancers. However, although initial evidence may be promising, the potential for clinical benefit in these conditions is still being investigated.
- *FDA Indications withdrawn*
    * The FDA indication for urothelial carcinoma (bladder cancer) was withdrawn after a confirmatory trial failed to demonstrate any clinical benefit in this treatment setting. As a result, the coverage of Tecentriq (atezolizumab) for bladder cancer is considered investigational.
    * Locally advanced or metastatic, PD-L1-positive, triple negative breast cancer (TNBC), front-line, in combination with Abraxane (nab-paclitaxel).
    * Confirmatory trials failed to demonstrate any clinical benefit in these treatment settings. As a result, the coverage of Tecentriq (atezolizumab) for these settings is considered investigational.
- *Reauthorization Criteria*: When coverage criteria are met, Tecentriq (atezolizumab) is authorized for six months (24 weeks) of therapy, after which time documentation must be provided to establish that the medication is effective. Specifically, there must be documentation of clinical benefit, including disease stability or improvement and there is a lack of disease progression, based on an assessment of change in tumor burden. Documentation of benefit must include an assessment of the most recent imaging ("restaging scans") and/or re-biopsy by the treating oncologist.

Regence Pharmacy Services performs independent analyses of oncology medication evidence, to establish coverability per the contracts with the health plan.

- Most contracts define coverability based on established clinical benefit in published, peer-reviewed literature, along with consideration of regulatory status.
- FDA approval does not in itself establish medical necessity, as unpublished, low-quality evidence, including exploratory analyses and unvalidated surrogate endpoints, may be used as the basis of approval. Regulatory approval may or may not reflect clinical benefit relative to standard of care and the recommendations of expert clinical advisors such as the Oncologic Drugs Advisory Committee (ODAC). FDA approvals generally do not consider cost compared to established therapies, or value to members.
- Likewise, NCCN clinical practice guidelines assignment of a recommendation (category 1, 2a, or 2b) does not necessarily establish medically necessity. NCCN recommendations

are inconsistently supported by published, peer-reviewed literature and do not uniformly consider value of new therapies relative to existing potentially higher-value treatment options, considering effectiveness, safety, and cost.

- Medication coverage criteria are developed based on the 'medical necessity' assessment, as described above.

Regence Pharmacy Services analysis and coverage policy may differ from FDA labeled indication and/or NCCN clinical practice guidelines.

CLINICAL EFFICACY

Non-Small Cell Lung Cancer (NSCLC)

Adjuvant therapy – NSCLC

- Tecentriq (atezolizumab), as a single agent, demonstrated improved disease-free survival (DFS) relative to best supportive care in the adjuvant setting for patients with stage II-IIIA NSCLC after complete tumor resection and standard adjuvant therapy with a platinum-based chemotherapy regimen and, if the tumor is ≥1% PD-L1 positive, defined as PD-L1 stained ≥1% of tumor cells [TC ≥1%]. Patients in the experimental arm received Tecentriq (atezolizumab) every 3 weeks for 16 cycles unless disease recurrence or unacceptable toxicity occurred. [1 2]
    * Patients in the trial received a median of four cycles of adjuvant cisplatin-based chemotherapy after complete resection.
    * Prior use of PD-1/PD-L1 inhibitors was not allowed, such as in the neoadjuvant setting.
    * Although patients with TC >1% PD-L1 expression demonstrated a DFS benefit, patients with a high PD-L1 expression (TC ≥ 50%) appeared to have the most significant DFS benefit based on a pre-determined subgroup analysis.
    * DFS is not a validated endpoint in adjuvant NSCLC and has not been correlated to meaningful clinical outcomes such as overall survival.
- The National Comprehensive Cancer Network (NCCN) NSCLC treatment guideline lists Tecentriq (atezolizumab) as an option in the adjuvant setting for completely resected stage IIB-IIIA or high-risk stage IIA PD-L1 ≥ 1% NSCLC in patients who received previous adjuvant chemotherapy. [3]

Front-line therapy (as monotherapy) - NSCLC:

- The approval of Tecentriq (atezolizumab) as a front-line agent (as monotherapy) for metastatic NSCLC with high PD-L1 expression was based on an open-label (not blinded), phase 3 trial [IMpower110 study] that compared Tecentriq (atezolizumab) with platinum doublet chemotherapy. [2 4]
    * Patients previously treated with PD-1/PD-L1 inhibitors, including in the neoadjuvant, adjuvant, or advanced setting were excluded from inclusion in the trial.
    * The primary endpoint of OS was tested hierarchically according to PD-L1 expression status. Only those in the high PD-L1 expression group (defined as PD-L1 stained ≥ 50% of tumor cells [TC ≥ 50%] or PD-L1 stained tumor-infiltrating

immune cells [IC] covering ≥ 10% of the tumor area [IC ≥ 10%] met the prespecified efficacy boundary.

  * At interim, a seven-month improvement in median OS was reported in the Tecentriq (atezolizumab) arm for patients with high PD-L1 expression.
  * Patients with EGFR or ALK aberrations were enrolled in the trial after progression on ALK/EGFR-directed therapies, but excluded from the primary analysis. In an exploratory analysis, monotherapy with Tecentriq (atezolizumab) was not superior to use of chemotherapy. Therefore, the use of Tecentriq (atezolizumab) for NSCLC after EGFR- or ALK-directed therapy is considered 'not medically necessary' and not coverable.

- Tecentriq (atezolizumab) monotherapy is listed in the NCCN NSCLC guideline as a preferred, recommended therapy among other immunotherapies, for metastatic NSCLC with high PD-L1 (>50%) expression) and no driver mutations. [3]

Front-line therapy, in combination with chemotherapy plus bevacizumab - NSCLC:

- The approval of Tecentriq (atezolizumab) as a front-line therapy for non-squamous metastatic NSCLC was based on a randomized, open-label (not blinded), phase 3 trial
- [IMpower150] that compared atezolizumab (A, Tecentriq)/ carboplatin (C)/ paclitaxel (P)/bevacizumab (B) [ABCP] with BCP alone in patients with metastatic, non-squamous NSCLC. [5]
  * Patients with EGFR or ALK aberrations were excluded from inclusion in the trial.
  * A 4-month survival advantage was reported in the ABCP group relative to the BCP group, with a median OS of 19.2 months, and 7.0 months, respectively [HR 0.71; 95% CI, 0.59, 0.85; p = 0.0002].
  * There were many threats to the reliability of these results, including the lack of blinding and numerous protocol changes during the trial which altered the predetermined efficacy analysis (high potential for bias in the results).
  * Despite the positive OS results, it is not known whether the addition of bevacizumab to Tecentriq (atezolizumab) plus platin-based chemotherapy is superior to Tecentriq (atezolizumab) plus platin-based chemotherapy alone, or whether the additional risks with this multi-drug regimen are acceptable, as ABCP was not formally compared with ACP. However, the median OS for these two groups was numerically similar suggesting a lack of any survival benefit (19.2 months and 19.4 months, respectively). Furthermore, it is not known if the addition of Tecentriq (atezolizumab) to platin-based chemotherapy is superior to platin-based chemotherapy alone. This is an area of ongoing investigation.
  * Additionally, the lack of formal comparison between the ABCP and ACP groups does not allow for an accurate assessment of the potential added safety risks when bevacizumab is added to an immunotherapy-based regimen.
- The NCCN NSCLC treatment guideline lists Keytruda (pembrolizumab)/cisplatin/Alimta (pemetrexed) as a preferred category 1 recommendation for front-line use in metastatic, non-squamous NSCLC. Tecentriq (atezolizumab)/carboplatin/paclitaxel/bevacizumab is listed as an 'other' category 1 recommendation. [3]

Front-line therapy, in combination with a platinum plus a taxane – NSCLC:

- Tecentriq (atezolizumab) was also approved as part of a front-line regimen for non-squamous metastatic NSCLC based on a randomized, open-label (not blinded), phase 3 trial that compared Tecentriq (atezolizumab) plus nab-paclitaxel and carboplatin with nab-paclitaxel and carboplatin with or without pemetrexed switch maintenance. [6]
    * Most patients had no EGFR or ALK aberrations.
    * Tecentriq (atezolizumab) was initiated with chemotherapy (carboplatin and nab-paclitaxel) as induction and then continued as monotherapy versus carboplatin plus nab-paclitaxel induction followed by pemetrexed switch maintenance or best supportive care (BSC).
    * The Tecentriq (atezolizumab) treatment arm demonstrated improved overall survival relative to the chemotherapy arm, with a 4.7-month improvement in median OS and 1.5-month improvement in median PFS.
    * It was noted that the combination of Tecentriq (atezolizumab) with chemotherapy may add additional toxicity relative to either therapy alone.
    * Applicability of the results to patients with squamous histology or patients with EGFR or ALK genetic aberrations cannot be determined as the sample size for these groups was too small.
    * The NCCN NSCLC treatment guideline lists Tecentriq (atezolizumab) plus carboplatin and nab-paclitaxel in the first-line, non-squamous, metastatic NSCLC setting as one of several 'other recommended' therapy options. [3]

Subsequent-line therapy (after disease progression on platinum-based front-line therapy) - NSCLC:

- Tecentriq (atezolizumab), as a single agent, demonstrated improved OS relative to docetaxel in patients with locally advanced or metastatic NSCLC who had disease progression after standard therapy with a platinum-based chemotherapy regimen and, if the tumor was EGFR- or ALK-positive, an appropriate tyrosine kinase inhibitor. [7 8]
    * A three- to four-month improvement in median overall survival was demonstrated with Tecentriq (atezolizumab) relative to docetaxel. Benefit was noted regardless of PD-L1 expression.
    * Prior treatment with PD-1/PD-L1 inhibitors was not allowed.
- The National Comprehensive Cancer Network (NCCN) NSCLC treatment guideline lists Tecentriq (atezolizumab), Opdivo (nivolumab), and Keytruda (pembrolizumab) among preferred category 1 recommendations for locally advanced or metastatic NSCLC that progressed on or after standard front-line therapy when there has been no prior use of anti-PD-1/PD-L1 therapy. [3]

Small Cell Lung Cancer (SCLC)

- The initial approval in SCLC was based on the results of a phase 3 RCT [IMpower133] that compared Tecentriq (atezolizumab) plus chemotherapy (carboplatin plus etoposide) with chemotherapy alone (placebo arm) in patients with untreated, extensive-stage SCLC (ES-SCLC). There was a small, but statistically significant difference in the 1-year survival rate that favored patients in the Tecentriq (atezolizumab) treatment arm. [2 9]

    * Subjects included in the study had no prior treatment for extensive-stage SCLC. If they had prior treatment for limited-stage SCLC, they had to have been treated with curative intent and must have had a treatment-free interval of at least 6 months since their last chemotherapy, radiotherapy, or chemoradiotherapy.
    * Patients with untreated or symptomatic CNS metastasis were not included in the study.
    * Tecentriq (atezolizumab) was initiated with carboplatin plus etoposide (given for four cycles) and was then continued as maintenance until disease progression.
    * Overall survival at 12 months was 51.7% and 38.2% in the Tecentriq (atezolizumab) and placebo arms, respectively [HR 0.70; 95% CI: 0.54, 0.91; p = 0.007]. Median OS was 12.3 months [95% CI: 10.8, 15.9] and 10.3 months [95% CI: 9.3, 11.3], respectively. No p-value was reported for the medians. Because the confidence intervals overlap, the meaningfulness of these findings is difficult to interpret.
- The NCCN SCLC guidelines include front-line use of Tecentriq (atezolizumab) as a preferred treatment option as initial therapy for ES- SCLC based on this data. [3]
- Optimal sequencing of chemotherapy and immunotherapy in SCLC has not been studied. Sequential use of immunotherapies is not supported by current evidence.
- Other Neuroendocrine Tumors: Neuroendocrine tumors include a variety of tumor types, such as GI tract bronchopulmonary (including SCLC), thymic, and pancreatic, among others. [10] Although SCLC is classified as a neuroendocrine tumor. Tecentriq (atezolizumab) is coverable only for neuroendocrine that is "managed as SCLC" per guidelines or trial evidence. There is insufficient evidence at this time to conclude safety or efficacy of Tecentriq (atezolizumab) for any other type of neuroendocrine tumor, aside from SCLC.

Hepatocellular carcinoma (HCC)

- The initial approval in HCC was based on the results of one open-label, phase 3 RCT [IMbrave150] in patients with previously untreated, unresectable, or metastatic HCC. [2 11]
    * The trial compared Tecentriq (atezolizumab) given in combination with bevacizumab with Nexavar (sorafenib) as a monotherapy.
    * All patients included in the study had Child-Pugh (CP) class A disease. The trial excluded sicker patients (Class B and C; see Appendix 2).
    * An early analysis of overall survival (OS) favored Tecentriq (atezolizumab) plus bevacizumab over Nexavar (sorafenib),With median OS reached in the Nexavar (sorafenib) arm at 13.2 months but not been reached in the Tecentriq (atezolizumab) plus bevacizumab combination arm at 17 months.
    * Subsequently, an updated analysis after 12 additional months reported median OS of 19.2 months with Tecentriq (atezolizumab) plus bevacizumab and 13.4 months with Nexavar (sorafenib). [12]
    * It is unknown how Tecentriq (atezolizumab) plus bevacizumab compares to either agent alone in this setting. In addition, the safety and efficacy of Tecentriq (atezolizumab) in combination with medications other than noted above is

unknown. A phase 3 trial of Tecentriq (atezolizumab) in combination with Cometriq (cabozantinib) was non-inferior to Nexavar (sorafenib) monotherapy. [13]

- The NCCN guidelines include the front-line use of Tecentriq (atezolizumab) plus bevacizumab among treatment options as an initial systemic therapy for advanced HCC. [3]
- Various rating scales may be used to estimate degree of hepatic dysfunction with chronic liver disease. In the IMbrave150 trial for HCC, the Child-Pugh (CP) score for cirrhosis mortality was used to screen for HCC patients with less severe liver disease. The CP score is an estimate of chronic liver disease and cirrhosis and is used as a prognostic indicator. Points are assigned for markers of hepatic dysfunction, including liver function tests, ascites, and encephalopathy. CP score is reported as a range, given it is an estimation assigned by the treating provider. Based on score, a CP class is assigned. The lower end of the reported range may be used as a marker for illness/prognosis (e.g., CP A6/B7 meets intent of coverage criteria of class A) (see Appendix 2).

Cutaneous Melanoma, BRAF mutation-positive

- The approval of Tecentriq (atezolizumab) in BRAF mutation-positive cutaneous melanoma is based on a large, double-blind, placebo-controlled RCT [IMspire150 study] that compared Tecentriq (atezolizumab) plus Zelboraf (vemurafenib) plus Cotellic (cobimetinib) with placebo plus Zelboraf (vemurafenib) plus Cotellic (cobimetinib). [2 14]
  * Subjects in the study had unresectable stage IIIC or stage IV (metastatic) cutaneous melanoma with a BRAF V600 mutation.
  * All patients were naïve to prior systemic therapy in the metastatic disease setting.
  * There was a PFS advantage of approximately four and a half months in the Tecentriq (atezolizumab) versus the placebo treatment arm [15.1 months and 10.6 months, respectively]. These results were statistically significant; however, the clinical meaningfulness of this difference is not known.
  * The OS data in this trial are not yet mature. No statistical difference in survival between the two therapy arms has been detected to date.
- Due to the design of this study and the current lack of proven clinical benefit, it is not known if adding Tecentriq (atezolizumab) to front-line BRAF inhibitors is superior to waiting to use anti-PD-1/PD-L1 therapies in the subsequent-line setting in BRAF mutation-positive melanoma. This should be considered in the decision when choosing a front-line therapy as sequential use of anti-PD-1/PD-L1 therapies is not covered by the health plan.
- The NCCN cutaneous melanoma guideline includes the use of Tecentriq (atezolizumab) in combination with Zelboraf (vemurafenib) and Cotellic (cobimetinib) among recommended options for the front-line treatment of BRAF mutation-positive metastatic or unresectable melanoma. [3]

Alveolar soft part sarcoma (ASPS)

- Alveolar soft part sarcoma (ASPS) is a very rare type of soft tissue sarcoma (STS) (less than 1% of all STS).

- The approval of Tecentriq (atezolizumab) in advanced ASPS is based one unpublished, non-randomized, multicenter, single-arm phase 2 trial in 49 patients with ASPS not curable by surgery (ML39345). [2 15]
    * All enrolled patients had prior surgery and were stage IV at the time of diagnosis.
    * A majority had prior other treatments (55% more than one), including radiation therapy (55%), chemotherapy (53%).
    * The primary outcome was overall response rate (ORR) (24%). Twelve patients (24%) had a partial response, and none had a complete response.
- The NCCN soft tissue sarcoma guideline includes the use of Tecentriq (atezolizumab) among preferred recommended options for unresectable or metastatic ASPS. [3]

REAUTHORIZATION

- When coverage criteria are met, Tecentriq (atezolizumab) is authorized for six months (24 weeks) of therapy, after which time documentation must be provided to establish that the medication is effective. Specifically, there must be documentation of clinical benefit, including disease stability or improvement and there is a lack of disease progression, based on an assessment of change in tumor burden.
    * The standard of care for evaluation of response to cancer immunotherapy, such as Tecentriq (atezolizumab), is use of the iRECIST criteria for assessment of tumor burden. [16]
    * The iRECIST criteria include use of quantitative and qualitative criteria for assessment of change in tumor burden for target lesions and non-target lesions. [17]
        - Quantitative measurements for target lesions (tumor size and % change)
        - Qualitative evaluation for non-target lesions (present/disappeared/ unequivocal progression)
    * Documentation of benefit must include an assessment of the most recent imaging ("restaging scans") by the treating oncologist. Given the complexity of the evaluation, including use of the iRECIST criteria, Tecentriq (atezolizumab) will not be reauthorized without an assessment of response to therapy, such a partial response (iPR), complete response (iCR), or stable disease (iSD).
    * Use of immunotherapy may result in pseudoprogression, due to immune and T-cell activation, which can appear similar to tumor flare. If there is documentation of potential disease progression ["unconfirmed progressive disease (iUPD)"], a shortened authorization (up to three months) may be approved to allow time for clarification of response to Tecentriq (atezolizumab), including clinical re-evaluation of the patient and reimaging. Guidelines recommend reimaging for iUPD after 4-8 weeks.
    * If a patient has confirmed, unequivocal new lesions (progression of disease, iPD), additional Tecentriq (atezolizumab) is not coverable. If a new lesion is equivocal, iUPD reassessment by the treating oncologist with repeat imaging would apply (as noted above).

NON-COVERED USES

Triple Negative Breast Cancer (TNBC)

- Trials of Tecentriq (atezolizumab) in TNBC have demonstrated variable results such that the benefit of Tecentriq (atezolizumab) in TNBC remain uncertain at this time.
- Front-line advanced [locally advanced (unresectable) or metastatic] treatment setting:
  * The FDA indication for use as a front-line therapy for locally advanced or metastatic, PD-L1-positive, triple negative breast cancer (TNBC) when used in combination with Abraxane (nab-paclitaxel) was withdrawn after a confirmatory trial failed to demonstrate any clinical benefit in this treatment setting. As a result, the coverage of Tecentriq (atezolizumab) for TNBC is considered investigational.
  * The rationale is as follows:
    - Tecentriq (atezolizumab) in combination with Abraxane (nab-paclitaxel) is FDA approved as a first-line therapy for locally advanced (unresectable) or metastatic TNBC (mTNBC) when the tumor expresses PD-L1.
    - However, this combination regimen has not adequately been demonstrated to provide any additional benefit, or to have an acceptable safety profile over, other coverable treatment options. The confirmatory trial failed to demonstrate any clinical benefit in this treatment setting. As a result, the coverage of Tecentriq (atezolizumab) for TNBC is considered investigational.
    - Accelerated FDA approval was granted based on an exploratory analysis, which found a small improvement in progression-free survival (PFS) in patients with tumors that express PD-L1; however, no difference in overall survival, or any other clinically relevant outcome, was demonstrated. [2 18]
    - As is the case with medications approved via the FDA accelerated process, further studies are required to show that the medication improves a clinically relevant outcome, such as improved survival or quality of life, before regular (continued) approval is granted.
    - While post-hoc subgroup analyses suggested a potential benefit in the PD-L1 positive population, this result was not statistically significant by the predefined endpoints in the trial (using *a priori* study criteria). [18 19]
    - There is a known potential for toxicity with PDL-1 inhibitors, including Tecentriq (atezolizumab).
    - In summary, given a modest improvement in a surrogate endpoint (PFS), a failure in the confirmatory trial to find an improvement in health outcomes (no proven overall survival benefit), conflicting data from other trials in this setting, risk of harms with PD-L1 inhibitors, and the availability of several other treatment options, the use of Tecentriq (atezolizumab) for front-line treatment mTNBC is considered investigational.

* The study upon which the accelerated FDA approval for advanced TNBC was based [IMpassion130 study] compared front-line use of Tecentriq (atezolizumab) plus Abraxane (nab-paclitaxel) versus Abraxane (nab-paclitaxel) alone in patients with unresectable locally advanced, or metastatic TNBC. Subjects were enrolled, regardless of PD-L1 expression. [2 18]
    - Accelerated approval was granted based on an improvement in PFS in the combination arm relative to the Abraxane (nab-paclitaxel) alone (placebo) arm. The initial primary endpoint was PFS in the intent-to-treat population. The primary endpoint was later modified to evaluate the PD-L1-positive population.
    - The median PFS was 7.5 months and 5.0 months (HR 0.62 [95% CI: 0.49, 0.78]; p<0.001), respectively in the PD-L1 positive cohort (PD-L1 [IC] ≥ 1%).
    - The trial was not able to demonstrate improvement in median OS or any other clinically relevant outcome, such as symptom control or quality of life. As with all medications approved via the FDA accelerated pathway, continued approval is contingent on additional trials that demonstrate clinical benefit.
    - Updated results from the second interim analysis again reported no statistically significant improvement in OS in the pre-specified ITT population. The significance of the OS difference in the PD-L1 positive cohort is unknown, as statistical testing was not possible for this exploratory analysis. [19]
    - Overall, there was a small increase in grade 3 and 4 adverse effects when Tecentriq (atezolizumab) was added to Abraxane (nab-paclitaxel). Additionally, immune reactions requiring systemic corticosteroids occurred in 13% of subjects in the Tecentriq (atezolizumab) arm.
* In addition to the use of a non-validated surrogate endpoint with unknown clinical relevance, there were several potential sources of bias in the trial that may overstate potential for benefit including a higher rate of Abraxane (nab-paclitaxel) discontinuation from the placebo arm for reasons other than meeting a study endpoint.
* Subsequently, other trials of Tecentriq (atezolizumab) have demonstrated variable results such that the benefit of Tecentriq (atezolizumab) in first-line treatment of unresectable TNBC remain uncertain ('investigational') at this time.
    - The FDA issued a safety warning after OS reportedly favored placebo plus paclitaxel over Tecentriq (atezolizumab) plus paclitaxel in the first-line treatment of locally advanced/metastatic setting in the IMpassion-131 trial. [20]
    - Further data in the metastatic setting from the IMpassion-132 trial has been delayed after a major expansion in the population was announced. [21]
* The NCCN breast cancer guideline removed Tecentriq (atezolizumab). [3]

- Neoadjuvant TNBC:
    * The IMpassion-031 trial found an improvement in of pathological complete response (cPR) rates, the co-primary endpoint, associated with the addition of Tecentriq (atezolizumab) to neoadjuvant chemotherapy [Abraxane (nab-paclitaxel)] as compared to use of Abraxane (nab-paclitaxel) alone in patients with early TNBC (58% vs. 41%, respectively). [22]
    * Subsequently, the NeoTRIPaPDL1 trial found no difference in the secondary pathological complete response (cPR) associated with the addition of Tecentriq (atezolizumab) to neoadjuvant chemotherapy [carboplatin/Abraxane (nab-paclitaxel)] versus chemotherapy alone. [23]

Other breast cancer:

- One Phase 3 trial found no benefit with the addition of Tecentriq (atezolizumab) to neoadjuvant chemotherapy for HER2-positive BC (Impassion050). [24]
- Currently, there is insufficient evidence for the use of Tecentriq (atezolizumab) for breast cancer in all other BC settings, including adjuvant, and subsequent therapy (second-line or beyond) settings for breast cancer (TNBC or other).

Hepatocellular Carcinoma, Adjuvant Use

- A phase 3, open-label RCT [IMbrave050] evaluating Tecentriq (atezolizumab) in combination with bevacizumab as an adjuvant therapy (after surgical resection) in patients with high-risk, resectable hepatocellular carcinoma improved recurrence-free survival (RFS) relative to active surveillance; however, there are currently no mature outcomes data available. This is not an FDA-approved use for Tecentriq (atezolizumab). [25]

Other Investigational Uses

- Urothelial Carcinoma (UC, Bladder cancer):
    * Tecentriq (atezolizumab) initially received Accelerated approval as a subsequent therapy (after disease progression on a cisplatin-based chemotherapy regimen) for unresectable or metastatic bladder cancer based on tumor response rate in a non-comparative (single-arm), observational study [IMvigor-210 study]. [26]
    * A subsequent phase 3 trial [IMvigor-211 study] intended to confirm the efficacy of Tecentriq (atezolizumab) in the bladder cancer setting failed to demonstrate an OS advantage over standard chemotherapy in the second-line setting. [27] Based on this failed confirmatory trial the manufacturer voluntarily withdrew the bladder cancer indication. Because there is no proven net health benefit relative to the standard of care, the use of Tecentriq (atezolizumab) for bladder cancer is considered investigational.
    * An additional follow-on, phase 3 trial of Tecentriq (atezolizumab) in the adjuvant muscle-invasive bladder cancer (MIBC) setting failed to meet its primary end-point (disease-free survival) versus best supportive care [IMvigor-010 study]. [28]
- Renal Cell Carcinoma (RCC):
    * A phase 3 study [IMmotion 151] of Tecentriq (atezolizumab) plus bevacizumab versus Sutent (sunitinib) in patients with clear cell or sarcomatoid, metastatic renal cell carcinoma (RCC) reported a PFS advantage for the combination

therapy treatment arm in patients with PD-L1-positive tumors (PD-L1 ≥ 1%). [29] However, there was no OS benefit seen at the final analysis. [30]

* A phase 3 trial of adjuvant Tecentriq (atezolizumab) for high-risk RCC failed to meet the prespecified endpoints. [31]
* Tecentriq (atezolizumab) was studied in combination with Cabometyx (cabozantinib) in patients with advanced RCC who had progressed after immune checkpoint inhibitor therapy [CONTACT-03]. The addition of Tecentriq (atezolizumab) to Cabometyx (cabozantinib) did not improve clinical outcomes and led to increased toxicity versus Cabometyx (cabozantinib) alone.[32]

- **Other phase 3 trials that did not demonstrate a clinical benefit**: [31-34]
  * Tecentriq (atezolizumab) failed to meet its prespecified endpoints in several additional studies including colorectal cancer [IMblaze-370], ovarian cancer [IMagyn050], and prostate cancer [IMbassador250].
  * A phase 3, open-label RCT [IPSOS] evaluating Tecentriq (atezolizumab) as a front-line therapy in patients with stage IIIB or IV NSCLC who were deemed unsuitable to receive standard platinum-based chemotherapy due to an ECOG PS of 2 to 3 demonstrated an improvement in OS relative to single-agent chemotherapy. Though the OS difference was statistically significant it was not clinically relevant (median OS improvement of 1 month).[33]Multiple trials are ongoing in various soft tissue sarcomas (STS) (other than ASPS).

Dosing and Administration [2]

- Tecentriq (atezolizumab) is dosed as 1200 mg intravenously (IV) every 21 days.
- Alternative dosing regimens include 840 mg IV every two weeks or 1680 mg IV every four weeks until disease progression or unacceptable toxicity.
- Adjuvant therapy, such as for NSCLC, is limited to a finite course (as detailed in the Quantity Limits), which is in line with FDA prescribing information.

Appendix 1: FDA-approved PD-1 and PD-L1 blocking monoclonal antibody therapies [a]
Programmed death receptor-1 (PD-1) inhibitors
Jemperli (dostarlimab)
Keytruda (pembrolizumab)
Libtayo (cemiplimab-rwlc)
Loqtorzi (toripalimab)
Opdivo (nivolumab)
Tevimbra (tislelizumab)
Zynyz (retifanlimab-dlwr)
Programmed death-ligand 1 (PD-L1) inhibitor
Bavencio (avelumab)
Imfinzi (durvalumab)
Tecentriq (atezolizumab)

[a] Or as listed on the FDA.gov website

Appendix 2: Child Pugh (CP) Score [a]	
Points	***Class***
5-6	Class A
7-9	Class B
10-15	Class C

[a] CP is reported as a range, given it is an estimation of chronic liver disease. The lower end of the reported range may be used as a marker for illness/prognosis (example: a CP score of A6/B7 meets intent of coverage criteria of "class A"). However, CP scoring was developed for use in determining surgical risk and not specifically as a marker for cancer.

Revision History

Revision Date	Revision Summary
9/19/2024	**Effective 1/1/2025:** Change reauthorization from 'may' to 'shall.' Operationally, all approvals will be for 24 weeks (6 months). Ongoing therapy (beyond 24 weeks) will be subject to reauthorization review every 24 weeks, for documentation of disease stability or improvement and lack of disease progression.
12/7/2023	No criteria changes with this annual review.
6/15/2023	Added coverage criteria for advanced alveolar soft part sarcoma (ASPS) (effective 7/15/2023).
12/9/2022	• Clarified wording of criteria for operational consistency (PD-L1 expression; provider attestation for Child-Pugh score, Quantity Limit table). • Clarify for adjuvant NSCLC criteria "no prior use of PD-1/PD-L1 inhibitors", given the recent approval of Opdivo (nivolumab) for NSCLC neoadjuvant use. • Added prostate, ovarian, and HER-2 positive breast cancer to the list of "investigational uses."
3/18/2022	• Coverage criteria for use in the adjuvant setting in NSCLC was added to align with label. • Clarified that one of the following is required for use of Tecentriq (atezolizumab) in metastatic NSCLC: no prior use of PD-1/PD-L1 or no progression on prior Tecentriq (atezolizumab) treatment.
10/15/2021	The coverage position for triple negative breast cancer (TNBC) was changed from 'not medically necessary' to 'investigational' with this update. The confirmatory clinical trial failed to demonstrate any clinical benefit in this population, so the manufacturer voluntarily withdrew this indication (it is no longer part of FDA labeling).

Revision Date	Revision Summary
4/21/2021	• The coverage criteria in urothelial carcinoma (bladder cancer) were removed with this update. Coverage in this population was moved to the 'investigational' section of the policy. The confirmatory clinical trial failed to demonstrate any clinical benefit in this population so the manufacturer voluntarily withdrew this indication (it is no longer part of FDA labeling). • Streamlined coverage under **NSCLC** by removing the criterion requiring confirmation that no EGFR or ALK genomic aberrations are present *(this is a well-observed standard of care).* • Streamlined coverage under **SCLC** by removing the criterion asking for details on prior treatment in limited-stage disease and the criterion surrounding the steroid requirement in CNS metastasis. • Added a criterion under **HCC** stating there has been no prior use of PD-1/ PD-L1 inhibitors to be consistent with other policy sections. • Added criteria for BRAF-positive **cutaneous melanoma** when used in combination with vemurafenib and cobimetinib. • Clarified the language under investigational section related to concomitant therapies by adding use with 'targeted therapies' (in addition to immuno- and chemotherapies) other than those specifically addressed in the policy as investigational. *(no change to original intent)* • Clarified the language surround NMN vs Investigational uses of atezolizumab in **TNBC** *(no change to original intent).*
10/28/2020	• Simplified coverage criteria for bladder cancer. • Added coverage criteria for several newly FDA-approved indications: - Hepatocellular carcinoma - As monotherapy in the first-line setting for non-small cell lung cancer (NSCLC) for high PD-L1 expressing tumors. - As combination therapy in the first-line setting for nonsquamous NSCLC when used with chemotherapy, such as a taxane and platin.
6/15/2020	Removed references to brand Avastin from policy to account for upcoming changes in biosimilars policy (dru620).
1/22/2020	Added continuation of therapy (COT) criteria (no change to intent of coverage criteria).
7/24/2019	Effective 8/15/2019: • Added use in triple negative breast cancer (TNBC), first-line, a new indication approved via the FDA accelerated approval pathway, as not medically necessary. • Updated dosing, to include alternative dosing intervals every two or four weeks.
4/25/2019	Add the concomitant use of bevacizumab with Tecentriq (atezolizumab) plus chemotherapy for NSCLC to "Not Medically Necessary" indications, based on the low quality of the evidence and the availability other similar therapies.

Revision Date	Revision Summary
1/31/2019	Added coverage criteria for extensive-stage SCLC.
7/20/2018	Updated criteria under urothelial carcinoma to clarify coverage in the front-line setting for cisplatin-ineligible patients only when PD-L1 expressing and any platinum-ineligible patients, regardless of PD-L1 expression.
4/20/2018	No changes to coverage criteria with this annual update. Clarified authorization is valid "until disease progression" (no change to intent).
9/8/2017	• Updated criteria under urothelial carcinoma to include coverage as front-line for cisplatin ineligible patients. • Added criteria for coverage as a subsequent therapy for metastatic NSCLC.
7/15/2016	New policy.

Drug names identified in this policy are the trademarks of their respective owners.

Medication Policy Manual

Policy No: dru479

Topic: Ocrevus, ocrelizumab

Date of Origin: December 16, 2016

Committee Approval Date: December 9, 2022

Next Review Date: December 2023

Effective Date: March 1, 2023

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of medication policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Ocrevus (ocrelizumab) is an intravenously administered medication indicated for the treatment of relapsing or primary progressive forms of multiple sclerosis. It works by destroying certain immune cells that are involved in the multiple sclerosis immune response.

Policy/Criteria

Most contracts require pre-authorization approval of Ocrevus (ocrelizumab) prior to coverage.

I. Continuation of therapy (COT): Ocrevus (ocrelizumab) may be considered medically necessary for COT when full policy criteria below are met.

II. New starts (treatment-naïve patients): Ocrevus (ocrelizumab) may be considered medically necessary when Site of Care administration requirements are met [refer to Medication Policy Manual, Site of Care Review, dru408].

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers Ocrevus (ocrelizumab) coverable only under the medical benefit (as a provider-administered medication).

B. Authorization may be reviewed at least annually to confirm that current medical necessity criteria are met and that the medication is effective. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, such as disease stability or improvement.

Position Statement

Summary

- Ocrevus (ocrelizumab) is a monoclonal antibody used as monotherapy for the treatment of patients with primary progressive multiple sclerosis (PPMS) and relapsing forms of multiple sclerosis (MS).
- Ocrevus (ocrelizumab) is considered a disease-modifying multiple sclerosis treatment. Other disease-modifying multiple sclerosis treatments for relapsing forms of MS include Lemtrada (alemtuzumab), interferon beta products (Avonex, Rebif, Betaseron, Extavia, or Plegridy), fingolimod (generic, Gilenya, Tascenso ODT), glatiramer acetate, Aubagio (teriflunomide), and dimethyl fumarate. Rituximab may also be used off label for the treatment of relapsing forms of MS. [1]
- Ocrevus (ocrelizumab) has not been studied in combination with other disease-modifying MS medications and it is therefore not recommended that Ocrevus (ocrelizumab) be administered concomitantly with other disease-modifying MS medications as efficacy and safety have not been established. Concomitant use of Ocrevus (ocrelizumab) with any other disease-modifying therapy for MS is considered investigational.
- Ocrevus (ocrelizumab) is an intravenously infused medication. The starting dose is 300 mg given on day one followed by 300 mg two weeks later. Thereafter, Ocrevus (ocrelizumab) is given every 6 months at a dose of 600 mg.
- The safety and effectiveness of Ocrevus (ocrelizumab) in conditions other than PPMS or relapsing forms of MS have not been established.

Clinical Efficacy in Multiple Sclerosis

- Ocrevus (ocrelizumab) has been shown to reduce elapse rate, slows disability progression, and slows worsening of disease based on MRI outcomes in patients with relapsing forms of MS. [2]
    * Two identical, 96-week studies (OPERA I and OPERA II), evaluated the effects of Ocrevus (ocrelizumab) compared to Rebif (interferon beta-1a) in patients with relapsing forms of MS. Ocrevus (ocrelizumab) was superior to interferon beta-1a in reducing annualized relapse and in slowing confirmed disability progression. On MRI, the patients in the Ocrevus (ocrelizumab) group had fewer new and/or enlarging T2 lesions, less T1 lesions, and a reduced rate of total brain volume loss relative to the Rebif (interferon beta-1a) group.
- Ocrevus (ocrelizumab) has been shown to slow disability progression, and slow the worsening of MRI outcomes in patients with PPMS. [3]
    * One 120-week study (ORATORIO), evaluated the effects of Ocrevus (ocrelizumab) relative to placebo in patients with PPMS. Ocrevus (ocrelizumab) was superior to placebo reducing the proportion of patients who had sustained 12-week confirmed disability progression. The treatment group also showed a significant decrease in T2 volume and showed significantly less brain volume loss on MRI.

Safety [4]

- Ocrevus (ocrelizumab) contains warnings for infusion reactions, infections, and risk of malignancy.
- Common adverse events include upper respiratory tract infections, infusion reactions, skin infections, and lower respiratory tract infections.

Dosing and Administration [4]

- Ocrevus (ocrelizumab) is administered as an intravenous (IV) infusion.
- The starting dose is 300 mg IV followed by 300 mg IV two weeks later. Subsequent doses of Ocrevus (ocrelizumab) are then given every 6 months at a dose of 600 mg IV as a single infusion.

Ocrevus (ocrelizumab) – Use in Other Conditions

- Due to a lack of published data, the use of Ocrevus (ocrelizumab) in conditions other than relapsing forms of MS and PPMS is considered investigational.
- While Ocrevus (ocrelizumab) has a similar mechanism of action to rituximab, it has not been studied for the same indications. Thus, due to a lack of data, these conditions are considered investigational.

Neuromyelitis Optica Spectrum Disorders (NMOSD)

- Neuromyelitis optica spectrum disorders (NMOSD; previously known as Devic disease) are characterized by a combination of bilateral optic neuropathy and cervical myelopathy. While both NMOSD and MS are demyelinating diseases they are considered different diseases based on unique immunologic features and differences in imaging features, biomarkers, and neuropathology. [5]

- For acute attacks and relapses of NMOSD, treatment usually consists of intravenous glucocorticoids followed soon by plasmapheresis for refractory or progressive symptoms. For prevention of attacks, systemic immunosuppression with agents including azathioprine, mycophenolate mofetil, rituximab, and mitoxantrone has been used, given the evidence that humoral autoimmunity plays a role in the pathogenesis of NMO. [6,7]
- Rituximab has been shown to the frequency of NMOSD relapses and neurologic disability based on results from one systematic review. However, the optimal treatment regimen and duration have not been determined and additional long-term safety experience is needed to clarify the role of rituximab as a first-line option. [8]
- There is no published evidence to support the use of Ocrevus (ocrelizumab) for NMOSD.

Appendix A: Disease-Modifying Agents Used in the Treatment of Multiple Sclerosis (MS)
Aubagio (teriflunomide)
Bafiertam (monomethyl fumarate)
Dimethyl fumarate
Fingolimod (generic, Gilenya, Tascenso ODT)
Glatiramer acetate
Interferon beta-1a (Avonex, Rebif)
Interferon beta-1b (Betaseron, Extavia)
Kesimpta (ofatumumab)
Lemtrada (alemtuzumab)
Mavenclad (cladribine)
Mayzent (siponimod)
Novantrone (mitoxantrone)
Ocrevus (ocrelizumab)
Plegridy (peginterferon beta-1a)
Ponvory (Ponesimod)
Rituximab[1]
Tysabri (natalizumab)
Vumerity (diroximel fumarate)
Zeposia (ozanimod)

[1] Rituximab is not FDA-approved for use in MS, but has evidence for efficacy.

Revision History

Revision Date	Revision Summary
12/9/2022	Updated Appendix A.
10/15/2021	• Removed clinical coverage criteria (effective 1/1/2022). • Updated Appendix A.
1/20/2021	• Clarified quantity limits. • Updated Preferred Disease-Modifying Therapies (DMTs).
1/22/2020	• Added continuation of therapy (COT) criteria (no change to intent of coverage criteria). • Revised step therapy requirements to include Mavenclad (cladribine). • Revised definition of relapsing form of MS.
1/31/2019	Clarified re-authorization requirements.
5/18/2018	Added Ocrevus (ocrelizumab) to the site of care program, effective 9/1/2018.
3/19/2018	Revised step therapy requirements to include Aubagio (teriflunomide).
1/19/2018	Clarified authorization periods. No change to intent of covered doses.
8/11/2017	• Revised step therapy requirements and definition of "ineffectiveness." • Added criteria for aggressive disease. • Removed Ocrevus (ocrelizumab) from site of care program.
4/14/2017	Updated indication, dosing, and administration based on prescribing information.
12/16/2016	New Policy effective upon FDA approval of Ocrevus (ocrelizumab).

Medication Policy Manual

Policy No: dru480

Topic: Exondys 51, eteplirsen

Date of Origin: January 13, 2017

Committee Approval Date: June 20, 2024

Next Review Date: 2024

Effective Date: October 1, 2024

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Exondys 51 (eteplirsen) is an intravenous medication that may be used for Duchenne muscular dystrophy (DMD) when patients have a specific gene mutation. A clinical benefit, such as improved ambulation, of Exondys 51 (eteplirsen) has not been established.

Policy/Criteria

Most contracts require pre-authorization approval of Exondys 51 (eteplirsen) prior to coverage.

I. Continuation of therapy (COT): Exondys 51 (eteplirsen) is considered investigational for all conditions, per the full policy criteria below.

***Please note**: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Exondys 51 (eteplirsen) is considered investigational for all conditions, including Duchenne muscular dystrophy (DMD) that is amenable to exon 51 skipping (Table 1). However, if found to be medically necessary, criteria A must also be met:

A. Site of care administration requirements are met [refer to Pharmacy Services Medication Policy Manual, Site of Care Review, dru408].

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers Exondys 51 (eteplirsen) coverable under the medical benefit (as a provider administered medication).

B. Although the use of Exondys 51 (eteplirsen) is considered investigational for all conditions, including Duchenne muscular dystrophy (DMD) that is amenable to exon 51 skipping, if pre-authorization is approved, Exondys 51 (eteplirsen) will be authorized in doses up to 30 mg/kg every week. (52 infusions per year).

C. Authorization shall be reviewed at least every twelve months for documented benefit. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met. Specifically, documentation that the medication is providing clinical benefit, including disease stability or improvement, and lack of disease progression.

Position Statement

Summary

- Exondys 51 (eteplirsen) is an intravenous therapy indicated for the treatment of Duchenne muscular dystrophy (DMD) when there is a confirmed mutation of the DMD gene that is amenable to exon 51 skipping. It was approved through the FDA Accelerated Approval Program based on an increase in dystrophin in skeletal muscles observed in some patients.
- A clinical benefit (e.g. prolongation of independent ambulation, improved quality of life, or prevention of disease progression and disability) of Exondys 51 (eteplirsen) has not been established. [1]

    * In two small studies in a total of 12 patients, Exondys 51 (eteplirsen) was shown to increase dystrophin levels. However, it has not been proven that an increase in dystrophin will translate to improved clinical outcomes, such as improved motor function.
    * The same studies failed to show that Exondys 51 (eteplirsen) helped improve performance on a 6-minute walk test, which is a clinically relevant measure of ambulatory ability.
- The U.S. Centers for Disease Control and Prevention (CDC) has developed general management guidelines for DMD. The CDC recommends corticosteroids and supportive care to slow disease progression. These guidelines were published prior to the approval to Exondys 51 (eteplirsen); thus, the use of Exondys 51 (eteplirsen) for DMD has not yet been addressed. [2,3]

Clinical Efficacy

- Evidence regarding the effect of Exondys 51 (eteplirsen) on dystrophin levels was inconclusive. Data is limited to a small, phase II trial (Study 201); an open-label, historically controlled, extension study (Study 202); and an ongoing, confirmatory phase III study (PROMOVI) with interim results. Although the preliminary evidence is promising, larger, well-controlled trials are needed to establish the safety and efficacy of Exondys 51 (eteplirsen) in Duchenne muscular dystrophy (DMD).
- In the pivotal trials (Study 201/202), 12 patients were initially randomized to receive either placebo or Exondys 51 (eteplirsen) 30 mg/kg/wk or 50 mg/kg/wk. There was a statistically significant percent increase (relative change) in dystrophin levels for the Exondys 51 (eteplirsen) treatment arms at 48 weeks. [4]
    * Dystrophin production is a surrogate biomarker of disease improvement with an unknown correlation to health outcomes. The use of dystrophin levels as a surrogate endpoint for DMD needs to be validated.
    * Only a relative change in dystrophin was reported, which could overestimate the difference observed. An analysis on the absolute change in dystrophin levels was not reported. An absolute increase in dystrophin levels has not been correlated to improved ambulation or muscle function and a minimal clinically important difference in dystrophin levels has not yet been established.
    * The muscle biopsies were processed and analyzed after unblinding occurred, which may have introduced bias into the results.
    * The study included patients from Europe. Since supportive care was not well-documented, the results may have been confounded by different standards of care.
    * The study became open-label after 12 weeks with subjects being compared to matched historical controls. Due to the observational nature of the trial, the cause and effect of Exondys 51 (eteplirsen) on dystrophin production cannot be established.
    * The FDA has acknowledged that findings from Study 201/202 are misleading and should be retracted. [5]

- After 180 weeks of treatment, the average dystrophin protein level in muscle tissue was found to be only 0.93% of the normal dystrophin level in found in healthy subjects. Experts have proposed that dystrophin levels greater than 10% of normal may be clinically meaningful; however, validation is needed. [1]
- In the ongoing confirmatory PROMOVI trial (open-label, observational), subjects treated with Exondys 51 (eteplirsen) for 48 weeks had an average dystrophin level of 0.44% of the normal dystrophin level in a healthy subject vs. 0.16% at baseline ($p < 0.05$). The median increase after 48 weeks was only 0.1%. [1]
- Exondys 51 (eteplirsen) has not been shown to improve distance walked on a 6-minute walk test (6MWT), which was the primary endpoint in Study 201/202. [4,6]
    * In Study 201, subjects in the Exondys 51 (eteplirsen) 30 mg/kg/wk arm actually performed worse on the 6MWT versus placebo at both 24 and 48 weeks. This was attributed to two subjects who had rapid disease progression after enrollment.
    * Study 202 showed no difference in performance on the 6MWT between the Exondys 51 (eteplirsen) arm compared to matched historical controls.
- Exondys 51 (eteplirsen) has not yet been shown to improve any clinical outcomes such as quality of life, prolongation of independent ambulation, or prevention of disease progression and disability.
- The change in forced vital capacity (FVC), an exploratory endpoint in the previously mentioned trials, was assessed after trials were completed, and compared to historical controls. There was a slight improvement in FVC decline, a surrogate endpoint. However, because the trial was not controlled, and efficacy analysis was based on a historical control, the data is considered insufficient to establish clinical utility
- The FDA Advisory Committee voted 7-6 against approval of Exondys 51 (eteplirsen) for DMD due to the lack of substantial evidence from adequate and well-controlled studies that Exondys 51 (eteplirsen) induces production of dystrophin to a level that is reasonably likely to predict clinical benefit. [5,7]

Safety

- Safety data for Exondys 51 (eteplirsen) is based on four years of clinical trial experience but in a very limited population (n = 12).
- The most common adverse reaction of Exondys 51 (eteplirsen) reported with an incidence of at least 35% were balance disorder and vomiting.
- Postmarketing safety studies on carcinogenicity are required in order to identify any unexpected serious risks associated with Exondys 51 (eteplirsen).

Medication Policy Manual | **Policy No:** dru485

Topic: Spinraza, nusinersen | **Date of Origin:** February 17, 2017

Committee Approval Date: December 7, 2023 | **Next Review Date:** 2024

Effective Date: March 1, 2024

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Spinraza (nusinersen) is a medication used to treat certain types of spinal muscular atrophy (SMA), a rare genetic disorder that affects motor function. It is given by intrathecal (IT) injection directly into the spinal column.

Policy/Criteria

Most contracts require pre-authorization approval of Spinraza (nusinersen) prior to coverage.

I. Continuation of therapy (COT): Spinraza (nusinersen) may be considered medically necessary for COT when full policy criteria below are met, including quantity limit.

Please note: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.

II. New starts (treatment-naïve patients): Spinraza (nusinersen) may be considered medically necessary for treatment of spinal muscular atrophy (SMA) when there is clinical documentation (including, but not limited to chart notes) that criteria A through E below are met.

A. A diagnosis of **classic SMA** (5q SMA) is established by, or in consultation with a pediatric neuromuscular specialist (pediatric neurologist or rehabilitation doctor)

AND

B. One of the following:

1. Documentation showing SMA-associated symptoms before 12 years of age (also known as SMA type 1, type 2, or type 3)

OR

2. Presymptomatic SMA with confirmation of 2 or 3 copies of SMN2

AND

C. Genetic confirmation of a diagnosis of classic SMA, with a loss of, or defect in, the survival motor neuron (SMN) 1 gene.

AND

D. Prior to starting Spinraza (nusinersen) therapy, documentation showing baseline motor function, with objective function-based testing (such as with a HINE or CHOP-Intend score).

AND

E. Documentation of comprehensive SMA care, including physical therapy, respiratory care, and nutrition support as part of the patient's care plan.

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers Spinraza (nusinersen) coverable only under the medical benefit (as a provider-administered medication).

B. When pre-authorization is approved, Spinraza (nusinersen) may be authorized for up to twelve months, for a maximum of 4 doses (12 mg per dose) in a 64-day period, based on loading doses on Days 1, 15, 29, 59, then a maximum of 1 dose (12 mg per dose) in a 4-month period (based on dosing on days 179 and 299), for a total of 6 doses in a 299-day period. NOTE: *If the loading dose regimen (standard timing) is interrupted, doses will be approved on a case-by-case basis per the FDA label, if there is detailed documentation as to prior doses and dates of administration.*

C. After initial authorization, Spinraza (nusinersen) may be reauthorized for a maximum of three doses (12 mg per dose) every 12 months [based on dosing of 12 mg every 4 months]. Authorization shall be reviewed at least every 12 months when criteria a and b are met:

a. Documentation (including, but not limited to chart notes) is provided showing current medical necessity criteria are met, including comprehensive care by, or in consultation with, a neuromuscular specialist.

AND

b. Documentation (including, but not limited to chart notes) is provided showing that the medication is effective, including documentation of clinically significant improvement of motor function or stabilization of motor function loss, which **must** include clinical documentation of a physical assessment, motor function function-based testing, and need for medical intervention related to SMA symptoms, relative to baseline (and/or previous authorization period). Overall motor function must be improved/superior relative to that projected for the natural course of SMA.

IV. Spinraza (nusinersen) is considered investigational when used for all other conditions or settings, including but not limited to:

A. Other types of classic SMA not specified above

B. Non-5q SMA (SMA due to genetic abnormalities other than on chromosome 5q)

C. Combination use with Evrysdi (risdiplam).

V. Spinraza (nusinersen) is considered not medically necessary when used after a Zolgensma (onasemnogene abeparvovec-xioi) infusion.

Position Statement

Summary

- Spinraza (nusinersen) is an antisense oligonucleotide (ASO), FDA approved for treatment of spinal muscle atrophy (SMA) due to a mutation of the SMN1 protein on the 5q chromosome ("classic SMA").
- SMA is a rare condition, with a genetic defect which leads to low the survival motor neuron (SMN) protein, progressive loss of motor neuron function, hypotonia, weakness, and chronic respiratory insufficiency.
  * Children with the most severe form (SMA type 1) have symptoms before the age of 6 months and do not reach motor milestones (like sitting unassisted). SMA type 1 is also called "infantile SMA" or Werdnig-Hoffman disease.
  * Later onset SMA (such as SMA type 2 or 3) is diagnosed later (symptom onset after 6 months of age), when a child fails to meet a motor milestone. SMA type 2 is also called Dubowitz disease. SMA type 3 is also called Kugelberg-Welander disease.

- Genetic testing is required to confirm of a diagnosis of classic SMA (5q SMA) and to rule out other causes of spinal muscular atrophy. Onset of SMA symptoms (such as failure to meet motor milestones) differentiates SMA types 1, 2, and 3. SMA type 1 has onset of symptoms prior to 6 months of age and is the most severe, progressive form of SMA.
- In clinical trials of young children (< 7 months of age) with SMA type 1 and presymptomatic SMA with 2 or 3 copies of SMN2, Spinraza (nusinersen) improved the ability to achieve motor milestones (such as head control, sitting, ability to kick in supine position, rolling, crawling, standing and walking), versus what is seen with the natural progression of SMA.
- In clinical trials of later-onset SMA (type 2 and type 3), Spinraza (nusinersen) improved motor function scores and slowed loss of motor function, versus what is seen with the natural progression of SMA.
- The safety and effectiveness of Spinraza (nusinersen) in conditions other than SMA types 1, 2, or 3 have not been established. Trials of nusinersen included patients up to 12 years of age, but not older. Therefore, the use of nusinersen for SMA type 4 is investigational.
- The use of Spinraza (nusinersen) after Zolgensma (onasemnogene abeparvovec-xioi) for patients with an incomplete response, defined as persistent SMA symptoms, may be effective. However, the use of Spinraza (nusinersen) for residual SMA symptoms after Zolgensma (onasemnogene abeparvovec-xioi) is considered not medically necessary. Given the very high cost of the Zolgensma (onasemnogene abeparvovec-xioi) and Spinraza (nusinersen) therapies, we are unable to cover both treatment options.
- Guidelines recommend aggressive, comprehensive supportive care.
- The recommended dose of Spinraza (nusinersen) is 12 mg injected intrathecally (IT), with four loading doses in 58 days (every 14 days for three doses, then in 30 days), then 12 mg IT every four months maintenance. The safety and effectiveness of higher doses have not been established. [1]

Disease Background [2-4]

- Spinal muscular atrophy (SMA) is a SMA is a rare, hereditary disease characterized by loss of motor neurons in the spinal cord and lower brain stem, and results in severe and progressive muscular atrophy, hypotonia, diffuse symmetric weakness, and restrictive lung disease. Patients with the most severe type of SMA can become paralyzed, never sit or walk, and have difficulty breathing and swallowing due to bulbar muscle weakness (requiring mechanical ventilation, gastrostomy tube enteral feeding, and nursing care).
- Classic SMA is caused by a loss of, or defect in, the survival motor neuron (SMN) 1 gene, with homozygous SMN1 exon 7 deletion and/or deletion and mutation on other alleles, resulting in inadequate production of SMN protein.
    * This protein is needed for the proper maintenance of motor neurons. SMN2 may be present, but mostly produces SMN protein lacking in exon 7, a less stable protein, and unable to compensate for the lack of SMN1.
    * SMN2 copies may be increased and produce SMN protein for milder forms of SMA (such as type 2 or 3).
- The incidence of SMA is approximately 4 to 10 per 100,000 live births (about 400 births in the U.S. per year).

- There is wide variability in age of onset, symptoms and rate of progression. Earlier onset is generally associated with more severe disease. The severity of SMA correlates with the amount of SMN protein.
- SMA Type 1 (infantile SMA, Werdnig-Hoffman disease; "non-sitters") is the most common and most severe form of SMA, with early symptom onset (< 6 months of age) and rapid progression to flaccid paralysis and restrictive progressive respiratory insufficiency. Most infants die without respiratory support within 1 year. Historic average time to death or full-time noninvasive ventilation (> 16 hours/day) is 13.5 months.
- Later onset SMA (type 2 and 3) patients produce greater amounts of SMN protein, have a later onset, and less severe. Outcome depends on severity of weakness at presentation; early onset correlates with greater weakness.
    * SMA Type 2 (intermediate form, Dubowitz disease; "sitters") present between 6 to 18 months, may reach motor milestone more slowly, can sit unassisted but lose this ability with time, and never walk.
    * SMA Type 3 (mild form, Kugelberg-Welander disease; "standers") presents after one year of age. Legs are affected more than arms. All walk but many lose ability to walk with time (highly variable).

Clinical Efficacy

- One phase 3 randomized, double-blinded, sham-controlled trial (ENDEAR) evaluated Spinraza (nusinersen) vs. sham injection in SMA1 in children started at less than 7 months of age. [4,5]
    * All subjects had onset of SMA symptoms prior to the age of 6 months and a diagnosis genetically confirmed.
    * Motor milestones were evaluated based on the Hammersmith Infant Neurological Exam (HINE) categories (in the modified section 2).
    * "Motor milestone responder" was defined as more categories of improvement than worsening, based on the modified section 2 of the HINE.
    * The proportion of subjects who were motor milestone responders was significantly higher with Spinraza (nusinersen) than placebo, based on a preplanned interim analysis. (n=82).
- One phase 3 randomized, double-blinded, sham-controlled trial (CHERISH) evaluated Spinraza (nusinersen) vs. sham injection (n=126) in later-onset SMA (types 2 and 3) in children started at 2 to 12 years of age. [4,7]
    * All subjects had onset of SMA symptoms at > 6 months of age, were between the age of 2 and 12 years of age at the time of screening for the trial, and the diagnosis of SMA was genetically confirmed. All subjects could sit independently, but never had the ability to walk independently.
    * Motor function was evaluated based on the Hammersmith functional motor scale expanded (HFMSE) score. A change from baseline of > 3 points was considered a responder.
    * Subjects in the Spinraza (nusinersen) arm had a significantly higher change in HFMSE versus those in the placebo arm. (+5.9 points, placebo-subtracted). Key secondary endpoints that were statistically higher with nusinersen vs. placebo

included percent of HFMSE responders (56.8% vs. 26.3%; p=0.006) and number of new motor milestones (+0.2 vs. -0.2; p<0.0001). However, more meaningful health outcomes of standing along and walking without assistance were not different between treatment arms, though secondary outcomes and not powered for statistical significance.

- Interim efficacy and safety data from an ongoing phase 2 open-label trial evaluated Spinraza (nusinersen) in presymptomatic SMA in children with 2 or 3 copies on SMN2 and started at less than 6 weeks of age
    * At the time of the data cut, patients ranged from 25.7 to 45.4 months of age, with a median 2.9 years since the first administration.
        - All enrolled patients were alive, and none required permanent ventilation.
        - Mean CHOP INTEND scores were 62.1 and 63.4 for those with two copies and 3 copies of SMN2, respectively. A max score of 64 was achieved by 10/15 (66%) and 10/10 (100%) with two and three copies of SMN2, respectively
        - All enrolled patients (25/25) achieved the ability to sit without support, 92% (23/25) achieved the ability to walk with assistance, and 88% (22/25) achieved the ability to walk independently.
- Long-term extension trials are ongoing to establish the long-term safety and efficacy of Spinraza (nusinersen) for health outcomes such as ability to stand, walk, and need for invasive or non-invasive ventilation. [4]
- Guidelines recommend maximizing aggressive multidisciplinary care, including orthopedic/rehabilitation, pulmonary, and gastrointestinal/nutrition care, along with psychological and social support. Therapy should be tailored to the patient functional level: nonsitter, sitter, or walker. [6]

Investigational Uses

- There is insufficient evidence to establish the efficacy of Spinraza (nusinersen) for the treatment of very late onset SMA (SMA type 4 or adult onset). Trials excluded patients over the age of 12.

Codes	Number	Description
HCPCS	J2326	Injection, nusinersen (Spinraza), 0.1 mg
ICD-10	G12.0	Infantile spinal muscular atrophy, type I [Werdnig-Hoffmann]
ICD-10	G12.1	Other inherited spinal muscular atrophy Includes: - Adult form spinal muscular atrophy - Childhood form, type II spinal muscular atrophy - Juvenile form, type III spinal muscular atrophy [Kugelberg-Welander]

Appendix 1 – SMA Subtypes

Clinical Subtype	% of cases	Usual # SMN2 copies	Symptom onset	Life expectancy	Motor development [a]
Type 0	Very rare	1	In utero	Die shortly after birth	None
Type 1	58	2	≤ 6 months	≤ 24 months	Never able to sit unassisted.
Type 2	29	80% have 3 copies	≤ 18 months	70% alive at 25 years	Unable to walk without assistance.
Type 3	13	80% have 4 copies	18-36 months (3-10 years)	May be normal	Able to stand and to walk without assistance, but lose ability as the disease progresses
Type 4	<5	≥4	20-30 years	Normal	Ambulatory. May experience mild muscle weakness

[a] Motor milestones: ability to kick, head control, rolling, sitting, crawling, and standing

Revision History

Revision Date	Revision Summary
12/7/2023	No criteria changes with this annual review.
12/9/2022	No criteria changes with this annual review.
1/20/2021	• Broadened prescriber requirement to include non-pediatric neuromuscular specialists. • Added combination use with Evrysdi (risdiplam) to investigational uses.
4/22/2020	Add coverage criteria for presymptomatic SMA in patients with 2 or 3 copies of SMN2. Added COT language.
4/25/2019	Added the use of Spinraza (nusinersen) after Zolgensma (onasemnogene abeparvovec-xioi) infusion to be considered not medically necessary.
1/31/2019	Investigational uses (presymptomatic SMA) updated with this annual update. Clarified documentation requirements (no change to intent).
2/16/2018	No criteria changes with this annual update.
7/14/2017	Add coverage criteria for later-onset SMA (types 2 and 3).
2/17/2017	New policy.

Drug names identified in this policy are the trademarks of their respective owners.

Medication Policy Manual **Policy No:** dru488

Topic: Pituitary Disorder Therapies **Date of Origin:** February 17, 2017

- Isturisa, osilodrostat
- Lanreotide acetate (generic, Somatuline Depot)
- Mycapssa, octreotide
- Recorlev, levoketoconazole
- Sandostatin LAR Depot, octreotide LAR
- Signifor, pasireotide
- Signifor LAR, pasireotide LAR
- Somavert, pegvisomant

Committee Approval Date: September 19, 2024 **Next Review Date:** 2025

Effective Date: December 1, 2024

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

The medications included in this policy are used to treat pituitary disorders, such as acromegaly, Cushing syndrome, and Cushing's disease. These pituitary disorders are typically the result of excessive growth hormone or cortisol production.

Policy/Criteria

Most contracts require pre-authorization approval of pituitary disorder therapies prior to coverage.

I. Continuation of therapy (COT): Pituitary Disorder therapies may be considered medically necessary for COT when criterion A or B below is met.

A. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

OR

B. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

Please note: *Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve) patients: Pituitary Disorder therapies may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) of use for one of the following indications listed in the criteria below and coverage criteria are met.

Diagnosis	Coverage Criteria	Coverable Products(s)
Acromegaly	When criteria 1 and 2 are met: **1.** Documented inadequate response to surgery and/or radiation **OR** surgery/radiation is documented as not an option. **AND** **2.** ***[For lanreotide (generic, Somatuline Depot), Signifor LAR (pasireotide LAR), Mycapssa (octreotide), and Somavert (pegvisomant)]:*** For adults only: Treatment with Sandostatin LAR Depot (octreotide LAR) has been ineffective, not tolerated, or is contraindicated.	• Lanreotide (generic, Somatuline Depot) • Mycapssa (octreotide) • Sandostatin LAR Depot (octreotide LAR) • Signifor LAR (pasireotide LAR) • Somavert (pegvisomant)
Carcinoid syndrome	When criteria 1 and 2 are met: **1.** Flushing and/or diarrhea due to a neuroendocrine tumor (NET), including carcinoid tumors (such as GI tract, lung, and thymus) and VIPoma. **AND** **2.** ***[For lanreotide (generic, Somatuline Depot)]***: Treatment with Sandostatin LAR Depot (octreotide LAR) has been ineffective, not tolerated, or is contraindicated	• Lanreotide (generic, Somatuline Depot) • Sandostatin LAR Depot (octreotide LAR)

Diagnosis	Coverage Criteria	Coverable Products(s)
Cushing's disease (CD)	When criteria 1 and 2 are met: **1.** Pituitary surgery is not an option or has not been curative. **AND** **2.** At least one prior lower-cost CD medication treatment option was not effective unless all are contraindicated (see *Appendix 1*).	• Isturisa (osilodrostat) • Signifor (pasireotide) • Signifor LAR (pasireotide LAR)
Endogenous Cushing's syndrome	When criteria 1, 2, and 3 are met: **1.** Patient has a documented cause for endogenous Cushing's syndrome (see *Appendix 2*). **AND** **2.** Surgical resection of primary tumor is not an option or has not been curative. **AND** **3.** Prior generic ketoconazole therapy was ineffective, defined as persistent urinary free cortisol greater than 50 µg/day despite at a maximized dose of ketoconazole 1200 mg/day. **PLEASE NOTE:** the intent of this criterion is NOT met with intolerance of ketoconazole or use of lower doses.	• Recorlev (levoketoconazole)
GEP-NET [a]	When criteria 1 and 2 are met: **1.** When unresectable, locally advanced or metastatic. **AND** **2.** ***[For lanreotide (generic, Somatuline Depot)]:*** Treatment with Sandostatin LAR Depot (octreotide LAR) has been ineffective, not tolerated, or is contraindicated.	• Lanreotide (generic, Somatuline Depot) • Sandostatin LAR Depot (octreotide LAR)

[a] Gastroentero-pancreatic neuroendocrine tumors (GEP-NET), such as gastrointestinal tract, lung, thymus, or pancreatic neuroendocrine tumors

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers Pituitary Disorder Therapies coverable only under the medical benefit (for provider-administration) and the pharmacy benefit (for self-administration), as outlined in *Table 1*.

B. When pre-authorization is approved, pituitary disorder therapies will be covered in the quantities outlined in *Table 1*.

C. **Recorlev (levoketoconazole) only, initial** authorization **shall** be reviewed at 6 months. Clinical documentation (including but not limited to chart notes) must be provided indicating that urinary free cortisol levels have normalized below the upper limit of normal (≤50 µg/day).

D. **A**uthorization for all other pituitary disorder therapies listed below in *Table 1* and **continued** authorization of Recorlev (levoketoconazole) **may** be reviewed annually. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, such as disease stability or improvement. For **Signifor (pasireotide) and Recorlev (levoketoconazole)**, clinical documentation indicating that urinary free cortisol levels are within normal limits must be provided.

Table 1:

Pituitary Disorder Therapies: Coverable Indications, Quantity Limits, and Coverage/Administration Product	**Coverable Indications and Quantity Limits**	**Coverage/Administration**
Lanreotide (generic, Somatuline Depot)	**1. Acromegaly:** **a. Initial authorization:** Up to one 90-mg kit every 4 weeks. **b. Dose escalations:** Up to one 120-mg kit every 4 weeks may be authorized for members who show inadequate response after 3 months on 90 mg every 4 weeks. **2. GEP-NET:** Up to one 120-mg kit every 4 weeks. **3. Carcinoid syndrome:** Up to one 120-mg kit every 4 weeks.	Medical benefit (Provider-administered)
Recorlev (levoketoconazole)	**Endogenous Cushing's syndrome:** Up to 1200 mg daily based on a maximum dose of 600 mg twice daily.	Pharmacy benefit (Self-Administered)
Mycapssa (octreotide)	**Acromegaly:** Up to 120 capsules per 30 days.	Pharmacy benefit (Self-Administered)
Sandostatin LAR Depot (octreotide LAR)	**1. Carcinoid syndrome** (including carcinoid tumors, VIPomas, or GEP-NET): **a. Initial authorization:** Up to 40 mg every 4 weeks. **b. Dose escalation:** Doses greater than 40 mg every 4 weeks may be authorized in patients who continue to have symptoms despite receiving 40 mg every 4 weeks. **2. Acromegaly:** Up to 40 mg every 4 weeks.	Medical benefit (Provider-administered)
Isturisa (osilodrostat)	**Cushing's Disease:** Up to 60 mg daily based on a maximum dose of 30 mg twice daily.	Pharmacy benefit (Self-administered)

Pituitary Disorder Therapies: Coverable Indications, Quantity Limits, and Coverage/Administration Product	Coverable Indications and Quantity Limits	Coverage/Administration
Signifor (pasireotide)	**1. Cushing's Disease** **a. Initial authorization:** Up to 60 of the 0.6-mg ampules every month. **b. Dose escalation:** Up to 60 of the 0.9-mg ampules every month may be authorized for members who show inadequate response to 0.6-mg twice daily.	Pharmacy benefit (Self-administered)
Signifor LAR (pasireotide LAR)	**1. Acromegaly** **a. Initial authorization:** Up to one 40-mg kit every 4 weeks. **b. Dose escalation:** Up to one 60-mg kit every 4 weeks may be approved for members who show inadequate improvement on 40 mg every 4 weeks. **2. Cushing's Disease** **a. Initial authorization:** Up to one 10-mg kit every 4 weeks. **b. Dose escalation:** Up to one 40-mg kit every 4 weeks may be approved for members who show inadequate response to 10 mg every 4 weeks.	Medical benefit (Provider-administered)
Somavert (pegvisomant)	**Acromegaly:** A one-time loading dose of 40 mg, followed by up to 30 of the 30-mg vials per month.	First dose ONLY: Medical benefit (Provider administered) *(first dose under provider supervision)* Subsequent doses: Pharmacy benefit (Self-administered)

IV. Not Medically Necessary Uses

A. Pituitary disorder therapies [as listed in Table 1, including, but not limited to, Sandostatin LAR (octreotide LAR)] are considered not medically necessary when used for chemotherapy-induced diarrhea.

V. The pituitary disorder therapies included in this policy are considered investigational when used for all other conditions not listed above in the coverage criteria.

Position Statement

Summary

- The intent of this policy is to allow for coverage of pituitary disorder therapies (as listed on page 1) for the FDA indications after use of step therapies (where appropriate, as detailed in the coverage criteria), for up to the doses supported in clinical trials.
- The medications included in this policy are either somatostatin analogs, growth hormone (GH) receptor antagonists, or cortisol-blocking therapies.
    * Somatostatin is a natural hormone that lowers excessive GH levels. Somatostatin analogs [e.g., lanreotide, octreotide, and pasireotide] work by binding to somatostatin receptors, thereby suppressing GH secretion. They also inhibit adrenocorticotropic hormone (ACTH) secretion, which leads to decreased cortisol secretion.
    * GH receptor antagonists [(Somavert (pegvisomant)] work by blocking endogenous GH from binding to GH receptors, which can lead to decreased serum insulin-like growth factor-I (IGF-I) concentrations.
    * Cortisol-blocking therapies, such as ketoconazole (generic), Recorlev (levoketoconazole), and Isturisa (osilodrostat), work by inhibition of cortisol synthesis via various pathways.
- Pituitary disorder therapies have data from randomized, controlled trials to support their use in FDA-approved indications, endorsement from guidelines as standard of care therapy, and years of clinical experience. Uses include:
    * Acromegaly
    * Cushing's syndrome (CS), including Cushing's disease
    * Advanced gastrointestinal tract, lung, thymus, or pancreatic neuroendocrine tumors (GEP-NET),
    * Carcinoid syndrome (flushing and/or diarrhea) from neuroendocrine tumors (NET), including but not limited to pancreatic neuroendocrine tumors which secretes vasoactive intestinal peptide (VIP), also known as VIPoma.
- *For acromegaly*:
    * Somatostatin analogs, such as octreotide (generic, Sandostatin LAR Depot), provide the best value for treatment of acromegaly.
    * Guidelines recommend transsphenoidal surgery as first-line treatment for most patients with acromegaly.
    * Somatostatin analogs are recommended as second-line options.
    * Mycapssa (octreotide) delayed release is an oral formulation of octreotide that is FDA approved for the treatment of acromegaly. Unlike other forms of octreotide, it is only FDA approved for acromegaly.
- *For Cushing's syndrome (CS), including Cushing's disease*:
    * Guidelines recommend surgical resection as first-line treatment for Cushing's.
    * Cortisol-blocking therapies and pituitary-directed medications are recommended as second-line options.

- Generic ketoconazole provides the best value for CS if surgical intervention is not an option or has failed. Higher-cost options are coverable only when lower-cost options are ineffective.
- *For advanced GEP-NET:*
    * Lanreotide (generic, Somatuline Depot) is approved and used for GEP-NET
    * Sandostatin LAR Depot (octreotide LAR) is not FDA-approved for GEP-NET; however, its use is supported by clinical trials and all three somatostatin analogs, including lower-cost Sandostatin (octreotide) and Sandostatin LAR Depot (octreotide LAR), are guideline recommended treatment options for GEP-NET [National Comprehensive Cancer Network (NCCN)].
- *For carcinoid syndrome (flushing and/or diarrhea) from carcinoid tumors and NET, including VIPoma:*
    * Sandostatin LAR Depot (octreotide LAR) and lanreotide (Somatuline Depot, brand only) are approved and used for carcinoid syndrome.
    * However, all three somatostatin analogs, including lower-cost Sandostatin (octreotide) and Sandostatin LAR Depot (octreotide LAR), are guideline recommended treatment options for carcinoid syndrome (flushing and diarrhea associated with carcinoid tumors).
- NCCN guidelines for neuroendocrine and adrenal tumors recommend either Sandostatin LAR Depot (octreotide LAR) or lanreotide (generic, Somatuline Depot) for the treatment of GEP-NETs and Carcinoid syndrome. [7] The guidelines do not give preference to either agent. Between the two long-acting options, Sandostatin LAR Depot (octreotide LAR) provides the best value.
- The recommended initial dosing for Sandostatin LAR Depot (octreotide LAR) for acromegaly or for symptomatic control in carcinoid tumors or VIPomas is 20 mg intramuscular injection given by a health care provider once every 4 weeks. Dosing adjustments should be made after two or three months, based on response and tolerability, up to a maximum dose of 40 mg every 4 weeks for acromegaly and 30 mg every 4 weeks for carcinoid tumors or VIPomas. Although the use of Sandostatin LAR Depot (octreotide LAR) for GEP-NET is not an FDA-approved use, the dose of 20 mg per month is a suggested starting dose per guidelines and expert input, to prevent excessive dosing and associated adverse events.
    * The safety and efficacy of doses exceeding the maximum dosage in the FDA-approved labeling have not been established in clinical trials; however, the NCCN guidelines suggest higher doses may be of value in GEP-NET or VIPoma and carcinoid syndrome when starting doses are insufficient for disease control, as detailed in the coverage criteria.
- For other products, including lanreotide (generic, Somatuline Depot), the safety and efficacy of doses exceeding the maximum dosage in the FDA-approved labeling have not been well established in clinical trials.
- The safety and efficacy of conditions not included in the FDA-approved labeling have not been established in clinical trials.

Clinical Efficacy

ACROMEGALY

Octreotide [1-3]

- A single, high-quality meta-analysis found that in patients taking Sandostatin LAR Depot (octreotide LAR) who were not preselected for somatostatin analog responsiveness, 54% met GH efficacy criteria and 63% had IGF-I normalization.
- Mycapssa (octreotide) was evaluated in one placebo-controlled trial in patients with acromegaly. The study demonstrated that Mycapssa (octreotide) produced higher rates of IGF-1 normalization compared to placebo.

Lanreotide (generic, Somatuline Depot) [4-6]

- One double-blind, controlled study evaluated the efficacy of lanreotide (generic, Somatuline Depot) 60 mg, 90 mg, and 120 mg compared to placebo in patients with acromegaly.
    * After 4 weeks, 63% of patients in the pooled lanreotide (generic, Somatuline Depot) arms had a > 50% decrease in mean GH compared to 0% in the placebo arm.
- One open-label uncontrolled trial evaluated the efficacy of lanreotide (generic, Somatuline Depot) 90 mg on IGF-1 levels in patients with acromegaly.
    * After 48 weeks, 43% of patients achieved normal age-adjusted IGF-1 concentrations. The mean IGF-1 concentration after treatment was 1.3 times the upper limit of normal (ULN) compared to 2.5 times ULN at baseline.
    * The reduction in IGF-1 concentrations correlated with a corresponding decrease in mean GH concentrations. After 48 weeks, 38% of patients had both normal IGF-1 concentrations and a GH concentration of ≤ 2.5 ng/mL, and 27% of patients had both normal IGF-1 concentrations and a GH concentration of <1 ng/mL.
- A single, low-quality meta-analysis evaluated head-to-head studies between Sandostatin LAR Depot (octreotide LAR) and lanreotide (generic, Somatuline Depot).
    * A GH level < 2.5 µg/L was achieved in 65.3% of patients on Sandostatin LAR Depot (octreotide LAR) versus 59.5% of patients on lanreotide (generic, Somatuline Depot).
    * Normalization of IGF-I was achieved in 46.7% of patients on Sandostatin LAR Depot (octreotide LAR) versus 52.7% of patients on lanreotide (generic, Somatuline Depot).
    * Biochemical control was achieved in 46% of patients on Sandostatin LAR Depot (octreotide LAR) versus 41.9% of patients on lanreotide (generic, Somatuline Depot).

Signifor LAR (pasireotide LAR) [7 8]

- A head-to-head, superiority trial evaluated the efficacy of Signifor LAR (pasireotide LAR) 40mg compared to Sandostatin LAR Depot (octreotide LAR) over a 12-month period in treatment-naïve patients with acromegaly.

    * The primary endpoint was a biochemical response (GH < 2.5 µg/L and normalized IGF-I adjusted for age and gender). However, current guidelines target a GH level < 1 µg/L.
    * Biochemical response was achieved in 31.3% of patients in the Signifor LAR (pasireotide LAR) arm and 19.2% of patients in the Sandostatin LAR Depot (octreotide LAR) arm. However, the maximum dose of Sandostatin LAR Depot (octreotide LAR) used in the trial was only 30 mg compared to the FDA-approved maximum of 40 mg.
- A randomized, controlled trial evaluated the efficacy of two strengths of Signifor LAR (pasireotide LAR) compared to continued treatment with Sandostatin LAR Depot (octreotide LAR) and Somatuline LAR (lanreotide) over a 6-month period in patients who were unable to achieve biochemical control with either Sandostatin LAR Depot (octreotide LAR) or Somatuline LAR (lanreotide).
    * The primary endpoint was a biochemical response (GH < 2.5 µg/L and normalized IGF-I adjusted for age and gender). Current guidelines target a GH level < 1 µg/L.
    * Biochemical response was achieved in 15% of patients in the Signifor LAR (pasireotide LAR) 40mg arm, 20% of patients in the Signifor LAR (pasireotide LAR) 60mg arm, and 0% of patients in the active control arm.
    * The maximum dose of Sandostatin LAR Depot (octreotide LAR) used in the trial was only 30 mg compared to the FDA-approved maximum of 40 mg.

Somavert (pegvisomant) [9 10]

- A randomized, double-blinded, placebo-controlled, 12-week study evaluated the safety and efficacy of Somavert (pegvisomant) 10 mg, 15 mg, or 20 mg in patients with acromegaly.
    * The mean serum IGF-I concentration decreased from baseline by 4.0%, 26.7%, 50.1%, and 62.5% in the placebo, 10 mg, 15 mg, and 20 mg arms, respectively. This difference was significant in all treatment arms compared to placebo.
    * Normalization of serum IGF-I concentrations were achieved in 10%, 54%, 81%, and 89% of subjects in the placebo, 10 mg, 15 mg, and 20 mg arms, respectively.
    * In patients treated with Somavert (pegvisomant) 15 mg or 20 mg daily, there were significant decreases in ring size, soft-tissue swelling, the degree of excessive perspiration, and fatigue.
    * The total score for signs and symptoms of acromegaly decreased significantly in all groups receiving Somavert (pegvisomant).

Guidelines [11]

- The Endocrine Society clinical guidelines for acromegaly recommend transsphenoidal surgery as first-line treatment for most patients.
    * Pharmacological treatment with a somatostatin analog or Somavert (pegvisomant) is recommended as the initial adjuvant medical therapy.
    * In patients with mild disease, a trial of a dopamine agonist, such as cabergoline, is recommended as the initial adjuvant medical therapy.

* Patients with an inadequate response to a somatostatin analog should try adding cabergoline or Somavert (pegvisomant).

GASTROENTEROPANCREATIC NEUROENDOCRINE TUMORS (GEP-NET) [4 5 12-15]

- The CLARINET trial (multicenter, randomized, double-blind, controlled) evaluated the efficacy of lanreotide (generic, Somatuline Depot) 120 mg in patients with GEP-NETs compared to placebo.
  * Patients were required to have non-functioning tumors without hormone-related symptoms. The majority (69%) of the study population had grade 1 tumors.
  * The primary endpoint was progression-free survival (PFS).
  * Patients in the lanreotide (generic, Somatuline Depot) arm had a statistically significant improvement in PFS compared placebo (median not reached vs. median of 18.0 months).
- The PROMID trial showed an improvement in time to tumor progression in neuroendocrine tumors of the midgut with Sandostatin LAR Depot (octreotide LAR) compared to placebo (14.3 months vs. 6 months).
- The National Comprehensive Cancer Network (NCCN) Neuroendocrine and Adrenal Tumors guideline list Sandostatin LAR Depot (octreotide LAR) and lanreotide (generic, Somatuline Depot) as category 2A recommendation for gastrointestinal tract, lung, thymus, or pancreatic neuroendocrine tumors (GEP-NET).
- The CLARINET FORTE phase 2 open-label single arm trial showed dosing of lanreotide (generic, Somatuline Depot) at every 14-day intervals in patients with previous disease progression on every 28-day dosing of lanreotide. The primary endpoint of progression free survival (PFS) was 8.3 months in the midgut and 5.6 in the pNEt cohorts. PFS is a surrogate endpoint and is not directly related to true clinical benefit such as overall survival and quality of life. There was a lack of comparator in the trial as well as a small sample size. The evidence of true clinical benefit due to dose interval increase rather than moving on to another treatment option in patients with pancreatic or midgut neuroendocrine tumors is insufficient at this time.
- NCCN guidelines state that octreotide (usually 150mcg-250mcg three times daily) can be added to Sandostatin LAR Depot (octreotide LAR) or lanreotide (generic, Somatuline Depot) for rapid relief of symptoms or breakthrough symptoms.
- Additional prospective randomized controlled studies are needed to establish the safety and efficacy of above label dosing for Sandostatin LAR Depot (octreotide LAR) and lanreotide (generic, Somatuline Depot).

CUSHING'S DISEASE (CD)

- Surgery is the mainstay, first-line treatment option for many patients with Cushing's disease. Cortisol-blocking therapies and pituitary-directed medications are recommended as second-line options.

- There are various medication treatment options, which differ based on mechanism of action, as well as cost.
    * Generic ketoconazole provides the best value for CD if surgical intervention is not an option or has failed. High-cost options are coverable only when lower-cost options (as listed in Appendix 1) are ineffective, as detailed in the coverage criteria.
    * High-cost options include, but are not limited to, Recorlev (levoketoconazole), Isturisa (osilodrostat), Signifor (pasireotide), Signifor LAR (pasireotide LAR). The evidence for the use of these high-cost options is detailed below.

Signifor (pasireotide) [7 16 17]

- There is low-quality evidence that Signifor (pasireotide) has any clinically relevant effect on improving symptoms in patients with CD. The effects of Signifor (pasireotide) on long-term consequences of CD, including cardiovascular outcomes, bone loss, or death, have not been studied.
- The evidence of efficacy for Signifor (pasireotide) in CD is of poor quality because it is based on a single, unblinded, uncontrolled (no comparator) trial.
    * The trial enrolled adult patients with confirmed CD (pituitary tumor) who had recurrent or persistent disease despite tumor resection or who were not candidates for surgery. Subjects enrolled in the trial had a mean urinary free cortisol (UFC) level of at least 1.5 times the upper limit of normal.
    * The trial evaluated three different doses of Signifor (pasireotide): 0.3 mg, 0.6 mg, or 0.9 mg subcutaneously twice daily.
    * The primary endpoint of the study was the proportion of subjects with normalized UFC levels at month 6. Additional endpoints included proportion of subjects with normalized UFC levels at month 3 and 12.
    * At month 3, 16% and 28% of subjects had normalization of UFC levels in the 0.6 mg and 0.9 mg treatment arms, respectively. At month 6, 16% and 29% had normalized UFC levels, respectively; and at month 12, UFC levels had normalized in 13% and 25% of subjects, respectively.
    * Subjects with lower baseline UFC levels were more likely to achieve normalization of UFC.

Signifor LAR (pasireotide LAR) [18 19]

- A phase 3 trial evaluated the efficacy of Signifor LAR (pasireotide LAR) 10mg compared to Signifor LAR (pasireotide LAR) 30mg every 4 weeks for 12 months in persistent, recurrent, or non-surgical patients with Cushing's disease.
    * The primary endpoint was the proportion of patients in each group with a mean urinary free cortisol (mUFC) concentration of less than or equal to the ULN at month 7.
    * The primary efficacy endpoint was met by 31 (41.9%) of patients in the 10 mg group and 31 (40.8%) of patients in the 30 mg group.

* The maximum dose of Signifor LAR (pasireotide LAR) used in the trial was 30 mg and 40mg in the 10 mg and 30 mg treatment arms, respectively.

Isturisa (osilodrostat)[20]

- Isturisa (osilodrostat) was evaluated in one phase 3 randomized, withdrawal study known as LINC-3. The study included patients with CD who previously had pituitary surgery or irradiation or were newly diagnosed and who refused surgery or were not surgical candidate.
- The primary endpoint was the proportion of patients who achieved normal (UFC) levels at the end of the randomized withdrawal period, without the need for uptitration.
- Results showed that osilodrostat improves the proportion of patients who achieve a normal UFC level compared to placebo. However, additional study is warranted as study was relatively short term and used a different dosing schedule than the FDA approved, recommend dose.

Recorlev (levoketoconazole) for Endogenous Cushing's Syndrome (CS)[21 22]

- The safety and efficacy of Recorlev (levoketoconazole) was evaluated in two phase 3 trials (SONICS and LOGICS) in adults with endogenous CS.
    * All patients in both studies had endogenous CS with a mUFC>1.5x the upper limit of normal and were either not eligible for surgery or had persistent/recurrent disease despite previous surgery.
    * Patients with pseudo or cyclic CS as well as endogenous CS due to either pituitary or adrenal carcinoma were excluded from trial.
    * SONICS (n=94) was a phase 3, open-label, single arm trial in adults consisting of a dose-titration phase, maintenance phase, and extended maintenance phase.
        - The dose was titrated based on mUFC response and patient tolerance, with the dose being established once mUFC was either less than upper limit of normal, max dose was obtained, or clinically meaningful response reached in the opinion of the investigator.
        - Once the therapeutic dose was achieved, the patients entered the maintenance phase of the trial, in which the primary endpoint was the number of patients to maintain mUFC normalization after 6 months without a dose increase.
        - Approximately 31% (n=29) met the primary endpoint of mUFC normalization after 6 months, with only 16 (17%) of patients still meeting that endpoint after the extended maintenance phase.
    * LOGICS (n=84) was a phase 3, open-label dose titration, with a randomized double-blind, placebo controlled, withdrawal and dose restoration phase.
        - Dose titration was similar to the SONICS trial, however they had to be on stable dose for 4 weeks prior to entry into randomized portion of trial.
        - 44 patients (22 in placebo and 22 in treatment arm) were enrolled in the randomized withdrawal phase of the trial in which the primary endpoint was loss of therapeutic response upon withdrawing to placebo vs those

with loss of response on levoketoconazole. Loss of response was defined as mUFC > than 1.5x the upper limit of normal or mUFC > 40% from baseline of withdrawal phase.
        - Significantly more patients in the placebo arm (96%, n=21), lost a response compared to 41% (n=9) of the patients in the levoketoconazole arm.
    * Results of both trials showed that levoketoconazole improved the number of patients achieving a normalized mUFC alone as well as when compared to placebo in a withdrawal trial.
    * However, there is low-quality evidence that Recorlev (levoketoconazole) has any clinically relevant effect on the long-term consequences of CS, including cardiovascular outcomes, bone loss, or death.
    * The evidence of efficacy for Recorlev (levoketoconazole) in CS is of poor quality because it is based on one small open label, single arm trial, and a small, randomized, placebo controlled, withdrawal trial with no active comparator.
- Use of ketoconazole (generic) is currently recommended by the Endocrine Society as well as the Pituitary Society as a second line option after surgical intervention fails or is not an option. [23] There is no trial evidence directly comparing the efficacy or safety of Recorlev (levoketoconazole) to ketoconazole (generic) in CS. The known adverse event profile of Recorlev (levoketoconazole) is similar to ketoconazole; therefore, the use of Recorlev (levoketoconazole) in patients who are intolerant to, or have a contraindication to, ketoconazole is considered not medically necessary and not coverable.

Guidelines:
- First-line mainstay treatment for Cushing's Syndrome (CS) is surgical resection of the tumor. If surgery is unsuccessful or not an option, pharmacologic treatment is considered second-line therapy.
- Pharmacologic options for treatment include the following with selection being individualized based on each patient's clinical scenario, severity of disease, availability and cost:
    * Steroidogenesis inhibitors: ketoconazole, metyrapone, mitotane, etomidate, Isturisa (osilodrostat).
    * Somatostatin analogues: cabergoline, Signifor (pasireotide).
    * Glucocorticoid-receptor antagonists: mifepristone.

CARCINOID SYNDROME - SYMPTOMATIC CONTROL IN CARCINOID (NET) TUMORS or VIPomas [1 14]
- The NCCN Neuroendocrine and Adrenal Tumors guideline list Sandostatin LAR Depot (octreotide LAR) and lanreotide (generic, Somatuline Depot) as category 2A recommendations for carcinoid syndrome.
- A 6-month, double-blind trial of malignant carcinoid syndrome evaluated the efficacy of Sandostatin LAR Depot (octreotide LAR) 10 mg, 20 mg, or 30 mg.

* Overall, mean daily stool frequency was decreased with Sandostatin LAR Depot (octreotide LAR). The average number of daily stools decreased from ~4.5 stools per day at baseline to ~2.5 stools per day.
* Mean daily flushing episodes also decreased with Sandostatin LAR Depot (octreotide LAR). The average number of daily flushing episodes decreased from 3.0-6.1 episodes per day at baseline to 0.6-1.0 episodes per day.
* The reductions observed with Sandostatin LAR Depot (octreotide LAR) are within the range reported in the published literature for patients treated with octreotide (generic) subcutaneous injection.

USE OF SANDOSTATIN LAR DEPOT (OCTREOTIDE LAR) IN OTHER CONDITIONS

- Use of non-long-acting octreotide (generic) is a standard of care treatment option for various secretory conditions, including but not limited to secretory diarrhea, chemotherapy-induced diarrhea, and gastrointestinal bleeding.
- However, there is insufficient evidence to establish Sandostatin LAR Depot (octreotide LAR) is superior to use of lower-cost octreotide (generic). Therefore, Sandostatin LAR Depot (octreotide LAR) is coverable only for the diagnoses listed in the policy (when the coverage criteria are met).
- There is interest in the use of long acting Sandostatin LAR (octreotide LAR) in chemotherapy-induced diarrhea, however, evidence is lacking (including two phase 3 trials failing) to establish Sandostatin LAR Depot (octreotide LAR) is superior to other standards of care (which includes lower cost octreotide (generic) or placebo in chemotherapy induced diarrhea, therefore use of Sandostatin LAR Depot (octreotide LAR) in this indication is considered " Not medically necessary".[24 25]
- Of note: as of the publication of this policy, octreotide (generic) does not have a medication coverage policy.

Safety [8 9 16 18 26]

- Pituitary disorder therapies may increase blood glucose levels or increase glucose tolerance. In patients with diabetes, blood glucose levels should be monitored, and anti-diabetic medications should be optimized prior to starting therapy.
- Signifor LAR (pasireotide LAR) was associated with higher rates of hyperglycemia (29% vs. 8%), diabetes mellitus (19% vs. 4%), and increased HbA1c (6% vs 2%) compared to Sandostatin LAR Depot (octreotide LAR). [10] Similar differences were observed when comparing Signifor LAR (pasireotide LAR) with lanreotide (generic, Somatuline Depot).
- Pasireotide (Signifor, Signifor LAR) is not recommended in patients with severe liver impairment.
- Baseline liver function tests [e.g., alanine aminotransferase (ALT), aspartate aminotransferase (AST), total bilirubin (TBIL), and alkaline phosphatase (ALP)] should be less than 3 times the upper limit of normal before starting Somavert (pegvisomant).
- Similar to ketoconazole, Recorlev (levoketoconazole) has a boxed warning for hepatoxicity and QT interval prolongation. Use in patients with severe liver disease or taking

concurrent medications associated with QT prolongation is not recommended. Baseline liver and ECG should be obtained before starting Recorlev (levoketoconazole) as well as monitored frequently.

Dosing

Table 2: Recommended Dosing and Administration for Pituitary Disorder Therapies

Drug	Dosing Schedule

Lanreotide (generic, Somatuline Depot) [4]
 	
Administered by a trained health care professional
	- Acromegaly: 90 mg subcutaneously once every 4 weeks.
	  * After 3 months of treatment, the dose of lanreotide (generic, Somatuline Depot) may be adjusted based on GH and IGF-1 levels.
	  * The dosage range is lanreotide (generic, Somatuline Depot) 60 mg to 120 mg.
	  * Patients who are controlled on lanreotide (generic, Somatuline Depot) 60 mg or 90 mg every 4 weeks may be considered for an extended dosing interval of lanreotide (generic, Somatuline Depot) 120 mg every 6 or 8 weeks.
	- GEP-NET: 120 mg subcutaneously once every 4 weeks.
	- Treatment of adults with carcinoid syndrome: 120 mg subcutaneously once every 4 weeks.

Recorlev (levoketoconazole) [26]	- Endogenous Cushing's Syndrome:
	  * Initiate dosage at 150 mg orally twice daily.
	  * Titrate dosage by 150 mg daily no more frequently than every 2-3 weeks based on 24-hour urinary free cortisol levels and tolerability.
	  * The maximum recommended dose is 600 mg twice daily.

Mycapssa (octreotide) [2]	- Acromegaly:
	  * 40 mg orally daily, administered as 20 mg twice daily.
	  * The dose may be adjusted based on GH and IGF-1 levels.
	  * The maximum dose is 80 mg daily.

Sandostatin LAR Depot (octreotide LAR) [1]
 	
Administered by a trained health care professional
	- Acromegaly:
	  * 20 mg intramuscularly once every 4 weeks.
	  * The recommended dosage range is 10 mg to 40 mg every 4 weeks.
	  * After 3 months of treatment, the dose may be adjusted based on GH and IGF-1 levels.
	- Diarrhea associated with carcinoid tumors or VIPomas:
	  * 20 mg intramuscularly once every 4 weeks.
	  * The recommended dosage range is 10 mg to 40 mg every 4 weeks.
	  * After 2 months of treatment, the dose may be adjusted based on symptomatic control.
	- GEP-NETs: Up to 40 mg intramuscularly once every 4 weeks.
	- For patients with GEP NETS, carcinoid tumors, or VIPomas, the dose may be further increased as needed based on symptom control. Short acting octreotide may also be added to Sandostatin LAR Depot (octreotide LAR) for rapid relief of symptoms or breakthrough symptoms. [14]

Drug	Dosing Schedule
Signifor (pasireotide) [16] *Self-administered*	- Starting dose for acromegaly: 0.6 or 0.9 mg subcutaneously twice a day. - The dose of Signifor (pasireotide) should be adjusted based on response and tolerability. - The dosage range of Signifor (pasireotide) is 0.3 to 0.9 mg twice daily. - Prior to initiating Signifor (pasireotide) therapy, it is recommended that the following baseline evaluations are obtained: fasting plasma glucose, hemoglobin A1c, liver tests, serum potassium and magnesium, an electrocardiogram, and a gallbladder ultrasound.

Signifor LAR (pasireotide LAR) [18]
 	
Administered by a trained health care professional
	- Acromegaly: 40 mg intramuscularly once every 4 weeks.
	  * The dose of Signifor LAR (pasireotide LAR) may be increased to a maximum of 60 mg once every 4 weeks in patients who do not have normalized GH or IGF-1 levels after 3 months of treatment or decreased to 20 mg once every 4 weeks based on tolerability.
	  * Prior to initiating Signifor LAR (pasireotide LAR) therapy, it is recommended that the following baseline evaluations are obtained: fasting plasma glucose, hemoglobin A1c, liver tests, serum potassium and magnesium, and an electrocardiogram.
	- Cushing's disease: 10 mg intramuscularly once every 4 weeks.
	  * Based on FDA label, the dose of Signifor LAR (pasireotide LAR) may be increased following 4 months of treatment in patients who have not normalized 24-hour urinary free cortisol (UFC). Based on tolerability, the dose may be increased to a maximum of 40 mg once every 4 weeks.
	  * Prior to initiating Signifor LAR (pasireotide LAR) therapy, it is recommended that the following baseline evaluations are obtained: fasting plasma glucose, hemoglobin A1c, liver tests, serum potassium and magnesium, and an electrocardiogram.

Somavert (pegvisomant) [9] *Self-administered*	- Loading dose: 40 mg subcutaneously done under physician supervision. - Somavert (pegvisomant) 10 mg subcutaneously once daily. - The daily dose of Somavert (pegvisomant) should be adjusted in 5 mg increments until serum IGF-I concentrations are maintained within normal range. IGF-I levels should be measured every 4 to 6 weeks. Doses should not be adjusted based on GH levels or signs/symptoms of acromegaly. - The dosage range of Somavert (pegvisomant) is 10 mg to 30 mg daily. - Prior to initiating Somavert (pegvisomant) therapy, it is recommended that baseline liver function tests are obtained. If AST or ALT is greater than 3 times the upper limit of normal, a work-up should be performed prior to Somavert (pegvisomant) administration.

Appendix 1: Lower-Cost Medications Used in the Management of Cushing's Disease [23 26 27]
Cabergoline (generic)
Ketoconazole (generic)
Metyrapone (Metopirone)
Mitotane (Lysodren)

Appendix 2: Endogenous Cushing's Syndrome Etiologies indicated for Recorlev use.[21 22]
Cushing's Disease (Pituitary adenoma)
Ectopic adrenocorticoticotrophic hormone (ACTH) secreting tumor
Adrenal adenoma
Adrenal hyperplasia

Codes	Number	Description
HCPCS	J1930	Injection, lanreotide (Somatuline Depot), 1 mg
HCPCS	J1932	Injection, lanreotide (Cipla), 1 mg
HCPCS	J2502	Injection, pasireotide long acting (Signifor LAR), 1 mg
HCPCS	J2353	Injection, octreotide, depot form for intramuscular injection (Sandostatin LAR Depot), 1 mg

Revision History

Revision Date	Revision Summary
9/19/2024	• No criteria changes with this annual review.
9/14/2023	• Added use of Sandostatin LAR (octreotide LAR) as "Not medically necessary" for use in chemotherapy induced diarrhea.
9/23/2022	• Added coverage for Recorlev (levoketoconazole), a new medication for endogenous Cushing's syndrome (CS). • Added lanreotide, a new generic product for Somatuline Depot. • Clarified intent of step therapy for Cushing's Disease (lower-cost medication treatment option); associated appendix updated. • Removed step through Sandostatin LAR Depot (octreotide LAR) in acromegaly for pediatric patients. • Simplified initial authorization quantity limits on Sandostatin LAR Depot (octreotide LAR).
10/15/2021	• Clarified authorization periods and quantity limits. • Updated preferred long-acting somatostatin analog for carcinoid syndrome and GEP-NETs.
10/28/2020	• Added Sandostatin LAR Depot (octreotide LAR) to policy and archived standalone octreotide policy (formerly dru489). • Added Mycapssa (octreotide) delayed release capsules as a new medication for acromegaly. • Added Isturisa (osilodrostat) as a new medication for Cushing's Disease. • Added continuation of therapy (COT) criteria to policy. No change to intent of policy. • Clarified that the dose of Sandostatin LAR Depot (octreotide LAR) may be increased to greater than 40 mg every 4 weeks in patients who have continue to have symptoms on standard and require additional symptom control.
10/23/2019	Clarification of policy criteria wording, for operational clarity (no change to coverage intent with this annual update).
10/19/2018	Added coverage of Signifor LAR (pasireotide LAR) for Cushing's disease consistent with its new FDA-approved indication.
10/13/2017	Added coverage of Somatuline Depot for carcinoid syndrome in adults consistent with its new FDA-approved indication.
2/17/2017	New policy (effective 7/1/17).

Medication Policy Manual | **Policy No:** dru489

Topic: Sandostatin LAR Depot, octreotide long-acting release | **Date of Origin:** June 1, 2017

Committee Approval Date: October 23, 2019 | **Next Review Date:** October 2020

Effective Date: January 1, 2020

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Octreotide long-acting release (Sandostatin LAR Depot) is a somatostatin analog indicated for acromegaly, diarrhea or flushing associated with metastatic carcinoid tumors, and watery diarrhea associated with vasoactive intestinal peptide tumors (VIPomas). The long-acting release (LAR) formulation is given intramuscularly once every four weeks.

This policy and the coverage criteria below do not apply to octreotide (generic). Octreotide (generic) does not require pre-authorization.

Policy/Criteria

I. Most contracts require pre-authorization approval of octreotide LAR (Sandostatin LAR Depot) prior to coverage. Octreotide LAR (Sandostatin LAR Depot) may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) of use for one of the following indications, as listed in criteria A, B, or C below.

A. Unresectable, locally advanced or metastatic **gastroenteropancreatic neuroendocrine tumors (GEP-NETs)** [e.g. gastrointestinal tract, lung, thymus, or pancreatic neuroendocrine tumors].

OR

B. **Carcinoid tumors** (metastatic) OR **vasoactive intestinal peptide tumors (VIPomas),** with documented associated severe diarrhea and/or flushing episodes

OR

C. **Acromegaly**

II. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services does not consider octreotide LAR (Sandostatin LAR Depot) to be a self-administered medication.

B. When pre-authorization is approved, octreotide LAR (Sandostatin LAR Depot) may be authorized in the following quantities:

1. **Carcinoid tumors, VIPomas, or GEP-NET**

a. **Initial authorization:** Up to #1 octreotide LAR (Sandostatin LAR Depot) 20-mg kit every 4 weeks for 2 months.

b. **Continued authorization:** Up to #1 octreotide LAR (Sandostatin LAR Depot) 40 mg every 4 weeks.

2. **Acromegaly**

a. **Initial authorization:** Up to #1 octreotide LAR (Sandostatin LAR Depot) 20-mg kit every 4 weeks for 3 months.

b. **Continued authorization:** Up to #1 octreotide LAR (Sandostatin LAR Depot) 40 mg every 4 weeks.

C. Authorization may be reviewed annually. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, such as disease stability or improvement.

III. Octreotide LAR (Sandostatin LAR Depot) is considered investigational when used for all other conditions, including meningiomas, portal hypertension, and other cancer settings.

Position Statement

Summary

- Somatostatin is a natural hormone that lowers excessive growth hormone (GH) levels. Somatostatin analogs, such as octreotide LAR (Sandostatin LAR Depot), work by binding to somatostatin receptors, thereby suppressing GH secretion. They also inhibit adrenocorticotropic hormone (ACTH) secretion, which leads to decreased cortisol secretion.
- The intent of this policy is to allow for coverage of octreotide LAR (Sandostatin LAR Depot) for the indications where is has been shown to be safe and effective, including both FDA indications (as detailed in the coverage criteria) and those uses supported in standard of care guidelines (GEP-NET), for up to the doses supported in clinical trials.
    * Somatostatin analogs, such as octreotide (generic, Sandostatin LAR Depot), is FDA-approved for treatment of acromegaly.
    * Octreotide LAR (Sandostatin LAR Depot) is also FDA-approved for severe diarrhea and flushing episodes associated with metastatic carcinoid tumors, and profuse watery diarrhea associated with vasoactive intestinal peptide-secreting tumors (VIPomas).
    * Octreotide LAR (Sandostatin LAR Depot) is not FDA-approved for locally advanced or metastatic gastroenteropancreatic neuroendocrine tumors GEP-NET; however, its use is supported by clinical trials, as well as standard of care guidelines [National Comprehensive Cancer Network (NCCN)].
- The recommended initial dosing for octreotide LAR (Sandostatin LAR Depot) for acromegaly or for symptomatic control in carcinoid tumors or VIPomas is 20 mg intramuscular injection given by a health care provider once every 4 weeks. Dosing adjustments should be made after two or three months, based on response and tolerability, up to a maximum dose of 40 mg every 4 weeks for acromegaly and 30 mg every 4 weeks for carcinoid tumors or VIPomas. Although the use of octreotide LAR (Sandostatin LAR Depot) for GEP-NET is not a FDA-approved use, the dose of 20 mg per month is a suggested starting dose per guidelines and expert input, to prevent excessive dosing and associated adverse events.
- The safety and efficacy of doses exceeding the maximum dosage in the FDA-approved labeling have not been established in clinical trials; however, the NCCN guidelines suggest higher doses may be of value in GEP-NET or VIPoma and carcinoid syndrome when starting doses are insufficient for disease control, as detailed in the coverage criteria.

Clinical Efficacy

ACROMEGALY

- A single, high quality meta-analysis found that in patients taking octreotide LAR (Sandostatin LAR Depot) who were not preselected for somatostatin analog responsiveness, 54% met GH efficacy criteria and 63% had IGF-I normalization. [2]
- A single, low quality meta-analysis evaluated head-to-head studies between octreotide LAR (Sandostatin LAR Depot) and lanreotide (Somatuline Depot). [3]
    * A GH level < 2.5 µg/L was achieved in 65.3% of patients on octreotide LAR (Sandostatin LAR Depot) versus 59.5% of patients on lanreotide (Somatuline Depot).
    * Normalization of IGF-I was achieved in 46.7% of patients on octreotide LAR (Sandostatin LAR Depot) versus 52.7% of patients on lanreotide (Somatuline Depot).
    * Biochemical control was achieved in 46% of patients on octreotide LAR (Sandostatin LAR Depot) versus 41.9% of patients on lanreotide (Somatuline Depot).
- The Endocrine Society clinical guidelines for acromegaly recommend transsphenoidal surgery as first-line treatment for most patients. [1]
    * Pharmacological treatment with a somatostatin analog or pegvisomant (Somavert) is recommended as the initial adjuvant medical therapy.
    * In patients with mild disease, a trial of a dopamine agonist, such as cabergoline, is recommended as the initial adjuvant medical therapy.
    * Patients with an inadequate response to a somatostatin analog should try adding cabergoline or pegvisomant (Somavert).

SYMPTOMATIC CONTROL IN CARCINOID (NET) TUMORS or VIPomas

- A 6-month, double-blind trial of malignant carcinoid syndrome evaluated the efficacy of octreotide LAR (Sandostatin LAR Depot) 10 mg, 20 mg, or 30 mg. [4]
    * Overall, mean daily stool frequency was decreased with octreotide LAR (Sandostatin LAR Depot). The average number of daily stools decreased from ~4.5 stools per day at baseline to ~2.5 stools per day.
    * Mean daily flushing episodes also decreased with octreotide LAR (Sandostatin LAR Depot). The average number of daily flushing episodes decreased from 3.0-6.1 episodes per day at baseline to 0.6-1.0 episodes per day.
    * The reductions observed with octreotide LAR (Sandostatin LAR Depot) are within the range reported in the published literature for patients treated with octreotide (generic) subcutaneous injection.

GASTROENTEROPANCREATIC NEUROENDOCRINE TUMORS (GEP-NETs)

- The PROMID trial showed an improvement in time to tumor progression in neuroendocrine tumors of the midgut with octreotide LAR (Sandostatin LAR Depot) compared to placebo (14.3 months vs. 6 months). [5]

- The National Comprehensive Cancer Network (NCCN) Neuroendocrine Tumors guideline list octreotide LAR (Sandostatin LAR Depot) as category 2A recommendation for gastrointestinal tract, lung, thymus, or pancreatic neuroendocrine tumors (GEP-NET). [6]
- A single systematic review showed that dose escalation up to 120 mg every 4 weeks may be considered for symptom control and tumor progression in neuroendocrine tumors; however, there was a lack of quantitative measurements of symptom severity and mainly supported by expert opinion. [6]
- Additional prospective randomized controlled studies are needed to establish the safety and efficacy of above label dosing for octreotide LAR (Sandostatin LAR Depot).

Investigational Uses

- Although there is interest in using octreotide LAR (Sandostatin LAR Depot) in a variety of other cancer settings (not listed above), there is currently no published randomized trials to support the efficacy and safety of octreotide LAR (Sandostatin LAR Depot) in these settings.
- The safety and efficacy of octreotide LAR (Sandostatin LAR Depot) has not been established in portal hypertension. [7]
- The dose escalation of octreotide LAR (Sandostatin LAR) in excess of 30 mg every 4 weeks in the treatment of carcinoid tumors or GEP-NET for somatostatin analogue resistance is considered investigational. While trials of telotristat (Xermelo) included a significant portion of patients who used octreotide LAR (Sandostatin LAR) in excess of 30 mg per 4 weeks, there is insufficient evidence to establish any benefit from dosing in excess of 30 mg every 4 weeks. As such, the use is considered investigational and cannot be covered. [8]

Safety [4]

- The most common adverse reactions associated with octreotide LAR (Somatostatin LAR Depot) in acromegaly were diarrhea, cholelithiasis, abdominal pain, and flatulence.
- The most common adverse reactions associated with octreotide LAR (Somatostatin LAR Depot) in carcinoid tumors and VIPomas were back pain, fatigue, headache, abdominal pain, nausea, and dizziness.
- Similarly to other somatostatin analogs, when octreotide LAR (Somatostatin LAR Depot) treatment is initiated, blood glucose levels should be monitored and anti-diabetic therapies should be adjusted accordingly.

Dosing

- Patients should be maintained on octreotide (generic) subcutaneous injection for at least 2 weeks to determine tolerance prior to initiating octreotide LAR (Sandostatin LAR Depot).
- The recommended dosing for octreotide LAR (Sandostatin LAR Depot) in acromegaly is as follows: [4]
    * Octreotide LAR (Sandostatin LAR Depot) 20 mg intramuscularly once every 4 weeks.

    * After 3 months of treatment, the dose of octreotide LAR (Sandostatin LAR Depot) may be adjusted based on GH and IGF-1 levels.
    * The recommended dosage range is octreotide LAR (Sandostatin LAR Depot) 10 mg to 40 mg.
- The recommended dosing for octreotide LAR (Sandostatin LAR Depot) in diarrhea associated with carcinoid tumors or VIPomas is as follows: [4]
    * Octreotide LAR (Sandostatin LAR Depot) 20 mg intramuscularly once every 4 weeks.
    * After 2 months of treatment, the dose of octreotide LAR (Sandostatin LAR Depot) may be adjusted based on symptomatic control.
    * The recommended dosage range is octreotide LAR (Sandostatin LAR Depot) 10 mg to 30 mg.
- The recommended dosing for octreotide LAR (Sandostatin LAR Depot) in GEP-NETs is 20 mg to 30 mg intramuscularly once every 4 weeks. [6]
- Octreotide LAR (Sandostatin LAR Depot) should be administered by a trained health care professional.

Medication Policy Manual | **Policy No:** dru499

Topic: Bavencio, avelumab | **Date of Origin:** July 14, 2017

Committee Approval Date: September 19, 2024 | **Next Review Date:** 2025

Effective Date: January 1, 2025

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Bavencio (avelumab) is an intravenously administered immunotherapy used in the management of certain types of cancer. It belongs to a class of medications called programmed death-ligand (PD-L1) blocking antibodies.

Policy/Criteria

Most contracts require pre-authorization approval of Bavencio (avelumab) prior to coverage.

I. Continuation of therapy (COT): Bavencio (avelumab) may be considered medically necessary for COT when criterion A, B, or C below is met.

A. For diagnoses NOT listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND there is documentation that the medication was covered by another health plan. Examples of documentation include the coverage approval letter from the previous health plan or paid claim.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

B. For diagnoses listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

C. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

Please note*: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Bavencio (avelumab) may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) that criterion A, B, or C below is met.

A. A diagnosis of **Merkel cell carcinoma**, metastatic, when criteria 1 and 2 below are met:

1. Bavencio (avelumab) will be used as monotherapy.

AND

2. No prior use of programmed death receptor-1 blocking antibody therapy (PD-1 inhibitors) or programmed death-ligand 1 blocking antibody therapy (PD-L1 inhibitors) [see *Appendix 1*].

OR

B. A diagnosis of **urothelial carcinoma** (bladder cancer), locally advanced or metastatic, when criteria 1, 2, and 3 below are met:

1. Prior treatment with platinum-containing chemotherapy.

AND

2. Bavencio (avelumab) will be used as monotherapy.

AND

3. No prior therapy with PD-1/PD-L1 blocking antibody therapy (see *Appendix 1*).

OR

C. A diagnosis of **renal cell carcinoma** (RCC), recurrent or metastatic, when criteria 1 through 4 below are met:

1. The tumor has clear cell histology.

AND

2. There has been no prior systemic therapy for advanced disease.

AND

3. Bavencio (avelumab) will be administered in combination with Inlyta (axitinib).

AND

4. No prior therapy with PD-1/PD-L1 blocking antibody therapy (see *Appendix 1*).

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy services considers Bavencio (avelumab) coverable only under the medical benefit (as a provider- administered medication).

B. When pre-authorization is approved, Bavencio (avelumab) will be authorized for 24 weeks in quantities of up to 800 mg every 2 weeks, until disease progression.

C. Reauthorization: Authorization **shall** be reviewed at least every 24 weeks for documented benefit. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met. Specifically, documentation that the medication is providing clinical benefit, including disease stability or improvement, and lack of disease progression, based on an assessment of change in tumor burden. If there is documentation of potential disease progression, a shortened authorization (up to three months) may be approved to allow time for clarification of response to Bavencio (avelumab), including clinical re-evaluation of the patient and reimaging.

PLEASE NOTE: Additional doses of Bavencio (avelumab) will not be authorized without a documented recent assessment by the treating provider (such as oncologist) with objective evidence of response to therapy, such as by re-imaging and use of iRECIST criteria.

IV. Bavencio (avelumab) is considered investigational when used for all other conditions, including but not limited to:

A. Gastric or gastroesophageal junction (GEJ) adenocarcinoma

B. Non-small cell lung cancer (NSCLC)

C. Renal cell carcinoma (RCC), when used in the subsequent-line treatment setting.

Position Statement

Summary

- Bavencio (avelumab) is a programmed death-ligand 1 (PD-L1) blocking antibody (immunotherapy) used in the treatment of several types of cancer.
- The intent of this policy is to cover Bavencio (avelumab) in settings where it has been studied and shown to be safe and effective, as detailed in the coverage criteria, with consideration for other available treatment options.
    * Where there is lack of proven additional benefit and/or lack of demonstrated health outcome (such as overall survival or improved quality of life) relative to alternative therapies, use of Bavencio (avelumab) alone or in combination with other therapies is not coverable ("not medically necessary" or "investigational").
    * It is important to note that the fact that a medication is FDA approved for a specific indication does not, in itself, make the treatment medically reasonable and necessary.
- Many of the clinical indications for immunotherapies (PD-1, PD-L1, and others) have been approved by the FDA and endorsed by clinical guidelines based on surrogate measures such as overall tumor response rate (ORR) and progression-free survival (PFS) which are not proven to accurately predict clinically important outcomes such as improved overall survival or improved quality of life.
- National Comprehensive Cancer Network (NCCN) guidelines recommend Bavencio (avelumab) as a potential option in each of the treatment settings listed in the coverage criteria. In general, NCCN recommendations parallel the FDA approved indications.
- The PD-1 and PD-L1 inhibitors have the potential to cause immune-mediated adverse reactions that can result in pneumonitis, colitis, hepatitis, endocrinopathies, and nephritis.
- Bavencio (avelumab) is intravenously administered in a dose of 800 mg every two weeks, until disease progression.
- Optimal sequencing of chemotherapy and immunotherapy in many cancers is unknown or the data is evolving. At this time, sequential use of immunotherapies is not supported by current evidence. Specifically, there is no evidence to support the sequential use of different PD-1 or PD-L1 inhibitors once there is disease progression on prior PD-1 or PD-L1 inhibitor therapy, as well as use of adjuvant PD-1/PD-L1 inhibitor after neoadjuvant PD-1/PD-L1 inhibitor therapy (unless explicitly listed in the coverage criteria). Therefore, the use of sequential courses of PD-1/PD-L1 immunotherapy is not coverable.
- There are ongoing studies using Bavencio (avelumab) in a variety of other cancers. However, although initial evidence may be promising, the potential for clinical benefit in these conditions is still being investigated.
- *Reauthorization Criteria*: When coverage criteria are met, Bavencio (avelumab) is authorized for six months (24 weeks) of therapy, after which time documentation must be provided to establish that the medication is effective. Specifically, there must be documentation of clinical benefit, including disease stability or improvement and there is a lack of disease progression, based on an assessment of change in tumor burden.
    * The standard of care for evaluation of response to cancer immunotherapy, such as Bavencio (avelumab) is use of the iRECIST criteria for assessment of tumor burden. [1]

* The iRECIST criteria include use of quantitative and qualitative criteria for assessment of change in tumor burden for target lesions and non-target lesions. [2]
    - Quantitative measurements for target lesions (tumor size and % change)
    - Qualitative evaluation for non-target lesions (present/disappeared/ unequivocal progression)
* Documentation of benefit must include an assessment of the most recent imaging ("restaging scans") by the treating oncologist. Given the complexity of the evaluation, including use of the iRECIST criteria, Bavencio (avelumab) will not be reauthorized without an assessment of response to therapy, such a partial response (iPR), complete response (iCR), or stable disease (iSD).
* Use of immunotherapy may result in pseudoprogression, due to immune and T-cell activation, which can appear similar to tumor flare. If there is documentation of potential disease progression ["unconfirmed progressive disease (iUPD)"], a shortened authorization (up to three months) may be approved to allow time for clarification of response to Bavencio (avelumab), including clinical re-evaluation of the patient and reimaging. Guidelines recommend reimaging for iUPD after 4-8 weeks.
* If a patient has confirmed, unequivocal new lesions (progression of disease, iPD), additional Bavencio (avelumab) is not coverable. If a new lesion is equivocal, iUPD reassessment by the treating oncologist with repeat imaging would apply (as noted above).

Regence Pharmacy Services performs independent analyses of oncology medication evidence, to establish coverability per the contracts with the health plan.

- Most contracts define coverability based on established clinical benefit in published, peer-reviewed literature, along with consideration of regulatory status.
- FDA approval does not in itself establish medical necessity, as unpublished, low-quality evidence, including exploratory analyses and unvalidated surrogate endpoints, may be used as the basis of approval. Regulatory approval may or may not reflect clinical benefit relative to standard of care and the recommendations of expert clinical advisors such as the Oncologic Drugs Advisory Committee (ODAC). FDA approvals generally do not consider cost compared to established therapies, or value to members.
- Likewise, NCCN clinical practice guidelines assignment of a recommendation (category 1, 2a, or 2b) does not necessarily establish medically necessity. NCCN recommendations are inconsistently supported by published, peer-reviewed literature and do not uniformly consider value of new therapies relative to existing potentially higher-value treatment options, considering effectiveness, safety, and cost.
- Medication coverage criteria are developed based on the 'medical necessity' assessment, as described above.

Regence Pharmacy Services analysis and coverage policy may differ from FDA labeled indication and/or NCCN clinical practice guidelines.

Clinical Efficacy

MERKEL CELL CARCINOMA (MCC) [3 4]

- Bavencio (avelumab) is approved for the treatment of metastatic MCC, regardless of prior therapy.
- Initial FDA approval of Bavencio (avelumab) in MCC was based on results from a single-group, open-label (observational) trial that evaluated it in patients with stage IV (metastatic) MCC that had progressed after cytotoxic chemotherapy.
    * All subjects in the study had progressed on at least one prior line of chemotherapy in the metastatic setting.
    * The study reported overall tumor response rate (ORR) as the primary endpoint. The clinical meaningfulness of this endpoint is unclear, as it has not been shown to accurately predict any clinically relevant outcome.
    * An overall ORR of 33% was reported in the trial. The duration of response ranged from 2.8 months to upwards of 23 months.
- Approval in treatment-naïve MCC patients was extrapolated from this initial study. However, there is now an ongoing study prospectively evaluating Bavencio (avelumab) in the front-line MCC setting.
- The relative safety and effectiveness of Bavencio (avelumab) in MCC is unknown as it has not been compared with either best supportive care, or with any other therapy. Chemotherapy historically has been the standard approach for advanced MCC. Although MCC appears to be chemosensitive, the duration of response is limited. The impact of chemotherapy on survival in patients with metastatic MCC is unclear.[5]

UROTHELIAL CANCER (BLADDER CANCER)

- Bavencio (avelumab) is approved in two bladder cancer settings: [6]
    * As a subsequent-line therapy when there has been progression of locally advanced or metastatic disease after front-line platinum-containing chemotherapy.
    * As switch maintenance when there has been no progression of disease after front-line platinum-containing chemotherapy.
- The initial FDA approval for Bavencio (avelumab) in bladder cancer was based on a phase 1, non-blinded, single-arm cohort from a larger study in a variety of solid tumors. [7 8]
    * The study evaluated ORR as the primary endpoint. ORR is not a validated surrogate endpoint. It has not been shown to accurately predict any clinically relevant benefit in locally advanced or metastatic bladder cancer.
    * The reported ORR was 14.8% and the duration of response was not estimable.
- To date, Bavencio (avelumab) has only been studied after platinum-based therapy.
- More recently, avelumab (Bavencio) was approved as switch maintenance therapy for locally advanced or metastatic bladder cancer after successful treatment with platinum-containing chemotherapy [JAVELIN Bladder 100 study]. [9]
    * Subjects in the trial were initially treated with four to six cycles of a platinum plus gemcitabine. If the tumor decreased in size or did not progress on the initial chemotherapy, subjects were given Bavencio (avelumab) or best supportive care until disease progression.

    * Subjects in the Bavencio (avelumab) treatment arm were noted to have improved survival relative to those who received best supportive care with a median OS of 21.4 months and 14.3 months, respectively.
- Platinum-based chemotherapy is the standard of care for front-line treatment of advanced or metastatic bladder cancer as it is associated with improved OS. Ideal sequencing of therapies in bladder cancer is still under investigation. Because only 43% of subjects in the chemotherapy only arm of the JAVELIN Bladder 100 study received a PD-1 or PD-L1 inhibitor after disease progression, it cannot be determined whether Bavencio (avelumab) maintenance is superior to waiting until disease progression before beginning anti-PD-1/PD-L1 therapy.
- The NCCN bladder cancer guideline lists several different anti-PD-1/PD-L1 medications, including Bavencio (avelumab), among its recommendations for bladder cancer in several different disease settings. [5]

RENAL CELL CARCINOMA (RCC)

- Bavencio (avelumab) is approved for the treatment of advanced (unresectable or metastatic) renal cell carcinoma (RCC) as a front-line therapy when used in combination with Inlyta (axitinib).
- The approval was based on interim results from a phase 3, open-label (not blinded), randomized controlled trial (RCT) in patients with advanced, clear cell RCC in the front-line treatment setting, comparing the combination of Bavencio (avelumab) plus Inlyta (axitinib) with sunitinib monotherapy [JAVELIN Renal 101 study]. [6 10] Sunitinib, like Inlyta (axitinib), is an orally administered tyrosine kinase inhibitor.
    * Median progression-free survival (PFS) was greater in the combination treatment arm [13.8 months and 8.4 months in the Bavencio (avelumab)/Inlyta (axitinib) and sunitinib treatment arms, respectively].
    * There was no difference in overall survival (OS) detected between groups at the time of the interim analysis. It is not known if Bavencio (avelumab)/Inlyta (axitinib) improves any clinical outcome at this time.
    * There was a slight increase in grade 3 and 4 adverse effects in the combination arm. Additionally, 11% of subjects in the combination arm had immune-mediated AEs that required 40 mg or more per day of prednisone.
- There is no evidence supporting the use of Bavencio (avelumab) in subsequent-line RCC settings, or as a monotherapy for RCC.
- The NCCN kidney cancer guideline lists the combination of Bavencio (avelumab) and axitinib (Inlyta) among several recommended regimens when used as a first-line treatment for advanced, clear cell RCC. [5]
- The ideal sequencing of immunotherapies [such as Bavencio (avelumab), Opdivo (nivolumab), Keytruda (pembrolizumab), and Yervoy (ipilimumab)] and tyrosine kinase inhibitor (TKI) therapies [Inlyta (axitinib), Cabometyx (cabozantinib), Lenvima (Lenvatinib), Votrient (pazopanib), and sunitinib] in advanced RCC has not been established. Further study is needed.

Investigational Uses

- Bavencio (avelumab) is actively being studied to determine if there is benefit in treating other types of cancers including gastric or gastroesophageal junction (GEJ)

adenocarcinoma (including esophageal) and NSCLC. [11] To date, there are no studies establishing a clinical benefit in these settings.

- There is an early phase, published study evaluating Bavencio (avelumab) in NSCLC. However, larger, well-controlled studies are necessary to establish the safety and effectiveness of Bavencio (avelumab) in this setting. [12]

Dosing [6]

- Bavencio (avelumab) is given as a 60-minute infusion in a dose of 800 mg every two weeks. It is continued until disease progression or unacceptable toxicity.
- In RCC, it is given in combination with axitinib (Inlyta) 5 mg orally twice daily.

Revision History

Revision Date	Revision Summary
9/19/2024	**Effective 1/1/2025:** Changed reauthorization from 'may' to 'shall.' Operationally, all approvals will be for 24 weeks (6 months). Ongoing therapy (beyond 24 weeks) will be subject to reauthorization review every 24 weeks, for documentation of disease stability or improvement and lack of disease progression.
12/7/2023	No criteria changes with this annual review.
12/9/2022	• Updated standard language in policy. • No changes to coverage criteria with this annual update.
4/21/2021	• Simplified and broadened the bladder cancer criteria by replacing the prior list of covered treatment settings with 'Prior treatment with platinum-containing chemotherapy'. This change allows for use in the new switch maintenance setting as well as in subsequent-line treatment settings. • Under renal cell carcinoma (RCC) the requirement for 'clear cell' histology was moved from the disease description to a separate numbered criterion to make sure it is not missed when applying coverage criteria (no change to intent of original criteria). • COT language was updated (no change to intent of coverage criteria).
1/22/2020	Added continuation of therapy (COT) criteria (no change to intent of coverage criteria).
10/23/2019	No criteria changes with this annual update.
7/24/2019	Effective 8/15/2019: • Updated policy with criteria for coverage in front-line RCC, which is a new FDA-approved indication • Updated with standard policy language (does not change intent).
10/30/2018	Updated dosing to flat 800 mg dosing, to reflect FDA label change.
4/20/2018	No changes with this annual update. Clarified authorization is valid "until disease progression" (no change to intent).

Drug names identified in this policy are the trademarks of their respective owners.

Medication Policy Manual | **Policy No:** dru500

Topic: Imfinzi, durvalumab | **Date of Origin:** September 8, 2017

Committee Approval Date: September 19, 2024 | **Next Review Date:** 2025

Effective Date: January 1, 2025

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Imfinzi (durvalumab) is an intravenously administered immunotherapy used in the treatment of several different cancers. It belongs to a class of medications called programmed death-ligand (PD-L1) blocking antibodies.

Policy/Criteria

Most contracts require pre-authorization approval of Imfinzi (durvalumab) prior to coverage.

I. Continuation of therapy (COT): Imfinzi (durvalumab) may be considered medically necessary for COT when criterion A, B, or C below is met.

A. For diagnoses NOT listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND there is documentation that the medication was covered by another health plan. Examples of documentation include the coverage approval letter from the previous health plan or paid claim.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

B. For diagnoses listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

C. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

Please note*: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Imfinzi (durvalumab) may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) that criterion A, B, C, D, E, or F below is met.

A. A diagnosis of **non-small cell lung cancer (NSCLC), locally advanced (unresectable stage III),** when all criteria 1 through 4 below are met.

1. The patient has received 2 or more cycles of definitive concurrent platinum-containing chemotherapy and radiation therapy.

AND

2. There has been no disease progression during or following platinum-containing chemotherapy and radiation therapy.

AND

3. Imfinzi (durvalumab) is used as monotherapy.

AND

4. No prior use of programmed death receptor-1 blocking antibody therapy (PD-1 inhibitors) or programmed death-ligand 1 blocking antibody therapy (PD-L1 inhibitors) (see *Appendix 1*).

OR

B. A diagnosis of **metastatic non-small cell lung cancer (NSCLC)** when criteria 1 through 4 below are met:

1. There has been no prior systemic therapy for metastatic NSCLC.

AND

2. There are no sensitizing epidermal growth factor (EGFR) mutations or anaplastic lymphoma kinase (ALK) genomic tumor aberrations.

AND

3. Imfinzi (durvalumab) will be used in combination with Imjudo (tremelimumab) AND platin doublet chemotherapy.

AND

4. No prior use of PD-1/PD-L1 blocking antibody therapy (see *Appendix 1*).

OR

C. A diagnosis of **small cell lung cancer, extensive-stage (ES-SCLC),** when criteria 1 through 3 below are met:

1. No prior systemic treatment for extensive stage SCLC (ES-SCLC) [not including any systemic treatment for early/limited-stage SCLC].

AND

2. Imfinzi (durvalumab) is initiated in combination with etoposide and either cisplatin or carboplatin.

AND

3. No prior use of PD-1/PD-L1 blocking antibody therapy (see *Appendix 1*).

OR

D. A diagnosis of **biliary tract cancer (BTC), unresectable locally advanced or metastatic,** when criteria 1 through 3 below are met:

1. No prior systemic treatment in the advanced or metastatic disease setting.

AND

2. Imfinzi (durvalumab) will be used in combination with gemcitabine plus cisplatin.

AND

3. No prior use of PD-1/PD-L1 blocking antibody therapy (see *Appendix 1*).

PLEASE NOTE: Biliary tract cancer includes intrahepatic cholangiocarcinoma (CCA), extrahepatic CCA, gallbladder cancer, and ampulla of Vater cancer.

OR

E. A diagnosis of **<u>unresectable</u> hepatocellular carcinoma (HCC)** when criteria 1 through 4 below are met:

1. There has been no prior systemic therapy for unresectable HCC.

AND

2. Patient has a Child-Pugh score of 5 to 6 (Class A). [provider attestation]

AND

3. Imfinzi (durvalumab) will be used in combination with Imjudo (tremelimumab).

AND

4. No prior use of PD-1/PD-L1 blocking antibody therapy (see *Appendix 1*).

OR

F. A confirmed diagnosis of **endometrial carcinoma**, **unresectable locally advanced or metastatic**, when criteria 1 through 4 below are met:

1. No prior systemic therapy in the advanced disease setting.

AND

2. The tumor is mismatch repair deficient (dMMR).

AND

3. Imfinzi (durvalumab) will be initiated in combination with carboplatin and paclitaxel.

AND

4. No prior use of PD-1/PD-L1 blocking antibody therapy (see *Appendix 1*).

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy services considers Imfinzi (durvalumab) coverable only under the medical benefit (as a provider-administered medication).

B. When pre-authorization is approved, Imfinzi (durvalumab) will be authorized in quantities as follows for the following durations:

1. ***NSCLC, locally advanced (unresectable, Stage 3)*:** For 24 weeks, up to two, 10 mg/kg infusions every 28 days OR 1500 mg every 4 weeks until disease progression or for up to a maximum of 12 months.

2. ***NSCLC, metastatic (in combination with Imjudo):*** For 24 weeks, up to 1500 mg every 3 weeks for up to 4 cycles, then 1500 mg every 4 weeks until disease progression.

3. ***ES-SCLC*:** For 24 weeks, up to 1500 mg every 3 weeks for up to 6 cycles then 1500 mg every 4 weeks until disease progression.

4. ***BTC*:** For 24 weeks, up to 1500 mg every three weeks for up to 8 cycles then 1500 mg every 4 weeks until disease progression.

5. ***HCC:*** For 24 weeks, up to 1500 mg every four weeks until disease progression.

6. ***Endometrial carcinoma:*** For 24 weeks, up to 1,120 mg every 3 weeks for up to 6 cycles then 1,500 mg every four weeks until disease progression.

C. Reauthorization: Authorization **shall** be reviewed at least every 24 weeks for documented benefit. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met. Specifically, documentation that the medication is providing clinical benefit, including disease stability or improvement, and lack of disease progression, based on an assessment of change in tumor burden. If there is documentation of potential disease progression, a shortened authorization (up to three months) may be approved to allow time for clarification of response to Imfinzi (durvalumab), including clinical re-evaluation of the patient and reimaging.

PLEASE NOTE: Additional doses of Imfinzi (durvalumab) will not be authorized without a documented recent assessment by the treating provider (such as oncologist) with objective evidence of response to therapy, such as by re-imaging and use of iRECIST criteria.

IV. Imfinzi (durvalumab) is considered investigational when used for all other conditions, including but not limited to:

A. Non-small cell lung cancer (NSCLC) [other than specified in the criteria above].

B. Biliary tract cancer (BTC) in the second- and subsequent-line setting.

C. Cervical cancer.

D. Endometrial sarcoma.

E. Head and Neck cancer (HNSCC).

F. Urothelial carcinoma (bladder cancer).

Position Statement

Summary

- Imfinzi (durvalumab) is a programmed death-ligand (PD-L1) blocking antibody (immunotherapy) used in the treatment of several different cancers.
- The intent of this policy is to cover Imfinzi (durvalumab) in settings where it has been studied and shown to be safe and effective, as detailed in the coverage criteria, with consideration for other available treatment options.
    * Where there is lack of proven additional benefit and/or lack of demonstrated health outcome (such as overall survival or improved quality of life) relative to alternative therapies, use of Imfinzi (durvalumab) alone or in combination with other therapies is not coverable ("not medically necessary" or "investigational").
    * It is important to note that the fact that a medication is FDA approved for a specific indication does not, in itself, make the treatment medically reasonable and necessary.
- Many of the clinical indications for immunotherapies (PD-1, PD-L1, and others), including Imfinzi (durvalumab), have been approved by the FDA and endorsed by clinical guidelines based on surrogate measures such as overall tumor response rate (ORR) and progression-free survival (PFS) which are not proven to accurately predict clinically important outcomes such as improved overall survival or improved quality of life.
- More recently, Imfinzi (durvalumab) was shown to improve overall survival (OS) in several cancer settings when used in combination with other medications; however, the therapies to which it was compared did not always reflect current standards of care.
- National Comprehensive Cancer Network (NCCN) guidelines recommend Imfinzi (durvalumab) as a potential option in each of the treatment settings listed in the coverage criteria. In general, NCCN recommendations parallel the FDA approved indications.
- The PD-1 and PD-L1 inhibitors have the potential to cause immune-mediated adverse reactions that can result in pneumonitis, colitis, hepatitis, endocrinopathies, and nephritis.
- Imfinzi (durvalumab) is intravenously administered until disease progression, per the dosing limits in the coverage criteria.
- Optimal sequencing of chemotherapy and immunotherapy in many cancers is unknown or the data is evolving. At this time, sequential use of immunotherapies is not supported by current evidence. Specifically, there is no evidence to support the sequential use of different PD-1 or PD-L1 inhibitors once there is disease progression on prior PD-1 or PD-L1 inhibitor therapy, as well as use of adjuvant PD-1/PD-L1 inhibitor after neoadjuvant PD-1/PD-L1 inhibitor therapy (unless explicitly listed in the coverage criteria). Therefore, the use of sequential courses of PD-1/PD-L1 immunotherapy is not coverable.
- There are ongoing studies using Imfinzi (durvalumab) in a variety of other cancers. However, although initial evidence may be promising, the potential for clinical benefit in these conditions is still being investigated.
- The FDA indication for urothelial carcinoma (bladder cancer) was withdrawn after additional, confirmatory trials failed to demonstrate a health outcome for this indication. The use of Imfinzi (durvalumab) for bladder cancer is considered investigational.

- *Reauthorization Criteria*: When coverage criteria are met, Imfinzi (durvalumab) is authorized for six months (24 weeks) of therapy, after which time documentation must be provided to establish that the medication is effective. Specifically, there must be documentation of clinical benefit, including disease stability or improvement and there is a lack of disease progression, based on an assessment of change in tumor burden. Documentation of benefit must include an assessment of the most recent imaging ("restaging scans") and/or re-biopsy by the treating oncologist.

Regence Pharmacy Services performs independent analyses of oncology medication evidence, to establish coverability per the contracts with the health plan.

- Most contracts define coverability based on established clinical benefit in published, peer-reviewed literature, along with consideration of regulatory status.
- FDA approval does not in itself establish medical necessity, as unpublished, low-quality evidence, including exploratory analyses and unvalidated surrogate endpoints, may be used as the basis of approval. Regulatory approval may or may not reflect clinical benefit relative to standard of care and the recommendations of expert clinical advisors such as the Oncologic Drugs Advisory Committee (ODAC). FDA approvals generally do not consider cost compared to established therapies, or value to members.
- Likewise, NCCN clinical practice guidelines assignment of a recommendation (category 1, 2a, or 2b) does not necessarily establish medically necessity. NCCN recommendations are inconsistently supported by published, peer-reviewed literature and do not uniformly consider value of new therapies relative to existing potentially higher-value treatment options, considering effectiveness, safety, and cost.
- Medication coverage criteria are developed based on the 'medical necessity' assessment, as described above.

Regence Pharmacy Services analysis and coverage policy may differ from FDA labeled indication and/or NCCN clinical practice guidelines.

Clinical Efficacy

Non-Small Cell Lung Cancer (NSCLC)

Unresectable, stage III disease as maintenance:

- Imfinzi (durvalumab) was approved for use in unresectable, locally advanced (stage III) NSCLC that has not progressed after concurrent chemoradiation therapy. The FDA approval was based on one phase 3, randomized, double-blind, placebo-controlled trial that reported overall survival (OS) benefit at an interim analysis. [1]
    * Imfinzi (durvalumab) was given as monotherapy and was continued until disease progression (or until intolerable adverse effects) for a maximum of 12 months.
    * The 24-month overall survival rate was 66.3% (95% confidence interval [CI], 61.7 to 70.4) in the Imfinzi (durvalumab) group, compared with 55.6% (95% CI, 48.9 to 61.8) in the placebo group (p=0.005).

    * Median OS was not reached in the Imfinzi (durvalumab) group compared to 28.7 months in the placebo group (HR 0.68, 95% CI 0.53 to 0.87, p = 0.0025).
- It is unknown if there are any differences in safety or effectiveness relative to other therapies because the study did not employ any active comparators.
- Platinum-based chemotherapy is the standard of care for the first-line treatment of advanced NSCLC in tumors without driver mutations. However, the use of immuno-therapy is becoming quickly adopted as an alternative in many first and second-line metastatic NSCLC settings.
- The National Comprehensive Cancer Network (NCCN) NSCLC treatment guideline lists Imfinzi (durvalumab) as consolidation therapy when there is no progression after 2 or more cycles of definitive concurrent platinum-based chemoradiation. [2]

Metastatic disease setting:

- A large, phase 3 RCT (POSEIDEN) compared the combination of Imfinzi (durvalumab) + Imjudo (tremelimumab) + platinum chemotherapy with platinum chemotherapy alone in adults with metastatic, previously untreated NSCLC. [3 4]
    * The trial excluded patients with sensitizing EGFR and ALK genetic alterations and symptomatic brain metastases. Approximately 64% of the population had tumors that were PD-L1-positive (PD-L1 TC $\geq$ 1%).
    * An OS advantage in favor of Imjudo (tremelimumab) + Imfinzi (durvalumab) + platinum chemotherapy was reported in the trial (HR 0.72 [95% CI: 0.65, 0.92]; p=0.003).
- Limitations of the evidence include but are not limited to: It is not known how Imjudo (tremelimumab) + Imfinzi (durvalumab) + platinum chemotherapy compares with Keytruda (pembrolizumab) + platinum chemotherapy which is the gold standard in this treatment setting based on NCCN guidelines. [2]
- There have been no direct comparisons of Imjudo (tremelimumab) and Yervoy (ipilimumab), the other commercially available CTLA-4 inhibitor.

Extensive-Stage Small Cell Lung Cancer (ES-SCLC)

- The FDA approval in SCLC was based on a single phase 3 randomized controlled trial that compared Imfinzi (durvalumab) plus chemotherapy (etoposide plus carboplatin or cisplatin) with chemotherapy alone (placebo arm) in patients with untreated ES-SCLC. [5 6]
    * Subjects included in the study had no prior treatment for ES-SCLC. If they had prior treatment for limited-stage SCLC, they had to have been treated with curative intent and must have had a treatment-free interval of at least 6 months since their last chemotherapy, radiotherapy, or chemoradiotherapy.
    * Patients with untreated or symptomatic CNS metastasis were not included in the study.
    * Imfinzi (durvalumab) was initiated with chemotherapy (given for four cycles) and was then continued as maintenance until disease progression.

    * After a median follow-up of 25.1 months. Median OS was 12.9 months [95% CI: 11.3 to 14.7] and 10.5 months [95% CI: 9.3 to 11.2], respectively.
- There was a small, but statistically significant difference in OS that favored patients in the Imfinzi (durvalumab) group.
- National Comprehensive Cancer Center (NCCN) guidelines list Imfinzi (durvalumab) in combination with chemotherapy among its recommendations for initial therapy for extensive-stage SCLC. [2]
- Optimal sequencing of chemotherapy and immunotherapy in SCLC has not been studied. Sequential use of immunotherapies (e.g., PD-1/PD-L1 inhibitors) is not supported by current evidence.

Biliary Tract Cancer (BTC)

- FDA approval of Imfinzi (durvalumab) as a front-line therapy for locally advanced and metastatic BTC was based on a single phase 3 randomized, double-blind, placebo-controlled trial that compared the addition of Imfinzi (durvalumab) to gemcitabine plus cisplatin versus gemcitabine and cisplatin alone. [7]
    * Patients had no prior treatment in the advanced disease setting and had no prior exposure to immune-mediated therapy (e.g., PD-1/PD-L1 inhibitors).
    * Eighty-six percent of the population had metastatic adenocarcinoma of the biliary tract, which included intrahepatic cholangiocarcinoma (CCA), extrahepatic CCA, and gallbladder cancer. The remainder of the population had unresectable, locally advanced disease.
    * There was a small (~ 5 weeks), but statistically significant difference in OS advantage favoring the Imfinzi (durvalumab) treatment arm.
- National Comprehensive Cancer Center (NCCN) guidelines list Imfinzi (durvalumab) in combination with chemotherapy among recommendations for initial therapy for front-line use in unresectable or metastatic BTC. [2]

Hepatocellular carcinoma (HCC)

- A large, phase 3 RCT (HIMALAYA) compared the combination of Imjudo (tremelimumab) + Imfinzi (durvalumab) with sorafenib in adults with unresectable, previously untreated HCC not amenable to locoregional treatment. [8 9]
    * The majority of patients (53%) had extrahepatic spread of their disease and nearly all (99%) had Child-Pugh Class A disease (score of A5, 73%; and score of A6, 26%).
    * An overall survival (OS) advantage in favor of Imjudo (tremelimumab) + Imfinzi (durvalumab) was reported in the study.
    * The study also employed a parallel Imfinzi (durvalumab) monotherapy arm. The median OS in the Imfinzi (durvalumab) monotherapy arm was numerically similar to the median OS in the Imjudo (tremelimumab) + Imfinzi (durvalumab) arm. However, a statistical difference was not demonstrated for the comparison between Imfinzi (durvalumab) monotherapy and sorafenib. A likely reason a statistical difference was not demonstrated is because of the lack of statistical power allocated to this secondary analysis (a non-inferiority analysis was done).

Endpoint	T+D (n=393)	D (n=389)	S (n=389)	HR [95% CI]; p-value
OS, median	16.4 mos	- - - - - -	13.8 mos	0.78 [0.66, 0.92]; 0.004
OS, median	- - - - - -	16.5 mos	13.8 mos	0.86 [0.73, 1.03]; non-inferior

D = durvalumab; T+D = tremelimumab+ durvalumab; S = sorafenib

- Based on this evidence it is unclear whether the addition of Imjudo (tremelimumab) to Imfinzi (durvalumab) results in a clinically relevant improvement in OS over sorafenib relative to Imfinzi (durvalumab) alone. *(Note: Durvalumab monotherapy has not been FDA approved for advanced HCC but is listed in NCCN guidelines as a potential treatment option).*
- Imjudo (tremelimumab) + Imfinzi (durvalumab) is listed among preferred options in the NCCN guidelines for front-line use in unresectable HCC. It is not known how it compares with the other preferred front-line option. [2]

Endometrial Cancer

- A double-blind RCT [DUO-E] evaluated Imfinzi (durvalumab) versus placebo in combination with chemotherapy (carboplatin/paclitaxel) followed by maintenance therapy with Imfinzi (durvalumab) or placebo after completion of chemotherapy in patients with newly diagnosed stage III (unresectable) or stage IV (metastatic) endometrial carcinoma. The trial also enrolled patients with recurrent disease if there was a low potential for cure with radiation therapy or surgery. [10 11]
    * For patients with recurrent disease, prior chemotherapy in the adjuvant setting was allowed only if at least 12 months had passed from the time of completion of adjuvant chemotherapy to the time of relapse.
    * The trial included patients with all histologies of endometrial carcinomas (including carcinosarcomas) but excluded those with endometrial sarcoma.
    * Randomization was stratified by tumor mismatch repair status [deficient (dMMR) vs. proficient (pMMR) tumors].
    * The trial demonstrated a statistically significant improvement in progression-free survival (PFS) in the overall population; however, a preplanned subgroup analysis showed that this improvement was primarily due to patients with dMMR tumors. For this reason, Imfinzi (durvalumab) was FDA-approved in and is only covered in patients with dMMR tumors.
    * The study also employed an Imfinzi (durvalumab) plus Lynparza (olaparib) treatment arm; however, the relative PFS values for Imfinzi (durvalumab) vs. placebo and for Imfinzi (durvalumab) plus Lynparza (olaparib) vs. placebo were similar in patients with dMMR tumors suggesting no added benefit with the addition of Lynparza (olaparib) to the regimen in this population.
- The NCCN Uterine cancer guideline lists both carboplatin/paclitaxel/Keytruda (pembrolizumab) and carboplatin/paclitaxel/Jemperli (dostarlimab) as preferred, category 1 recommendations for stage III and stage IV endometrial carcinomas. The guideline has not been updated since the approval of Imfinzi (durvalumab) in this treatment area. [2]

Reauthorization Criteria:

- When coverage criteria are met, Imfinzi (durvalumab) is authorized for six months (24 weeks) of therapy, after which time documentation must be provided to establish that the medication is effective. Specifically, there must be documentation of clinical benefit, including disease stability or improvement and there is a lack of disease progression, based on an assessment of change in tumor burden.
    * The standard of care for evaluation of response to cancer immunotherapy, such as Imfinzi (durvalumab), is use of the iRECIST criteria for assessment of tumor burden. [12]
    * The iRECIST criteria include use of quantitative and qualitative criteria for assessment of change in tumor burden for target lesions and non-target lesions. [13]
        - Quantitative measurements for target lesions (tumor size and % change)
        - Qualitative evaluation for non-target lesions (present/disappeared/ unequivocal progression)
    * Documentation of benefit must include an assessment of the most recent imaging ("restaging scans") by the treating oncologist. Given the complexity of the evaluation, including use of the iRECIST criteria, Imfinzi (durvalumab) will not be reauthorized without an assessment of response to therapy, such a partial response (iPR), complete response (iCR), or stable disease (iSD).
    * Use of immunotherapy may result in pseudoprogression, due to immune and T-cell activation, which can appear similar to tumor flare. If there is documentation of potential disease progression ["unconfirmed progressive disease (iUPD)"], a shortened authorization (up to three months) may be approved to allow time for clarification of response to Imfinzi (durvalumab), including clinical re-evaluation of the patient and reimaging. Guidelines recommend reimaging for iUPD after 4-8 weeks.
    * If a patient has confirmed, unequivocal new lesions (progression of disease, iPD), additional Imfinzi (durvalumab) is not coverable. If a new lesion is equivocal, iUPD reassessment by the treating oncologist with repeat imaging would apply (as noted above).

Investigational Uses

- *Urothelial carcinoma (UC, bladder cancer)*
    * Imfinzi (durvalumab) initially received Accelerated approval as a subsequent therapy (after disease progression on a cisplatin-based chemotherapy regimen) for unresectable or metastatic bladder cancer based on tumor response rate in a non-comparative (single-arm), observational study.
    * A subsequent phase 3 trial (DANUBE study) intended to confirm the efficacy of Imfinzi (durvalumab) in the bladder cancer setting failed to demonstrate an OS advantage over standard chemotherapy. Based on this failed confirmatory trial the manufacturer voluntarily withdrew the bladder cancer indication. Because there is no proven net health benefit relative to the standard of care, the use of Imfinzi (durvalumab) for bladder cancer is considered investigational. [14]

- *Head and neck squamous cell cancer (HNSCC), recurrent or metastatic:* Imfinzi (durvalumab) failed to show an OS benefit relative to standard of care in a phase 3 trial (EAGLE study) as a front-line therapy for PD-L1-postive HNSCC. Because there is no proven net health benefit relative to the standard of care, the use of Imfinzi (durvalumab) for recurrent or metastatic HNSCC is considered investigational. [15]
- There are also ongoing studies designed to evaluate Imfinzi (durvalumab) in other solid tumors. [16]
- *Cervical cancer*
    * A phase 3, double-blind RCT [CALLA study] compared Imfinzi (durvalumab) with placebo in patients with untreated, locally advanced cervical cancer. Therapy was initiated with chemoradiotherapy, and then continued as maintenance after completion of the chemoradiotherapy. The primary endpoint was progression-free survival (PFS). [17]
    * There was no difference in PFS detected between the two treatment groups. There were five treatment-related deaths in the Imfinzi (durvalumab) treatment arm and one treatment-related death in the placebo arm.

Dosing and Administration [11]

- For ***NSCLC:***
    * *Locally advanced (unresectable, stage 3):* the dose of Imfinzi (durvalumab) is 10 mg/kg every 2 weeks or as 1500 mg every 4 weeks. It is given until disease progression, or for up to a maximum of 12 months, as consolidation therapy.
    * *Metastatic (in combination with Imjudo):* Up to 1500 mg every 3 weeks for up to 4 cycles, then 1500 mg every 4 weeks until disease progression. It is initiated in combination with Imjudo (tremelimumab) and platinum doublet chemotherapy, and then continued as monotherapy.
- For ***ES-SCLC*** the dose of Imfinzi (durvalumab) is 1500 mg every 3 weeks for 4-6 cycles followed by 1500 mg every 4 weeks as a single agent.
- For ***BTC*** the dose of Imfinzi (durvalumab) is 1500 mg every 3 weeks for up to 8 cycles (in combination with chemotherapy) followed by 1500 mg every 4 weeks as a single agent.
- For ***HCC*** the dose of Imfinzi (durvalumab) is 1500 mg every 4 weeks until disease progression. A single dose of Imjudo (tremelimumab) is given on Day 1 of Cycle 1.
- For **endometrial carcinoma** the dose of Imfinzi (durvalumab) is 1,120 mg (weight $\geq$30 kg) IV in combination with carboplatin/paclitaxel every three weeks for 6 cycles, followed by 1,500 mg IV every four weeks (as a single agent) until disease progression.

Appendix 1: FDA-Approved PD-1 and PD-L1 Blocking Monoclonal Antibody Therapies [a]
Programmed death receptor-1 (PD-1) inhibitors
Jemperli (dostarlimab)
Keytruda (pembrolizumab)
Libtayo (cemiplimab-rwlc)
Loqtorzi (toripalimab)
Opdivo (nivolumab)
Tevimbra (tislelizumab)
Zynyz (retifanlimab)
Programmed death-ligand 1 (PD-L1) inhibitor
Bavencio (avelumab)
Imfinzi (durvalumab)
Tecentriq (atezolizumab)

[a] Or as listed on the FDA.gov website.

Revision History

Revision Date	Revision Summary
9/19/2024	**Effective 1/1/2025:** Changed reauthorization from 'may' to 'shall.' Operationally, all approvals will be for 24 weeks (6 months). Ongoing therapy (beyond 24 weeks) will be subject to reauthorization review every 24 weeks, for documentation of disease stability or improvement and lack of disease progression.
9/19/2024	**Effective 12/1/2024** • Added coverage criteria for locally advanced and metastatic dMMR endometrial carcinoma as a front-line therapy (no prior therapy in the advanced disease setting) when used in combination with carboplatin and paclitaxel (new indication). • Added cervical cancer and endometrial sarcoma to the list of investigational uses.
12/7/2023	No criteria changes with this annual review.
3/16/2023	• Added coverage for metastatic NSCLC as first-line therapy when used in combination with Imjudo (tremelimumab) and a platinum doublet. *[new indication].* • Added coverage for unresectable HCC as a first-line therapy when used in combination with a priming dose of Imjudo (tremelimumab). *[new indication].*
12/9/2022	Effective 1/15/2023: • Updated standard language in policy. • Added coverage for front-line use in advanced biliary tract cancer (BTC), a new indication. • Added use in second- and subsequent-line BTC as investigational.
4/21/2021	• Removed coverage criteria for urothelial carcinoma (bladder cancer) as FDA indication withdrawn due to failed confirmatory trial. Use in urothelial carcinoma (bladder cancer) moved to 'investigational' section. • Simplified coverage criteria for ES-SCLC to facilitate administration of the policy (removed criterion describing allowed prior treatments in limited-stage SCLC and removed criterion stating member should not have steroid-dependent CNS metastasis). • Standardized language relating to 'No prior PD-1/PD-L1 therapy' so it is consistent across the PD-1/PD-L1 set of policies. • Updated 'Quantity Limitations' section to reflect newly approved dosing parameters for NSCLC (added 'up to 1500 mg every 4 weeks'). • COT language updated (No change to intent of coverage criteria).
10/28/2020	Added coverage criteria for use in extensive-stage small cell lung cancer, a newly FDA approved indication.

Revision Date	Revision Summary
1/22/2020	• Added continuation of therapy (COT) criteria (no change to intent of coverage criteria). • The allowed duration of therapy for urothelial carcinoma was corrected (may be given until progression of disease).
10/23/2019	No criteria changes with this annual update.
6/15/2018	Added coverage criteria use in non-small cell lung cancer.
9/8/2017	New policy.

Drug names identified in this policy are the trademarks of their respective owners.

Medication Policy Manual | **Policy No:** dru504

Topic: Brineura, cerliponase alfa | **Date of Origin:** July 14, 2017

Committee Approval Date: March 21, 2024 | **Next Review** 2025

Effective Date: June 1, 2024

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Brineura (cerliponase alfa) is used to treat pediatric patients with late infantile neuronal ceroid lipofuscinosis type 2 (CLN2). CLN2 is an ultra-rare inherited disorder caused by an enzyme deficiency that primarily affects the nervous system.[1] Brineura (cerliponase alfa) is administered once every other week directly into the brain by intracerebroventricular infusion.

Policy/Criteria

Most contracts require pre-authorization approval of Brineura (cerliponase alfa) prior to coverage.

I. Continuation of therapy (COT): Brineura (cerliponase alfa) may be considered medically necessary for COT when criterion A, B, or C below is met.

A. For diagnoses NOT listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND there is documentation that the medication was covered by another health plan. Examples of documentation include the coverage approval letter from the previous health plan or paid claim.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

B. For diagnoses listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

C. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

Please note: *Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Brineura (cerliponase alfa) may be considered medically necessary in patients when there is clinical documentation (including, but not limited to chart notes) that criteria A, B, and C, below are met.

A. A diagnosis of **late infantile neuronal ceroid lipofuscinosis type 2** (CLN2) established by a pediatric neurologist, pediatric epileptologist, or geneticist.

AND

B. Patient is symptomatic (e.g., changes in gait, falls, or difficulty ambulating).

AND

C. The goal of treatment is to slow loss of ambulation.

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers Brineura (cerliponase alfa) coverable only under the medical benefit (as a provider-administered medication).

B. When pre-authorization is approved, Brineura (cerliponase alfa) will be authorized in quantities of 300 mg every two weeks, up to 26 infusions per year.

C. Authorization shall be reviewed at least annually. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, such as disease stability or improvement.

IV. Brineura (cerliponase alfa) is considered investigational when used for all other conditions.

Position Statement

Summary

- Brineura (cerliponase alfa) is a hydrolytic lysosomal N-terminal tripeptidyl peptidase used to slow the loss of ambulation in symptomatic pediatric patients with late infantile neuronal ceroid lipofuscinosis type 2 (CLN2). The intent of this policy is to allow for coverage of Brineura (cerliponase alfa) in this population, as detailed in the coverage criteria.
- CLN2 is an ultra-rare inherited disorder caused by the deficiency of the lysosomal enzyme tripeptidyl peptidase.
- There are no other treatment options for CLN2. Prior to the approval of Brineura (cerliponase alfa), treatment was limited to symptomatic and supportive care. [2]
- Brineura (cerliponase alfa) has not been studied for any indications other than to slow the loss of ambulation in CLN2. Therefore, its use for any other condition is considered investigational.

Clinical Efficacy

- The efficacy of cerliponase alfa was evaluated in a prospective, non-randomized, open-label, single-arm clinical study with extension trial in symptomatic pediatric patients (N=23) aged 3 to 8 years with CLN2 disease confirmed by TPP1 deficiency. [3,4]
- The primary endpoint was a 2-point decline or an unreversed score of 0 in the Motor domain of the CLN2 rating scale (0, profoundly impaired, to 3, grossly normal) at 48 weeks. [3,4]
- In the matched patient analysis, 94% of patients treated with cerliponase alfa demonstrated fewer declines in the Motor domain of the CLN2 score compared to 76% of patients in the natural history cohort after 48 weeks of follow-up. [3,4]
- During the extension phase, after 96 weeks of treatment 94% of patients treated with cerliponase alfa did not experience a decline in the Motor domain of the CLN2 Clinical Rating Scale compared to 35% of matched patients in the natural history cohort. [3,4]

- Limitations to the trial include the use of an outcome measure with a subjective endpoint in which the clinical meaningfulness of a change in score is unknown. The observational study lacks design to demonstrate cause and effect; however, the historical control group was required to meet the same baseline inclusion criteria as the treatment group and a matched patient analysis was performed to minimize bias. Although the sample size appears small, CLN2 is an ultra-rare disease, and a large study population was identified and accurately represents the overall population. A randomized, placebo-controlled trial would be unethical, and appropriate measures were taken to increase the validity of the evidence where feasible given the complexity and severity of the disease.
- CLN2 treatment guidelines list Brineura (cerliponase alfa) as a treatment option; however, medication start and stop criteria were considered out of scope for this international guideline and therefore not included. Management of CLN2 is symptomatic and palliative. Treatment is directed at mitigating manifestations of the disease: seizures, sleep-related problems, malnutrition, gastroesophageal reflux, pneumonia, hypersalivation, hyperactivity and behavior problems, psychosis, anxiety, spasticity, Parkinsonian symptoms, and dystonia. [2,5,6]

Safety

- The most commonly reported adverse reactions (incidence of 8% or more) reported with Brineura (cerliponase alfa) include pyrexia, ECG abnormalities, decreased CSF protein, vomiting, seizures, device-related complications, hypersensitivity, increased CSF protein, hematoma, headache, irritability, pleocytosis, device-related infections, bradycardia, feeling jittery, and hypotension. A commonly reported adverse event during post approval use of Brineura (cerliponase alfa) was bacterial meningitis. [3]

Medication Policy Manual

Policy No: dru510

Topic:

- Radicava, edaravone
- Radicava ORS, edaravone oral suspension

Date of Origin: August 11, 2017

Committee Approval Date: June 17, 2022

Next Review Date: December 2022

Effective Date: September 1, 2022

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Radicava and Radicava ORS (edaravone) are medications for the treatment of amyotrophic lateral sclerosis (ALS), also known as Lou Gehrig's disease.

Policy/Criteria

Most contracts require pre-authorization approval of Radicava and Radicava ORS (edaravone)

I. Continuation of therapy (COT): Radicava and Radicava ORS (edaravone) may be considered medically necessary for COT when full policy criteria below are met, including reauthorization criteria and quantity limit. Diagnostic criteria as well as the BASELINE functional status, including the standard functional testing, prior to initiation of edaravone (Radicava) must be provided.

***Please note**: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Radicava and Radicava ORS (edaravone) may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) that criteria A through F below are met.

A. **For provider-administered (IV) Radicava (edaravone) only:** Site of care administration requirements are met. [refer to Regence Pharmacy Services Medication Policy Manual, Site of Care Review, dru408]

AND

B. A diagnosis of **amyotrophic lateral sclerosis (ALS),** established by or in consultation with specialist in neurology or ALS.

AND

C. Disease duration of two years or less.

AND

D. Currently taking riluzole, unless riluzole has been ineffective, contraindicated, or not tolerated.

AND

E. The patient has a score of greater than or equal to two on all items of the ALS functional rating scale (ALSFRS-R) at the start of treatment.

AND

F. Normal respiratory function [defined as a forced vital capacity (FVC) ≥80%] at the start of treatment

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers intravenous Radicava (edaravone) coverable only under the medical benefit (as a provider-administered medication).

B. Regence Pharmacy Services considers Radicava ORS (edaravone oral solution coverable only under the pharmacy benefit (as a self-administered medication).

C. When pre-authorization is approved, intravenous Radicava (edaravone) will be authorized in quantities of up to 134 infusions per year, based on the prescribing information.

D. When pre-authorization is approved, Radicava ORS (edaravone oral solution) will be authorized as follows:

Initial Cycle: Up to 2 starter packs (70ml) will be authorized for the initial 28 days of treatment, based on daily dosing for 14 days, followed by a 14-day drug-free period.

Subsequent Cycles (maintenance): Up to 50ml will be authorized per 28 days, based on daily dosing for 10 days out of 14-day periods, followed by 14-day drug-free periods

E. Authorization may be reviewed at least annually. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, including disease stability or improvement, as demonstrated by stabilization or improvement in baseline ALSFRS-R or other measures of function.

IV. Edaravone (Radicava) is considered investigational when used for all other conditions, including but not limited to:

A. Acute ischemic stroke

B. In patients with ALS and an FVC of less than 80% at the start of treatment**.**

Position Statement

Summary

- ALS is a neurodegenerative disease characterized by loss of motor neurons in the spinal cord, brainstem, and motor cortex. As the disease progresses individuals lose strength and the ability to move their arms, legs, and body. Progression of the disease also leads to a decline in respiratory function.
- Edaravone (Radicava) is an intravenously infused medication indicated for the treatment of amyotrophic lateral sclerosis (ALS).
- The intent of the criteria is to limit use to patients with a diagnosis of ALS, for the indications, regimen, and dose for which it has been studied, as detailed in the coverage criteria (diagnosed in the past two years and are currently taking or have failed riluzole). Patients must also have a forced vital capacity of at least 80% at baseline and a score of at least 2 on all 12 items of ALSFRS-R, a measure of functional impairment.
- Edaravone (Radicava) demonstrated efficacy in ALS patients with normal respiratory function in one randomized, placebo-controlled phase 3 study.
    * All patients had a diagnosis of definite or probably ALS and a disease duration of less than two years.
    * A score of at least 2 on all 12 items of ALSFRS-R. The ALSFRS-R is a validated measure of functional impairment. Scores of at least 2 indicate that functionality of most activities of daily living.

    * Patients were required to have a forced vital capacity (FVC) of at least 80% at baseline.
    * Most patients in the study were taking riluzole at baseline.
- While edaravone (Radicava) is approved for ALS, it has only been shown to be beneficial in a subset of patients.
- Edaravone (Radicava) did not show any benefit in an earlier phase 3 study that was conducted in a broader population that include patients with more advanced respiratory dysfunction (FCV <80% at the start of treatment). FVC may be measured in an upright or supine position.
- American Academy of Neurology (AAN) guidelines recommend that riluzole should be offered to slow disease progression. The guidelines have not been updated to include edaravone (Radicava) .
- The recommended dosing for the initial treatment cycle of edaravone (Radicava) is 60 mg IV given daily for 14 days followed by a 14-day drug free period. In subsequent treatment cycles edaravone (Radicava) is given at a dose of 60 mg IV for 10 days followed by a 14-day drug free period. The safety and effectiveness of higher doses have not been established.
- The safety and effectiveness of edaravone (Radicava) in conditions other than ALS have not been established.

Clinical Efficacy [1,2]

- One phase 3 randomized, controlled trial (RCT) was used to support FDA approval.
    * The study was conducted entirely in Japan and included newly diagnosed patients with ALS.
        - All patients had a diagnosis of definite or probably ALS and a disease duration of less than two years.
        - A score of at least 2 on all 12 items of ALSFRS-R. The ALSFRS-R is a validate measure of functional impairment, scores of at least 2 indicate that functionality is maintained for most activities of daily living.
        - Patients were required to have a forced vital capacity (FVC) of at least 80% at baseline.
        - Most patients in the study were taking riluzole at baseline.
    * The primary endpoint was change in the revised ALS functional rating scale (ALSFRS-R), a validated rating instrument for monitoring the progression of disability in patients with ALS.
    * Edaravone (Radicava) was shown to slow the reduction in ALSFRS-R compared to placebo.
- Edaravone (Radicava) did not demonstrate benefit compared to placebo in an earlier study which was conducted in a broader population. However, a post-hoc analysis identified that there may have been benefit in patients with preserved respiratory function, thus a second phase 3 study was designed to investigate efficacy in this narrow population and support regulatory approval.

Guidelines

- American Academy of Neurology (AAN) guidelines recommend that riluzole be offered to slow disease progression in patients with ALS. The AAN concluded that riluzole has a modest beneficial effect in slowing disease progression and cohort studies suggest riluzole may be associated with longer survival. [3]
- AAN guidelines have not been updated to include edaravone (Radicava).

Revised ALS Functional Rating Scale (ALSFRS-R) [4]

- The ALSFRS-R is a questionnaire-based scale that assesses the ability of patients to perform activities of daily living (ADLs). Scores range from 0 (worst) to 48 (normal)
- It consists of 12 functional domains and each item is rated from 0 to 4, with higher scores indicating better function.
- The 12 domains are speech, salivation, swallowing, handwriting, cutting food, dressing and hygiene, turning in bed, walking, climbing stairs, orthopnea, and respiratory insufficiency.

Investigational Uses

- Although edaravone (Radicava) has been studied for the treatment of acute ischemic stroke, the evidence is currently preliminary. Larger, well controlled trials are needed to establish the safety and efficacy of edaravone (Radicava) in this setting. [5,6]
- Edaravone (Radicava) has only efficacy in patients with an FVC of greater than or equal to 80% at the start of treatment. [1,2] Additional studies are needed to establish efficacy in patients with lower baseline FVC.

Revision History

Revision Date	Revision Summary
6/17/2022	Added Radicava ORS (edaravone oral solution) to policy.
1/20/2021	No criteria changes with this annual review.
01/22/2020	- Added continuation of therapy (COT) criteria (no change to intent of coverage criteria). - Clarify reauthorization criteria (including use of ALSFRS-R scoring or other measure of function).
1/31/2019	Updated reauthorization criteria to clarify that clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, such as disease stability or improvement. Clarified initial documentation requirements (no change to intent).
2/19/2018	- Clarified that the patient must have a score of greater than or equal to 2 on the ALSFRS-R at the start of treatment. - Clarified that use in patients with an FVC of less than 80% at the start of treatment is considered investigational.
8/11/2017	New policy (effective 8/11/2017)

Medication Policy Manual | **Policy No:** dru517

Topic: New to Market Drugs and Indications | **Date of Origin:** August 2017

Committee Approval Date: September 19, 2024 | **Next Review Date:** 2025

Effective Date: January 1, 2025

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

The intent of the New to Market Drugs and Indications pre-authorization criteria is to ensure appropriate use of newly approved ("new-to-market") medications, as well as newly approved indications for existing medications, as outlined in Food and Drug Administration (FDA) approved product labeling while full medication policy criteria are being developed (new or updated medication policies). Appropriate use is defined as use in patients who have an FDA approved indication, would meet the inclusion/exclusion criteria for the pivotal trials, who are receiving the FDA labeled dose, and who do not have any FDA labeled contraindications.

Policy/Criteria

Most contracts require pre-authorization approval of new to market drugs (NTMDs) and existing medications used for new indications (EMFNI) prior to coverage.

I. Continuation of therapy (COT):

NTMDs may be considered medically necessary for COT when criteria A and B below are met.

EMFNI may be considered medically necessary for COT when there is clinical documentation (including, but not limited to chart notes) confirming that criteria A, B, and C below are met.

A. The patient is established on this therapy prior to current health plan membership AND the medication was covered by another health plan.

***Note**: If the diagnosis is not an FDA approved indication, written documentation of coverage must be provided, such as an approval letter or paid claim.*

AND

B. If the diagnosis is not an FDA approved indication, documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria, is provided.

AND

C. ***EMFNI only:*** There are no specific COT criteria built into the drug-specific medication policy.

PLEASE NOTE: Specific COT criteria in drug-specific medication policies take precedence over the general criteria listed in this policy.

***Please note**: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): **NTMDs** and **EMFNI** may be considered medically necessary for coverage when criteria A through D below are met.

A. The patient has an FDA approved indication for the requested medication.

AND

B. The patient would meet the inclusion and exclusion criteria for the pivotal trial(s) for the requested FDA approved indication, as detailed in *Appendix A*.

AND

C. The patient does not have any FDA labeled contraindications to the requested medication.

AND

D. The quantity requested is within the manufacturer's FDA labeled maximum dose and duration.

III. Administration, Quantity Limitations, and Authorization Period

A. For the scope of this coverage policy, self-administered or provider-administered drug status will be determined by product specific labeling and prescribing information.

B. When prior authorization is approved, the requested medication may be authorized in quantities (including dose and duration) that are reasonably safe and effective based on information contained in the FDA approved labeling.

C. Authorization **shall** be reviewed at least annually (shorter, for drugs with data of uncertain safety/efficacy or in indications dictating a shorter duration of use, such as, neoadjuvant therapy), until applicable drug-specific policy has been updated and developed for **NTMDs** and **EMFNI**.

1. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, such as disease stability or improvement.

2. OF NOTE: For new medications (or indications) approved under the FDA's accelerated approval regulations, continued approval for the medication/indication may be contingent upon verification and description of clinical benefit in the confirmatory trials. If confirmatory trials fail to show clinical benefit, the coverage may be considered not medically necessary and may not be continued, per the terms of the health plan contract.

IV. New to market drugs and existing medications used for new indications are considered investigational when used for all other conditions not listed in their FDA approved prescribing information, as described in the criteria above.

Appendix A: Sources for Determination of Inclusion and Exclusion Criteria for the Pivotal Trial
The intent is limiting coverage to requests that mirror how the drug and indication was studied in the clinical trials used for the FDA approval. The following sources will be considered for determination of inclusion and exclusion criteria for the pivotal trial: • "Section 14 Clinical Trials" of the FDA-approved product labeling • clinicaltrials.gov (based on the NCT) • The "Methods" section in the published trial (if available) • The pivotal trial protocol(s) (if available) Major considerations include the diagnostic criteria, prior therapies (line in therapy), and dosing regimen, including use of mono- or combination therapy (if applicable).

NCT = national clinical trial number

Revision History

Revision Date	Revision Summary
9/19/2024	Clarified authorization period. Removed criteria "the prescribed dose cannot be achieved using a lesser quantity of a higher strength" (criterion IID2), to be consistent with intent of policy. No changes to intent of criteria.
9/14/2023	Clarified COT criteria requirements (no change to intent of coverage criteria).
12/9/2022	Added clarity to authorization period, indicating that authorizations are 12 months unless the label indicates a shorter duration of use.
10/15/2021	Clarified authorization limit. No change to intent of policy criteria.
10/26/2020	Added continuation of therapy (COT) criteria (no change to intent of coverage criteria).
7/24/2019	• Updated criteria to add review of new indications for existing medications, in addition to newly approved medications ("new to market drugs"). • Add criteria for review of requests versus pivotal trial inclusion and exclusion criteria, to mirror the rationale for the FDA labeling.
8/17/2018	No updates to criteria on this annual review.
9/8/2017	New policy (effective 1/1/2018).

Drug names identified in this policy are the trademarks of their respective owners.

Medication Policy Manual

Policy No: dru523

Topic: Chimeric Antigen Receptor (CAR) T-Cell Therapies:

- Abecma, idecabtagene vicleucel
- Aucatzyl, obecabtagene autoleucel
- Breyanzi, lisocabtagene maraleucel
- Carvykti, ciltacabtagene autoleucel
- Kymriah, tisagenlecleucel
- Tecartus, brexucabtagene autoleucel
- Yescarta, axicabtagene ciloleucel

Date of Origin: April 1, 2018

Committee Approval Date: March 6, 2025

Effective Date: April 15, 2025

Next Review Date: 2025

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Chimeric antigen receptor (CAR) T-cell therapies are immunotherapies that target specific types of cancer. CAR T therapies are made for each patient, from the patient's own blood cells. CAR T therapies target and kill cancer cells.

Policy/Criteria

Most contracts require pre-authorization approval of CAR T-cell therapies prior to coverage.

I. CAR T-cell therapies are considered investigational, except for those situations specifically addressed in the policy criteria below.

PLEASE NOTE: Under this criterion, any products not specifically addressed in this policy will be considered investigational.

II. Continuation of therapy (COT): CAR T-cell therapies may be considered medically necessary when full policy criteria below are met, including quantity limit. However, CAR T-cell therapy is not coverable for repeated doses and is not coverable if a patient has previously received prior CAR T-cell therapy (including, but not limited to those listed in *Appendix 5*).

***Please note**: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

III. New starts (treatment-naïve patients): CAR T-cell therapies may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) that the patient has one of the following CAR T-cell therapy specific coverable diagnoses listed and meets all the requirements in criterion 1, 2, 3, 4, 5, or 6 below:

1. **B-cell acute lymphoblastic leukemia** (ALL) – Aucatzyl (obecabtagene autoleucel), Kymriah (tisagenlecleucel) and Tecartus (brexucabtagene autoleucel) only:

a. Diagnostic	AND	b. Documentation of relapsed/refractory disease	AND	c. Step therapy	AND	d. Suitability for CAR T
BOTH of the following: **i.** There is morphologic marrow tumor involvement (≥ 5% lymphoblasts). **AND** **ii.** Current confirmation of CD19 tumor expression.		One of the following: **i.** ALL has **relapsed after an allogeneic stem cell transplant** (SCT) and CAR T-cell therapy is infused after SCT as follows: a) **Kymriah only:** infused 6 months or more after SCT. b) **Tecartus, and Aucatzyl only:** infused 100 days or more after SCT. **OR** **ii.** ALL is refractory, as defined by ONE of the following: a) An initial complete remission is not achieved after two cycles of chemotherapy. b) A complete remission is not achieved after one cycle of chemotherapy for ALL that relapses after an initial complete remission. **OR** **iii.** ALL has relapsed after a second- or subsequent complete remission (post-chemotherapy).		**For Philadelphia chromosome positive ALL** (Ph+ ALL) only: the patient is refractory to, or relapsed after, treatment with two or more tyrosine kinase inhibitors (TKIs) indicated for ALL, unless the patient has intolerance or contraindications to the TKIs indicated for ALL (see *Appendix 1*).		ALL of the following: **i.** Age requirements met, as defined in Table 1. **AND** **ii.** Patient is fit for therapy, as defined in *Table 2*. **AND** **iii.** No prior use of gene therapy (see *Appendix 5*).

Table 1: Age requirements for CAR T-cell therapy [a]

Diagnosis	CAR T-cell product	Age criterion
B-cell ALL	Kymriah (tisagenlecleucel)	The patient is 25 years old or younger at the time of infusion.
B-cell ALL	Aucatzyl (obecabtagene autoleucel) and Tecartus (brexucabtagene autoleucel)	The patient is 18 years old or older at the time of infusion.

[a] **PLEASE NOTE:** Age criteria are based on clinical trials and aligned with FDA approved labeling.

2. Follicular lymphoma (FL) *(not "transformed")* [b] **-** Breyanzi (lisocabtagene maraleucel), Yescarta (axicabtagene ciloleucel), and Kymriah (tisagenlecleucel) only:

a. Diagnostic:	**AND**	**b. Documentation of relapsed/refractory disease**	**AND**	**c. High risk of relapse**	**AND**	**d. Suitability for CAR T**
BOTH of the following: **i.** Patient is diagnosed with stage III or IV FL. **AND** **ii.** The FL has not "transformed" (grade IIIb) to a more aggressive lymphoma, such as DLBCL. [b]		Disease has progressed following two or more prior FL chemotherapy regimens. *Prior therapy must have included an anti-CD20 monoclonal antibody, and an alkylating agent (such as bendamustine, cyclophosphamide, or chlorambucil).*		One of the following: **i.** Disease has progressed within 24 months of initiation of the first line of anti-CD20 monoclonal antibody. **OR** **ii.** Disease has progressed within 6 months of completion of the most recent FL chemotherapy regimen.		BOTH of the following: **i.** Patient is fit for therapy, as defined in *Table 2*. **AND** **ii.** No prior use of gene therapy (see *Appendix 5*).

[b] **PLEASE NOTE**: For patients with grade IIIb (transformed FL), please use the DLBCL criteria, for consideration of coverage.

3. Mantle-cell lymphoma (MCL) - Breyanzi (lisocabtagene maraleucel) and Tecartus (brexucabtagene autoleucel) only:

a. Documentation of relapsed/refractory disease	AND	b. Suitability for CAR T
One of the following: **i.** Disease is refractory to two or more prior chemotherapy regimens. [c] **OR** **ii.** Disease has relapsed following a second or subsequent complete remission (post chemotherapy or chemoimmunotherapy). [c]		BOTH of the following: **i.** Patient is fit for therapy, as defined in *Table 2*. **AND** **ii.** No prior use of gene therapy (see *Appendix 5*).

[c] **PLEASE NOTE:** Prior therapy must have included an anti-CD20 monoclonal antibody, an anthracycline or bendamustine, and a Bruton's tyrosine kinase (BTK) inhibitor (see *Appendix 3*).

4. **Large B-cell lymphoma -** Breyanzi (lisocabtagene maraleucel), Kymriah (tisagenlecleucel), or Yescarta (axicabtagene ciloleucel) only:

a. Diagnostic	AND	b. Documentation of relapsed/refractory disease	AND	c. No active <u>primary</u> CNS disease	AND	d. Suitability for CAR T
One of the following: **i. Diffuse large B-cell lymphoma** (DLBCL), not otherwise specified (NOS). **OR** **ii.** High-grade B-cell lymphoma. **OR** **iii.** DLBCL arising from follicular lymphoma (transformed FL). **OR** **iv. <u>For Yescarta and Breyanzi only:</u>** Primary mediastinal large B-cell lymphoma (PMBCL).		One of the following: **i.** Disease is refractory to two or more prior chemotherapy regimens. [d] **OR** **ii.** Disease has relapsed following a second- or subsequent complete remission (post chemotherapy). [d] **OR** **iii.** For DLBCL arising from FL: disease is refractory to, or relapsed after, two or more prior chemotherapy regimens <u>after</u> transforming to DLBCL. [d] **OR** **iv. <u>For Yescarta and Breyanzi only:</u>** Disease is refractory to first-line chemotherapy (primary refractory). [de] **OR** **v. <u>For Yescarta and Breyanzi only:</u>** Disease relapsed within 12 months of a first-line complete remission (post chemotherapy). [d]		Patient does not have active <u>primary</u> central nervous system (CNS) disease.		BOTH of the following: **i.** Patient is fit for therapy, as defined in *Table 2*. **AND** **ii.** No prior use of gene therapy (see *Appendix 5*).

[d] **PLEASE NOTE:** Prior therapy must have included an anti-CD20 monoclonal antibody for CD20-positive tumors ("chemoimmunotherapy"), and an anthracycline-containing regimen.

[e] **PLEASE NOTE:** Primary refractory is defined as no complete remission to 1st-line therapy. Intolerance to 1st-line therapy does not meet intent of this criteria.

5. Multiple myeloma (MM) - Abecma (idecabtagene vicleucel) and Carvykti (ciltacabtagene autoleucel) only:

A. Documentation of relapsed/ refractory disease	**AND**	**B. Step therapy**			**AND**	**C. Suitability for CAR T**
One of the following: **i.** For Abecma: Disease is relapsed after, or refractory to, two or more prior MM regimens including an immunomodulatory agent, a proteosome inhibitor, and an anti-CD38 monoclonal antibody (see *Appendix 4*). **OR** **ii.** For Carvykti: Disease is relapsed after, or refractory to, one or more prior MM regimens including an immunomodulatory agent and a proteosome inhibitor AND is refractory to lenalidomide (see *Appendix 4*).		**Prior HSCT** Patient has had a prior HSCT, unless contraindicated.	**AND**	**No prior BCMA therapy** No prior use of therapy directed against B-cell maturation antigen, such as Blenrep (belantamab mafodotin), Elrexfio (elranatamab), or Tecvayli (teclistamab).		BOTH of the following: **i.** Patient is fit for therapy, as defined in *Table 2*. **AND** **ii.** No prior use of gene therapy (see *Appendix 5*).

HSCT: hematopoietic stem cell transplant [bone marrow transplant (BMT)].

6. Chronic lymphocytic leukemia (CLL) and **Small lymphocytic lymphoma** (SLL) - Breyanzi (lisocabtagene maraleucel) only:

a. Documentation of relapsed/ refractory disease	AND	b. No active CNS disease	AND	c. Suitability for CAR T
The patient has disease refractory to or relapsed after three or more prior CLL/SLL therapies including a Bruton's tyrosine kinase (BTK) inhibitor-based regimen and a Venclexta (venetoclax)-based regimen.		The patient does not have active central nervous system (CNS) disease.		BOTH of the following: **i.** Patient is fit for therapy, as defined in *Table 2*. **AND** **ii.** No prior use of gene therapy (see *Appendix 5*).

Table 2: Suitability for CAR T-cell therapy

The patient is a suitable candidate for CAR T-cell therapy and meets all the following criteria 1 through 3 below:
1. The patient has an ECOG performance status of 0 or 1 [or Karnofsky Performance score (KPS) of at least 80; the patient is ambulatory and able to carry out work of a light or sedentary nature].
AND
2. The patient has adequate and stable kidney, liver, and cardiac function (provider attestation).
AND
3. The patient has no active systemic infections (including, but not limited to HCV, HBV, and HIV infection) (provider attestation). **PLEASE NOTE:** Suitability for CAR-T therapy must be documented in recent clinical documentation (such as in chart notes, laboratory reports), which may include evaluation for a hematopoietic stem cell transplant [HSCT; bone marrow transplant (BMT)].

IV. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers chimeric antigen receptor (CAR) T-cell therapies coverable only under the medical benefit (as provider-administered medications).

B. When pre-authorization is approved, CAR T-cell therapies will be authorized in quantities of one treatment course per lifetime.

V. Investigational Uses:

A. Repeated doses of CAR T-cell therapies (see *Appendix 5*), including for CAR T previously given as part of a clinical trial.

B. CAR T-cell therapies are considered investigational for all other conditions not specifically addressed in the coverage criteria defined above.

Position Statement

Summary

- There are multiple CAR T-cell therapies undergoing study for the treatment of several different types of cancers. Most of these therapies are still in early stages of development. Further study is necessary to determine whether they are safe and effective.
- CAR T-cell therapies are adoptive immuno-therapies in which T-cells are removed from the body and genetically engineered to recognize cancer cells that express an antigen receptor protein, such as CD-19 or B-cell maturation antigen (BCMA). They are known as "CAR-T cells". The harvest and reinfusion of the T-cells is a complex procedure requiring precise scheduling and coordination of resources.
- In addition to coverage criteria set forth in this medication policy, patients must also meet stringent eligibility criteria set forth by the manufacturers of each CAR T-cell therapy.
- Patients meeting criteria for CAR T-cell therapy will be enrolled in a health plan care management program.
- The intent of this policy is to allow for coverage of these CAR T-cell therapies for the specific diagnoses for which they have been studied and to limit coverage to doses studied and shown to be safe and effective in clinical trials.
- In pivotal trials for initial FDA approval of CAR-T therapies, patients were required to have adequate performance status (PS), stable and adequate organ function, no active infections, and no graft-versus-host disease (GVHD). Recent clinical documentation must be provided, including documentation of ECOG performance status and/or Karnofsky Performance score (KPS) score. In addition, all patients were also required to be naïve to prior immunotherapy and gene therapy, including prior CAR T-cell therapy.
- Most pivotal trials required failure of standard therapy, such as (but not limited to):
  * an anti-CD20 monoclonal antibody [e.g., rituximab].
  * standard chemotherapy, such as an anthracycline-containing (e.g., doxorubicin) chemotherapy regimen for large B-cell lymphoma or an alkylator for follicular lymphoma (FL).
  * Use of targeted tyrosine kinase inhibitors [Ph+ acute lymphoblastic leukemia

(ALL) and mantle cell lymphoma (MCL)].
    * use of standard multiple myeloma (MM) therapies (a proteosome inhibitor, an immunomodulatory agent, and an anti-CD38 antibody).
- There is interest in using CAR T-cell therapies in earlier stages of disease than they were initially studied and approved, as well as use of CAR T after other targeted therapies. Although there are several ongoing studies that indicate they may have activity in these settings, there has also been a more critical look at the potential safety of these products, particularly surrounding their potential for causing secondary malignancies. Until a more accurate benefit versus risk is sorted out, CAR T therapies are only coverable after the number of prior lines of therapy and regimens specified in the coverage criteria.
- Administration of CAR T-cell therapy can result in cytokine release syndrome (CRS) which may cause fatal or life-threatening reactions. More recently the FDA has proposed that CAR-T products include a boxed warning for T-cell malignancies.
- CAR T-cell therapy is given via an intravenous infusion as a one-time infusion. Repeat doses have not been adequately studied.
- Although there is interest in the use of CAR T-cell therapies in other diagnoses, including in patients with primary CNS lymphoma, the use of CAR T-cell therapies in other diagnoses, except as specified in the coverage criteria above, are considered unproven ("investigational"), along with use of repeated doses of CAR T-cell therapies. Many trials are ongoing in various diagnoses as well as for various dosing regimens.

Regence Pharmacy Services performs independent analyses of oncology medication evidence, to establish coverability per the contracts with the health plan.

- Most contracts define coverability based on established clinical benefit in published, peer-reviewed literature, along with consideration of regulatory status.
- FDA approval does not in itself establish medical necessity, as unpublished, low-quality evidence, including exploratory analyses and unvalidated surrogate endpoints, may be used as the basis of approval. Regulatory approval may or may not reflect clinical benefit relative to standard of care and the recommendations of expert clinical advisors such as the Oncologic Drugs Advisory Committee (ODAC). FDA approvals generally do not consider cost compared to established therapies, or value to members.
- Likewise, NCCN clinical practice guidelines assignment of a recommendation (category 1, 2a, or 2b) does not necessarily establish medically necessity. NCCN recommendations are inconsistently supported by published, peer-reviewed literature and do not uniformly consider value of new therapies relative to existing potentially higher-value treatment options, considering effectiveness, safety, and cost.
- Medication coverage criteria are developed based on the 'medical necessity' assessment, as described above.

Regence Pharmacy Services analysis and coverage policy may differ from FDA labeled indication and/or NCCN clinical practice guidelines.

Clinical Efficacy

KYMRIAH (TISAGENLECLEUCEL)

- Kymriah (tisagenlecleucel) has been studied in, and is FDA-approved for:
  - * B-cell precursor ALL that expresses the CD19 antigen and is refractory to, or in a second or later relapse after, treatment with standard chemotherapy, in patients up to 25 years of age.
  - * Large B-cell lymphoma that is relapsed after or refractory to two or more prior lines of systemic therapy. This indication specifically includes diffuse large B-cell lymphoma (DLBCL), not otherwise specified; high-grade B-cell lymphoma; and DLBCL arising from follicular lymphoma (FL). The indication does not include use in primary central nervous system (CNS) lymphoma.
  - * Follicular lymphoma (FL) that has relapsed after two or more prior lines of systemic therapy for FL.

B-cell precursor acute lymphoblastic leukemia (ALL):

- In single-arm, clinical studies Kymriah (tisagenlecleucel) demonstrated high rates of complete remission in children and young adults with refractory or relapsed, CD19-positive, precursor B-cell ALL. All patients who achieved complete remission were also minimal residual disease negative which is predictive of survival. A small, single-arm clinical trial (ELIANA; N = 63 at the interim analysis for the FDA approval [1] and n=75 in the published trial [2]) evaluated remission rates in pediatric and young adult patients 25 years and younger with refractory or recurrent CD19-positive, B-cell precursor ALL.
  - * Subjects had a median of three prior therapies. Fifty six percent received a prior hematopoietic stem cell transplant (HSCT).
  - * The primary endpoint was complete remission (CR), or CR with incomplete blood recovery (CRi), sustained for 4 weeks within three months after infusion (refer to Appendix 2 for remission definitions).
  - * An ORR was achieved in 82.5% of the subjects in the trial three months after treatment, of which 63.5% had a CR.
  - * All subjects who achieved CR were also negative for minimum residual disease (MRD) based on bone marrow findings.
- A second, smaller (N = 29), identically designed trial (ENSIGN) reported similar results. [1]
  - * CR was achieved by 69% of subjects three months after treatment.
  - * All subjects with CR were also MRD-negative.
- MRD refers to the ongoing detection of disease despite a designation of CR based on conventional pathologic analysis. In a large meta-analysis of patients with ALL, achieving MRD negativity was determined to be a substantial finding as it was consistently associated with improved survival. [3] However, use of MRD as an intermediate endpoint does not preclude the need for confirmatory trials using traditional clinically relevant endpoints.
- The safety and effectiveness of Kymriah (tisagenlecleucel) has not been established in patients over 25 years of age. In patients over the age of 25, B-cell precursor ALL is generally considered to be a different disease with a different disease course (poorer prognosis with poorer survival) such that the efficacy of Kymriah (tisagenlecleucel) cannot be presumed based on the available evidence from patients who are less than 25 years old.

- The NCCN ALL guideline lists Kymriah (tisagenlecleucel) among several recommended options for relapsed or refractory ALL. It is recommended in the following settings: [4]
    * *Philadelphia chromosome-positive ALL:* For patients 25 years and younger with refractory disease or two or more relapses, and failure of two tyrosine kinases inhibitors (TKIs).
    * *Philadelphia chromosome-negative ALL:* For patients 25 years and younger with refractory disease or two or more relapses.

Diffuse large B-cell lymphoma (DLBCL):

- Approval in large B-cell lymphoma was based on two small, single-arm, observational studies. Specifically, Kymriah (tisagenlecleucel) was studied in two, small, single-arm observational studies (low-quality evidence) that evaluated remission rates at six months in adults with relapsed or refractory DLBCL, high-grade B-cell lymphoma, and DLBCL arising from follicular lymphoma (FL, also known as transformed FL). [1,5]
    * Subjects enrolled in the trials had a median of three prior therapies. Between 56% and 86% had refractory disease, and approximately half had a prior stem cell transplant (SCT).
    * Patients included in the study were required to have failed standard therapy which included an anti-CD20 monoclonal antibody [e.g., rituximab] if the tumor was CD20-positive, and an anthracycline-containing (e.g., doxorubicin) chemotherapy regimen.
    * Prior CAR T-cell therapy was not allowed.
    * Patients were required to have adequate performance status, stable and adequate organ function, no active infections, and no advanced graft-versus-host disease.
    * One of the studies required confirmation of CD19 antigen (the target of this therapy) on cancer cells, the other did not; however, the CD19 antigen is present in nearly all large B-cell lymphomas.
    * Complete remission at 6 months was observed in 32% to 57% of subjects. In one study, the median duration of remission (DoR) for those who had achieved a complete remission was 29 months (range: 7.7 to 38 months). In the other study, the median DoR has not been reached.
- Although a relatively high rate of complete remission at 6 months was observed in some patients, long-term survival and durability of effect are still being evaluated. The effects on clinically relevant outcomes are not yet known.
- A phase 3, international, randomized controlled trial (BELINDA) evaluated Kymriah (tisagenlecleucel) in patients with aggressive B-cell lymphoma that was refractory or relapsed within 12 months after receiving first-line therapy with an anti-CD20 antibody and an anthracycline-containing chemotherapy regimen. The study failed to show a difference in event-free survival (EFS), the primary endpoint, between Kymriah (tisagenlecleucel) and investigator's choice of standard of care chemotherapy. [30]
- Kymriah (tisagenlecleucel) has not been adequately evaluated in subjects with a history of central nervous system (CNS) lymphoma. In particular, there is insufficient evidence to establish the safety and efficacy of CAR T therapies in patients with primary CNS lymphoma (see *Investigational Uses* below, for additional discussion).

- The NCCN B-cell lymphoma guideline lists Kymriah (tisagenlecleucel) as a treatment option for DLBCL that is refractory to, or relapses after, at least two prior chemoimmunotherapy regimens. The guideline further states that it is not appropriate for patients who have achieved a complete response to chemoimmunotherapy. [4]

Follicular lymphoma (FL):

- In a single-arm, clinical study Kymriah (tisagenlecleucel) demonstrated high rates of complete remission (CR) in patients with relapsed or refractory FL after at least two prior systemic therapies for FL. [26]
    * Patients enrolled in the trial had grade 1, 2, and 3A FL (patients with grade 3B FL were excluded from the trial).
    * Patients with transformed FL, prior allogeneic hematopoietic SCT, and prior CAR T-cell therapy were excluded from participating in the trial.
    * Remission rate was the primary endpoint of the study. Complete remission was observed in 68% [95% CI: 57, 77] of subjects. Patients were followed for a median duration of 9.1 months. The median duration of response is not yet known.
- Although a relatively high rate of complete remission at 6 months was observed in some patients, long-term survival and durability of effect are still being evaluated. The effects on clinically relevant outcomes are not yet known.
- The NCCN B-cell lymphoma guideline lists Kymriah (tisagenlecleucel) as a treatment option for FL that is refractory to, or relapses after, at least two prior chemoimmunotherapy regimens. [4]

YESCARTA (AXICABTAGENE CILOLEUCEL)

B-cell lymphomas, including large B-cell lymphoma (DLBCL, PMBCL, transformed FL) and follicular lymphoma (FL):

Yescarta (axicabtagene ciloleucel) demonstrated high rates of response to therapy, including complete responses, in adults with relapsed or refractory B-cell lymphomas. Although results are promising, its effect on any clinically relevant outcome is not yet known.

- The pivotal single-arm trial (ZUMA-1) evaluated 101 adult large B-cell lymphoma patients who had relapsed, or were refractory to, two or more prior lines of systemic therapy. [6,7]
    * The following large B-cell lymphomas were included in the trial: Diffuse large B-cell lymphoma (DLBCL) [76%], DLBCL arising from follicular lymphoma (also known as transformed FL) [16%], and primary mediastinal B-cell lymphoma (PMBCL) [8%]. However, it does not include use in primary central nervous system (CNS) lymphoma.
    * Subjects enrolled in the trial had disease that was either refractory to the most recent therapy [77%] or relapsed within one year of autologous hematopoietic stem cell transplant (HSCT) [21%]. Enrolled patients had a median of three prior therapies for their large B-cell lymphoma.
    * For enrollment in the clinical trial, patients were required to have prior therapy that included an anti-CD20 monoclonal antibody [e.g., rituximab] if the tumor was CD20-positive, and an anthracycline-containing (e.g., doxorubicin) chemotherapy regimen.

    * Prior treatment with a CAR-T-cell therapy was not allowed.
    * Patients were required to have adequate performance status, stable and adequate organ function, no active infections, and no advanced graft-versus-host disease. They were also required to be naïve to prior immunotherapy and gene therapy, including prior treatment with Yescarta (axicabtagene ciloleucel).
    * Although Yescarta (axicabtagene ciloleucel) is designed to target the CD19 antigen on cancer cells, confirmation that the tumor cells were positive for this antigen was not required as a condition for inclusion in the study as it is present in nearly all large B-cell lymphomas.
    * The primary endpoint was overall response rate (ORR), which is based on disease involvement in the lymph nodes, organs, and bone marrow and is assessed via positron emission tomography (PET) scan or computerized tomography (CT) scan.
    * An ORR of 72% [95% CI: 62, 81] was achieved in this uncontrolled study. Of the responses, 51% [95% CI: 41, 62] were complete (CR) and 21% [95% CI: 13, 30] were partial (PR).
    * The median duration of response was 9.2 months, and was longer in those who had achieved a CR.
- An ongoing, pivotal, single-arm trial (ZUMA-5) evaluated 124 adult patients with follicular lymphoma (FL) (grade 1, 2, 3a) with measurable disease who had relapsed, or were refractory to two or more prior lines of systemic therapy, including at least one prior line of therapy that included a CD20-directed monoclonal antibody (mAb) combined with an alkylating agent. [8]
    * The majority of FL subjects enrolled in the trial had disease that was at high risk of relapsing. This included patients that were refractory to the most recent therapy [68%], which was defined as progression within 6 months of completion of the most recent prior treatment, or they were considered to be an early relapser [55%], defined as progression within 24 months of initiation of the first line of anti-CD20 containing immunochemotherapy. Due to the indolent nature of FL, it is in this population, that the benefit may outweigh the risks.
    * Enrolled patients had a median of three prior therapies for their follicular lymphoma.
    * Prior treatment with a CAR-T-cell therapy was not allowed.
    * Patients were required to have adequate performance status, stable and adequate organ function, no active infections, and no advanced graft-versus-host disease. They were also required to be naïve to prior immunotherapy and gene therapy, including prior treatment with Yescarta (axicabtagene ciloleucel).
    * Although Yescarta (axicabtagene ciloleucel) is designed to target the CD19 antigen on cancer cells, confirmation that the tumor cells were positive for this antigen was not required as a condition for inclusion in the study as it is present in the majority of FL cases.
    * The primary endpoint was overall response rate (ORR), which is based on disease involvement in the lymph nodes, organs, and bone marrow and is assessed via positron emission tomography (PET) scan or computerized tomography (CT) scan.

    * In a subset of the FL population that was evaluable (n=84), an ORR of 94% [95% CI: 62, 81] was achieved in this uncontrolled study. Of the responses, 80% were complete (CR).
    * The median duration of response and progression free survival data is immature at this time.
- The ongoing phase 3, multicenter, open-label, randomized ZUMA-7 trial studied Yescarta (axicabtagene ciloleucel) in the second-line DLBCL setting compared to standard of care (SOC) chemotherapy with intent to stem cell transplant (SCT) (n=359). [25]
    * Subjects enrolled in the trial had disease that was considered primary refractory to first line therapy [74%] or had relapsed within one year of a first-line therapy complete response [26%].
    * For enrollment in the clinical trial, patients were required to have prior chemotherapy that included an anti-CD20 monoclonal antibody [e.g., rituximab] and an anthracycline-containing (e.g., doxorubicin) chemotherapy regimen.
    * Prior treatment with a CAR-T-cell therapy was not allowed.
    * Patients were required to have adequate performance status, stable and adequate organ function, no active infections, and no advanced graft-versus-host disease. They were also required to be naïve to prior gene therapy, including prior treatment with Yescarta (axicabtagene ciloleucel).
    * Although Yescarta (axicabtagene ciloleucel) is designed to target the CD19 antigen on cancer cells, confirmation that the tumor cells were positive for this antigen was not required as a condition for inclusion in the study as it is present in nearly all large B-cell lymphomas.
    * The primary endpoint was event free survival (EFS), while PFS, tumor response (ORR), and OS were key secondary endpoints.
    * Yescarta (axicabtagene ciloleucel) improved the primary endpoint of EFS (8.3 vs. 2.0 months), as well as PFS (14.7 vs 3.7 months) and ORR (83% vs. 50%), compared to SOC chemoimmunotherapy followed by SCT. However, EFS, PFS, and ORR are unvalidated surrogate endpoints. Of note, the complete response (CR) was 62% with Yescarta (axicabtagene ciloleucel) versus 35% with SOC chemotherapy.
    * At this time, the OS data is immature. However, at a median follow-up of 47.2 months, the estimated OS at 4 years was 54.6% and 46.0% in the Yescarta (axicabtagene ciloleucel) and SOC treated groups, respectively.
- Yescarta (axicabtagene ciloleucel) has not been adequately evaluated in subjects with a history of central nervous system (CNS) lymphoma. In particular, there is insufficient evidence to establish the safety and efficacy of CAR T therapies in patients with primary CNS lymphoma (see *Investigational Uses* below for additional information).
- In addition, Yescarta (axicabtagene ciloleucel) has not been adequately evaluated in subjects who had received a prior allogeneic SCT. [6-8]
- The NCCN B-cell lymphoma guideline lists Yescarta (axicabtagene ciloleucel) as a treatment option for large B-cell lymphoma in patients with primary refractory disease, disease that has relapsed <12 months after a first-line therapy complete response, or

those that have disease that is refractory to, or relapses after, at least two prior chemoimmunotherapy regimens. In addition, Yescarta (axicabtagene ciloleucel) is listed as a treatment option for FL that is refractory to, or relapses after, at least two prior chemoimmunotherapy regimens. [4]

BREYANZI (LISOCABTAGENE MARALEUCEL)

Large B-cell lymphoma:

In a single-arm observational trial, Breyanzi (lisocabtagene maraleucel) demonstrated high rates of response, including complete responses, in adults with refractory large B-cell lymphomas. Although results are promising, its effect on any clinically relevant outcome is not yet known.

- The pivotal single-arm observational trial (TRANSCEND NHL 001) evaluated 256 adult patients who had lymphoma that had relapsed, or was refractory to, two or more prior lines of systemic therapy. [9]
    - The following types were included in the trial: Diffuse large B-cell lymphoma (DLBCL) [51%], DLBCL arising from follicular lymphoma (FL, also known as transformed FL) [22%], high-grade B-cell lymphoma (HGBCL) [13%], primary mediastinal B-cell lymphoma (PMBCL) [6%], and other B-cell lymphomas [8%]. However, it did not include use in primary central nervous system (CNS) lymphoma.
    - Subjects enrolled in the trial had disease that was either refractory to the most recent chemotherapy [67%] or relapsed within one year of autologous hematopoietic stem cell transplant (HSCT) [35%]. Enrolled patients had a median of three prior therapies for their large B-cell lymphoma.
    - Patients were required to have prior therapy that included an anti-CD20 monoclonal antibody [e.g., rituximab] if the tumor was CD20-positive, and an anthracycline-containing (e.g., doxorubicin) chemotherapy regimen. Prior treatment with a CAR-T-cell therapy was not allowed.
    - Patients were required to have adequate performance status, stable and adequate organ function, no active infections, and no advanced graft-versus-host disease.
    - Although Breyanzi (lisocabtagene maraleucel) is designed to target the CD19 antigen on cancer cells, confirmation that the tumor cells were positive for this antigen was not required as a condition for inclusion in the study as it is present in nearly all large B-cell lymphomas.
    - The primary endpoint was overall response rate (ORR), which is based on disease involvement in the lymph nodes, organs, and bone marrow and is assessed via positron emission tomography (PET) scan or computerized tomography (CT) scan.
    - An ORR of 73% [95% CI: 67, 78] was achieved in this uncontrolled study. Of the responses, 53% [95% CI: 47, 59] were complete (CR) and 20% were partial (PR).
    - At 12 months, the response rate had decreased to 54.7% [46.7, 62.0].
- The ongoing phase 3, multicenter, open-label, randomized TRANSFORM trial studied Breyanzi (lisocabtagene maraleucel) in the second-line DLBCL setting compared to standard of care (SOC) chemotherapy with intent to stem cell transplant (SCT) (n=184).[27]

    * Subjects enrolled in the trial had disease that was considered primary refractory to first line therapy [73%] or had relapsed within one year of a first-line therapy complete response [27%].
    * For enrollment in the clinical trial, patients were required to have prior chemotherapy that included an anti-CD20 monoclonal antibody (e.g., rituximab) and an anthracycline-containing (e.g., doxorubicin) chemotherapy regimen.
    * Prior treatment with a CAR-T-cell therapy or gene therapy was not allowed.
    * Patients were required to have adequate performance status, stable and adequate organ function, no active infections, and no advanced graft-versus-host disease.
    * Although Breyanzi (lisocabtagene maraleucel) is designed to target the CD19 antigen on cancer cells, confirmation that the tumor cells were positive for this antigen was not required as a condition for inclusion in the study as it is present in nearly all large B-cell lymphomas.
    * The primary endpoint was event free survival (EFS), while PFS, tumor response (ORR), and OS were key secondary endpoints.
    * Breyanzi (lisocabtagene maraleucel) improved the primary endpoint of EFS (10.1 vs. 2.3 months), as well as PFS (14.8 vs 5.7 months) and ORR (86% vs. 48%), compared to SOC chemoimmunotherapy followed by SCT. However, EFS, PFS, and ORR are unvalidated surrogate endpoints. Of note, the complete response (CR) was 66% with Breyanzi (lisocabtagene maraleucel) versus 39% with SOC chemotherapy.
    * At this time, the OS data is immature, with a median follow-up of 6.2 months.
- The ongoing phase 2, multicenter, open-label, single-arm PILOT trial studied Breyanzi (lisocabtagene maraleucel) in the second-line DLBCL setting in those deemed by the investigator, to be SCT-ineligible (n=61).[28]
    * Subjects enrolled in the trial had disease that was considered primary refractory to first line therapy [52%], had relapsed within one year of a first-line therapy complete response [23%], or had relapsed greater than one year of a first-line therapy complete response [25%].
    * For enrollment in the clinical trial, patients were required to have prior chemotherapy that included an anti-CD20 monoclonal antibody [e.g., rituximab] and an anthracycline-containing (e.g., doxorubicin) chemotherapy regimen.
    * Prior treatment with a CAR-T-cell therapy was not allowed.
    * Patients were required to be deemed ineligible for both high-dose chemotherapy and hematopoietic SCT while also having adequate organ function for CAR T-cell treatment. Of note, the demographic and baseline disease characteristics of the PILOT trial are not representative of the general transplant-ineligible population with DLBCL after one prior line of therapy. The majority of patients met the ineligibility criteria solely based on age (≥ 70 years), which is not necessarily a standard of care exclusion for SCT in practice.

    * Although Breyanzi (lisocabtagene maraleucel) is designed to target the CD19 antigen on cancer cells, confirmation that the tumor cells were positive for this antigen was not required as a condition for inclusion in the study as it is present in nearly all large B-cell lymphomas.
    * The primary endpoint was tumor response (ORR), while event free survival (EFS), PFS, and OS were key secondary endpoints.
    * For those patients that received Breyanzi (lisocabtagene maraleucel) during the PILOT trial, an ORR of 81% was achieved in this uncontrolled study. Of the responses, 54% were complete (CR) and 26% were partial (PR). At this time, the OS data is immature.
    * At the data-cut, a total of 7 patients had completed the study, 26 had ongoing follow-up, and 28 had discontinued.
    * In the transplant-ineligible population, the clinical benefit of Breyanzi (lisocabtagene maraleucel), compared to alternate therapies is unknown at this time. Given the current trial limitations in the HSCT-ineligible population, additional data is needed to assess if the benefit outweighs the known safety concerns in this population.
- Breyanzi (lisocabtagene maraleucel) has not been adequately evaluated in subjects with a history of central nervous system (CNS) lymphoma. In particular, there is insufficient evidence to establish the safety and efficacy of CAR T therapies in patients with primary CNS lymphoma (see *Investigational Uses* below, for additional discussion).
- In addition, Breyanzi (lisocabtagene maraleucel) has not been adequately evaluated in subjects who had received a prior allogeneic SCT.
- The NCCN B-cell lymphoma guideline lists Breyanzi (lisocabtagene maraleucel) as a treatment option for large B-cell lymphoma in patients with primary refractory disease, disease that has relapsed <12 months after a first-line therapy complete response, or those that have disease that is refractory to, or relapses after, at least two prior chemoimmunotherapy regimens. Of note, the guidelines list Breyanzi (lisocabtagene maraleucel) as a category 2B recommendation in the transplant ineligible population. [4]

Chronic Lymphocytic Leukemia (CLL) or Small Lymphocytic Lymphoma (SLL):

In a small, single-arm study Breyanzi (lisocabtagene maraleucel) demonstrated moderated rates of response to therapy, including complete remissions, in adults with relapsed or refractory CLL or SLL who had progressed after standard front-line therapies. Although results are promising, its effect on any clinically relevant outcome is not yet known.

- The pivotal single-arm trial [TRANSCEND CLL 004] evaluated 65 adult patients with relapsed or refractory CLL/SLL after prior front-line therapies. [36]
    * Subjects enrolled in the trial had disease that was either refractory or had relapsed after the most recent systemic therapy regimen which must have included both a Bruton's Tyrosine Kinase (BTK) inhibitor and a B-cell Lymphoma 2 (BCL-2) inhibitor [e.g., Venclexta (venetoclax)]. Subjects enrolled in the study had a median of five prior lines of therapy.
    * Prior treatment with a CAR-T-cell therapy or gene therapy was not allowed. Patients with Richter transformation were also excluded from the study.

    - Although Breyanzi (lisocabtagene maraleucel) is designed to target the CD19 antigen on cancer cells, confirmation that the tumor cells were positive for this antigen was not required as a condition for inclusion in the study as it is present in the majority of CLL/SLL cases.
    - The primary endpoint was objective response rate (ORR), which was defined as the incidence of a complete or partial remission using the 2018 International Workshop on Chronic Lymphocytic Leukemia (iWCLL 2018) criteria. It is based on disease involvement in the lymph nodes, organs, and bone marrow and is assessed via positron emission tomography (PET) scan or computerized tomography (CT) scan.
    - In the intent-to-treat population (ITT), an ORR of 45% was achieved in this uncontrolled study. Of the responses, 20% were complete remissions (CR) and 25% were partial remissions (PR).
    - The median duration of response (DOR) was 35 months. The DOR was greater in patients who had achieved a complete remission than in those only achieving a partial remission.
- Breyanzi (lisocabtagene maraleucel) has not been adequately evaluated in subjects with a history of central nervous system (CNS) leukemia (see *Investigational Uses* below, for additional discussion).
- In addition, Breyanzi (lisocabtagene maraleucel) has not been adequately evaluated in subjects who had received a prior allogeneic SCT.
- NCCN B-cell CLL/SLL guidelines list Breyanzi (lisocabtagene maraleucel) as a third-line treatment option for relapsed/refractory CLL/SLL, only after BTK- and Venclexta (venetoclax)-based regimens. [4]

Follicular Lymphoma (FL):

- An ongoing, pivotal, single-arm trial (TRANSCEND-FL, NCT04245839) evaluated 114 adult patients with follicular lymphoma (FL) (grade 1, 2, 3a) with measurable disease who had relapsed, or were refractory to two or more prior lines of systemic therapy, including at least one prior line of therapy that included a CD20-directed monoclonal antibody (mAb) combined with an alkylating agent. [37] A total of 139 patients were enrolled. However, 25 patients were “second line” and not included in the primary efficacy data set (n=114). [24,37]
    - The majority of FL subjects enrolled in the trial had disease that was at high risk of relapsing. This included patients that were refractory to the most recent therapy [64%], which was defined as progression within 6 months of completion of the most recent prior treatment, or they were considered to be an early relapser [50%], defined as progression within 24 months of initiation of the first line of anti-CD20 containing immunochemotherapy. Due to the indolent nature of FL, it is in this population, that the benefit may outweigh the risks.
    - Enrolled patients had a median of three prior therapies for their follicular lymphoma.
    - Prior treatment with a CAR-T-cell therapy was not allowed.

    - Patients were required to have adequate performance status, stable and adequate organ function, no active infections, and no advanced graft-versus-host disease. They were also required to be naïve to prior immunotherapy and gene therapy, including prior treatment with Breyanzi (lisocabtagene maraleucel).
    - The primary endpoint was overall response rate (ORR), which is based on disease involvement in the lymph nodes, organs, and bone marrow and is assessed via positron emission tomography (PET) scan or computerized tomography (CT) scan.
    - In a subset of the FL population that was evaluable (n=94), an ORR of 96% [95% CI: 89.5, 98.8] was achieved in this uncontrolled study. Of the responses, 73% were complete (CR). [24]
    - The median duration of response and progression free survival data is immature at this time.
- The NCCN B-cell lymphoma guideline lists Breyanzi (lisocabtagene maraleucel) as a treatment option for FL that is refractory to, or relapses after, at least two prior chemoimmunotherapy regimens. [4]

Mantle Cell Lymphoma (MCL):

In the single-arm clinical study Breyanzi (lisocabtagene maraleucel) demonstrated high rates of response to therapy, including complete responses, in adults with relapsed or refractory MCL. Although results are promising, its effect on any clinically relevant outcome is not yet known.

- The pivotal single-arm trial, MCL cohort (TRANSCEND NHL 001, NCT02631044) evaluated 88 adult patients who had relapsed or refractory mantle-cell lymphoma (MCL), after multiple specific prior therapies. [24,38]
    - Subjects enrolled in the trial had disease that was either refractory or had relapsed after the most recent chemotherapy regimen and needed to have been on an anti-CD20 monoclonal antibody [e.g., rituximab], an alkylating agent [such as an cyclophosphamide-, ifosfamide-, or bendamustine-containing chemotherapy regimen], and a Bruton's tyrosine kinase (BTK) inhibitor. Enrolled patients had a median of three prior therapies for their MCL (range 1 to 11).
    - Prior treatment with a CAR-T-cell therapy was not allowed.
    - Of note: 10% of enrolled subjects had secondary CNS lymphoma at time of enrollment in the trial. However, patients with primary CNS lymphoma were excluded.
    - The primary endpoint was objective response rate (ORR), which is defined as the incidence of a complete response or a partial response by the revised IWG Response Criteria for Malignant Lymphoma. It is based on disease involvement in the lymph nodes, organs, and bone marrow and is assessed via positron emission tomography (PET) scan or computerized tomography (CT) scan.
    - In the intent-to-treat population (ITT, n=71), an ORR of 85.3% was achieved in this uncontrolled study. Of the responses, 67.6% were complete (CR) and 17.6% were partial (PR). [24]
- NCCN B-cell lymphoma guidelines list Breyanzi (lisocabtagene maraleucel) as a third-line treatment option for relapsed/refractory MCL, only after chemotherapy and a BTK inhibitor. [4]

TECARTUS (BREXUCABTAGENE AUTOLEUCEL)

Mantle Cell Lymphoma (MCL):

In the single-arm clinical study Tecartus (brexucabtagene autoleucel) demonstrated high rates of response to therapy, including complete responses, in adults with relapsed or refractory MCL. Although results are promising, its effect on any clinically relevant outcome is not yet known.

- The pivotal single-arm trial (ZUMA-2) evaluated 74 adult patients who had relapsed or refractory mantle-cell lymphoma (MCL), after multiple specific prior therapies. [12]
    - Subjects enrolled in the trial had disease that was either refractory or had relapsed after the most recent chemotherapy regimen and needed to have been on an anti-CD20 monoclonal antibody [e.g., rituximab], an anthracycline-containing (e.g., doxorubicin) or bendamustine-containing chemotherapy regimen, and a Bruton's tyrosine kinase (BTK) inhibitor. Enrolled patients had a median of three prior therapies for their MCL.
    - Prior treatment with a CAR-T-cell therapy was not allowed.
    - Although Tecartus (brexucabtagene autoleucel) is designed to target the CD19 antigen on cancer cells, confirmation that the tumor cells were positive for this antigen was not required as a condition for inclusion in the study as it is present in the majority of MCL cases.
    - The primary endpoint was objective response rate (ORR), which is defined as the incidence of a complete response or a partial response by the revised IWG Response Criteria for Malignant Lymphoma. It is based on disease involvement in the lymph nodes, organs, and bone marrow and is assessed via positron emission tomography (PET) scan or computerized tomography (CT) scan.
    - In the intent-to-treat population (ITT), an ORR of 85% was achieved in this uncontrolled study. Of the responses, 59% were complete (CR) and 26% were partial (PR).
    - At 12 months, the estimated progression-free survival and overall survival were 61% and 83%, respectively.
- Tecartus (brexucabtagene autoleucel) has not been adequately evaluated in subjects with a history of central nervous system (CNS) lymphoma. In particular, there is insufficient evidence to establish the safety and efficacy of CAR T therapies in patients with primary CNS lymphoma (see *Investigational Uses* below, for additional discussion).
- In addition, Tecartus (brexucabtagene autoleucel) has not been adequately evaluated in subjects who had received a prior allogeneic SCT.
- NCCN B-cell lymphoma guidelines list Tecartus (brexucabtagene autoleucel) as a third-line treatment option for relapsed/refractory MCL, only after chemotherapy and a BTK inhibitor. [4]

B-cell precursor acute lymphoblastic leukemia (ALL):

- In the pivotal, single-arm, phase 2 ZUMA-3 trial, Tecartus (brexucabtagene autoleucel) demonstrated a high rate of complete remission in adults with refractory or relapsed, CD19-positive, precursor B-cell ALL. [13]

    * Subjects had a median of two prior therapies and 42% had received a prior allogeneic stem cell transplant (ASCT). In those with a prior ASCT, more than 100 days were required to pass prior to CAR-T cell therapy administration.
    * The primary endpoint was complete remission (CR) or CR with incomplete blood recovery (CRi), which was achieved in 71% of treated patients.
    * A CR was achieved in 56% of subjects treated with brexucabtagene autoleucel, while a CRi was achieved in 15%.
    * Minimum residual disease (MRD) negativity rate, based on bone marrow findings, was achieved by 97% of patients that achieved a CR/CRi.
    * The median relapse-free survival (RFS) and duration of remission were 11.6 months and 12.8 months, respectively.

- MRD refers to the ongoing detection of disease despite a designation of CR based on conventional pathologic analysis. In a large meta-analysis of patients with ALL, achieving MRD negativity was determined to be a substantial finding as it was consistently associated with improved survival. [3] However, use of MRD as an intermediate endpoint does not preclude the need for confirmatory trials using traditional clinically relevant endpoints.
- The safety and effectiveness of Tecartus (brexucabtagene autoleucel) has not been established in patients younger than 18 years of age. [14] In younger patients, B-cell precursor ALL is generally considered to be a different disease with a different disease course, such that the efficacy and safety of Tecartus (brexucabtagene autoleucel) cannot be presumed based on the available evidence from patients who are older than 18 years of age. [4]
- NCCN ALL guideline lists Tecartus (brexucabtagene autoleucel) among several recommended options for relapsed or refractory ALL and after prior tyrosine kinases inhibitors (TKIs) if Philadelphia chromosome-positive (Ph+) ALL. [4]

ABECMA (IDECABTAGENE VICLEUCEL)

Multiple Myeloma (MM):

- In the pivotal trial, Abecma (idecabtagene vicleucel) demonstrated high rates of response to therapy, including complete responses, in adults with relapsed or refractory multiple myeloma (MM). Although results are promising, the effect on any clinically relevant outcome is not yet known. The pivotal open-label, dose-finding trial (KarMMa) enrolled 140 adult patients, who had relapsed or refractory MM, after multiple specific prior therapies. However, only 128 patients received an infusion of idecabtagene vicleucel, of which, 124 received the FDA-approved dose of idecabtagene vicleucel (300-450x10^6 CAR-positive T cells). [15, 16]
    * Subjects enrolled in the trial must have received at least 3 prior MM treatment regimens, had disease that was refractory to the most recent chemotherapy regimen, and needed to have been on an anti-CD38 monoclonal antibody (mAb), a proteosome inhibitor (PI), and an immunomodulator (IMID).
    * Enrolled patients had a median of six prior therapies for their MM and the majority of patients (84%) were considered triple-refractory, defined as refractory to an IMID, a PI, and an anti-CD38 mAb. In addition, most (94%) had a prior

autologous stem cell transplant (auto HSCT).

* Prior treatment with a CAR-T-cell therapy and/or BCMA targeted therapy was not allowed.
* Although Abecma (idecabtagene vicleucel) is designed to target the BCMA on cancerous plasma cells, confirmation that the tumor cells were positive for this antigen was not required as a condition for inclusion in the study as it is present in the majority of MM cases.
* The primary endpoint was objective response rate (ORR) by independent review in accordance with IMWG response criteria.
* In the patients that received an infusion of idecabtagene vicleucel, an ORR of 73.4% was achieved in this uncontrolled study. Of the responses, 30.5% were stringent complete (sCR), 0.8% complete (CR), 20.3% very good partial (VGFR), and 21.9% were partial (PR).
* The median progression-free survival (PFS) and duration of response (DoR) were 8.8 months and 10.6 months, respectively, across all dosing arms.

- Subsequently, the efficacy of Abecma (idecabtagene vicleucel) was further evaluated in a randomized, open-label study [KarMMa-3] in patients with relapsed or refractory MM where it was compared with one of five standard MM therapy regimens. [34] The primary endpoint was PFS according to International Myeloma Working Group (IMWG) criteria.
  * Patients had two to four prior therapies (median of 3) which must have included Darzalex (daratumumab), an immunomodulatory agent, and a proteosome inhibitor. Disease progression must have occurred within 60 days of completing their last therapy.
  * The comparator (standard MM regimen) was chosen prior to randomization on the basis of the most recent regimen received.
  * Eighty-five percent of the patients had a prior autologous HSCT. Sixty-eight percent of the population was double-class refractory, and 66% was triple-class refractory.
  * Patients who received prior BCMA-directed therapies were excluded from the study.
  * The median PFS was 13.3 months and 4.4 months in the Abecma (idecabtagene vicleucel) and standard MM therapy treatment arms, respectively.
  * Grade 3 or 4 AEs occurred in 93% of patients in the Abecma (idecabtagene vicluecel) treatment arm and in 75% of patients in the standard therapy arm.
- Abecma (idecabtagene vicleucel) is one of several therapies directed against B-cell maturation antigen (BCMA), such as BCMA-specific bispecific T-cell engagers (BiTEs), Elrexfio (elranatamab), Tecvayli (teclistamab), or Blenrep (belantamab mafodotin). Although there is interest in the use of CAR T for MM after prior BCMA-directed therapy, there is insufficient evidence to support the use of sequential anti-BCMA therapy at this time.
- The NCCN MM guideline lists Abecma (idecabtagene vicleucel) as a category 1 treatment recommendation for MM that has progressed on or after two prior MM regimens, which must have included an anti-CD38 monoclonal antibody, an

immunomodulator agent, and a proteosome inhibitor. BCMA-specific bispecific T-cell engagers (BiTEs) [Elrexfio (elranatamab) or Tecvayli (teclistamab)] are recommended further down the treatment line, after at least four (or more) prior lines of therapy. Blenrep (belantamab mafodotin) is only available via compassionate use programs. [4]

CARVYKTI (CILTACABTAGENE AUTOLEUCEL)

Multiple Myeloma (MM):

In the single-arm CARTITUDE-1 trial, Carvykti (ciltacabtagene autoleucel) demonstrated high rates of response to therapy, including complete responses, in adults with relapsed or refractory multiple myeloma (MM).[17] Although results are promising, its effect on any long-term clinically relevant outcome is not yet known.

- The pivotal open-label CARTITUDE-1 trial enrolled 113 adult patients, who had relapsed or refractory MM, after multiple specific prior therapies. [17] However, only 97 patients received an infusion of Carvykti (ciltacabtagene autoleucel) at a dose of $0.75x10^6$ CAR-positive T cells per kilogram.
    * Subjects enrolled in the trial must have received at least 3 prior MM treatment regimens, had disease that was refractory to the most recent chemotherapy regimen, and needed to have been on an anti-CD38 monoclonal antibody (mAb), a proteosome inhibitor (PI), and an immunomodulator (IMID).
    * Enrolled patients had a median of six prior therapies for their MM and the majority of patients (88%) were considered triple-refractory, defined as refractory to an IMID, a PI, and an anti-CD38 mAb. In addition, most (98%) had a prior stem cell transplant (HSCT) [90% autologous HSCT].
    * Prior treatment with a CAR-T-cell therapy and/or BCMA targeted therapy was not allowed.
    * Although Carvykti (ciltacabtagene autoleucel) is designed to target the BCMA on cancerous plasma cells, confirmation that the tumor cells were positive for this antigen was not required as a condition for inclusion in the study as it is present in the majority of MM cases.
    * The primary endpoint was objective response rate (ORR) by independent review in accordance with IMWG response criteria.
    * In the patients that received an infusion of Carvykti (ciltacabtagene autoleucel), an ORR of 97.9% was achieved in this uncontrolled study. Of the responses, 80.4% were stringent complete (sCR), 14.4% very good partial (VGFR), and 3.1% were partial (PR).
    * The median progression-free survival (PFS) and duration of response (DoR) were 22.8 months and 21.8 months, respectively.
- The efficacy of Carvykti (ciltacabtagene autoleucel) was further evaluated in a randomized, open-label study [CARTITUDE-4] in patients with relapsed or refractory MM where it was compared with one of two standard MM therapy regimens. [35] The primary endpoint was PFS according to International Myeloma Working Group (IMWG) criteria.
    * Patients had one to three prior therapies (median of 2) which must have included an immunomodulatory agent and a proteosome inhibitor. All patients were

required to have lenalidomide-refractory disease. Only 23% of patients had disease refractory to Darzalex (daratumumab).

* Patients who received prior BCMA-directed therapies were excluded from the study.
* Additionally, patients that had MM with CNS involvement were excluded.
* The comparator (standard MM regimen) was chosen by the investigator based on prior treatment history. The choice of standard regimens included either PVd (pomalidomide/bortezomib/dexamethasone) or DPd (daratumumab/pomalidomide/dexamethasone.
* Eighty-five percent of the patients had a prior autologous HSCT. Only 15% of the population had triple-class refractory disease.
* The median PFS was not estimable and 11.8 months in the Carvykti (ciltacabtagene autoleucel) and standard MM therapy treatment arms, respectively. The hazard ratio was 0.41 [95% CI: 0.30, 0.56].

- Grade 3 or 4 AEs occurred in 97% of patients in the Carvykti (ciltacabtagene autoleucel) treatment arm and in 94% of patients in the standard therapy arm.
- Carvykti (ciltacabtagene autoleucel) is one of several therapies directed against B-cell maturation antigen (BCMA), such as BCMA-specific bispecific T-cell engagers (BiTEs), Elrexfio (elranatamab), Tecvayli (teclistamab), or Blenrep (belantamab mafodotin). Although there is interest in the use of CAR T for MM after prior BCMA-directed therapy, there is insufficient evidence to support the use of sequential anti-BCMA therapy at this time.
- The NCCN MM guideline lists Carvykti (ciltacabtagene autoleucel) as a category 1 treatment recommendation for MM that has progressed on or after <u>one</u> prior MM regimen, which must have included an immunomodulator agent and a proteosome inhibitor, and the disease is refractory to lenalidomide. BCMA-specific bispecific T-cell engagers (BiTEs) [Elrexfio (elranatamab) or Tecvayli (teclistamab)] are recommended further down the treatment line, after at least four (or more) prior lines of therapy. Blenrep (belantamab mafodotin) is only available via compassionate use programs. [4]

<u>AUCATZYL (OBECABTAGENE AUTOLEUCEL)</u>

Aucatzyl (obecabtagene autoleucel) has been studied in, and is FDA-approved for, adult patients with B-cell precursor ALL that expresses the CD19 antigen and is refractory to, or in a second or later relapse after, treatment with standard chemotherapy. [39]

B-cell precursor acute lymphoblastic leukemia (ALL):

- In a single-arm, clinical study [FELIX] Aucatzyl (obecabtagene autoleucel) demonstrated high rates of complete remission in adults with refractory or relapsed, CD19-positive, precursor B-cell ALL. [40,41]
    * Subjects had a median of two prior therapies and 34% had received a prior allogeneic stem cell transplant (ASCT). In those with a prior ASCT, more than 100 days were required to pass prior to CAR-T cell therapy administration.
    * The primary endpoint was complete remission (CR) or CR with incomplete blood recovery (CRi), which was achieved in 63% of treated patients.

    * A CR was achieved in 42% of subjects treated with Aucatzyl (obecabtagene autoleucel).
    * The MRD assay used in this trial was not analytically valid so the FDA did not allow MRD as part of the labeling for this therapy.
    * The median duration of remission was 14.1 months.
- The safety and effectiveness of Aucatzyl (obecabtagene autoleucel) has not been established in patients younger than 18 years of age. In younger patients, B-cell precursor ALL is generally considered to be a different disease with a different disease course, such that the efficacy and safety of Aucatzyl (obecabtagene autoleucel) cannot be presumed based on the available evidence from patients who are older than 18 years of age. [39]
- NCCN ALL guideline lists Aucatzyl (obecabtagene autoleucel) among several recommended options for relapsed or refractory ALL and after prior tyrosine kinases inhibitors (TKIs) if Philadelphia chromosome-positive (Ph+) ALL. [4]

PERFORMANCE STATUS

- Clinical trials of CAR T-cell therapies used Eastern Cooperative Oncology Group (ECOG) performance status (PS) as a measure of a patient's level of function and suitability for enrollment in trials.
- In clinical practice, either ECOG PS (0-1) or Karnofsky Performance Score (≥ 80) may be used to establish suitability for CAR T-cell therapy. [18]

Investigational Uses

Repeat doses of CAR-T therapy

- There is interest in the use of repeated doses of CAR T-cell therapies in patients that have resistance to or relapse after CAR T-cell infusion, including for patients with poor cell persistence. However, there is insufficient evidence currently for repeated doses of CAR T-cell therapies (see *Appendix 5*). This includes use of commercial CAR T-cell therapy products after use of CAR T-cell therapy in a clinical trial.

Use of CAR-T therapy in earlier stages of disease

- There is interest in using CAR T-cell therapies in earlier stages of disease than they were initially studied and approved. Although there are several ongoing studies that indicate they may have activity in these settings, there has also been a more critical look at the potential safety of these products, particularly surrounding their potential for causing secondary malignancies. Until a more accurate benefit versus risk is sorted out, CAR T therapies are only coverable after the number of prior lines of therapy specified in the coverage criteria.

Richter's Transformation

- There is interest in the use of CAR T-cell therapies in patients that progress to DLBCL from CLL (Richter's transformation). However, there is currently insufficient evidence to establish the safety and efficacy in Richter's transformation. Preliminary data in a small subset (n=8) at a single site is promising; however, the trial is still ongoing, and additional data is needed. [19]

Central Nervous System (CNS) lymphomas

- There is interest in the use of CAR T-cell therapies for primary CNS lymphomas. However, currently there is insufficient evidence to establish the safety and efficacy in primary CNS lymphomas.
    * *Secondary CNS lymphoma:*
        - A case series of in eight patients with secondary CNS lymphoma received Kymriah (tisagenlecleucel). [20] Two of the eight patients were treated for systemic disease, as well as CNS. Three patients had a complete response but follow up was limited (90-180 days) such that durability of response is unknown at this time.
        - In the pivotal trial for Breyanzi (lisocabtagene maraleucel) for large B cell lymphoma, seven patients had secondary CNS lymphoma, with three patients having an objective response. [9]
    * *Primary CNS lymphoma: [31]*
        - A small, uncontrolled study evaluated 12 patients who received Kymriah (tisagenlecleucel) for their relapsed or refractory primary CNS lymphoma.
        - Response was observed in 7 of the patients (6 complete responses and 1 partial response). At 12 months, 3 of 12 patients had not experienced disease progression.
- Although the available data in CNS lymphoma is promising, additional evidence is needed to establish the safety and efficacy of CAR T therapies in this setting. Use of CAR T therapies to treat CNS lymphoma is considered investigational until better information is available.
- NCCN Central Nervous System Cancers guideline does not include use of CAR T-cell therapy in primary CNS lymphoma. [4]

All Other Conditions: There is interest in using CAR T-cell therapies in other cancers, including B-cell mediated cancers that express the CD19 antigen and other leukemias and lymphomas; however, the safety and effectiveness of this therapy in diseases other than listed in the coverage criteria has not been established. [21]

Safety *[1,14,22-24,29]*

- ***Boxed Warnings:*** All currently available CAR T-cell therapy product prescribing information includes boxed warnings for cytokine release syndrome (CRS) and neurological toxicity.
    * CRS reactions may be fatal or life-threatening and may require supportive care, including admission to an intensive care unit (ICU). Package labeling has a box warning describing this risk.
    * CAR T-cell therapies are only available through restricted programs under a Risk Evaluation and Mitigation Strategy (REMS) and are only infused at authorized treatment centers.
    * The box warnings also describe a risk of serious and potentially fatal or life-threatening neurological toxicities, including seizures (risk varies with product. See full prescribing information for details).

- *Additional Abecma Boxed Warnings:* Hemophagocytic lymphohistiocytosis/ macrophage activation syndrome (HLH/MAS) and prolonged cytopenia with bleeding and infection.
- Additional warnings and precautions include hypersensitivity reactions (premedication is recommended prior to administration), serious infections, hypogammaglobulinemia (the need for life-long immune globulin is possible), prolonged cytopenias, development of secondary malignancies, and decreased ability to drive and operate machinery for at least eight weeks after infusion of CAR-T therapies. See full prescribing information for additional details.
- Treatment with CAR T-cell therapy is only available through select treatment centers authorized by the respective manufacturers.

- In some regions, site of care may be further limited by insurance providers.

Appendix 1:

Tyrosine Kinase Inhibitors (TKIs) Indicated for Philadelphia chromosome-Positive B-Cell Acute Lymphoblastic Leukemia (ALL) [4]	
Iclusig (ponatinib)	(dasatinib (generic, Sprycel)
imatinib (generic, Gleevec)	

Appendix 2:

Response (Remission) Definitions for ALL [4]
Blood and Bone Marrow:
Complete response (CR): - No circulating blasts or extramedullary disease - Trilineage hematopoiesis (TLH) and < 5% blasts - Absolute neutrophil count (ANC) > 1000/microliter - Platelets > 100,000/microliter - No recurrence for 4 weeks ***Complete response with incomplete blood count recovery (CRi):*** - Meets all criteria above for a complete response except for platelet count and/or ANC ***The overall response rate (ORR) includes both CR and CRi [ORR = CR + CRi]***
CNS remission:
No lymphoblasts in CSF regardless of WBC count
Lymphomatous Extramedullary Disease:
CR: Complete resolution of lymphomatous enlargement by CT scan of neck, chest, abdomen, and pelvis with IV contrast. (If previous positive PET scan, a post-treatment residual mass of any size is considered a complete response if it is PET negative)

Appendix 3:

Bruton's Tyrosine Kinase (BTK) Inhibitors Indicated for Mantle-Cell Lymphoma (MCL) and Chronic Lymphocytic Leukemia (CLL) or Small Lymphocytic Lymphoma (SLL) [4]	
Brukinsa (zanubrutinib)	Imbruvica (ibrutinib)
Calquence (acalabrutinib)	Jaypirca (pirtobrutinib)

Appendix 4:

Select Therapies Indicated for Multiple Myeloma (MM) [4]	
Anti-CD38 Monoclonal Antibodies	
daratumumab (Darzalex, Darzalex Faspro)	Sarclisa (isatuximab)
Proteosome Inhibitors	
bortezomib (generics, Velcade) Kyprolis (carfilzomib)	Ninlaro (ixazomib)
Immunomodulatory Agents	
lenalidomide (generics, Revlimid) Pomalyst (pomalidomide)	Thalomid (thalidomide)

Appendix 5:

Gene Therapies – CAR T [1,14,22-24,29]									
Coverable diagnoses, by CAR T product [f]	**B-cell ALL**	**Large B-cell lymphoma, or a related lymphoma diagnosis**				**FL**	**MCL**	**MM**	CLL/ SLL
		DLBCL	**High-grade B-cell lymphoma**	**DLBCL arising from FL (transformed FL)**	**PMBCL**				
Abecma, idecabtagene vicleucel								√	
Aucatzyl, obecabtagene autoleucel	√

Codes	Number	Description
Abecma (idecabtagene vicleucel)		
HCPCS	Q2055	Idecabtagene vicleucel, up to 460 million autologous b-cell maturation antigen (bcma) directed car-positive t cells, including leukapheresis and dose preparation procedures, per therapeutic dose
Aucatzyl (obecabtagene autoleucel)		
HCPCS	N/A	Not available
Breyanzi (lisocabtagene maraleucel)		
HCPCS	Q2054	Lisocabtagene maraleucel, up to 110 million autologous anti-cd19 car-positive viable t cells, including leukapheresis and dose preparation procedures, per therapeutic dose
Carvykti (ciltacabtagene autoleucel)		
HCPCS	Q2056	Ciltacabtagene autoleucel, up to 100 million autologous b-cell maturation antigen (bcma) directed car-positive t cells, including leukapheresis and dose preparation procedures, per therapeutic dose
Kymriah (tisagenlecleucel)		
HCPCS	Q2042	Tisagenlecleucel (Kymriah), up to 250 million car-positive viable t-cells, including leukapheresis and dose preparation procedures, per infusion
Tecartus (brexucabtagene autoleucel)		
HCPCS	Q2053	Brexucabtagene autoleucel, up to 200 million autologous anti-cd19 car positive viable t cells, including leukapheresis and dose preparation procedures, per therapeutic dose
Yescarta (axicabtagene ciloleucel)		
HCPCS	Q2041	Axicabtagene ciloleucel (Yescarta), up to 200 million autologous anti-cd19 car positive viable t cells, including leukapheresis and dose preparation procedures, per therapeutic dose

Revision History

Revision Date	Revision Summary
3/6/2025	Effective 4/15/25: • Added coverage for Aucatzyl (oxecabtagene autoleucel) for relapsed or refractory CD19-postive, B-cell acute lymphocytic leukemia (B-ALL). • Coverage is identical to the other two CAR T therapies approved for B-ALL. (Aucatzyl was added to the coverage table for Kymriah and Tecartus under criterion 1).
9/19/2024	• Expanded coverage of Breyanzi (lisocabtagene maraleucel) based on new evidence and new FDA indications. Added coverage criteria for the following: • Relapsed or refractory chronic lymphocytic leukemia (CLL) and small lymphocytic lymphoma (SLL) after at least three prior therapies for disease with standard risk disease (no high-risk cytogenetics). Prior therapy must have included a BTK inhibitor-based regimen and a Venclexta (venetoclax)-based regimen in each population. • Relapsed or refractory follicular lymphoma (FL) after at least two prior therapies.

Revision Date	Revision Summary
	• Relapsed or refractory mantle cell lymphoma (MCL) after at least two prior therapies.
6/20/2024	• Updated criteria for Abecma (idecabtagene vicleucel) in multiple myeloma (MM) based on new evidence which led to an expanded indication. Coverage was modified from 'at least four prior therapies' to 'at least two prior MM regimens including an immunomodulatory agent, a proteosome inhibitor, and an anti-CD38 monoclonal antibody'. • Updated criteria for Carvykti (ciltacabtagene autoleucel) in MM based on new evidence which led to an expanded indication. Coverage was modified from 'at least four prior therapies' to 'at least one prior MM regimen including an immunomodulator agent and a proteosome inhibitor, AND is refractory to lenalidomide'.
3/21/2024	No criteria changes with this annual review.
3/16/2023	• No changes to coverage criteria with this annual update. • Appendices were updated (no change to policy intent).
9/23/2022	• Added coverage criteria for Kymriah (tisagenlecleucel) in the third- and subsequent-line FL setting. • Added coverage criteria for Breyanzi (lisocabtagene maraleucel) in the second-line DLBCL setting, when certain criteria are met, a newly FDA approved indication.
6/17/2022	Added coverage criteria for Yescarta (axicabtagene ciloleucel) in the second-line DLBCL setting, when certain criteria are met, a newly FDA approved indication.
3/18/2022	• Formatted coverage criteria in tabular format to simplify review (no change to intent of policy). • Simplified criteria for "suitable ("fit") for CAR T therapy." Removed criteria requiring not eligible for a clinical trial, need to be enrolled in a health plan care management program, and absence of GVHD. • Added "Repeat doses of CAR T-cell therapy" to the list of Investigational Uses (no change to intent of coverage). • Added brand name for ciltacabtagene autoleucel, Carvykti. Product is now FDA-approved.
10/15/2021	• Added coverage criteria for ciltacabtagene autoleucel, a new CAR-T product under FDA review, for patients with relapsed or refractory multiple myeloma. • Added coverage criteria for Tecartus (brexucabtagene autoleucel) in adult patients with acute lymphoblastic leukemia (ALL), a newly FDA approved indication.

Revision Date	Revision Summary
7/16/2021	• Added the newly FDA-approved Abecma (idecabtagene vicleucel) to policy. Limits coverage to patients with relapsed or refractory multiple myeloma when certain criteria are met. • Added coverage criteria for Yescarta (axicabtagene ciloleucel) in patients with follicular lymphoma when certain criteria are met, a newly FDA approved indication. • Updated coverage criteria for patients with diffuse large B-cell lymphoma (DLBCL) and secondary CNS lymphoma.
4/22/2021	• Updated policy background section and updated lisocabtagene maraleucel with its final product name, Breyanzi, where applicable. • Updated coverage criteria to allow coverage of Breyanzi in PMBCL, • Clarified coverage criteria for patient suitability for CAR T-cell therapy, including the need for recent clinical documentation, performance status (use of ECOG or KPS), enrollment in to care management, and clinical trial (provider attestation).
10/28/2020	Updated policy background section and updated KTE-X19 with its final product name, Tecartus (brexucabtagene autoleucel), where applicable. No change to intent of policy.
7/22/2020	Added coverage criteria for lisocabtagene maraleucel (liso-cel) and KTE-X19, two new CAR-T products under FDA review (effective 9/1/2020).
6/15/2020	Removed references to brand Rituxan from policy to account for upcoming changes in biosimilars policy (dru620).
4//22/2020	• Added continuation of therapy (COT) criteria (no change to intent of coverage criteria). • Added criteria III.A.6, referencing ineligibility for clinical trial enrollment. • Updated evidence for the use with CNS lymphoma (Investigational).
11/16/2018	Lymphoma coverage criterion (II.B.2.c) was modified to state that a contraindication to coverage is active CNS disease.
9/21/2018	Added coverage of tisagenlecleucel in DLBCL, a new indication.
3/19/2018	New policy.

Drug names identified in this policy are the trademarks of their respective owners.

Medication Policy Manual | **Policy No:** dru527

Topic: Luxturna, voretigene neparvovec-rzyl | **Date of Origin:** August 1, 2018

Committee Approval Date: March 21, 2024 | **Next Review Date:** 2025

Effective Date: June 1, 2024

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of medication policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Luxturna (voretigene neparvovec-rzyl) is a gene therapy used for the treatment of patients with confirmed biallelic RPE65 mutation-associated retinal dystrophy.

Policy/Criteria

Most contracts require pre-authorization approval of Luxturna (voretigene neparvovec-rzyl) prior to coverage.

I. Luxturna (voretigene neparvovec-rzyl) may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) confirming that criteria A through E below are met.

A. A diagnosis of biallelic RPE65 mutation-associated retinal dystrophy confirmed by genetic testing.

AND

B. There are sufficient viable retinal cells (defined an area of retinal thickness>100 microns within the posterior pole), as measured by optical coherence tomography (OCT).

AND

C. The member is at least 12 months of age.

AND

D. The member has remaining light perception in the eye or eyes that will receive treatment.

AND

E. The member has not had any of the following:

1. Prior intraocular surgery within 6 months.

2. Use of high-dose (>7500 retinol equivalent units [or >3300 IU] per day of vitamin A) retinoid compounds in the past 18 months.

II. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers Luxturna (voretigene neparvovec-rzyl) coverable only under the medical benefit (as a provider-administered medication).

B. When preauthorization is approved, Luxturna (voretigene neparvovec-rzyl) will be authorized in quantities of one dose per eye per lifetime.

III. Luxturna (voretigene neparvovec-rzyl) is considered investigational when:

A. Used as re-treatment.

B. Used for inherited retinal diseases not due to an RPE65 mutation.

C. Used after or in combination with any other gene therapy.

Position Statement

- Luxturna (voretigene neparvovec-rzyl) is indicated for the treatment of patients with confirmed biallelic RPE65 mutation-associated retinal dystrophy. Patients must have viable retinal cells as determined by the treating physician(s). [1]
- Inherited retinal dystrophies (IRDs) are a diverse group of disorders with overlapping phenotypes characterized by progressive degeneration and dysfunction of the retina.[2]
- Biallelic RPE65 mutation-associated retinal dystrophy is a rare genetic condition and encompasses several clinical diagnoses, including Leber congenital amaurosis (LCA), Retinitis Pigmentosa (RP), and Severe Early Childhood Onset Retinal Dystrophy (SECORD).
- Genetic testing is required to confirm the diagnosis of RPE65-mediated retinal dystrophy.
- Luxturna (voretigene neparvovec-rzyl) is given as sequential, bilateral subretinal injections of 1.5E11 (or 150 billion) vg delivered in a total subretinal volume of 0.3 mL per eye. The individual procedures to each eye are performed on separate days no more than 6 days apart. The procedure is given under general anesthesia.
- Use of Luxturna (voretigene neparvovec-rzyl) is limited to medical centers with retina specialists with expertise in inherited retinal disorders, vitreoretinal surgery expertise, and pharmacies adequately trained to handle the product.
- Luxturna (voretigene neparvovec-rzyl) has been shown to improve visual function in low light settings, as measured by the multi-luminance mobility test (MLMT).
- In clinical studies, patients who had more advanced disease, did not experience improvement.
- Use in infants under 12 months of age is not recommended because of potential dilution or loss of Luxturna (voretigene neparvovec-rzyl) after administration due to active retinal cells proliferation.
- Luxturna (voretigene neparvovec-rzyl) has only been studied for inherited retinal dystrophies due to biallelic RPE65 mutations. There is no evidence for inherited retinal diseases due to other mutations.
- Repeated doses of Luxturna (voretigene neparvovec-rzyl) have not been studied. In clinical studies, patients received one dose in each eye once.
- Luxturna (voretigene neparvovec-rzyl) has not been studied after or in combination with other gene therapies.

Clinical Efficacy

- The efficacy of Luxturna (voretigene neparvovec-rzyl) was evaluated in one open-label, randomized, controlled, phase 3 trial. [3 4]
    * Patients with a confirmed diagnosis of RPE65-mediated retinal dystrophy were randomized 2:1 to receive Luxturna (voretigene neparvovec-rzyl) or to a control group.
    * The study excluded patients who had used high-dose (>7500 retinol equivalent units [or >3300 IU] per day of vitamin A) retinoid compounds in the past 18 months or who had intraocular surgery in the past 6 months.

* The primary endpoint was change in multi-luminance mobility test (MLMT) score at 1 year.
    - The MLMT was designed to measure functional vision and integrate aspects of visual acuity, visual field, and light sensitivity. To complete the MLMT patients navigate a marked path in varying light levels. The path contained various obstacles that subjects must navigate around. Patients successfully completed the MLMT if they completed the course in less than 3 minutes with less than 4 errors.
    - An improvement in score at one year meant that patients could complete the course at a lower light level than at baseline.
* The mean of the bilateral MLMT change score at one year was 1.8 in the intervention group and 0.2 in the control group (a difference of 1.6; 95% CI 0.72 to 2.41, p = 0.0013).
* Three patients who could not complete the MLMT at the brightest light level at baseline did not experience improvement after one year. Patients with more advanced disease may be less likely to have improvement in visual function.
* Key secondary endpoints included full-field light sensitivity threshold testing (FST) and best corrected visual acuity (BCVA).
    - In the intervention group, mean FST showed improvement in light sensitivity by day 30 and remained stable over 1 year. The control group showed no meaningful change in this measure over 1 year.
    - Results for BCVA favored the treatment group, but were not statistically significant.
* While Luxturna (voretigene neparvovec-rzyl) provides a significant therapeutic advance which may provide improvement in vision, it is not expected to restore normal vision, and longer-term clinical evidence is pending, to understand the durability of response.
    - A systematic review found that for improvements in BCVA and FST, voretigene neparvovec was effective up to 2 years post treatment. However, the improvement in BCVA was not sustainable and the data were not available in FST sensitivity beyond 2 years post treatment. [5]

Diagnosis

- Genetic testing is required to establish a diagnosis of RPE65 mediated retinal dystrophy. Pathogenic variant(s) must be present in both copies of the RPE65 gene to establish a diagnosis of biallelic RPE65-mediated inherited retinal dystrophy. Clinical studies included patients with pathogenic variations in the homozygous or compound heterozygous state. [1 6]

Investigational Uses

- Retreatment with Luxturna (voretigene neparvovec-rzyl) has not been studied. Additional studies and clinical experience with Luxturna (voretigene neparvovec-rzyl) are needed to determine the role of retreatment and to identify safety and efficacy with repeat dosing. [3]

- Luxturna (voretigene neparvovec-rzyl) has not been studied in patients with inherited retinal dystrophies due to mutations other than biallelic RPE65 mutations.

Medication Policy Manual | **Policy No:** dru529

Topic: Besponsa, inotuzumab ozogamicin | **Date of Origin:** March 1, 2018

Committee Approval Date: March 21, 2023 | **Next Review Date:** 2025

Effective Date: June 1, 2024

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Besponsa (inotuzumab ozogamicin) is an intravenously infused antibody-drug conjugate medication. It delivers cytotoxic chemotherapy to malignant B-cells, thereby causing cell death. It is approved for the treatment of adults with B-cell precursor acute lymphoblastic leukemia (ALL).

Policy/Criteria

Most contracts require pre-authorization approval of Besponsa (inotuzumab ozogamicin) prior to coverage.

I. Continuation of therapy (COT): Besponsa (inotuzumab ozogamicin) may be considered medically necessary for COT when criteria A, B, or C **AND** D below is met.

A. For diagnoses NOT listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND there is documentation that the medication was covered by another health plan. Examples of documentation include the coverage approval letter from the previous health plan or paid claim.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

B. For diagnoses listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

C. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

AND

D. The requested number of doses (cycles) is within the policy limits below (Note: Doses (cycles) already administered will be counted towards the coverable maximum quantity).

Please note*: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Besponsa (inotuzumab ozogamicin) may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes), that criteria A through E below are met.

A. A diagnosis of **relapsed or refractory B-cell acute lymphoblastic leukemia** (ALL).

AND

B. There is documentation providing current confirmation of CD22 tumor expression.

AND

C. The patient has received prior therapy meeting criteria 1 and 2 below:

1. At least one prior cytotoxic chemotherapy induction regimen has been ineffective.

AND

2. If the ALL is positive for the Philadelphia chromosome (Ph-positive), at least one tyrosine kinase inhibitor (TKI) indicated for ALL was not effective, unless all are contraindicated or not tolerated.

AND

D. The patient does not have active central nervous system (CNS) leukemia.

AND

E. When either criterion 1 or 2 is met:

1. Besponsa (inotuzumab ozogamicin) will be used as a monotherapy.

OR

2. Besponsa (inotuzumab ozogamicin) will be used in combination with a mini-hyperCVD (cyclophosphamide, dexamethasone, vincristine, methotrexate, and cytarabine) regimen in relapsed or refractory Ph-negative ALL.

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers Besponsa (inotuzumab ozogamicin) coverable only under the medical benefit (as a provider-administered medication).

B. **Initial authorization:** When pre-authorization is approved, up to nine doses (three cycles) of Besponsa (inotuzumab ozogamicin) will be authorized over a three-month period.

C. **Continued authorization:** In patients who achieve a complete remission but who are not proceeding to a hematopoietic stem cell transplant (HSCT), up to nine additional doses (three additional cycles) will be authorized in a consecutive three-month period. No doses beyond a total of six-cycles will be authorized.

IV. Besponsa (inotuzumab ozogamicin) is considered investigational when:

A. Used in combination with other ALL therapies.

B. Used in quantities exceeding the number of doses listed above.

C. Use after hematopoietic stem cell transplant (HSCT), including use of doses pre-authorized for administration prior to HSCT, but given after HSCT.

D. Used for all other conditions.

Position Statement

Summary

- Besponsa (inotuzumab ozogamicin) is an intravenously infused antibody-drug conjugate that targets the CD22 antigen on B-cells. It delivers a cytotoxic chemotherapy agent that causes cell death. It was studied and subsequently approved for the treatment of relapsed or refractory B-cell precursor acute lymphoblastic leukemia (ALL).
- Intent of the policy is to cover Besponsa (inotuzumab ozogamicin) for B-cell precursor ALL when standard chemotherapy is ineffective, the setting where its safety and effectiveness has been studied.
- Besponsa (inotuzumab ozogamicin) was studied in adult patients with CD22-positive B-cell ALL that had relapsed after, or was refractory to, induction with a standard chemotherapy regimen who were scheduled for their first- or second salvage therapy. For Philadelphia chromosome-positive (Ph+) disease, patients were unresponsive to both standard induction therapy and a tyrosine kinase inhibitor indicated for Ph+ ALL.
- Patients with active central nervous system (CNS) leukemia were not included in the pivotal clinical study.
- Approval of Besponsa (inotuzumab ozogamicin) was based on its ability to induce a complete remission relative to investigator's choice of chemotherapy. The remission rates were 80% and 29%, respectively. However, there was no difference in median overall survival between the two groups.
- The National Comprehensive Cancer Network (NCCN) acute lymphoblastic lymphoma guideline Besponsa (inotuzumab ozogamicin) among category 1 recommendations for patients with Ph-negative relapsed or refractory ALL. It is listed as a category 2A recommendation for those with Ph-positive relapsed or refractory ALL.
- Besponsa (inotuzumab ozogamicin) is administered as a 60-minute infusion on Days 1, 8, and 15 of each cycle (the initial cycle is 21 days, subsequent cycles are 28 days). The dose is dependent of the response achieved after cycle 1, and may be adjusted based on side effects. It may be given for a maximum of six cycles in patients who do not receive a hematopoietic stem cell transplant (HSCT).
- Besponsa (inotuzumab ozogamicin) has not been studied for use after hematopoietic stem cell transplant.
- Besponsa (inotuzumab ozogamicin) labeling carries a BOX WARNING describing the potential for liver toxicity, including veno-occlusive disease, and an increase in post bone marrow transplant mortality.
- There is possible interest in using Besponsa (inotuzumab ozogamicin) in other B-cell lymphomas; however, there is currently no published evidence evaluating the safety and effectiveness of this medication in these conditions.

Regence Pharmacy Services performs independent analyses of oncology medication evidence, to establish coverability per the contracts with the health plan.

- Most contracts define coverability based on established clinical benefit in published, peer-reviewed literature, along with consideration of regulatory status.

- FDA approval does not in itself establish medical necessity, as unpublished, low-quality evidence, including exploratory analyses and unvalidated surrogate endpoints, may be used as the basis of approval. Regulatory approval may or may not reflect clinical benefit relative to standard of care and the recommendations of expert clinical advisors such as the Oncologic Drugs Advisory Committee (ODAC). FDA approvals generally do not consider cost compared to established therapies, or value to members.
- Likewise, NCCN clinical practice guidelines assignment of a recommendation (category 1, 2a, or 2b) does not necessarily establish medically necessity. NCCN recommendations are inconsistently supported by published, peer-reviewed literature and do not uniformly consider value of new therapies relative to existing potentially higher-value treatment options, considering effectiveness, safety, and cost.
- Medication coverage criteria are developed based on the 'medical necessity' assessment, as described above.

Regence Pharmacy Services analysis and coverage policy may differ from FDA labeled indication and/or NCCN clinical practice guidelines.

Clinical Efficacy

- The approval of Besponsa (inotuzumab ozogamicin) was based on an open-label RCT that compared it with investigator's choice of chemotherapy in patients who relapsed after or were refractory to a front-line chemotherapy regimen. [1]
    - Patients enrolled in the study had CD22-positive ALL (included both Philadelphia chromosome (Ph)-positive and Ph-negative patients).
    - Complete remission, the primary endpoint, was achieved by 80.7% and 29.4% of subjects in the Besponsa (inotuzumab ozogamicin) and chemotherapy arms, respectively.
    - The median duration of response was 4.6 months and 3.1 months in the Besponsa (inotuzumab ozogamicin) and chemotherapy arms, respectively. However, no difference in overall survival was detected between the two therapies.
- Although it appears Besponsa (inotuzumab ozogamicin) has activity in patients with relapsed or refractory B-cell ALL based on its ability to induce disease remission, the small difference in duration of response and the lack of improvement in overall survival relative to chemotherapy brings into question the overall clinical benefit of this therapy.
- The National Comprehensive Cancer Network (NCCN) acute lymphoblastic leukemia (ALL) guideline lists Besponsa (inotuzumab ozogamicin) as a category 1 recommendation for Ph-negative ALL. Blincyto (blinatumomab) is also listed as a category 1 recommendation in this population. Besponsa (inotuzumab ozogamicin) is also listed among several category 2A recommendations for patients with Ph-positive ALL. In patients with relapsed or refractory Ph-negative ALL, use of Besponsa (inotuzumab ozogamicin) in combination with mini-hyperCVD (cyclophosphamide, dexamethasone, vincristine, methotrexate, and cytarabine) is listed as a category 2a.[2]

Investigational Uses

- Based on its mechanism of action, Besponsa (inotuzumab ozogamicin) may have potential applications in other B-cell-mediated cancers; [3] however, there is currently no published evidence supporting use in any condition other than CD22-positive B-cell ALL.
- NCCN guidelines do not list Besponsa (inotuzumab ozogamicin) as a treatment option outside of the relapsed or refractory B-cell ALL setting.

Safety [4,5]

- Current safety experience with Besponsa (inotuzumab ozogamicin) is limited. However, there are significant adverse effects associated with its use that have been identified in the clinical trial. It delivers the same cytotoxic chemotherapy agent to cells as Mylotarg (gemtuzumab ozogamicin), which was withdrawn from the market for several years due to deaths associated with hepatic veno-occlusive disease (VOD).
- Besponsa (inotuzumab ozogamicin) and Mylotarg (gemtuzumab ozogamicin) carry BOX WARNINGS for hepatotoxicity, including hepatic VOD and increased risk of post-hematopoietic stem cell transplant non-relapse mortality.

Dosing [4]

- Premedication with corticosteroids, antipyretics, and antihistamines is recommended prior to each Besponsa (inotuzumab ozogamicin) infusion.
- Besponsa (inotuzumab ozogamicin) is given via a 60-minute infusion on Days 1, 8, and 15 of each cycle. The initial cycle is 21 days. Subsequent cycles are 28 days in length. Dosing is based on body surface area.
- For patients proceeding to a hematopoietic stem cell transplant, the recommended duration of therapy is two cycles. A third cycle may be given if the patient does not achieve a complete remission and minimal residual disease (MRD) negativity after two cycles.
- A maximum of six cycles of treatment may be administered to patients who are not proceeding to hematopoietic stem cell transplant.

Medication Policy Manual | **Policy No:** dru530

Topic: Mylotarg, gemtuzumab ozogamicin | **Date of Origin:** March 1, 2018

Committee Approval Date: September 19, 2024 | **Next Review Date:** 2025

Effective Date: December 1, 2024

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Mylotarg (gemtuzumab ozogamicin) is an intravenously infused antibody-drug conjugate medication. It delivers cytotoxic chemotherapy to myeloid cells that express the CD33 antigen, thereby causing cell death. It is approved for the treatment of CD33-positive acute myeloid leukemia (AML).

Policy/Criteria

I. Continuation of therapy (COT): Mylotarg (gemtuzumab ozogamicin) may be considered medically necessary for COT criterion A, B, or C below is met.

A. For diagnoses NOT listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND there is documentation that the medication was covered by another health plan. Examples of documentation include the coverage approval letter from the previous health plan or paid claim.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

B. For diagnoses listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

C. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

Please note*: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Mylotarg (gemtuzumab ozogamicin) may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) that criteria A and B below are met.

A. A diagnosis of **CD33-positive acute myeloid leukemia** (AML) in one of the following settings (1 or 2):

1. Adult or pediatric patients (1 month of age and older) naïve to prior AML treatment.

OR

2. Adult or pediatric patients (2 years of age and older) with disease that relapsed after, or was refractory to, a prior AML induction chemotherapy regimen.

AND

B. The patient does not have active central nervous system (CNS) leukemia.

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers Mylotarg (gemtuzumab ozogamicin) coverable only under the medical benefit (as a provider-administered medication).

B. When pre-authorization is approved, Mylotarg (gemtuzumab ozogamicin) will be approved in the following quantities:

Table 1:

Treatment setting:	**Maximum number of infusions:**
Adults with newly diagnosed AML when used in combination with chemotherapy	Up to five infusions
Pediatric patients with newly diagnosed AML when used in combination with chemotherapy	Up to two infusions
Adults with newly diagnosed AML when used as a single agent	Up to ten infusions
Adults or pediatric patients with relapsed or refractory AML	Up to three infusions

C. **Continued Authorization:** No additional doses of Mylotarg (gemtuzumab ozogamicin) will be authorized.

IV. Mylotarg (gemtuzumab ozogamicin) is considered investigational when:

A. Used in quantities exceeding the maximum number of infusions listed in the Quantity Limits above (*Table 1).*

B. Used for all other conditions.

Position Statement

Summary

- Mylotarg (gemtuzumab ozogamicin) is an intravenously infused antibody-drug conjugate that targets the CD33 antigen present on myeloid cells. It delivers a cytotoxic chemotherapy agent that causes cell death. It was studied and subsequently approved for newly diagnosed CD33-positive (CD33+) acute myeloid leukemia (AML) in adults, and in relapsed or refractory CD33+ AML in adults and pediatrics (≥ 2 years of age).
- The intent of this policy is to cover Mylotarg (gemtuzumab ozogamicin) for the indications and regimen for which it has been shown to be safe and effective, as detailed in the coverage criteria.
- Mylotarg (gemtuzumab ozogamicin) initially received FDA Accelerated approval in 2000 but was withdrawn from the market in 2010 because clinical benefit (survival) had not yet been established despite the completion of several follow-on phase 3 trials. Post-marketing experience also revealed a significant risk of fatal hepatic veno-occlusive disease (VOD) suggesting that risks with this medication were greater than potential benefit.
- The re-approval of Mylotarg (gemtuzumab ozogamicin) in late 2017 is based on four pivotal studies in various populations and settings. Although it appears to have activity in AML based on induction of disease remission, an initial goal of therapy, a clear long-term clinical benefit has not yet been established (e.g., improved survival or quality of life).
    * ***Adults with newly diagnosed CD33+ AML:***
        - There was no difference in remission rates in patients receiving chemotherapy alone, versus chemotherapy plus Mylotarg (gemtuzumab ozogamicin). There was no difference in overall survival (OS) at 2 years after adjustment for factors of prognostic importance.
        - A statistically significant, but not likely a clinically relevant, difference in median OS (five weeks) was noted with Mylotarg (gemtuzumab ozogamicin) relative to best supportive care.
    * ***Adults with CD33+ AML in first relapse:*** Remission rates of 26% were reported in a small observational study. Long term clinical benefits, and relative comparisons to other therapies or best supportive care are not known.
    * ***Pediatric patients with relapsed or refractory CD33+ AML:*** Use in pediatrics in based on a small (28 patient) observational study in children ages 2 to 18 years and a retrospective literature review of case studies in which it was noted that there were no differences in efficacy or safety observed by age.
- Patients with active central nervous system (CNS) leukemia were not included in the pivotal clinical studies so it is not known if it provides any benefit in this population.
- The National Comprehensive Cancer Network (NCCN) AML guideline lists Mylotarg (gemtuzumab ozogamicin) as a treatment option for its labeled indications.

- Mylotarg (gemtuzumab ozogamicin) is administered as a 120-minute infusion. The dose and schedule are determined by the disease setting and whether it is administered as an add-on to a chemotherapy regimen, or as a single agent *(refer to Dosing section of policy).*
- Mylotarg (gemtuzumab ozogamicin) labeling carries a BOX WARNING describing the potential for liver toxicity, including severe or fatal VOD.

Regence Pharmacy Services performs independent analyses of oncology medication evidence, to establish coverability per the contracts with the health plan.

- Most contracts define coverability based on established clinical benefit in published, peer-reviewed literature, along with consideration of regulatory status.
- FDA approval does not in itself establish medical necessity, as unpublished, low-quality evidence, including exploratory analyses and unvalidated surrogate endpoints, may be used as the basis of approval. Regulatory approval may or may not reflect clinical benefit relative to standard of care and the recommendations of expert clinical advisors such as the Oncologic Drugs Advisory Committee (ODAC). FDA approvals generally do not consider cost compared to established therapies, or value to members.
- Likewise, NCCN clinical practice guidelines assignment of a recommendation (category 1, 2a, or 2b) does not necessarily establish medically necessity. NCCN recommendations are inconsistently supported by published, peer-reviewed literature and do not uniformly consider value of new therapies relative to existing potentially higher-value treatment options, considering effectiveness, safety, and cost.
- Medication coverage criteria are developed based on the 'medical necessity' assessment, as described above.

Regence Pharmacy Services analysis and coverage policy may differ from FDA labeled indication and/or NCCN clinical practice guidelines.

Clinical Efficacy

- Mylotarg (gemtuzumab ozogamicin) initially received FDA Accelerated approval in 2000 but was withdrawn from the market in 2010 because clinical benefit (survival) had not yet been established despite the completion of several follow-on phase 3 trials. Post-marketing experience also revealed a significant risk of fatal hepatic veno-occlusive disease (VOD) suggesting that risks with this medication were greater than potential benefit. [1]
- The current approval (late 2017) of Mylotarg (gemtuzumab ozogamicin) was based on four pivotal trials in the following settings:
    * ***Adults with newly diagnosed AML with Mylotarg (gemtuzumab ozogamicin) as an add-on to chemotherapy:*** [2]
        - This study compared chemotherapy alone with chemotherapy plus Mylotarg (gemtuzumab ozogamicin) in patients between 50 and 70 years of age.
        - There was no difference in complete remission rates between the groups.

- The two-year overall survival (OS) rates were 41.9% and 53.2%, respectively; however, after adjustment for factors of prognostic importance (genotype and cytogenetics), there was no difference in OS between groups.

* ***Adults with newly diagnosed AML with Mylotarg (gemtuzumab ozogamicin) as a monotherapy:*** [3]
  - This study compared Mylotarg (gemtuzumab ozogamicin) monotherapy with best supportive care (BSC) in patients who were ineligible for intensive chemotherapy (the median age was 77 years).
  - The median OS was 4.9 months and 3.6 months in the Mylotarg (gemtuzumab ozogamicin) and BSC treatment groups, respectively. This small difference is statistically different but is not likely clinically relevant.
  - Although CD33 status was not part of the inclusion criteria, there was a strong correlation between CD33 expression and OS.

* ***Adults with CD33+ AML in first relapse:*** [4]
  - This single-arm, observational study evaluated remission rates in adults with CD33+ AML who were receiving Mylotarg (gemtuzumab ozogamicin) in their first disease relapse.
  - The rate of complete remission was 26%, with a median relapse-free survival of 11.6 months.
  - The study did not evaluate long-term clinical outcomes and did not compare Mylotarg (gemtuzumab ozogamicin) with any other therapy.

* ***Pediatric patients with relapsed or refractory CD33+ AML:***
  - Approval of Mylotarg (gemtuzumab ozogamicin) in pediatric patients is based on an observational trial in 28 patients with relapsed or refractory CD33+ AML that ranged in age from 2 years to 18 years. Additional case reports from the literature were also included.
  - No differences in efficacy and safety were observed based on age.

- Although induction of remission is a goal of therapy in AML, achieving remission has not been shown to be predictive of long-term benefit such as improved overall survival. None of the current studies establishes a durable clinical benefit with Mylotarg (gemtuzumab ozogamicin) in treating AML. Increased mortality due to hepatic VOD remains a significant risk with this medication.
- Patients with active central nervous system (CNS) leukemia were not included in the pivotal clinical trials, so it is not known if Mylotarg (gemtuzumab ozogamicin) provides any potential benefit in this population.
- The National Comprehensive Cancer Network (NCCN) acute myeloid leukemia (AML) guideline lists Mylotarg (gemtuzumab ozogamicin) as a treatment option for its labeled indications. [5]

Investigational Uses

- There is interest in using Mylotarg (gemtuzumab ozogamicin) in other leukemias, and in high-risk myelodysplastic syndrome (MDS). [6] Studies in these areas are ongoing. There is currently no published evidence in these conditions.
- The NCCN compendium lists Mylotarg (gemtuzumab ozogamicin) as a treatment option for acute promyelocytic leukemia (APL). It also recommends its use in high-risk AML (WBC > 10,000/mcL), regardless of tumor CD33 status, when cardiac issues are present. This use lies outside of package labeling and is not well-supported by clinical evidence. [5]

Safety

- Mylotarg (gemtuzumab ozogamicin) carries a BOX WARNING for hepatotoxicity, including severe or fatal veno-occlusive disease (VOD). [4]
- The overall incidence of hepatic VOD with Mylotarg (gemtuzumab ozogamicin) was approximately 9% based on a safety registry surrounding its prior approval. A pharmacovigilance program identified more than twice the number of hepatic VOD cases as the registry, which puts its overall incidence somewhere between 10% and 20%. [1]
- Hospitalization occurred in 80% of the 99 cases of hepatic VOD that were retrospectively reported in the pharmacovigilance program. Over 66% of these patients died as a result of hepatic VOD. [1]
- A European safety assessment reported an incidence of hepatic VOD of 1% when there was no prior or subsequent hematopoietic stem cell transplant (HSCT) surrounding Mylotarg (gemtuzumab ozogamicin) administration, 19% in patients with a HSCT prior to Mylotarg (gemtuzumab ozogamicin) administration, and 16% when HSCT was received after Mylotarg (gemtuzumab ozogamicin) administration. [1]
- Although dosing of Mylotarg (gemtuzumab ozogamicin) varies from that which was originally approved in 2000, the risk of hepatic VOD remains an active concern as it has also been reported with the newly approved dosing. There are post-marketing requirements in place to attempt to better quantify the risk. [7]

Dosing [4]

Setting	Dose	Schedule	Cycles
Newly diagnosed AML, with daunorubicin and cytarabine (adults)	3 mg/m^2 (up to 4.5 mg)	Days 1, 4, and 7	1 induction cycle
	3 mg/m^2 (up to 4.5 mg)	Day 1 only	2 consolidation cycles
Newly diagnosed AML, with daunorubicin and cytarabine (pediatric patients)	3 mg/m2 (when BSA ≥ 0.6 m^2) 0.1 mg/kg (when BSA < 0.6 m^2)	Once in combination with standard chemotherapy	1 induction cycle
	3 mg/m2 (when BSA ≥ 0.6 m^2) 0.1 mg/kg (when BSA < 0.6 m^2)	Once in combination with standard chemotherapy	1 intensification cycle (no Mylotarg in first or third intensification cycles; during intensification cycle 2 only)
Newly diagnosed AML, as a single agent (adults)	6 mg/m^2 3 mg/m^2	Day 1 Day 8	1 induction cycle
	2 mg/m^2	Day 1, every 4 weeks	Up to 8 (maintenance)
Relapsed/refractory AML, as a single agent (adults or pediatric patients)	3 mg/m^2 (up to 4.5 mg)	Days 1, 4, and 7	Single cycle

Key: AML=acute myeloid leukemia; BSA=body surface area

Revision History

Revision Date	Revision Summary
9/19/2024	No criteria changes with this annual review.
9/14/2023	The requirement for use of Mylotarg (gemtuzumab ozogamicin) as monotherapy in relapsed/refractory AML was removed for practical reasons (there was no change in clinical evidence).
9/23/2022	There were no changes to coverage criteria with this annual update.
10/15/2021	- Updated COT language. - Clarify the intent of criteria for relapsed/refractory AML, limited to use "as a monotherapy" (no change to policy intent). - Updated quantity limitation and dosing charts with pediatric information
10/28/2020	No changes to coverage criteria with this annual update.
7/22/2020	Updated coverage criteria newly diagnosed AML to include pediatric patients 1 month of age or older, a new FDA approved indication. Added COT language.
10/23/2019	Updated policy with standard language (no change to policy intent).
2/16/2018	New policy.

Drug names identified in this policy are the trademarks of their respective owners.

Medication Policy Manual | **Policy No:** dru531

Topic: Vyxeos, daunorubicin liposomal and cytarabine liposomal for injection | **Date of Origin:** March 1, 2018

Committee Approval Date: September 19, 2024 | **Next Review Date:** 2025

Effective Date: December 1, 2024

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Vyxeos (daunorubicin liposomal and cytarabine liposomal for injection) is a combination of two chemotherapy drugs in a liposomal formulation. It is an intravenous therapy used in the treatment of some types of acute myeloid leukemia (AML).

PLEASE NOTE: This policy does **not** apply to non-liposomal forms of generic daunorubicin (J9150) or generic cytarabine (J9100 or J9110).

Policy/Criteria

Most contracts require pre-authorization approval of Vyxeos (daunorubicin liposomal and cytarabine liposomal) prior to coverage.

I. Continuation of therapy (COT): Vyxeos (daunorubicin liposomal and cytarabine liposomal) may be considered medically necessary for COT when there is clinical documentation (including, but not limited to chart notes) confirming that criterion A B, or C below is met.

A. For diagnoses NOT listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND there is documentation that the medication was covered by another health plan. Examples of documentation include the coverage approval letter from the previous health plan or paid claim.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

B. For diagnoses listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

C. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

Please note*: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Vyxeos (daunorubicin liposomal and cytarabine liposomal) may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) that criteria A and B below are met.

A. A diagnosis of **therapy-related acute myeloid leukemia** (t-AML) or **AML with myelodysplasia-related changes** (AML-MRC) which has not been previously treated (treatment-naïve).

AND

B. Vyxeos (daunorubicin liposomal and cytarabine liposomal) will be used as monotherapy.

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers Vyxeos (daunorubicin liposomal and cytarabine liposomal) coverable only under the medical benefit (as a provider-administered medication).

B. When pre-authorization is approved, Vyxeos (daunorubicin liposomal and cytarabine liposomal) will be authorized in quantities up to 9 infusions per lifetime.

IV. Vyxeos (daunorubicin liposomal and cytarabine liposomal) is considered investigational when used for all other conditions, including but not limited to:

A. *De-novo* acute myeloid leukemia.

B. Relapsed or refractory acute myeloid leukemia of any type.

Position Statement

Summary

- Vyxeos (daunorubicin liposomal and cytarabine liposomal) is a combination of two generically available cytotoxic chemotherapeutic drugs in a liposomal formulation. *Note: Pre-authorization is not required for generic daunorubicin or generic cytarabine.*
- Vyxeos (daunorubicin liposomal and cytarabine liposomal) is FDA-approved for the treatment of therapy-related acute myeloid leukemia (t-AML) or AML with myelodysplasia-related changes (AML-MRC) which has not been previously treated (treatment-naïve).
- The intent of this policy is to cover Vyxeos (daunorubicin liposomal and cytarabine liposomal) for the indications and regimen for which it has been shown to be safe and effective, as detailed in the coverage criteria.
- FDA-approval was based on a single pivotal phase 3 trial. This trial has not been published.
- In clinical trials, subjects were treated with up to a total of nine doses as follows: an induction cycle, an optional repeat induction cycle, and up to two consolidation cycles. There is no data to support more than 9 doses per lifetime.
- The safety and effectiveness of Vyxeos (daunorubicin liposomal and cytarabine liposomal) in other conditions has not been established.
- NCCN AML guideline lists Vyxeos (daunorubicin liposomal and cytarabine liposomal) as a category 1 recommendation for initial induction in patients 60 years and over with t-AML and AML-MRC, and as a category 2B recommendation for patients less than 60 years of age. [1]

Regence Pharmacy Services performs independent analyses of oncology medication evidence, to establish coverability per the contracts with the health plan.

- Most contracts define coverability based on established clinical benefit in published, peer-reviewed literature, along with consideration of regulatory status.
- FDA approval does not in itself establish medical necessity, as unpublished, low-quality evidence, including exploratory analyses and unvalidated surrogate endpoints, may be used as the basis of approval. Regulatory approval may or may not reflect clinical benefit relative to standard of care and the recommendations of expert clinical advisors such as the Oncologic Drugs Advisory Committee (ODAC). FDA approvals generally do not consider cost compared to established therapies, or value to members.
- Likewise, NCCN clinical practice guidelines assignment of a recommendation (category 1, 2a, or 2b) does not necessarily establish medically necessity. NCCN recommendations are inconsistently supported by published, peer-reviewed literature and do not uniformly consider value of new therapies relative to existing potentially higher-value treatment options, considering effectiveness, safety, and cost.
- Medication coverage criteria are developed based on the 'medical necessity' assessment, as described above.

Regence Pharmacy Services analysis and coverage policy may differ from FDA labeled indication and/or NCCN clinical practice guidelines.

Clinical Efficacy [2]

- Approval was based on a Phase-III, randomized, open-label trial comparing Vyxeos (daunorubicin liposomal and cytarabine liposomal) to standard of care ("7+3" therapy with conventional daunorubicin and cytarabine).
- Vyxeos (daunorubicin liposomal and cytarabine liposomal) was associated with an overall survival (OS) advantage (HR 0.69, 50% CI 0.52-0.9). Median survival was not different between groups (9.56 months, 95% CI 6.6-11.86 vs. 5.95 months, 95% CI 4.99 – 7.75).
- Because the pivotal trial has not been published, study details such as attrition and censoring rules are not available; confidence in these results is correspondingly low.
- The study included subjects from 60-75 years of age; the safety and efficacy of Vyxeos (daunorubicin liposomal and cytarabine liposomal) in younger patients has not been established.

Investigational Uses

- Phase 2 studies in *de-novo* and relapsed/refractory acute myeloid leukemia have not shown any difference in overall survival or 1-year survival. [3,4] Further studies are needed to assess the safety and efficacy of Vyxeos (daunorubicin liposomal and cytarabine liposomal) in these populations.

Medication Policy Manual

Policy No: dru535

Topic: Medications for Hereditary Angioedema (HAE)

Date of Origin: July 1, 2018

- Berinert, plasma-derived C1-INH
- Cinryze, plasma-derived C1-INH
- icatibant (generic, Firazyr, Sajazir)
- Kalbitor, ecallantide
- Haegarda, plasma-derived C1-INH
- Orladeyo, berotralstat
- Ruconest, recombinant human C1-INH
- Takhzyro, lanadelumab-flyo

Committee Approval Date: June 20, 2024

Next Review Date: 2024

Effective Date: October 1, 2024

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Medications included in this policy are used to treat hereditary angioedema (HAE). Administration is different for each medication, and may be a subcutaneous injection (SC), intravenous injection (IV), or oral. Kalbitor (ecallantide), icatibant (generic, Firazyr, Sajazir), plasma-derived C esterase inhibitor (pdC1-INH, Berinert), and recombinant human C1-INH (rhC1-INH, Ruconest) are approved for the treatment of HAE attacks. Takhzyro (lanadelumab-flyo) and Orladeyo (berotralstat), are both kallikrein inhibitors, and two other forms of plasma-derived C1-INH (Haegarda and Cinryze), are approved for the prophylaxis of HAE attacks.

Policy/Criteria

Most contracts require pre-authorization approval of medications used to treat hereditary angioedema (HAE) prior to coverage.

I. Continuation of therapy (COT): Medications used to treat HAE may be considered medically necessary for COT when criterion A AND B below are met.

A. One of the following (1, 2, or 3):

1. For diagnoses NOT listed in the coverage criteria below, full policy criteria must be met for coverage.

OR

2. For diagnoses listed in the coverage criteria below, criteria a, b, and c must be met:

a. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

b. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

AND

c. **For use of branded Firazyr or Sajazir:** There is clinical documentation (including, but not limited to chart notes) of an intolerance or contraindication to an inactive ingredient in the generic equivalent medication icatibant.

OR

3. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission. **For use of branded Firazyr or Sajazir:** There is clinical documentation (including, but not limited to chart notes) of an intolerance or contraindication to an inactive ingredient in the generic equivalent medication icatibant.

AND

B. **For Cinryze (plasma-derived C1-INH) ONLY:** Site of care administration requirements are met [refer to Pharmacy Services Medication Policy Manual, Site of Care Review, dru408].

Please note*: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Medications used to treat HAE may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) that criterion A, B, or C **AND** D below are met.

A. Hereditary Angioedema (Type I, II, or HAE with normal C1INH (HAE-nl-C1INH)): Acute Treatments (for "as needed" use)

1. Generic icatibant may be considered medically necessary when criteria **a through d below** are met.

2. Berinert (plasma-derived C1-INH), and Kalbitor (ecallantide) may be considered medically necessary when criteria **a through e** are met.

3. Ruconest (recombinant human C1-INH) may be considered medically necessary when criteria **a through f** are met.

4. Brand icatibant (Firazyr, Sajazir) may be considered medically necessary when criteria **a through d and criterion g** are met.

a. A diagnosis of **Type I HAE, Type II HAE, or HAE-nl-C1INH** has been established by, or in consultation with a provider specializing in allergy, immunology, or hematology.

AND

b. Clinical documentation (including, but not limited to chart notes) of serum C4 and C1-INH (antigenic or functional level) that are below the limits of the laboratory's normal reference range (for Type I and Type II HAE only).

AND

c. Clinical documentation (including, but not limited to chart notes) of at least one of the following:

i. Family history of HAE.

OR

ii. Normal level of serum C1q antigenic protein based on the laboratory's normal reference range.

AND

d. The treatment is not used in conjunction with other HAE-specific therapies for acute treatment [e.g., Berinert (plasma-derived C1-INH), Kalbitor (ecallantide), icatibant (generic, Firazyr, Sajazir), or Ruconest (recombinant human C1-INH)].

AND

e. **[Ruconest (recombinant human C1-INH), Berinert (plasma-derived C1-INH) and Kalbitor (ecallantide) only]** Clinical documentation (including, but not limited to chart notes) confirming that generic icatibant has been ineffective, not tolerated, or contraindicated.

AND

f. **[Ruconest (recombinant human C1-INH) only]** Clinical documentation (including, but not limited to chart notes) confirming that treatment with Berinert (plasma-derived C1-INH) has been ineffective, not tolerated, or contraindicated.

AND

g. **[Brand Firazyr or Sajazir only]** There is an intolerance or contraindication to an inactive ingredient in generic icatibant.

OR

B. Hereditary Angioedema (Type I or II): Prophylactic medications (for scheduled use)

1. Haegarda (plasma-derived C1-INH) and Takhzyro (lanadelumab-flyo) may be considered medically necessary when criteria **a through f** are met.

2. Cinryze (plasma-derived C1-INH) and Orladeyo (berotralstat) may be considered medically necessary when criteria **a through g** are met.

a. A diagnosis of **Type I or Type II HAE** has been established by, or in consultation with a provider specializing in allergy, immunology, or hematology.

AND

b. Clinical documentation (including, but not limited to chart notes) of serum C4 and C1-INH (antigenic or functional level) that are below the limits of the laboratory's normal reference range.

AND

c. Clinical documentation (including, but not limited to chart notes) of at least one of the following:

i. Family history of HAE.

OR

ii. Normal level of serum C1q antigenic protein based on the laboratory's normal reference range.

AND

d. The patient has been evaluated for potentially treatable triggers of HAE attacks and is maximally managed with respect to avoiding triggers.

AND

e. A history of attacks that are considered severe with swelling of the face, throat, or gastrointestinal tract. Severe is defined as events that significantly interrupt usual daily activity despite short term symptomatic treatment, as documented in clinical documentation (including, but not limited to chart notes or HAE calendar).

AND

f. The treatment is not used in conjunction with other HAE-specific therapies for the prophylaxis of HAE attacks.

AND

g. **[Cinryze (plasma-derived C1-INH) and Orladeyo (berotralstat) only]** Clinical documentation (including, but not limited to chart notes) confirming that treatment with at least one of the following has been ineffective, not tolerated, or

contraindicated.

i. Haegarda (plasma-derived C1-INH).

OR

ii. Takhzyro (lanadelumab-flyo).

OR

C. Acquired Angioedema: Acute Treatments (for "as needed" use)

1. Generic icatibant may be considered medically necessary in patients with a diagnosis of acquired angioedema when criteria **a through d** are met.

2. Kalbitor (ecallantide) may be considered medically necessary when criteria **a through e** are met.

3. Brand icatibant (Firazyr or Sajazir) may be considered medically necessary when criteria **a through d AND f** are met.

a. A diagnosis of acquired angioedema has been established by, or in consultation with a specialist in allergy, immunology, or hematology.

AND

b. Clinical documentation (including, but not limited to chart notes) of serum C4 and C1-INH (antigenic or functional level) that are below the limits of the laboratory's normal reference range.

AND

c. The patient has been evaluated for an underlying B-cell lymphoproliferative disorder.

AND

d. C1q levels are below the limits of the laboratory's normal reference range.

AND

e. **[Kalbitor (ecallantide) only]** Clinical documentation (including, but not limited to chart notes) confirming that generic icatibant has been ineffective, not tolerated, or contraindicated.

AND

f. **[Brand Firazyr, Sajazir only]** There is an intolerance or contraindication to an inactive ingredient in generic icatibant.

AND

D. For Cinryze (plasma-derived C1-INH) ONLY: Site of care administration requirements are met [refer to Pharmacy Services Medication Policy Manual, Site of Care Review, dru408].

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers icatibant (generic, Firazyr, Sajazir), Takhzyro (lanadelumab-flyo), Orladeyo (berotralstat), and Haegarda (plasma-derived C1-INH) coverable only under the pharmacy benefit (as self-administered medications).

B. Regence Pharmacy Services considers Berinert (plasma-derived C1-INH), Ruconest (recombinant human C1-INH), and Cinryze (plasma-derived C1-INH) coverable under the pharmacy benefit (as self-administered medications) OR coverable under the medical benefit (as provider-administered medications).

C. Regence Pharmacy Services considers Kalbitor (ecallantide) coverable only under the medical benefit (as a provider-administered medication).

D. When pre-authorization is approved, each drug may be covered in the following quantities and for the following authorization periods outlined in Table 1.

Table 1. Quantity and Authorization Limits

Berinert (plasma-derived C1-INH)	Initial: Berinert (plasma-derived C1-INH) may be authorized in a quantity sufficient for the treatment of three attacks per month based on a dose of 20 international units (IU) per kg of body weight per dose. Reauthorization: Authorization shall be reviewed at least every twelve months. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, such as disease stability or improvement. Berinert (plasma-derived C1-INH) may be authorized in a quantity sufficient for the treatment of four to six attacks per month, based on a dose of 20 IU per kg of body weight per dose, when criteria 1 below is met: **1.** The patient has been evaluated for potentially treatable triggers of HAE attacks and is maximally managed with respect to avoiding triggers.
Kalbitor (ecallantide)	Initial: Kalbitor (ecallantide) may be authorized in a quantity sufficient for the treatment of three attacks per month (up to nine 10 mg/1 mL vials per month). Reauthorization: Authorization shall be reviewed at least every twelve months. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, such as disease stability or improvement. Kalbitor (ecallantide) may be authorized in quantities of ten to eighteen 10 mg/1 mL vials per month (up to six treatments) when criteria 1 below is met: **1.** The patient has been evaluated for potentially treatable triggers of HAE and AAE attacks and is maximally managed with respect to avoiding triggers.
Icatibant (generic, Firazyr, Sajazir)	Initial: Icatibant (generic, Firazyr, Sajazir) may be authorized in a quantity sufficient for the treatment of three attacks per month (up to three 30 mg/3 mL pre-filled syringes per month). Reauthorization: Authorization shall be reviewed at least every twelve months. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, such as disease stability or improvement. **For brand**

	icatibant (Firazyr, Sajazir), there must also be documentation of an intolerance or contraindication to an inactive ingredient in generic icatibant. Icatibant (generic, Firazyr, Sajazir) may be authorized in quantities of <u>four to six</u> 30 mg/3 mL pre-filled syringes per month when criteria 1 below is met. **1.** The patient has been evaluated for potentially treatable triggers of HAE attacks and is maximally managed with respect to avoiding triggers.
Ruconest (recombinant human C1-INH)	<u>Initial</u>: Ruconest (recombinant human C1-INH) may be authorized in a quantity sufficient for the treatment of three attacks per month (up to <u>six</u> 2100 IU vials per month). <u>Reauthorization</u>: Authorization shall be reviewed at least every twelve months. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, such as disease stability or improvement. Ruconest (recombinant human C1-INH) may be authorized in quantities of up to seven to twelve 2100 IU vials per month (a quantity sufficient for the treatment of 4 to 6 attacks) when criteria 1 below is met: **1.** The patient has been evaluated for potentially treatable triggers of HAE attacks and is maximally managed with respect to avoiding triggers.
Cinryze (plasma-derived C1-INH)	Cinryze (plasma-derived C1-INH) may be authorized in quantities of 1,000 units twice per week for a total of 8,000 units (16 of the 500-unit vials) every 28 days. <u>Reauthorization</u>: Authorization shall be reviewed at least **every twelve months.** Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is effective as defined by at least a 50% decrease in frequency of HAE attacks subsequent to start of therapy, significant improvement/stability in severity and duration of attacks, and clinical documentation of functional improvement/stability.
Haegarda (plasma-derived C1-INH)	Haegarda (plasma-derived C1-INH) may be authorized in quantities up to 60 IU per kg body weight twice weekly. <u>Reauthorization</u>: Authorization shall be reviewed at least **every twelve months.** Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is effective as defined by at least a 50% decrease in frequency of HAE attacks subsequent to start of therapy, significant improvement/stability in severity and duration of attacks, and clinical documentation of functional improvement/stability.

Takhzyro (lanadelumab-flyo)	Initial authorization: Takhzyro (lanadelumab-flyo) may be authorized in quantities up to 300 mg every two weeks, for a total of 600 mg (two of the 300mg/2ml vials) every 28 days for the first twelve months of treatment. Reauthorization: Authorizations shall be reviewed at least **every twelve months.** Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is effective as defined by at least a 50% decrease in frequency of HAE attacks subsequent to start of therapy, significant improvement/stability in severity and duration of attacks, and clinical documentation of functional improvement/stability. Maintenance: After the initial authorization, Takhzyro (lanadelumab-flyo) may be authorized in the following quantities: **a.** Up to 300 mg every four weeks, for a total of 300 mg (one of the 300mg/2ml vials) every 28 days. **OR** **b.** Up to 300 mg every two weeks, for a total of 600 mg (two of the 300mg/2ml vials) every 28 days if clinical documentation is provided that demonstrates the patient has continued to experience HAE attacks, defined as ≥1 attack over the last 6 months, while compliant on stable Takhzyro (lanadelumab-flyo) therapy.
Orladeyo (berotralstat)	Orladeyo (berotralstat) may be authorized in quantities of up to 28 tablets every 28 days. Reauthorization: Authorization shall be reviewed at least **every twelve months.** Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is effective as defined by at least a 50% decrease in frequency of HAE attacks subsequent to start of therapy, significant improvement/stability in severity and duration of attacks, and clinical documentation of functional improvement/stability.

IV. Investigational Uses

A. Combination use of acute treatments for HAE (icatibant [generic, Firazyr, Sajazir], Kalbitor, Ruconest, or Berinert) is considered investigational.

B. Combination use of prophylactic treatments for HAE (Haegarda, Cinryze, Takhzyro, Orladeyo) is considered investigational.

C. Unless other specified, medications included in this policy are considered investigational when used for all other conditions, due to lack of published data, lack of high quality data, or lack of positive data, including for doses in excess of those listed in Section III, Table 1 (above). Details of select investigational uses are listed below in Table 2.

Table 2. Investigational Uses

Acute Medications

Berinert (plasma-derived C1-INH)	1. Treatment of angioedema due to causes other than HAE, including but not limited to drug-induced angioedema, acquired angioedema, allergic angioedema, and idiopathic angioedema. 2. The prophylaxis of HAE attacks.
Kalbitor (ecallantide)	1. Treatment of angioedema due to causes other than HAE or AAE, including but not limited to drug-induced angioedema, allergic angioedema, and idiopathic angioedema. 2. The prophylaxis of HAE or AAE attacks.
Icatibant (generic, Firazyr, Sajazir)	1. Treatment of angioedema due to causes other than HAE, including but not limited to drug-induced angioedema, acquired angioedema, allergic angioedema, and idiopathic angioedema. 2. Angiotensin converting enzyme inhibitor induced angioedema. 3. Prophylaxis of HAE or AAE attacks. 4. Osteoarthritis. 5. Ischemic heart disease.
Ruconest (recombinant human C1-INH)	1. Treatment of angioedema due to causes other than HAE, including but not limited to drug-induced angioedema, acquired angioedema, allergic angioedema, and idiopathic angioedema. 2. The prophylaxis of HAE attacks.

Prophylactic Medications

Cinryze (plasma-derived C1-INH)	1. Angioedema due to causes other than HAE, including but not limited to drug-induced angioedema, acquired angioedema, HAE-nl-C1INH, allergic angioedema, and idiopathic angioedema. 2. Myocardial infarction. 3. Sepsis. 4. Treatment of graft rejection. 5. Prevention of transplant rejection. 6. Stroke.

Haegarda (plasma-derived C1-INH)	1. Angioedema due to causes other than HAE, including but not limited to drug-induced angioedema, acquired angioedema, HAE-nl-C1INH, allergic angioedema, and idiopathic angioedema. 2. Myocardial infarction. 3. Sepsis. 4. Treatment of graft rejection. 5. Prevention of transplant rejection. 6. Stroke.
Takhzyro (lanadelumab-flyo)	1. Angioedema due to causes other than HAE, including but not limited to drug-induced angioedema, acquired angioedema, HAE-nl-C1INH, allergic angioedema, and idiopathic angioedema.
Orladeyo (berotralstat)	1. Angioedema due to causes other than HAE, including but not limited to drug-induced angioedema, acquired angioedema, HAE-nl-C1INH, allergic angioedema, and idiopathic angioedema.

Position Statement

Summary

- HAE is a rare and potentially life-threatening genetic blood disease characterized by inadequate or non-functional C1-INH proteins in the blood. C1-INH protein is a normal component of blood that helps regulate the inflammatory and clotting systems.
- The intent of the policy is to allow for coverage of HAE therapies for the specific diagnoses for which they have been studied when managed by a specialist (as outlined in the coverage criteria), and to limit coverage to doses studied and shown to be safe and effective in clinical trials.
- HAE is diagnosed with clinical presentation, family history and low serum levels of C4 and C1-INH antigenic proteins. HAE with normal levels of C1INH (HAE-nl-C1INH), formerly known as Type III HAE, is suspected in patients with HAE clinical presentation, but levels of C1-INH and C4 are normal, family history is present and serum C1q is also normal. If acquired angioedema (AAE) is suspected due to lack of family history or late onset of symptoms (age over 40 years), C1q antigenic protein testing is used to rule out AAE. Serum C1q level is low in patients with AAE but normal in patients with HAE.[1]
- The symptoms of HAE attacks vary in location and severity. They are highly unpredictable even within the same individual. Symptoms can range from swelling in the extremities or gastrointestinal tract to cases involving the face and throat which are less frequent but could be life threatening.
- Treatment strategies for HAE include long-term prevention, short-term prevention, and on-demand treatment for acute HAE attacks. Medications used in HAE management (other than oral medications) are associated with high healthcare costs.
- Berinert, icatibant (generic, Firazyr, Sajazir), Kalbitor (ecallantide), and Ruconest are FDA-approved for the on-demand treatment of HAE attacks. However, unlike other on-demand treatment options, the effectiveness of Ruconest for the treatment of laryngeal

attacks has not been established. Generic icatibant is the lowest cost of all available options. [2]

- Cinryze, Haegarda, Takhzyro (lanadelumab-flyo), and Orladeyo (berotralstat) are FDA approved for the prophylaxis of HAE attacks. Based on clinical trials, none of the products are superior in terms of safety or efficacy, however, Haegarda and Takhzyro (lanadelumab-flyo) are the lowest costs. Haegarda, lanadelumab, and berotralstat may be self-administered.
- For acute attacks, it is recommended that treatment be initiated as early as possible. Treatment options include Berinert, Kalbitor (ecallantide), icatibant (generic, Firazyr, Sajazir) and Ruconest. There were no preferences given to these acute treatment options.[3]
- Patients with frequent attacks, attacks involving swelling of the face or throat, or incapacitating gastrointestinal attacks may benefit from long-term preventive therapy.
- Patients who are not on long-term preventive therapy that are undergoing surgical or dental procedures may benefit from short-term preventive therapy.
- Strategies in managing HAE should be focused on avoiding or treating triggers, patient's quality of life, and availability of health care resources.
- The World Allergy Organization/European Academy of Allergy and Clinical Immunology (WAO/EAACI), the United States Hereditary Angioedema Associate Medical Advisory Board (US HAEA) and the International/Canadian Hereditary Angioedema guidelines all recommend C1-INH as first line long-term prophylaxis over attenuated androgens, along with the management of potential triggers.[1 4-6].
- HAE-nl-C1INH (formerly known as Type III HAE), is a rare disorder similar to HAE types I and II but is characterized by normal levels of C1-INH, family history and later onset. Treatment options are limited in HAAE-nl-C1INH as no FDA-approved therapies exist and treatment is extrapolated from HAE type I and II treatment.[1]
- Guidelines currently only recommend acute treatment for HAE-nl-C1INH, as evidence for prophylactic treatment is lacking.
- AAE is a rare disorder similar to HAE, as characterized by recurrent episodes of swelling and a deficiency of C1-INH, although AAE develops in older patients and is often associated with lymphoproliferative disorders.[7-9]
- Treatment options for the management of AAE are limited. There are no FDA-approved therapies for AAE and treatment is extrapolated from that of HAE. While no controlled studies have been performed in patients with AAE, observational data from case studies has demonstrated that Kalbitor (ecallantide), icatibant (generic, Firazyr, Sajazir), Berinert (plasma-derived C1-INH), and Ruconest (recombinant human C1-INH) were successfully used to treat AAE attacks. Expert consensus recommendations include these agents for the treatment of AAE. Additionally, management of the underlying lymphoproliferative disorder may control angioedema symptoms.[8-10]
- Given the high cost of medications for the treatment of HAE and AAE, confirmation of efficacy and that current medical necessity criteria are met is required.

Guidelines[1 2 4-6]

- WAO/EAACI and AAAAI guidelines recommend that HAE attacks be treated as early as possible, and that all attacks including those caused by HAE-nl-C1INH and acquired angioedema be considered for on-demand treatment. There is no recommendation on the specific agent used for on-demand therapy.
- WAO/EAACI, US HAEA or the International/Canadian guidelines do not specifically recommend when to initiate prophylaxis as the decision should reflect the disease activity, patient's quality of life, and availability of heath care resources. As such patients should be evaluated for long term prophylaxis once per year.
- In these most recent guidelines, C1-INH medications are recommended as first line therapy for long-term prophylaxis in HAE Types 1 and 2, with attenuated androgens and fibrinolytics recommended as second and third line, respectively.
- Guidelines do not recommend one long term C1-INH prophylaxis agent over the other, therefore Haegarda (plasma derived C1-INH) and Takhzyro (lanadelumab-flyo) are the most cost-effective options. There is insufficient evidence on prophylactic treatment in patients with HAE-nl-C1INH and acquired angioedema, as such use in these patient populations is considered investigational.

Diagnosis[1 2 11 12]

- HAE is diagnosed with clinical presentation, family history, and low serum levels of C4 and C1-INH antigenic proteins (for Type I and Type II only). HAE with normal C1-INH levels (HAE-nl-C1INH)(formerly called Type III) is a subset of rare HAE that largely resembles Type 1 or 2 HAE and may be caused by multiple mutations. However, in many patients with HAE-nl-C1INH, no gene mutation can be found, and the diagnosis is based on family history, normal levels of C4, C-1 INH antigen and function, and normal levels of C1q protein. . Due to normal levels of C1-INH, use of C1INH replacement therapy for long term prophylaxis is controversial, not recommended by guidelines, and evidence of efficacy is anecdotal.
- If acquired angioedema (AAE) is suspected due to lack of family history or late onset of symptoms (age over 40 years), C1q antigenic protein testing is used to rule out AAE. Serum C1q level is low in patients with AAE but normal in patients with HAE.

Clinical Efficacy – Acute Treatments[1 5 8]

- Berinert, Ruconest, icatibant (generic, Firazyr, Sajazir), and Kalbitor (ecallantide) have all demonstrated efficacy in the treatment of acute attacks of HAE. While the body of evidence is generally considered low quality evidence, the products have demonstrated an overall improvement in symptoms following an HAE attack.
- However, the evidence for efficacy of Ruconest contains several notable limitations.
    * Based on a subgroup analysis of the phase 3 trials, there appeared to be decreased efficacy in women and patients located in the United States. While the reason for the difference in treatment effect is unknown, there is uncertainty regarding the clinical effect of Ruconest.
    * Additionally, the effectiveness of Ruconest for the treatment of laryngeal attacks has not been established.

- There are no head-to-head studies comparing treatments for acute HAE attacks.
- The treatment effect of on-demand therapies in HAE-nl-C1INH, (formerly Type III HAE), is uncertain; however, due to the possible influence of bradykinin in some of these patients, Kalbitor (ecallantide) and icatibant (generic, Firazyr, Sajazir) are among the possible treatment options.

Clinical Efficacy – Haegarda[13]

- Approval for Haegarda (pdC1-INH) was based on the COMPACT study, which was a phase 3 randomized, double-blind, placebo-controlled, cross-over study. The study evaluated two doses of Haegarda, but the FDA approved dose is 60 IU/kg.
    * Patients received twice weekly injections of either placebo or weight-based Haegarda (pdC1-INH).
    * Patients included in the study had a history of at least four HAE attacks in the over a 2-month period within 3 months of screening. Attacks must have required immediate treatment, medical attention, or caused significant functional impairment.
    * Patients were permitted to continue oral prophylaxis, but dose changes were not allowed during the study period.
    * Haegarda (pdC1-INH) 60 IU/kg reduced the median number of HAE attacks by 95% compared to placebo. The mean number of attacks per month was 0.52 in the Haegarda (pdC1-INH) period compared to 4.03 during the placebo period. Use of rescue medication was also significantly lower while patients received Haegarda (pdC1-INH).
    * A lower dose of 30 IU/kg was also found to be effective versus placebo but was less effective than the 60 IU/kg dose.
- There are no studies to date evaluating the efficacy of Haegarda (pdC1-INH) compared to other standard treatments for prevention of HAE attacks; however, the COMPACT study included patients who received concomitant attenuated androgens.
- No comparative studies have been performed between attenuated androgens and either Haegarda (pdC1-INH) or Cinryze (pdC1-INH).

Clinical Efficacy – Cinryze[14]

- FDA approval for Cinryze was based on one clinical trial in HAE attack prevention. The study was a prospective, randomized, double-blinded, placebo-controlled multi-center crossover study with 22 HAE patients aged ≥ 6 years of age (range 9 to 73 years) for a 24-week period (12-week placebo and 12-week C1-INH).
    * Patients received twice weekly injections of either placebo or 1,000 units of C1-INH.
    * Patients included in the study had a history of at least two HAE attacks per month. Inclusion was not dependent on the severity of attack.
    * Patients were permitted to continue current medications, but dose changes to androgen or aminocaproic acid were not allowed during the study or 30-days prior to the study.

    * Cinryze (pdC1-INH) reduced the number of HAE attacks by 52% (primary endpoint), the severity of HAE attacks by 32% and duration of swelling by 66% (secondary endpoints). All values were statistically significant.
    * Only half of study patients responded with a 50% or greater reduction in frequency of HAE attacks.
- No comparative studies have been performed between attenuated androgens and Cinryze (pdC1-INH).

Clinical Efficacy – Lanadelumab[15-17]

- FDA approval for lanadelumab was based on one randomized phase 3, double-blind, placebo-controlled trial; the HELP trial. The study evaluated various dosing regimens of lanadelumab. The FDA approved dose of 300 mg every 2 weeks was evaluated for prophylaxis of HAE attacks.
    * Patients included in the study had a history of at least one HAE attacks per 4 weeks.
    * Patients were not permitted to continue current prophylactic medications
    * Treatment with lanadelumab 300 mg subcutaneously every 2 weeks significantly reduced the number of attacks versus placebo (0.257 attacks vs. 1.967, respectively; $p < 0.001$).
    * Treatment with lanadelumab 300 mg subcutaneously every 4 weeks significantly reduced the number of attacks versus placebo (0.526 attacks vs. 1.967, respectively; $p < 0.001$).
    * Treatment with lanadelumab 150 mg subcutaneously every 4 weeks significantly reduced the number of attacks versus placebo (0.480 attacks vs. 1.967, respectively; $p < 0.001$).
    * Additionally, the lanadelumab group had less rescue medication use and a lower number of moderate to severe HAE attacks compared to the placebo-group.
- In patients with no HAE attacks in the past 6-months while on lanadelumab, a dose reduction to 300mg every 4 weeks has been shown to be safe and effective.
- No comparative studies have been performed between attenuated androgens, C1-INH, and lanadelumab.
- Doses higher than 300 mg every 2 weeks were not studied during clinical trials.
- There are no trials of Takhzyro (lanadelumab) used in combination with Haegarda (C1-INH) or any other HAE prophylactic agent; therefore, use of Takhzyro (lanadelumab) in combination with any other HAE prophylactic agent is considered investigational.

Clinical Efficacy – Berotralstat[18]

- FDA approval for berotralstat was based a single phase 3, multicenter, randomized, double-blind, placebo-controlled trial; the APEX-2 trial. The study evaluated two doses of berotralstat.
    * Patients included in the study had a history of at least one HAE attacks per 4 weeks (≥2 investigator confirmed HAE attacks in the 56-day run-in period).

    * Patients were not permitted to continue current prophylactic medications
    * Treatment with berotralstat 110 mg by mouth every day significantly reduced the monthly rate of attacks versus placebo (1.65 attacks vs. 2.35, respectively; p = 0.024).
    * Treatment with berotralstat 150 mg by mouth every day significantly reduced the monthly rate of attacks versus placebo (1.31 attacks vs. 2.35, respectively; p < 0.001).
    * Additionally, the berotralstat groups had less rescue medication use compared to the placebo-group.
- No comparative studies have been performed between attenuated androgens, C1-INH, lanadelumab and berotralstat.
- Doses higher than 150 mg every day were not studied during clinical trials.

Investigational Uses

- C1-INH is currently being studied in a variety of other conditions including angioedema due to causes other than HAE, myocardial infarction, and sepsis; however, due to lack of published data, it is considered investigational in these conditions.
- Icatibant (generic, Firazyr, Sajazir) is currently being studied in a variety of other conditions including angioedema due to causes other than HAE, prevention of HAE attacks, osteoarthritis, and ischemic heart disease; however, due to lack of published data, it is considered investigational in these conditions.

Safety

- The most common adverse reactions with Berinert are injection site nausea, headache, dysgeusia, abdominal pain, and vomiting. Other rare but serious adverse events include hypersensitivity and thromboembolic events. There is also a risk for the transmission of infectious agents (e.g. viruses) because Berinert is derived from human blood.[19]
- The most common adverse reactions with Ruconest are headache, nausea, and diarrhea. Other rare but serious adverse events include hypersensitivity and thromboembolic events.[20]
- The most common adverse reactions with icatibant (generic, Firazyr, Sajazir) are injection site reactions (97%), such as erythema (redness of skin) and swelling. Other common adverse reactions (> 1%) included pyrexia, increased liver enzymes, dizziness, and rash.[21 22]
- Kalbitor (ecallantide) is given subcutaneously and carries a boxed warning for anaphylactic reactions (3.9%). Due to the risk of anaphylaxis Kalbitor (ecallantide) should only be administered by a healthcare professional with appropriate medical support to manage anaphylaxis and hereditary angioedema.[23]
- The most common adverse reactions with Kalbitor (ecallantide) are headache, nausea, diarrhea, pyrexia, injection site reactions, and nasopharyngitis.[23]
- The most common adverse events reported with plasma-derived Haegarda include injection site reactions, hypersensitivity, nasopharyngitis, and dizziness. Of the injections site reactions reported in clinical trials, 95% were of mild intensity and 83% resolved within one day of onset.[24]

- The most common side effects experienced during lanadelumab clinical trials included injection site reactions, rash, dizziness, upper respiratory infections, headache, diarrhea and myalgia.[17]
- The most common side effects experienced during berotralstat clinical trials included upper respiratory tract infection, abdominal pain, diarrhea, headache, and back pain.[25]
- Plasma-derived C1-INH replacement therapy has a long history of use without evidence of drug interactions or immunogenicity. No cases of pathogen transmission have been reported.[2]

Appendix 1: Oral Prophylactic Medications for Hereditary Angioedema[3 26 27]

Drug	Usual Adult Dose	Dosage Range	FDA Approved for HAE
danazol (Danocrine)	200 mg/day	100 mg every 3 days – 600 mg/day	Yes
stanozolol (Winstrol)	2 mg/day	1 mg every 3 days – 6 mg/day	Yes
oxandrolone (Oxandrin)	10 mg/day	2.5 mg every 3 days – 20 mg/day	No
epsilon aminocaproic acid (Amicar)	2 g three times/day	1 g twice/day – 4 g three times/day	No
tranexamic acid (Lysteda)	20-50 mg/kg/day	3-6 g/day maximum	No

Appendix 2: FDA-Approved, HAE-specific Medications			
Drug	**Indication**	**Usual Dose and Route**	**Approved for Self-Administration**
Kalbitor (ecallantide)[23]	Treatment of acute attacks of HAE	30 mg injected subcutaneously in three 10 mg injections	No
icatibant (generic, Firazyr, Sajazir)[21 22]	Treatment of acute attacks of HAE	30 mg injected subcutaneously to the abdominal area	Yes
Berinert (pdC1-INH)[19]	Treatment of acute attacks of HAE	20 IU per kg injected intravenously	Yes
Ruconest (rhC1-INH)[20]	Treatment of acute attacks of HAE Limitation of Use: Effectiveness was not established in HAE patients with laryngeal attacks	50 IU per kg injected intravenously; Max dose 4200 IU	Yes
Cinryze (IV plasma derived C1-INH)[14]	Routine prophylaxis to prevent HAE attacks	1000 U IV twice weekly (every 3 to 4 days)	Yes
Haegarda (SC plasma-derived C1-INH) [24]	Routine prophylaxis to prevent HAE attacks	60 IU/kg SC twice weekly (every 3 to 4 days)	Yes
Takhzyro (lanadelumab-flyo)[17]	Routine prophylaxis to prevent HAE attacks	300mg SC every two weeks	Yes
Orladeyo (berotralstat) [25]	Routine prophylaxis to prevent HAE attacks	150mg PO daily	Yes

Codes	Number	Description
HCPCS	J1290	Injection, ecallantide (Kalbitor), 1 mg
HCPCS	J0597	Injection, c-1 esterase inhibitor (human), Berinert, 10 units
HCPCS	J0598	Injection, c-1 esterase inhibitor (human), Cinryze, 10 units
HCPCS	J0596	Injection, c1 esterase inhibitor (recombinant), Ruconest, 10 unit

Revision History

Revision Date	Revision Summary
6/20/2024	Added Cinryze (plasma-derived C1-INH) to site of care (SOC) program (effective 10/1/2024).
12/7/2023	• Updated reauthorization time frame to 12 months for all HAE medications in this policy.
12/9/2022	• Added Sajazir (icatibant), newly approved medication, to the policy. • Added step therapy requirement with Berinert (plasma-derived C1-INH) to Ruconest (recombinant human C1-INH) for acute HAE treatment. • Removed step through attenuated androgens/antifibrinolytics for prophylactic HAE treatments. • Clarified HAE-nl-C1INH (formerly Type III HAE) diagnosis and treatment, with prophylactic treatment considered investigational.
1/20/2021	• Added Orladeyo (berotralstat), a newly-approved medication, to the policy. • Added generic icatibant step therapy requirement for all acute HAE therapies. • Removed Haegarda step therapy requirement for Takhzyro (lanadelumab-flyo). • Clarified reauthorization criteria and quantity limits for maintenance Takhzyro (lanadelumab-flyo) therapy.
1/22/2020	• Added step therapy requirement with generic icatibant to brand Firazyr (icatibant). • Added continuation of therapy (COT) criteria (no change to intent of coverage criteria).
1/31/2019	No criteria changes with this annual update.
11/16/18	Added Takhzyro (lanadelumab-flyo), a newly-approved medication, to the policy (effective January 1, 2019).
2/19/2018	• New policy (effective July 1, 2018): All existing HAE policies have been combined into a single policy, with no overall change to the intent of coverage criteria. • Added a criterion clarifying that multiple treatments for acute attacks of HAE should not be used concurrently. • Extended the authorization period to 6 months from 3 months for all medications.

Medication Policy Manual **Policy No:** dru538

Topic: Monoclonal antibodies for asthma and other immune conditions

- Cinqair, reslizumab
- Fasenra, benralizumab
- Nucala, mepolizumab
- Tezspire, tezepelumab-ekko
- Xolair, omalizumab

Date of Origin: April 1, 2018

Committee Approval Date: June 20, 2024 **Next Review Date:** 2025

Effective Date: September 1, 2024

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Medications included in this policy are monoclonal antibodies that target specific proteins to treat several immune diseases such as severe asthma and chronic idiopathic urticaria. Administration is via subcutaneous (SC) or intravenous (IV) injection.

Policy/Criteria

Most contracts require pre-authorization approval of monoclonal antibodies for asthma and other immune conditions prior to coverage.

I. Continuation of therapy (COT): Monoclonal antibodies for asthma and other immune conditions may be considered medically necessary for COT when criteria A **AND** B below are met.

A. One of the following (1, 2, or 3):

1. For diagnoses NOT listed in the coverage criteria below, criteria a and b must be met:

a. The patient was established on therapy prior to current health plan membership AND there is documentation that the medication was covered by another health plan. Examples of documentation include the coverage approval letter from the previous health plan or paid claim.

AND

b. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

2. For diagnoses listed in the coverage criteria below, criteria a and b must be met:

a. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

b. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

3. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

AND

B. For provider-administered medications: site of care administration requirements are met [refer to Medication Policy Manual, Site of Care Review, dru408].

***Please note**: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve) patients: Monoclonal antibodies for asthma and other immune conditions may be considered medically necessary when criteria A and B below are met.

A. One of the following diagnostic criteria 1 through 6 below are met.

1. Asthma:

Fasenra (benralizumab), Nucala (mepolizumab), Cinqair (reslizumab), or Xolair (omalizumab), or Tezspire (tezepelumab-ekko) may be considered medically necessary for severe asthma when there is clinical documentation (including, but not limited to chart notes) that criteria a through e below are met.

a. Patient is currently followed by an asthma specialist (allergist, immunologist, or pulmonologist).

AND

b. Adherent use of maximally tolerated inhaled corticosteroids (ICS) and long-acting inhaled beta-2 agonist (LABA) therapy (see *Appendices 1 and 2*) has been ineffective as defined by at least one of the following markers of uncontrolled asthma within the previous 12 months (as defined in criterion i, ii, or iii below):

i. Treatment with a course of oral corticosteroids (e.g., steroid bursts).

OR

ii. An emergency department (ED) visit or hospitalization.

OR

iii. There is clinical documentation of poor asthma control as demonstrated by limitation of activities of daily living (ADLs), nighttime awakening, or dyspnea.

AND

c. An evaluation has been performed to assess for underlying conditions or triggers for asthma or pulmonary disease. If identified, a documented plan is in place to address these.

AND

d. ***[*For *Fasenra (benralizumab), Nucala (mepolizumab), and Cinqair (reslizumab) only]*:** A blood eosinophil count of at least 150 cells/µL in the past 12 months.

AND

e. ***[For Xolair (omalizumab) only]*:** A diagnosis of **severe extrinsic (allergic) asthma** and criteria i and ii below are met:

i. Positive skin prick test or in-vitro specific IgE test (such as RAST, MAST, FAST, ELISA) to one or more allergens, (or is currently receiving specific immunotherapy like allergy shots) which support the patient's clinical history.

AND

ii. Total serum IgE level is one of the following (1 or 2 below):

1) For patients ≥12 years of age: 30 to 700 IU/ml

OR

2) For patients age 6 to <12 years of age, based on weight, as follows in a) to g) below:

a) >90 to 150 kg: 30 to 300 IU/ml.

b) >70 to 90 kg: 30 to 500 IU/ml.

c) >60 to 70 kg: 30 to 600 IU/ml.

d) >50 to 60 kg: 30 to 700 IU/ml.

e) >40 to 50 kg: 30 to 900 IU/ml.

f) >30 to 40 kg: 30 to 1,100 IU/ml.

g) 20 to 30 kg: 30 to 1,300 IU/ml.

OR

2. Chronic idiopathic/Spontaneous Urticaria (CIU/CSU):

Xolair (omalizumab) may be considered medically necessary for CIU/CSU when there is clinical documentation (including, but not limited to chart notes) that all criteria a through e below are met.

a. Specialist evaluation: Patient has been evaluated by and is currently followed by a specialist (allergist, immunologist, pulmonologist, dermatologist).

AND

b. A diagnosis of chronic idiopathic/spontaneous urticaria and current urticarial flares as supported by i and ii below:

i. Documentation of spontaneous flares: Spontaneous urticarial flares, despite avoidance of triggers (in the absence of potential triggers).

PLEASE NOTE: Urticarial flares may also occur in the presence of a trigger ("inducible urticaria"). However, patients may have a mixed diagnosis of CSU/CIU, along with inducible urticaria. The intent of this criterion is for documentation of spontaneous flares, in the absence of a trigger.

AND

ii. Comprehensive evaluation: An evaluation has been performed to rule out other causes of urticaria and identify potential triggers, and a trigger management plan is in place, if applicable.

AND

c. Trigger avoidance: Underlying conditions or identified triggers for urticaria are being maximally managed, including a trigger avoidance management plan for any identified triggers to reduce flares.

AND

d. Documented functional impairment due to poor urticaria control or exacerbations, which may include (but is not limited to) documentation of limitation of activities of daily living (ADLs), such as missing school or work or insomnia due to itching.

AND

e. Maximal antihistamine step therapy: The patient is compliant with H1 antihistamines (see *Appendix 3*) at the maximally tolerated doses consistent with current guidelines, unless contraindicated.

PLEASE NOTE: Clinical documentation of initial urticaria workup, as well as subsequent visits, should be submitted for review.

OR

3. Eosinophilic Granulomatosis with Polyangiitis (EGPA, formerly known as Churg-Strauss Syndrome):

Nucala (mepolizumab) may be considered medically necessary for EGPA when there is clinical documentation (including, but not limited to chart notes) that criteria a, b, and c below are met.

a. A specialist (allergist, immunologist, pulmonologist, or rheumatologist) has established the diagnosis and is currently following the patient.

AND

b. The patient has a diagnosis of EGPA confirmed by either criterion i or ii below:

i. The patient meets **at least four** of the six criteria (1 to 6) below:

1) History of asthma (wheezing or the finding of diffusion high-pitched wheezes in expiration).

2) Blood eosinophil count of greater than 10% (% EOS) on differential white blood count (diff WBC).

3) Peripheral neuropathy.

4) Migratory or transient pulmonary opacities detected radiographically (such as on chest X-ray; CXR).

5) Paranasal sinus abnormality.

6) Blood vessel biopsy (such as artery, arteriole, or venule) with extravascular eosinophils.

OR

ii. The patient meets ALL of the following criteria 1, 2, and 3 below:

1) Medical history of asthma.

AND

2) Peak blood eosinophil count of greater than 1500 cells/microliter.

AND

3) Systematic vasculitis involving two or more extra-pulmonary organs.

AND

c. The patient has a history of EGPA for at least 6 months with a history of relapsing or refractory disease and criteria i and ii below are met.

i. Currently on maximally tolerated oral corticosteroid within the past 90 days, unless not tolerated or contraindicated.

AND

ii. Treatment with an oral DMARD (such as azathioprine or methotrexate) in the past 90 days has been ineffective, not tolerated, or all oral DMARDs are contraindicated.

OR

4. Hypereosinophilic Syndrome (HES):

Nucala (mepolizumab) may be considered medically necessary for HES when there is clinical documentation (including, but not limited to chart notes) that criteria a, b, and c below are met.

a. A specialist (allergist, dermatologist, immunologist, hematologist, neurologist, or pulmonologist) has established the diagnosis and is currently following the patient.

AND

b. The patient has a diagnosis of HES and criteria i and ii below are met.

i. FIP1L1-PDGFRA–negative.

AND

ii. Peak blood eosinophil count of greater than 1000 cells/microliter.

AND

c. The patient has a history of flares and criteria i and ii below are met.

i. Treatment with an adequate course (at least four weeks) of oral corticosteroids within the past 6 months, unless not tolerated or contraindicated.

AND

ii. Persistent HES symptoms despite adequate treatment (at least four weeks) with a steroid-sparing therapy (as listed in Appendix 4) within the past 6 months has been ineffective, not tolerated, or all are contraindicated.

OR

5. Nasal Polyps:

Xolair (omalizumab) or Nucala (mepolizumab) may be considered medically necessary for nasal polyps when there is clinical documentation (including, but not limited to chart notes) that criteria a through f below are met.

a. The diagnosis has been established by a specialist in allergy, immunology, or otolaryngology.

AND

b. Documented recurrent, persistent, and/or current symptomatic nasal polyps, defined as meeting one of the following (i or ii) below:

i. The nasal polyps are currently documented as bilateral.

OR

ii. A history of recurrent bilateral nasal polyps, requiring more than one nasal polypectomy.

AND

c. Persistent symptomatic nasal polyps despite maximal medical treatment with both of the following (i and ii), unless ineffective, contraindicated, or not tolerated:

i. A corticosteroid used intranasally (INCS) for at least 12 weeks, as documented by detailed chart notes, including but not limited to a non-prescription INCS, INCS eluding stent) or pharmacy claims (for prescriptions INCS).

AND

ii. At least one 5-to-14-day course of oral corticosteroids in the past two years.

AND

d. There is a treatment plan for use in combination with an intranasal corticosteroid.

AND

e. Documented functional impairment due to CRSwNP, including but not limited to poor sleep quality, loss of smell, symptomatic nasal obstruction, and/or facial pain.

AND

f. **For Xolair (omalizumab) only:** Total serum IgE level is between 30 IU/ml and 1500 IU/ml.

OR

6. IgE-mediated food allergy:

Xolair (omalizumab) may be considered medically necessary for IgE-mediated food allergy when there is clinical documentation (including, but not limited to chart notes) that criteria a. through e. below are met:

a. Multiple confirmed allergies: A diagnosis of an IgE-mediated food allergy to peanut **and** *at least* one other food allergy, confirmed by a positive result of at least one of the following (i., ii, and/or iii):

i. A skin prick test (SPT) to the offending food allergens.

OR

ii. A food-specific IgE test to the specific offending food allergens.

OR

iii. A oral food challenge to the offending food allergens.

AND

b. Age: The patient is 1-17 years old at the start of Xolair (omalizumab) therapy.

AND

c. Specialist: Xolair (omalizumab) is prescribed by an allergist or immunologist.

AND

d. Severity: Documentation of at least one significant allergic reaction to all of the offending food allergens, defined as meeting all of the following criteria (i., ii., and iii.):

i. The reaction was a significant *systemic* allergic reaction with documented symptoms including, but not limited to, hives, swelling, wheezing, hypotension, gastrointestinal symptoms, and/or anaphylaxis.

AND

ii. The reaction occurred within a short time frame (up to 2 hours) following ingestion of the offending food allergen.

AND

iii. The reaction prompted a medical intervention (including, but not limited to, the use of an epinephrine rescue device, a visit to the emergency department or urgent care, or hospitalization).

AND

e. Ongoing avoidance: There is a treatment plan for use in conjunction with ongoing food allergen avoidance.

AND

B. **For provider-administered medications** (per *Table 1*): Site of care administration requirements are met [refer to Medication Policy Manual, Site of Care Review, dru408].

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers products in this policy covered per the administration and benefits as detailed in *Table 1*:

Table 1. Provider- versus Self-administered Products

Provider-Administered Product Pharmacy Services considers the following under the medical benefit (as provider-administered medications):	**Coverable Self-Administered Alternatives** Pharmacy Services considers the following coverable under the pharmacy benefit (as self-administered medications):
- Fasenra (benralizumab) PFS	- Fasenra (benralizumab) autoinjector
- Nucala (mepolizumab) vials - Nucala (mepolizumab) PFS [a]	- Nucala (mepolizumab) autoinjector - Nucala (mepolizumab) PFS [a]
- Xolair (omalizumab) vials - Xolair (omalizumab) PFS [a]	- Xolair (omalizumab) PFS [a] - Xolair (omalizumab) autoinjector
- Cinqair (reslizumab) vials	- Fasenra (benralizumab) autoinjector - Nucala (mepolizumab) autoinjector - Nucala (mepolizumab) PFS[a]
- Tezspire (tezepelumab-ekko) vials - Tezspire (tezepelumab-ekko) PFS	- Tezspire (tezepelumab-ekko) single-use autoinjector

[a] Pharmacy Services considers this product coverable under the pharmacy benefit (as a self-administered medication) **OR** coverable under the medical benefit (as a provider-administered medication).
PFS = pre-filled syringe

B. When pre-authorization is approved, each drug will be covered in the following quantities and for the following authorization periods outlined in *Table 2*.

TABLE 2. Authorization Limits

Product	**Authorization Limits**
Cinqair (reslizumab)	**Severe eosinophilic asthma:** - Up to 3 mg/kg every 28 days. - Authorization **may** be reviewed at least every 12 months to confirm that current medical necessity criteria are met and the medication is effective, defined as sustained clinical improvement from reduced asthma symptoms (such as reduced missed days from work or school) or stable asthma control.
Fasenra (benralizumab)	**Severe eosinophilic asthma:** 12 years of age and older: Up to 8 doses (30mg/ml PFS or 30mg/ml autoinjector; dosage form per *Table 1*) in a 52-week period, based on recommended initial dosing of 30 mg every 4 weeks for 3 doses, followed by 30 mg every 8 weeks. 6 years to 11 years of age: - Weighing less than 35 kg: Up to 8 doses (10mg/ml PFS) in a 52-week period, based on recommended initial dosing of 10mg every 4 weeks for 3 doses, followed by 10mg every 8 weeks.

Product	Authorization Limits
	- Weighing 35 kg or more: Up to 8 doses (30mg/ml PFS or 30mg/ml autoinjector; dosage form per *Table 1*) in a 52-week period, based on recommended initial dosing of 30mg every 4 weeks for 3 doses, followed by 30mg every 8 weeks. Authorization **may** be reviewed at least every 12 months to confirm that current medical necessity criteria are met and the medication is effective, defined as sustained clinical improvement from reduced asthma symptoms (such as reduced missed days from work or school) or stable asthma control.
Nucala (mepolizumab)	**Severe eosinophilic asthma:** - Up to 100 mg (one vial, PFS, or autoinjector; dosage form per *Table 1*) every 28 days. - Authorization **may** be reviewed at least every 12 months to confirm that current medical necessity criteria are met and the medication is effective, defined as sustained clinical improvement from reduced asthma symptoms (such as reduced missed days from work or school) or stable asthma control. **Eosinophilic Granulomatosis with Polyangiitis (EGPA) or Hypereosinophilic Syndrome (HES):** - Up to 300 mg (three – 100 mg vials, three – 100 mg PFS, or three – 100 mg autoinjectors; dosage form per *Table 1*) every 28 days for up to 12 months. - Authorization **shall** be reviewed at least every 12 months to confirm that current medical necessity criteria are met and the medication is effective, defined as disease stability, improvement, or decreased corticosteroid dose. **Nasal Polyps:** - Up to 100mg (one vial, PFS, or autoinjector every 28 days. - Reauthorization: Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, that there is ongoing INCS use, and that the medication is effective, defined as sustained clinical improvement from reduced symptoms from nasal polyps (such as improved sleep quality, sense of smell, reduction in nasal obstruction symptoms, and/or facial pain) or stable CRSwNP control. - Authorization **may** be reviewed at least every 12 months.
Tezspire (tezepelumab-ekko)	**Severe asthma:** - 210 mg (one vial, pre-filled syringe, or pen) every 28 days. - Authorization **may** be reviewed at least every 12 months to confirm that current medical necessity criteria are met and the medication is effective, defined as sustained clinical improvement from reduced asthma symptoms (such as reduced missed days from work or school) or stable asthma control.
Xolair (omalizumab)	**Severe extrinsic (allergic) asthma:** - Up to 375 mg every 14 days [375 mg dose supplied as up to three - single-dose 150 mg vials (total of 3 mL) OR two - 150 mg and one - 75 mg PFS or autoinjector (total of 2.5 mL) OR one - 300mg and one - 75mg PFS or autoinjector (total of 2.5 ml); dosage form per *Table 1*]. - Authorization **may** be reviewed at least every 12 months to confirm that current medical necessity criteria are met, and the medication is effective defined as sustained clinical improvement from reduced asthma/ symptoms (such as reduced missed days from work or school) or stable asthma control.

Product	Authorization Limits
	Chronic Idiopathic/ Spontaneous urticaria (CIU/CSU): - Initial Authorization: Up to 300 mg every 28 days [300 mg dose supplied as up to two - 150 mg single-dose vials OR two - 150 mg PFS or autoinjectors (total of 2 ml) OR one - 300mg PFS or autoinjector (total of 2 ml); dosage form per *Table 1*]. - Reauthorization: o Authorization **may** be reviewed at least every 12 months to confirm that current medical necessity criteria are met and the medication is effective defined as sustained clinical improvement from reduced urticaria symptoms (such as reduced missed days from work or school) or stable asthma control. o Doses of up to 600 mg every 28 days (such as 300 mg every 14 days) may be authorized on a case-by-case basis if documentation of objective measures supporting the need for more frequent dosing are provided, including documentation of partial response to starting dosing but incomplete urticaria control. **Nasal Polyps:** - Up to 600 mg every 14 days [600 mg dose supplied as up to four – single-dose 150 mg vials, PFS or autoinjectors (total of 4 mL) OR up to two – 300 mg PFS or autoinjectors (total of 4 ml); dosage form per *Table 1*]. - Reauthorization: Authorization **may** be reviewed at least every 12 months. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, that there is ongoing INCS use and that the medication is effective defined as sustained clinical improvement from reduced symptoms from nasal polyps (such as improved sleep quality or sense of smell, reduction in nasal obstruction symptoms and/or facial pain) or stable CRSwNP control. **IgE-Mediated Food Allergy:** - Initial authorization (6 months): up to 600mg every 14 days [600 mg dose supplied as up to two 300 mg PFS or autoinjectors (total of 4 ml) OR up to four 150 mg single-dose vials, PFS or autoinjectors (total of 4 ml); dosage form per *Table 1*]. - Reauthorization Authorization **SHALL** be reviewed at least every 12 months. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and BOTH of the following (1. and 2.): 1. That there is ongoing food allergen avoidance. 2. That the medication is effective, defined as a reduction in severe food allergens reactions requiring medical care. *This may include reduction the frequency and/or severity of allergic reactions to the offending food(s), AND a reduction in the need for additional medical care, such as rescue epinephrine (EpiPen) use, urgent care or emergency department visits, or hospitalizations.*

IV. Not Medically Necessary Uses

A. Respiratory monoclonal antibodies [as listed in *Table 1*, including, but not limited to, Xolair (omalizumab)] are considered not medically necessary when used for allergic rhinitis.

V. Investigational Uses

A. Combination use of any anti-IL-5, anti-IgE, anti TSLP, or anti IL-4 monoclonal antibodies in this and other policies (see *Cross References).*

B. Dose escalations (such as for partial or non-response) in excess of those listed in the "Quantity Limitations," *Table 2* (above) is considered investigational for any indication.

C. Unless otherwise specified in the coverage criteria above, medications included in this policy are considered investigational when used for all other conditions, due to lack of published data, lack of high-quality data, or lack of positive data. Details of select investigational uses are listed (in *Table 3*) below.

Table 3. Investigational Uses

Allergic bronchopulmonary aspergillosis (ABPA)	- There is insufficient evidence to establish the efficacy of monoclonal anti-IgE or anti-IL-5 antibodies for the treatment of ABPA. - The one small crossover trial (n=13) found a reduction in exacerbations over a 4-month period in ABPA patients with use of high-dose Xolair (omalizumab) (750 mg monthly) (p=0.048); however, the long-term clinical benefit is unknown. Additional research is needed to clarify the safety, efficacy, and optimal dosing of Xolair (omalizumab) for ABPA. [1]
Atopic dermatitis (AD)	- There is insufficient evidence to support the use of monoclonal anti-IgE or anti-IL-5 antibodies for atopic dermatitis. [2 3] - Nucala (mepolizumab) has been studied in atopic dermatitis, and no significant benefit was observed.
Chronic eosinophilic pneumonia (CEP)	- There is insufficient published evidence for the use of monoclonal anti-IgE or anti-IL-5 antibodies for the treatment of CEP. - In addition, no ongoing trials were identified for monoclonal anti-IgE or anti-IL-5 antibodies for the treatment of CEP. [4]
Chronic obstructive pulmonary disease (COPD)	- There is no reliable evidence to establish efficacy or safety of monoclonal anti-IgE, anti-IL-5, or anti-TSLP antibodies for the treatment of eosinophilic COPD. - Nucala (mepolizumab) was studied in two phase 3 trials evaluating annual COPD exacerbation rate; however, the benefit with Nucala (mepolizumab) was not consistently demonstrated in patients with eosinophilic COPD. Despite promising results of clinical trials, high-quality, long-term clinical trials are needed to confirm efficacy and safety of Nucala (mepolizumab) in this setting. [5] - Additional studies are ongoing for Fasenra (benralizumab) and Tezspire (tezepelumab-ekko). [4]

Table 3. Investigational Uses	
Eosinophilic esophagitis (EE)	- There is no reliable evidence to establish efficacy or safety of monoclonal anti-IgE or anti-IL-5 antibodies in the treatment of eosinophilic esophagitis. - One small trial found no benefit of Xolair (omalizumab) in patients with eosinophilic esophagitis. [6]
Eosinophilic granulomatosis with polyangiitis (EGPA) / allergic granulomatosis / Churg-Strauss syndrome	- Except as noted in the coverage criteria, the use of monoclonal anti-IgE or anti-IL-5 antibodies in the treatment of EGPA is investigational. - There are no published clinical trials evaluating the safety or efficacy of Xolair (omalizumab), Fasenra (benralizumab), and Cinqair (reslizumab) for the treatment of EGPA. Additional studies are ongoing for Fasenra (benralizumab) and Cinqair (reslizumab). [7]
Hypereosinophilic syndrome (hyper E, HES)	- Except as noted in the coverage criteria, the use of monoclonal anti-IgE or anti-IL-5 antibodies in the treatment of HES is investigational. - One small phase 2 of Fasenra (benralizumab) in patients with symptomatic PDGFRA-negative HES reported a superior rate of reduction in eosinophil count at week 12 as compared to placebo. [8] A phase 3 trial is ongoing to evaluate clinical outcomes (HES flares). [4]
IgE-mediated food allergies (other than noted in the coverage criteria above)	- *In adults*: There is insufficient evidence to establish the safety and efficacy of Xolair (omalizumab) used in adults (age ≥ 18 years old) for the treatment of food allergies. - *Testing*: Use of Xolair (omalizumab) for treatment of food allergy determined by tests (other than listed in the coverage criteria) is considered investigational and not coverable. - *Other food allergies (not listed in the coverage criteria):* There is insufficient evidence to establish the efficacy of monoclonal anti-IgE and anti-IL-5 antibodies for the treatment of food allergies (other than specifically listed in the criteria above) including for the use of Xolair (omalizumab) in patients without a documented peanut allergy OR for an isolated peanut allergy.

Position Statement

Summary

Monoclonal anti-IgE and anti-IL-5, and anti-TSLP antibodies may be covered for specific diagnoses where there is demonstrated safety and efficacy from randomized, controlled trials to support their use, including asthma and other specific indications.

- Anti-IgE monoclonal antibodies [e.g., Xolair (omalizumab)] reduces the levels of circulating immunoglobulin E (IgE) and inhibits binding of IgE to mast cells, to prevent the activation of the allergic cascade and decrease inflammation.
- Anti-IL-5 antibodies [e.g., Fasenra (benralizumab), Nucala (mepolizumab), and Cinqair (reslizumab)] prevent activation of interleukin 5 (IL-5) that is responsible for the growth and survival of eosinophils, to decrease inflammation.

- Anti-TSLP antibodies [e.g., Tezspire (tezepelumab-ekko)] prevent activation of the TSLP cytokine that is responsible for modulating the downstream pathway involved in the epithelial cell inflammatory response. [10]
- Interleukin-4 receptor antagonist [IL-4; Dupixent (dupilumab)] is also used for add-on maintenance treatment for asthma (covered in a separate policy; see *Cross References*).

Asthma

- Monoclonal respiratory antibodies may be coverable for poorly controlled asthma despite use of maximal step therapy, which includes patient compliance with therapy, an assessment for triggers, and a plan to control identified triggers.
- Monoclonal respiratory antibodies may be covered when there is documentation of uncontrolled severe asthma with utilization of other appropriate medications, as detailed in the coverage criteria. Use of monoclonal respiratory antibodies for management outside of these criteria are not coverable.
- For severe asthma (STEP 5), Global Initiative for Asthma (GINA) guidelines recommend high-dose ICS-inhaled long-acting beta-agonist (LABA) therapy/add-on therapy with a biologic agent or tiotropium may be considered after phenotypic assessment. [11]
    * In patients with severe eosinophilic phenotype asthma uncontrolled on STEP 4-5 treatment, Nucala (mepolizumab), Cinqair (reslizumab), Fasenra (benralizumab), or Dupixent (dupilumab) are recommended as add-on treatment options. [12]
    * In patients with IgE-mediated allergic phenotype asthma uncontrolled on STEP 4-5 treatment, Xolair (omalizumab) is recommended as add-on therapy. [12]
    * In patients with severe asthma, regardless of phenotype, on STEP 4-5 treatment, Tezspire (tezepelumab-ekko) is recommended. [13]
- There is insufficient evidence that any one monoclonal respiratory antibody for uncontrolled asthma is superior to another. There are no comparative trials. Based on indirect trial comparisons, the benefits are roughly equivalent (rate of exacerbations).

Chronic Idiopathic/Spontaneous Urticaria (CIU/CSU) (Xolair)

- Xolair (omalizumab) may be coverable for poorly controlled chronic idiopathic urticaria despite use of maximal step therapy, which includes patient compliance with antihistamines and an assessment for other causes, including triggers, as well as a plan to control identified triggers.
- Standard of care for chronic urticaria includes identification and elimination of the underlying aggravating triggers followed by use of antihistamines. [14]
- Other potential therapies include leukotriene antagonists (such as montelukast), cyclosporine, dapsone, other oral DMARDs, and corticosteroids.
- All patients in Xolair (omalizumab) urticaria clinical trials of were refractory to antihistamines.
- The goal of CIU therapy is to decrease functional impairment due to itching, hives, and other related symptoms, such as missed days from work and/or school.

Eosinophilic granulomatosis with polyangiitis (EGPA) (Nucala)

- Nucala (mepolizumab) may be coverable when specific diagnostic criteria for EGPA are met and persistent disease despite use of maximal step therapy, which includes steroids and immunosuppressants (oral DMARDs).
- Glucocorticoids are the mainstay of therapy for EGPA. [15 16] Patients in clinical trials of Nucala (mepolizumab) for EGPA were relapsing or refractory to corticosteroids with or without immunosuppressives.
- Immunosuppressive oral DMARD therapy [e.g., azathioprine, methotrexate] is used as add-on therapy for patients with life and/or organ manifestations for maintenance of remission.
- There are still no trials comparing the effectiveness of Nucala (mepolizumab) to that of oral DMARD therapy in patients with EGPA, and 55% of patients in the MIRRA trial were on a non-steroid immunosuppressant.
- The American College of Rheumatology (ACR) recommend Nucala (mepolizumab) in combination with glucocorticoids as first line treatment for EGPA over oral DMARDS. However, oral DMARDS have a long-standing track record as an established treatment option for EGPA, are still recommended by the current ACR guidelines, and are a more cost-effective option.
- Other second line therapy options for EGPA include rituximab, immunoglobulins, and interferon-alpha.

Hypereosinophilic Syndrome (HES) (Nucala)

- Nucala (mepolizumab) may be coverable for uncontrolled HES (FIP1L1-PDGFRA–negative) despite stable background therapy for HES.
- Standard treatments for HES include oral corticosteroids, hydroxyurea, other cytotoxic therapy for HES (e.g., chlorambucil, vincristine), or interferon alpha.

Nasal Polyps

- Xolair (omalizumab) and Nucala (mepolizumab) may be coverable for nasal polyps in patient who have continued symptoms and quality of life impacts despite standard management.
- Standard treatments for nasal polyps include oral corticosteroids and intranasal corticosteroids (INCS).
- Initial coverage authorization is 24 weeks, per current guidelines to reassess effectiveness outlined in coverage criteria, as CRSwNP symptoms can resolve or medication may not provide adequate benefit.
- Monoclonal respiratory antibodies may be covered at the doses proven to be safe and effective for asthma and other associated conditions in clinical trials (as detailed in the coverage criteria above).

IgE-Mediated Food Allergy

- Xolair (omalizumab) may be coverable for confirmed multiple, severe IgE-mediated food allergy, as outlined in coverage criteria, when used conjunction with ongoing food allergen avoidance.

- The goal of treatment with Xolair (omalizumab) is the reduction of severe allergic reactions, including anaphylaxis, from accidental food allergen exposure, by increasing the tolerance or sensitivity threshold to the allergen(s). However, at this time, the evidence is limited to increase in allergic reaction threshold, based on tolerance of a single dose of peanut protein without dose-limiting symptoms. It is unknown if Xolair (omalizumab) will reduce the incidence of severe reactions with real-world food allergen exposure, use of rescue epinephrine, need for emergency medical care (such as ED visits), or improve quality of life.
- Confirmation of food allergens: Given complexity of food allergen evaluation, all patients should be evaluated by a specialist. Confirmatory tests used to diagnose food allergies include a skin prick test, an allergen specific IgE blood test, and an oral food challenge to the offending allergens, interpreted by a specialist, *in conjunction with* a medical history of a true food allergic reaction. True food allergies are defined by moderate to severe reactions affecting the skin, respiratory tract, gastrointestinal tract, or cardiovascular system. A positive diagnostic test, in the absence of a clinical history of a true allergic reaction, is not, by itself, indicative of a true allergy to the offending food allergen(s).
- Ongoing food allergen avoidance: Standard management is strict food allergen avoidance and the availability of rescue epinephrine for as-needed use with accidental food allergen exposure. Ongoing food allergen avoidance is required when using Xolair (omalizumab).

<u>Self-administration</u>

- Several options are now available in a single-dose pre-filled syringe (PFS) or autoinjector, FDA-approved for self-administration, and coverable under the pharmacy benefit, as detailed in the coverage criteria.
- Use of self-administered options provides the best value (lower overall cost) and may offer convenience for members.
- Provider-administered products may be needed when there is a documented reason why a patient cannot self-administer a medication (see *Appendix 5*).

The safety and efficacy of monoclonal respiratory antibodies in combination with other monoclonal respiratory antibodies or in conditions not included in coverage criteria (as listed above) have not been established. There are no trials of the use of anti-asthma monoclonal antibodies as combination or sequential therapy. Additional trials are ongoing.

Clinical Efficacy

ASTHMA BACKGROUND

- Asthma is a chronic inflammatory disorder of the airways in which many cells and cellular elements (multiple cytokines and mediators, as well as potentially IgE-mediated events involving mast cells and basophils) play a role (in particular, mast cells, eosinophils, T lymphocytes, macrophages, neutrophils, and epithelial cells). Eosinophilic asthma is a subphenotype of severe asthma characterized by elevated sputum and blood eosinophil levels as well as increased asthma severity, atopy, late-onset disease, and steroid refractoriness.
- IgE may be in the inflammatory cascade of some events leading to asthmatic airway inflammation. Anti-IgE monoclonal antibody, Xolair (omalizumab) binds circulating IgE.

- Anti-IL-5 monoclonal antibodies (Cinqair, Nucala, and Fasenra) specifically target formation of eosinophils and depletes blood eosinophil levels.
- Various peripheral blood eosinophil levels were studied in clinical trials. The eosinophil levels in the coverage criteria for the anti-IL-5 monoclonal antibodies are based on the efficacy data from the clinical trials of these medications and where they were found to be most effective.
- Global Initiative for Asthma (GINA) guidelines recommend STEP 5 add-on therapy with long-acting muscarinic antagonists (LAMA) such as tiotropium, anti-IgE therapy (omalizumab), anti-IL-5 therapy, anti-TSLP, or anti-interleukin-4 therapy after phenotypic assessment of asthma subtype. [17]
- There is no reliable evidence to establish efficacy or safety of monoclonal anti-IL-5 antibodies for severe allergic asthma without documentation of severe eosinophilia. [3]
- TSLP is a cytokine that is thought to stimulate the immune cascade response in epithelial cells leading to asthmatic airway inflammation. Anti-TSLP monoclonal antibody Tezspire (tezepelumab-ekko) blocks the TSLP cytokine to reduce the epithelial inflammatory response. [10]
- Tezepelumab has demonstrated efficacy in patients regardless of eosinophils or IgE levels. [18 19]

Fasenra (benralizumab) for Eosinophilic Asthma

- Two randomized, double-blinded, placebo-controlled studies (SIROCCO and CALIMA) evaluated the safety and efficacy of Fasenra (benralizumab) 30 mg in patients with severe eosinophilic asthma, uncontrolled on moderate- to high-doses ICS. [20 21]
    * The trials enrolled patients with a history of two or more asthma exacerbations requiring oral or systemic corticosteroid treatment in the past 12 months despite medium to high dose ICS/LABA. Patients were stratified by baseline blood eosinophil count (<300 or ≥300 cells/microliter).
    * The primary endpoint was reduction in asthma exacerbations for patients with baseline blood eosinophil count ≥300 cells/microliter in both studies. After 48-56 weeks, Fasenra (benralizumab) reduced the annual rate of exacerbations by 28-51% compared to placebo.
    * However, in the SIROCCO trial, only patients with a baseline blood eosinophil count ≥300 cells/microliter responded to the standard starting dose of Fasenra (benralizumab) 30 mg every 8 weeks. For patients with baseline blood eosinophil count <300 cells/microliter, response was seen only with double the dose (30 mg every 4 weeks).
- In CALIMA, patients on medium-dose ICS/LABA were included. Therefore, the generalizability of the results to patients optimized on standard STEP 5 therapy with high-dose ICS/LABA is uncertain. One double-blind, multicenter, randomized study evaluated the efficacy of Fasenra (benralizumab) on oral corticosteroid (OCS) reduction compared to placebo. [22]

    - Patients were required to have a daily oral corticosteroid dose between 7.5 to 40 mg per day in addition to high dose ICS/LABA and a baseline eosinophil count of at least 150 cells/microliter.
    - Patients in the Fasenra (benralizumab) arms (30 mg every 4 weeks or every 8 weeks) had a statistically significant reduction in daily OCS compared to placebo (75% vs. 25%, respectively). However, the external validity of the results is uncertain, given the inclusion of patients on medium-dose ICS/LABA.

- The role of Fasenra (benralizumab) for patients with a baseline blood eosinophil count of <300 cells/microliter is unclear. The overall assessment of benefit is uncertain, with inconsistent response to standard starting dosing and confounded baseline characteristics. Patients in two of the three trials were <u>not</u> on optimized high-dose ICS/LABA, as is the standard STEP5 (NHLBI and GINA guidance), prior to addition of anti-IL5 therapy.
    - In the SIROCCO trial, patients were optimized on high dose ICS/LABA. However, there was no statistical reduction in the rate of asthma exacerbations for patients with baseline blood eosinophil count of <300 in the arm of Fasenra (benralizumab) 30 mg every 8 weeks. Benefit was seen only at higher dosing (30 mg every 4 weeks). As such, Fasenra (benralizumab) if coverable only for patients with baseline blood eosinophil count of ≥300 cells/microliter. [Bleeker, PMID: 27609408]
    - In the CALIMA and ZONDA trials, there was statistically significant response to standard Fasenra (benralizumab) 30 mg every 8 weeks. However, patients were NOT optimized on high-dose ICS/LABA prior to enrollment. Both studies included patients on medium dose ICS/LABA, which is not reflective of Step 5 of NHLBI Guidelines for add-on IL-5 therapy. Therefore, the benefit in optimized Step 5 asthma patients with an eosinophil count of <300 is unknown.
        - In CALIMA, there was a statistically significant reduction in asthma exacerbation rates for patients with baseline blood eosinophil count of <300 cells/microliter in the arm of Fasenra (benralizumab) 30 mg every 8 weeks; however, because baseline ICS/LABA was not maximized, the external validity of this finding for use in a STEP5 therapy optimized patient is unknown. [Fitzgerald, PMID 27609406]
        - In ZONDA, there was a statistically significant reduction in the need for oral steroids for patients with baseline blood eosinophil count of >150 cells/microliter with Fasenra (benralizumab); however, because baseline ICS/LABA was not maximized, the external validity of this finding for use in a STEP 5 therapy optimized patient is unknown. [Nair, PMID 28530840]

<u>Nucala (mepolizumab) for Eosinophilic Asthma</u>

- One randomized, double-blinded, placebo- and active-controlled, 32-week study evaluated the safety and efficacy of Nucala (mepolizumab) 75 mg or 100 mg compared to placebo in patients with severe refractory eosinophilic asthma. [23]
    - The trial enrolled patients with blood eosinophil counts ≥150 cells/microliter within 6 weeks of dosing or ≥300 cells/microliter within 12 months.

    - The primary endpoint was frequency of asthma exacerbations. Nucala (mepolizumab) demonstrated a statistically significant reduction of annual exacerbation rates by 13% compared to placebo.
- One randomized, controlled trial evaluated the efficacy of Nucala (mepolizumab) in reducing daily oral corticosteroid dose compared to placebo. [24]
    - The primary end point was percent reduction of oral corticosteroid dose during weeks 20 to 24 without loss of asthma control. Overall, Nucala (mepolizumab) achieved greater reduction in oral corticosteroid use while maintaining asthma control when compared to placebo. However, the difference between the Nucala (mepolizumab) and placebo groups was not statistically significant.
- Nucala (mepolizumab) has been studied in moderate persistent asthma, and no significant benefit was observed. [25]

Xolair (omalizumab) for Extrinsic (allergic) Asthma

- One high-quality meta-analysis evaluated the efficacy of Xolair (omalizumab) in reducing asthma exacerbations and corticosteroid use compared to placebo.
    - After 16 to 60 weeks, Xolair (omalizumab) reduced asthma exacerbations from 26% to 16% of patients suffering from an exacerbation.
    - An absolute reduction in hospitalization risk was reduced from 3% to 0.5% with Xolair (omalizumab) over 28 to 60 weeks.
- Xolair (omalizumab) increases the number of asthma patients able to reduce or withdraw their inhaled steroids and is effective in reducing asthma. [26-29]
- There is no available data demonstrating that Xolair (omalizumab) is superior to step therapy options (e.g., ICS/LABAs and oral steroids for exacerbations) recommended in treatment guidelines for moderate-to-severe persistent asthma.
- Optimal clinical response to Xolair (omalizumab) requires strict compliance with dosing, as there is a 6 to 12-week lag before beneficial effects are apparent (effects are not immediate and explain the various phases that are included in study protocols).
- Although preliminary results are promising, there is no conclusive evidence that omalizumab is effective in patients with non-allergic (nonatopic) asthma, based on one small proof-of-concept trial. [30]

Total IgE Levels for Asthma

- Xolair (omalizumab) is only indicated in patients with elevated IgE levels and is dosed according to IgE levels between 30 to 700 IU/ml in adults with asthma. [31] There is no established dose or benefit for IgE levels outside of this range.
- Efficacy and dosing of Xolair (omalizumab) in asthma patients (>50 kg) with IgE levels less than 30 or greater than 700 have not been established. [31] The majority of data on the use of Xolair (omalizumab) in patients with baseline IgE <30 or >700 IU/ml are limited to case reports with inconsistent results of effectiveness.
- There is evidence to support the safety and efficacy of Xolair (omalizumab) in patients aged 6 to less than 12 years old with a baseline IgE as follows:
    - >90 to 150 kg: baseline IgE of 30 to 300 IU/ml

* >70 to 90 kg: baseline IgE of 30 to 500 IU/ml
* >60 to 70 kg: baseline IgE of 30 to 600 IU/ml
* >50 to 60 kg: baseline IgE of 30 to 700 IU/ml
* >40 to 50 kg: baseline IgE of 30 to 900 IU/ml
* >30 to 40 kg: baseline IgE of 30 to 1,100 IU/ml
* 20 to 30 kg: baseline IgE of 30 to 1,300 IU/ml

As with adults, there is no established dose or benefit for IgE levels outside of this range.

- Monitoring IgE levels after administration of Xolair (omalizumab) are problematic, as IgE levels post-administration measure both bound and unbound (free) IgE.

Cinqair (reslizumab) for Eosinophilic Asthma

- Cinqair (reslizumab) has been studied in people with moderate and severe refractory eosinophilic asthma that is inadequately controlled despite use of high-dose corticosteroids and a controller medication. [32-35]
- Two double-blind, controlled studies evaluated the efficacy of Cinqair (reslizumab) 3 mg/kg compared to placebo in patients with severe eosinophilic asthma. [35]
  * Patients were required to have at least 1 asthma exacerbation requiring systematic corticosteroids.
  * The primary endpoint was frequency of asthma exacerbation. After 52 weeks, Cinqair (reslizumab) reduced the annual asthma exacerbation rate by 10-14% compared to placebo.

Tezspire (tezepelumab-ekko) for Severe Asthma [10 18 19 36-39]

- One phase III, randomized, double-blinded, placebo controlled, 52-week study (NAVIGATOR) evaluated the safety and efficacy of Tezspire (tezepelumab-ekko) 210mg every 4 weeks compared to placebo in patients with severe asthma, uncontrolled on ICS/LABA therapy.
  * The trial enrolled patients who were previously diagnosed with asthma receiving a med/high dose ICS for the past 12 months (75% of patients were on high dose ICS in both arms) and secondary controller medication (LABA) for the past 3 months. Patients must have had a history of two or more asthma exacerbations (defined as requiring either oral/systemic corticosteroids or asthma related hospital stay) in the previous 12 months. Patients were stratified by baseline blood eosinophil count (<150, 150-300,300-450, and >450 cells/µL).
  * The primary endpoints were annualized asthma exacerbations rate (AAER) overall as well as in patients with blood eosinophil counts of ≤300 cells/µL. Tezspire (tezepelumab-ekko) demonstrated a statistically significant reduction in both overall annual exacerbation rates (56%) and in patients with blood eosinophil counts of ≤300 µL (41%) when compared to placebo.
  * Sub-group analysis of patients with blood eosinophils <150 cells/µL showed a statistically significant reduction in AAER by 39% when compared to placebo.
  * The above results were supported by similar findings in a previous phase IIB randomized placebo-controlled dose optimization trial (PATHWAY). In addition,

a sub-group analysis of patients with non-allergic asthma (IgE<30 IU/ml) showed a statistically significant reduction in AAER of 54% in this trial.

- One phase 3, randomized, double blind, placebo-controlled trial (SOURCE trial) evaluated the efficacy of Tezspire (tezepelumab-ekko) in reducing daily oral corticosteroid dose compared to placebo.
    * The primary end point was percent reduction of oral corticosteroid dose at week 48 without loss of asthma control. Overall, Tezspire (tezepelumab-ekko) achieved a greater reduction in oral corticosteroid use while maintaining asthma control when compared to placebo.
- Tezspire (tezepelumab-ekko) is the first monoclonal antibody to show statistically significant reductions in AAER in patients that have non eosinophilic asthma (blood eosinophils <150cells/µL) and in patients with non-allergic asthma (IgE<30 IU/ml).

CHRONIC IDIOPATHIC URTICARIA (CIU/CSU) BACKGROUND

- Standard of care includes identification and elimination of the underlying aggravating triggers followed by use of antihistamines, which are FDA-approved for treatment of urticaria and may be used at doses exceeding the manufacturer's recommended dosages. [14]
- Second-line treatment options for antihistamine-refractory urticaria include H2-antihistamines (e.g., ranitidine, famotidine), leukotriene antagonists, cyclosporine, dapsone, other oral DMARDs/anti-inflammatories (methotrexate, sulfasalazine), and corticosteroids. The guidelines acknowledge the evidence supporting the use of these second-line therapies is of lower quality; however, their costs and safety profiles should be considered when choosing therapies. [14]
- The terms "chronic urticaria" (CU), "chronic spontaneous urticaria" (CSU), and "chronic idiopathic urticaria" (CIU) are used interchangeably, but are generally defined as a frequent cause of severe chronic urticaria, lasting greater than 6 weeks. [14] However, in clinical trials, all patients had CIU/CSU symptoms for at least 6 months. [40-43]
- The diagnosis of "CIU/CSU" requires exclusion of triggers as a main cause of the urticaria symptoms, such as:
    * Physical causes [dermatographism (firm stroking), delayed pressure urticaria (pressure), cold urticaria (cold), solar urticaria (exposure to sun), or vibratory urticaria (vibration)].
    * Other causes [aquagenic urticaria (water exposure), cholinergic urticaria (heat, stress, exercise), exercise-induced anaphylaxis/urticaria, contact with urticariogenic substances].
    * Urticaria despite avoidance of any triggers is a hallmark feature of CIU/CSU. [14]
- In addition, spontaneous flares in the absence of a trigger must be documented to establish the diagnosis of spontaneous urticaria (CSU/CIU).
- A subset of patients with a diagnosis of CSU/CIU may have autoimmune urticaria, which can be associated with some type of trigger which can aggravate symptoms but is not the main cause of CU symptoms. Aggravating triggers may include but are not limited to extreme hot or cold, and irritation from clothing. Primary treatment for CU

should include aggravating trigger control and histamine blockade. Refractory patients may be responsive to Xolair (omalizumab). [14 41 42]

Xolair (omalizumab) for CIU/CSU

- Two randomized, double-blinded, placebo-controlled 12- to 24-week studies evaluated the safety and efficacy of Xolair (omalizumab) in patients with refractory chronic idiopathic/spontaneous urticaria. [41 44]
    - The trial enrolled patients with a urticaria activity score (UAS) >4 despite use of H1-antihistamines and a weekly itch severity score (ISS) >8.
    - Xolair (omalizumab) doses of up to 300 mg every 4 weeks were used.
    - The primary endpoint of the study was change from baseline in weekly ISS at week 12. Additional endpoints included the change in UAS over 7 days and proportion of complete responders.
    - Mean change in weekly ISS with Xolair (omalizumab) decreased by -3.0 from placebo. Although, this is a subjective endpoint with a lack of defined minimal clinically important difference, it is clinically relevant to patients. The FDA recognizes reduction of itching as the most important outcome.
- Xolair (omalizumab) may reduce urticaria severity, as measured by itch-severity score, in patients with chronic idiopathic urticaria who remained symptomatic despite use of H1-antihistamine therapy. However, Xolair (omalizumab) has not been proven to eliminate itching or improve functional impairment due to urticaria symptoms. [14 41-43]
- Xolair (omalizumab) has only been studied as add-on therapy in patients who are refractory to antihistamines.
    - Guidelines recommend use of maximally tolerated doses of non-sedating (2nd generation) antihistamines, up to four-times the recommended FDA-approved doses. [14]
    - All patients in clinical trials of Xolair (omalizumab) for chronic urticaria were refractory to antihistamines. [14] However, Xolair (omalizumab) has not been compared to the many other available therapies for antihistamine-refractory urticaria. Therefore, it is unknown if Xolair (omalizumab) is superior to these less-costly alternatives.
- IgE levels are not measured nor used as a marker for Xolair (omalizumab) therapy with urticaria.
- Urticarial flares may also occur in the presence of a trigger ("inducible urticaria"). However, patients may have a mixed diagnosis of CSU/CIU, along with inducible urticaria. Spontaneous flares, in the absence of a trigger, must be documented to establish the diagnosis of spontaneous urticaria (CSU/CIU).
- The efficacy or safety of Xolair (omalizumab) in other types of urticaria with a clearly defined cause, such as physical (inducible) urticaria (e.g., "cold" urticaria, dermographism, delayed-pressure urticaria, cholinergic urticaria, aquagenic urticaria, solar urticaria, or vibratory urticaria), urticarial vasculitis, or contact urticaria, has not been established. [14 43 45]

* Patients with a clearly defined cause for urticaria, such as physical cause, were excluded from CIU/CSU phase 3 clinical trials. [14 41-43]
* Avoidance of the stimulus is the primary treatment for physical (inducible) urticaria. Other treatments vary, dependent on the trigger, but may include antihistamines, steroids, desensitization protocols, and immunomodulators (such as cyclosporine). [46]
* Two small phase 2 trials investigated Xolair (omalizumab) in patients with cold and solar urticaria refractory to antihistamines.
    - CUTEX (n=30): [45] Patients with refractory cold urticaria were randomized to 150 mg, 300 mg, or placebo every 4 weeks. The primary endpoint was the individual temperature required to induce symptoms [critical temperature threshold (CTT)]. Although the CTT reduced in the treatment period, the benefit on health outcomes (such as systemic reactions and anaphylaxis) is unknown.
    - XOLUS (n=10): [47] Patients with refractory solar urticaria [to photoprotection (SPF 50 sunscreen) and antihistamines] were treated with Xolair (omalizumab) 300 mg every 4 weeks. The primary endpoint was response to therapy, measured by the percent of patients without urticaria triggering with exposure to UV light (10-times baseline level). Two of 10 met the primary endpoint. However, the benefit on health outcomes (such as systemic reactions and anaphylaxis) is unknown.
    - Additional trials are needed to clarify the benefit of Xolair (omalizumab) in refractory cold and/or solar urticaria. Of note: both of these trials were published as a 'letter to the editor' and were not peer-reviewed.
* The published evidence for the use of Xolair (omalizumab) in other types of physical (inducible) urticaria is limited to case reports. [46]

EOSINOPHILIC GRANULOMATOSIS WITH POLYANGIITIS (EGPA) BACKGROUND

- Eosinophilic granulomatosis with polyangiitis (EGPA), also known as allergic granulomatosis or Churg-Strauss syndrome, is a multisystem autoimmune syndrome characterized by eosinophil-rich granulomatosis inflammation of microscopic vessels. The respiratory tract is typically affected, and EGPA commonly includes asthma among its manifestations; however, widespread manifestations are found, including neurological, cardiac, and renal involvement.
- Classification of EGPA is most often according to 1990 classification criteria from the American College of Rheumatology. Patients with vasculitis may be classified as having EGPA if they have at least 4 of 6 typical findings: [48]
    * Asthma (a history of wheezing or finding or diffuse high-pitched wheezes on expiration).
    * Greater than 10 percent eosinophils on the differential leukocyte count.
    * Mononeuropathy (including multiplex) or polyneuropathy.
    * Migratory or transient opacities detected radiographically.
    * Paranasal sinus abnormality.

    - Biopsy containing a blood vessel showing the accumulation of eosinophils in extravascular areas.

- The primary therapy for EGPA is systemic corticosteroids. An additional immunosuppressive agent (e.g., cyclophosphamide) is typically added for patients with more active or severe disease and in those whose disease flares with tapering of systemic glucocorticoids. Once remission is induced, patients can be switched to less toxic immunosuppressives, such as azathioprine or methotrexate, for maintenance therapy. Second or third-line drugs include rituximab, immunoglobulins, and interferon-alpha. [15 16]

Nucala (mepolizumab) for EGPA

- The MIRRA trial (multicenter, randomized, double-blind, controlled) evaluated the efficacy of Nucala (mepolizumab) 300 mg in patients with relapsing or refractory EGPA not optimally controlled with an oral corticosteroid with or without oral DMARDs compared to placebo. [7]
- The primary endpoint was total accrued weeks of remission. Nucala (mepolizumab) was found to result in significantly more weeks in remission than placebo (28% vs. 3% of patients had ≥24 weeks of accrued remission).
- After 48 weeks, 32% of Nucala (mepolizumab) patients remained in remission allowing for reduced corticosteroid use compared to 3% of placebo patients.
- Nucala (mepolizumab) has only been studied as add-on therapy for EGPA. It has not been compared to oral DMARDs for corticosteroid-refractory EGPA. Therefore, it is unknown if Nucala (mepolizumab) is superior to these less costly alternatives.
- The 2021 American College of Rheumatology (ACR) guidelines for EGPA recommend systemic steroids in combination with Nucala (mepolizumab) as first line treatment for patients with active non-severe disease over methotrexate (MTX), azathioprine (AZA) or mycophenolate (MMF), however this is based solely on Nucala (mepolizumab) having a randomized trial showing benefit in EPGA compared to only clinical experience and observational studies with MTX, AZA, and MMF. [49]
- There are no trials comparing efficacy of Nucala (mepolizumab) to that of MTX, AZA, or MMF in patients with EGPA, and 55% of patients in the pivotal MIRRA trial were on a non-steroid immunosuppressant such as MTX, AZA, or MMF. [49]
- These non-steroid immunosuppressants have demonstrated effectiveness in observational trials and well as in clinical experience, are still recommended and recognized as treatment options by the ACR guidelines, and are significantly less costly. Adverse effects may limit use in some patients, but monitoring can alleviate most adverse events. [49]

HYPEREOSINOPHILIC SYNDROME (HES) BACKGROUND [50 51]

- HES is a rare blood disorder. It occurs when an individual's blood has very high numbers of eosinophils. Eosinophils make their way into various tissues, causing inflammation and eventually organ dysfunction. The most commonly involved organs in HES include the skin, lungs, heart, and nervous system.
- In approximately 75% of cases, the underlying cause is unknown. However, recent advances have led researchers to believe that eosinophilia may be due to a variety of

causes including myeloproliferative disorders or other disorders that affect bone marrow (myeloproliferative HES), increased production of interleukin-5 (lymphocytic HES), or a mutation in an unknown gene passed genetically (familial HES).

- The goal of HES treatment is to reduce eosinophil levels in the blood and tissues, thereby reversing and preventing end organ tissue damage, especially in the heart.
- For imatinib-sensitive HES variants (including those associated with the FIP1-like-1-platelet-derived growth factor receptor a fusion gene [FIP1L1-PDGFRA]), tyrosine kinase inhibitors such as imatinib (generic, Gleevec) are used for controlling malignant cell growth. [50 51]
- For all other types of HES (including FIP1L1-PDGFRA-negative HES), standard HES treatment includes: [50 51]
    * First line: corticosteroids such as prednisone
    * Steroid-sparing and second line options: immunosuppressives and chemotherapeutic agents such as cyclophosphamide, rituximab, imatinib (in select patients), vincristine, hydroxyurea, chlorambucil, interferon-alpha, and other kinase inhibitors (such as tofacitinib, ruxolitinib). Choice of treatment is dependent on presence/absence of myeloid features and suspected myeloid malignancy. In clinical trials, other steroid sparing therapies also included cyclosporine, imatinib, methotrexate, tacrolimus, and azathioprine. [52]
- At this time, Nucala (mepolizumab) is the only respiratory mAb with evidence for efficacy in HES as a steroid-sparing disease modifier. Trials of Fasenra (benralizumab) are ongoing. [4]

Nucala (mepolizumab) for HES

- The efficacy of Nucala (mepolizumab) in HES was evaluated in a phase 3, randomized, double-blind, placebo-controlled trial in patients with a diagnosis of FIP1L1-PDGFRA–negative HES ≥6 months (Study 200622). [52]
- All enrolled patients had FIP1L1-PDGFRA–negative HES.
- HES was required to be uncontrolled (defined as a history of ≥2 flares within the past 12 months and a blood eosinophil count ≥1000 cells/μL) despite stable background with HES therapy.
- Background HES therapy included at least four weeks on a stable dose of oral corticosteroids and/or various immunosuppressants/cytotoxic agents, including but not limited to hydroxyurea, cyclosporine, imatinib, methotrexate, tacrolimus, and azathioprine.
- Patients received treatment with mepolizumab or placebo, in addition to their existing HES therapy.
- The primary endpoint was the proportion of patients with 1 or more flares at the end of the 32-week study.
- At the end of the treatment period, less patients treated with Nucala (mepolizumab) experienced a flare compared to patients treated placebo (28% vs. 56%, respectively).

- Nucala (mepolizumab) has only been studied as add-on therapy for HES and has not been compared to other alternatives. Therefore, it is unknown if Nucala (mepolizumab) is superior to less costly alternatives.

CHRONIC RHINOSINUTISIS WITH NASAL POLYPS BACKGROUND[53-55]

- Chronic rhinosinusitis (CRS) is a common condition. It is defined as inflammation of at least one paranasal sinus. It is characterized as chronic when symptoms persist for at least 12 weeks. CRS is divided into CRS with nasal polyps (CRSwNP) and CRS without nasal polyps (CRSsNP). Endoscopy or on a sinus computed tomographic (CT) is needed to confirm the diagnosis of nasal polyps.
- Symptoms of nasal polyps include chronic congestion, facial pressure, purulent postnasal drip, throat clearing, coughing, and reduced ability to smell.
- Oral corticosteroids and intranasal corticosteroids (INCS) are the mainstay of therapy. Oral corticosteroids decrease nasal polyp size but are not used long-term.
- INCS decrease polyp size and prevent recurrence in patients who have had polyps removed through surgery. INCS include those products for intranasal use specifically (such as sprays), as well as other steroid solutions (such as budesonide nebs, used intranasally) or surgically implanted steroid-eluding stents.

Xolair (omalizumab) for Nasal Polyps[56]

- The safety and efficacy of Xolair (omalizumab) for nasal polyps was established based on two phase 3 studies: POLYP-1 and POLYP-2.
- Both studies compared Xolair (omalizumab) in combination with mometasone fumarate nasal spray (MFNS) vs. MFNS alone.
- The studies included patients with bilateral polyposis that persisted despite treatment with oral corticosteroids.
- The primary endpoints were change in Nasal Polyp Score (NPS) and nasal congestion score (NCS). Secondary endpoints other measures such as polyp size, disease severity, and symptoms.
- Treatment with Xolair (omalizumab) with MFNS improved nasal polyp scores and improved symptoms compared to MFNS alone. Secondary endpoints also favored the Xolair (omalizumab) group.
- Xolair (omalizumab) is only indicated in patients with elevated IgE levels and is dosed according to IgE levels between 30 and 1600 IU/mL in patients with nasal polyps. There is no established dose or benefit for IgE levels outside of this range.

Nucala (mepolizumab) for Nasal Polyps[57]

- The safety and efficacy of Nucala (mepolizumab) for nasal polyps was established in one 52-week phase 3 study.
- The study compared Nucala (mepolizumab) in combination with MFNS versus MFNS alone.
- Patients were required to have had at least one surgery for nasal polyps in the past 10 years and must have received background nasal corticosteroids for at least 8 weeks prior to the study.

- The co-primary endpoints were change in total endoscopic Nasal Polyp Score (NPS) from baseline and change in mean nasal obstruction VAS score during weeks 49-52. Secondary endpoints included other measures such as polyp size, disease severity, and symptoms.
- Treatment with Nucala (mepolizumab) decreased the size of nasal polyps and improved nasal obstruction through 52 weeks. Treatment with Nucala (mepolizumab) also resulted in a longer time to nasal surgery (nasal polypectomy) compared to standard of care.

IgE-MEDIATED FOOD ALLERGY BACKGROUND[58 59]

- IgE-mediated food allergies typically develop within seconds or minutes after ingestion of the culprit food with widespread activation of immune cells, which are responsible for the accompanying allergic symptoms--the most life-threatening being anaphylaxis.
- IgE-mediated allergic symptoms usually involve more than one organ system, and may include severe airway problems (bronchospasm, angioedema), hypotension, severe gastrointestinal symptoms (nausea, vomiting), and skin reactions (urticarial rash, erythema, flushing).
- Given the complexity of assessment of allergic reactions, a full evaluation by a clinical specialist (such as an allergist/immunologist) is recommended.
- The diagnosis of an IgE-mediated food allergy is confirmed by a positive result of at least one of the following allergy-diagnostic tests, in combination with a history of a food-related allergic reaction to the suspected foods:
- Skin prick test (SPT)
- Allergen-specific IgE test
- Double-blind oral-food challenge to the offending food(s) [gold standard].

  The many other non-standardized testing methods are considered non-confirmatory. [59]
- Avoidance of culprit food allergens to decrease the risk of allergic reactions is the preferred strategy outlined in guidelines, in addition to as-needed antihistamines (diphenhydramine) and epinephrine use for the treatment of an acute allergic reaction.
- Desensitization: Current guidelines do not recommend the use of oral immunotherapy (OIT) as a treatment approach for severe food allergy. However, the guidelines have not been recently updated (2011) and many allergists/immunologists use OIT as part of comprehensive management of allergies, when appropriate.

Xolair (omalizumab) for IgE-Mediated Food Allergies[60]

- The safety and efficacy of Xolair (omalizumab) for reduction of food allergy reactions was evaluated in one 16-week, phase 3 randomized, double blind, placebo-controlled trial in 168 patients with moderate-to-severe food allergies (of which 165 were pediatric).
- All subjects had an allergy to peanut plus at least two other foods, including milk, egg, wheat, cashew, hazelnut, and/or walnut.

- All food allergies were confirmed by all of the following positive diagnostic tests:
  * Skin prick test (SPT) defined as ≥ 4mm wheal greater than saline control to allergen.
  * Allergen specific immunoglobulin, IgE, ≥ 6kUA/L determined by ImmunoCAP.
  * Double blinded placebo-controlled food challenge (DBPCFC) defined as experiencing dose-limiting symptoms at a single dose of ≤ 100mg of peanut protein or ≤ 300mg of other above-listed allergen protein [100mg of peanut protein is the equivalent of 1/2 of a peanut].
  * Use of Xolair (omalizumab) for treatment of food allergy determined by tests (other than listed in the coverage criteria) is considered investigational and not coverable.
- All subjects had a moderate-to-severe peanut allergy, defined as:
  * Dose-limiting food allergy symptoms to a single dose of 100mg or less of peanut protein (equivalent to one-half of a peanut) and 300mg or less of protein for each of the other six foods at baseline.
- Moderate to severe symptoms including skin, respiratory, and/or gastrointestinal (GI) symptoms.
  * The primary efficacy endpoint was the percentage of patients who were able to consume a single dose of 600mg or more of peanut protein at week 16 without dose-limiting symptoms.
    - At week 16, a higher percent of subjects in the Xolair (omalizumab) arm were able to consume at least 600mg of peanut protein as compared to placebo (68% vs. 5%, p<0.001).
    - The clinical meaningfulness of the primary endpoint is unknown, as the 600 mg dose is a small amount of peanut protein relative to what may be consumed during an accidental exposure [600 mg is the equivalent to three whole peanuts or one-half teaspoon of peanut butter]. It is unknown if this endpoint predicts the clinically meaningful outcomes, such as reduced healthcare utilization, reduction in fatal anaphylaxis, need for rescue epinephrine use, or emergency department care.
    - Of note, 17% of subjects treated with Xolair (omalizumab) had no significant change in the amount of peanut protein tolerated. Therefore, the use of Xolair (omalizumab) for ongoing treatment of IgE-mediated food allergies is coverable only when there is a reduction in the frequency or severity of food allergic reactions, and need for additional medical care, as compared to baseline reactions.
  * Secondary endpoints included tolerance of a food challenge with a variety of other allergen food challenges (cashews, milk, egg), all of which met statistical significance in favor of omalizumab [≥ 1000mg cashew protein (~3.5 cashews), milk protein (~2 tablespoons of milk) or egg (1/4 of an egg)]. However, despite numerical trends of improvement, more adequately powered studies are needed to confirm any clinical utility of the use of Xolair (omalizumab) for other food allergies. On average, around 20% of subjects treated with Xolair (omalizumab) had no significant change in the amount of cashew, milk, or food protein tolerated.

- Clinically relevant outcomes for IgE-mediated food allergy, such as absence of any allergic reaction, reduced rates of hospitalizations or emergency department visits, reduction in rates of anaphylaxis, reductions in rates of epinephrine rescue use, or overall quality of life improvement were not evaluated in the pivotal trial.
- Use of Xolair (omalizumab) for food allergy has not been shown to reduce the need for additional medical care [such as emergency department (ED) use or epinephrine (EpiPen) use], induce permanent tolerance to allergens, or improve ability to eat an unrestricted diet. Because Xolair (omalizumab is not curative, treatment will require chronic administration, continuation of allergen avoidance, and availability of "as needed" epinephrine (EpiPen) rescue use for allergic reactions from accidental exposure.
- Investigational Uses:
    * In the pivotal trial for IgE-related food allergy, subjects aged 1 to 55 years old were eligible for enrollment in the trial. However, 165 of 168 enrolled subjects were pediatric (age 1 to 17) and the prespecified primary efficacy analysis population. At this time, there is insufficient evidence to establish the safety, efficacy, or dosing of Xolair (omalizumab) for IgE-mediated food allergy in adults. Therefore, the use of Xolair (omalizumab) in adults (≥ 18 years old) with IgE-mediated food allergy is considered investigational.
    * All patients in the available trial(s) had a confirmed peanut allergy along with at least two other food allergies. Therefore, there is insufficient evidence to establish the efficacy of Xolair (omalizumab) in patients without a documented peanut allergy OR in patients with isolated peanut allergy. The use of Xolair (omalizumab) in patients with isolated peanut allergy is not supported by the available published clinical trial evidence.

Not Medically Necessary Uses

- Xolair (omalizumab) reduces seasonal and perennial allergic rhinitis symptoms but has not been shown to have better efficacy than first-line alternatives, such as nasal corticosteroids, antihistamines, or allergen desensitization therapy. [61-63]
- There is interest in the use of other monoclonal antibodies for allergic rhinitis, such a mepolizumab (Nucala). However, there is insufficient evidence to establish benefit versus the many available lower cost treatment options. [64]

Safety

- All monoclonal antibodies for asthma have a theoretical risk of opportunistic infections (including parasitic infections) and malignancy. Immunogenicity and development of antidrug antibodies was observed in clinical trials of Nucala (mepolizumab) and Cinqair (reslizumab). [65 66]
- Anaphylaxis is a concern with administration of anti-asthma monoclonal antibodies. Xolair (omalizumab) FDA labeling details assessment of risk for anaphylaxis (see *Appendix 5*).
- The safety and effectiveness of dose escalation for patients not responding to standard doses have not been established.

Appendix 1: Low, Medium, and High Daily Doses of Inhaled Corticosteroids (Adapted from GINA 2019 Guidelines) [12]

Adults and Adolescents (Age 12 years and Older)				
Drug	**Products**	**Daily Dose**		
		Low	**Medium**	**High**
Beclomethasone dipropionate (CFC)	None	200-500	>500-1000	>1000
Beclomethasone dipropionate (HFA)	QVAR Redihaler	100-200	>200-400	>400
Budesonide (DPI)	- Symbicort - Pulmicort Flexhaler	200-400	>400-800	>800
Ciclesonide (HFA)	Alvesco	80-160	>160-320	>320
Fluticasone furoate (DPI)	- Breo Ellipta - Arnuity Ellipta - Trelegy Ellipta	100	N/A	200
Fluticasone propionate (DPI)	- Advair Diskus - Flovent Diskus - Wixela Inhub - AirDuo RespiClick - ArmonAir RespiClick	100-250	>250-500	>500
Fluticasone propionate (HFA)	- Advair HFA - Flovent HFA	100-250	>250-500	>500
Mometasone furoate	- Dulera - Asmanex	110-220	>220-440	>440
Triamcinolone acetonide	Azmacort	400-1000	>1000-2000	>2000

Key: DPI: dry power inhaler; HFA: hydrofluoroalkane.

Children age 6-11 years				
Drug	**Products**	**Daily Dose**		
		Low	**Medium**	**High**
Beclomethasone dipropionate (CFC)	None	100-200	>200-400	>400

Triamcinolone acetonide	Azmacort	400-800	>800-1200	>1200

Key: DPI: dry power inhaler; HFA: hydrofluoroalkane.

Children age 0-5 years		
Drug	**Products**	**Daily Dose**
		Low
Beclomethasone dipropionate (HFA)	QVAR Redihaler	100 (ages ≥5 years)
Budesonide nebulized	Generic	500 (ages ≥1 years)
Budesonide pressurized MDI	Pulmicort Flexhaler	Not sufficiently studied in this age group
Ciclesonide (HFA)	Alvesco	Not sufficiently studied in this age group
Fluticasone propionate (HFA)	Flovent HFA	50 (ages ≥4 years)
Mometasone furoate	Asmanex	110 (ages ≥4 years)
Triamcinolone acetonide	Azmacort	Not sufficiently studied in this age group

Key: DPI: dry power inhaler; HFA: hydrofluoroalkane.

Appendix 2: Inhaled Corticosteroid/Long-acting Beta-agonist (ICS/LABA) Combinations

Product	Dosing	Max Puff/Day	High Dose?	Available Strength [a]
Fluticasone propionate/salmeterol DPI (Advair Diskus)	Twice daily	2 (1,000 mcg)	Yes (>500)	100/50 250/50 500/50
Fluticasone propionate/ salmeterol MDI (Advair HFA)	Twice daily	4 (920 mcg)	Yes (>440)	45/21 115/21 230/21
Budesonide + formoterol MDI (Symbicort)	Twice daily	4 (640 mcg)	No[a]	80/4.5 160/4.5
Fluticasone propionate / salmeterol DPI (AirDuo RespiClick)	Twice daily	2 (464 mcg)	No[b]	55/14 113/14 232/14
Mometasone/ formoterol MDI (Dulera)	Twice daily	4 (800 mcg)	Yes (>400)	100/5 200/5
Fluticasone furoate/vilanterol DPI (Breo Ellipta)	Once daily	1 (200 mcg)	Yes (>200)	100/25 200/25

[a] High dose budesonide is >1,200 mcg/day. Maximum daily dose of budesonide from Symbicort (budesonide/formoterol) is 640 mcg/day, a medium dose of ICS.

[b] High dose fluticasone propionate DPI is >500 mcg/day. Maximum daily dose of fluticasone propionate from AirDuo RespiClick (fluticasone propionate/salmeterol DPI) is 464 mcg/day, a medium dose of ICS.

Appendix 3: Antihistamines

H_1-Antihistamines

First Generation (non-selective, "sedating")

- brompheniramine
- chlorpheniramine (generic Chlor-Trimeton)
- clemastine (generic Tavist)
- cyproheptadine (generic Periactin)
- dexbrompheniramine
- dexchlorpheniramine
- diphenhydramine (generic Benadryl)
- hydroxyzine (generic Vistaril)

Second Generation (peripherally-selective, "non-sedating")

- cetirizine (generic Zyrtec)
- desloratadine (Clarinex)
- fexofenadine (generic Allegra)
- levocetirizine (Xyzal)
- loratadine (generic Claritin)

H_2-Antihistamines

- cimetidine (generic Tagamet)
- famotidine (generic Pepcid)
- nizatidine (generic Axid)
- ranitidine (generic Zantac)

Appendix 4: Steroid-sparing therapies for Hypereosinophilic syndrome (HES) [50-52]
Immunosuppressives and chemotherapeutic agents: - cyclophosphamide - rituximab - imatinib (in select patients) [a] - vincristine - hydroxyurea [a] - chlorambucil - interferon-alpha - other kinase inhibitors (such as tofacitinib, ruxolitinib) - cyclosporine [a] - methotrexate [a] - tacrolimus [a] - azathioprine [a] - alemtuzumab - Other: cladribine, etoposide, mycophenolate mofetil (MMF)

[a] One of the baseline HES therapies reported in the mepolizumab pivotal HES trial (Study 200622)

Appendix 5. Monoclonal antibodies for asthma and other immune conditions approved for self-administration – Examples of Medical Rationale for Contraindications to Self-Injection	
For all self-administered options	
The healthcare provider determines self-injection is not appropriate, as documented by a medically justifiable rationale, such as: - Patient or patient's caregiver is not able to self-administer the prescribed monoclonal antibody as a PFS or autoinjector (Fasenra, Nucala, or Xolair) due to significant behavioral issues and/or cognitive impairment including, but not limited to, those associated with developmental delay, down syndrome, dementia, or excessive anxiety such as severe needle phobia, documented in the clinical records. - Prior severe infusion reactions - Medically unstable asthma, such as concurrent treatment with medications that require a higher level of monitoring (such as oxygen) or acute treatment of asthma despite maximal medical management.	
Product-specific contraindications	
Fasenra (benralizumab)[67]	None
Nucala (mepolizumab)[65]	Patient is less than 11 years of age (the 40 mg dose is not currently available as a self-administered formulation: PFS or autoinjector)
Xolair (omalizumab)[53]	Patient is higher risk of anaphylaxis (has known risk factors) - Prior history of anaphylaxis, including to Xolair (omalizumab) or other agents, such as foods, drugs, biologics, etc. - History of hypersensitivity reactions to Xolair (omalizumab). - Patient or caregiver is NOT able to recognize symptoms of anaphylaxis and treat anaphylaxis appropriately.

PFS = pre-filled syringe

Appendix 6. Monoclonal Antibodies and Targeted Immunomodulators for Asthma and other Autoimmune (Inflammatory) conditions
Fasenra (benralizumab)
Dupixent (dupilumab) [refer to Dupixent, dupilumab, Medication Policy Manual, Policy No. dru493]
Nucala (mepolizumab)
Cinqair (reslizumab)
Xolair (omalizumab)
Tezspire (tezepelumab-ekko)
Targeted immunomodulators Antibodies for CID [refer to Drugs for chronic inflammatory diseases, Medication Policy Manual, Policy No. dru444]

Revision History

Revision Date	Revision Summary
6/20/2024	• Added coverage criteria for a new indication for Xolair (omalizumab) for treatment of IgE-mediated food allergy. Limits coverage to patients with one or more food allergies, confirmed with allergy diagnostic testing and use in combination with ongoing food allergen avoidance (effective 9/1/2024). • Added Tezspire (tezepelumab) to site of care program (effective 10/1/2024).
12/7/2023	Removed monoclonal antibody step for Tezspire (tezepelumab) in severe asthma. Updated reauthorization criteria for operational consistency.
6/15/2023	• Clarification of steroid-sparing therapy step criteria for Nucala (mepolizumab) in hypereosinophilic syndrome (HES), for operational consistency (no change to intent). • Added Tezspire single-use autoinjector as a self-administered treatment option.
12/9/2022	• Reworded criteria for chronic idiopathic urticaria, (CIU) criteria for operational consistency (no change to intent). • Updated CIU/CSU reauthorization and quantity limit for patients with a partial response to Xolair (omalizumab), but persistent symptoms. • Added chronic eosinophilic pneumonia (CEP) and Hyper E Syndrome (HES) (except as listed in the coverage criteria) to the list of "Investigational Uses." • Clarified that allergic rhinitis is "Not Medically Necessary Uses" to include allergic rhinitis for all monoclonal antibody therapies in this policy.
6/17/2022	• Added coverage criteria for the newly FDA-approved drug Tezspire (tezepelumab-ekko). Limits coverage to patients with severe asthma when prescribed by a specialist, adherent use of ICS/ LABA has been ineffective, and blood eosinophils are less than 150 cells/ L. Additionally the asthma must be non-allergic, and the patient is not oral corticosteroid dependent. Step therapy with at least one monoclonal antibody for severe asthma is required. • Updated nasal polyp criteria for initial authorization to be at 24 weeks per guidelines, and continued reauthorization may be annually thereafter.

Revision Date	Revision Summary
3/18/2022	• Updated nasal polyp criteria to show that both Xolair (omalizumab) and Nucala (mepolizumab) require combination use of intranasal corticosteroids. IgE levels are only required for use of Xolair (omalizumab) in nasal polyps.
10/15/2021	• Added Site of Care (SOC) requirements for provider-administered doses. • Added coverage criteria for Nucala (mepolizumab) for nasal polyps and clarified severity criteria. • Updated benefit and administration language section.
4/21/2021	• Added coverage criteria for use of Nucala (mepolizumab) in hypereosinophilic syndrome (HES), a newly FDA approved indication. • Added coverage criteria for use of Xolair (omalizumab) in nasal polyps, a newly FDA approved indication. • Revised asthma criteria: - Changed requirement for previous courses of oral corticosteroids in past 12 months from two to one. - Simplified eosinophil count criteria for Fasenra (benralizumab), Nucala (mepolizumab), and Cinqair (reslizumab). - Removed requirement that smoking must have been discontinued. • Added Continuation of Therapy (COT) criteria • Updated "Investigational Uses" • Added Xolair pre-filled syringe as a self-administered treatment option.
10/23/2019	• Added Fasenra (benralizumab) and Nucala (mepolizumab) single-dose pre-filled autoinjector for self-administration to the policy. All other anti-asthma antibodies in the policy remain provider-administered only. Effective November 15, 2019: • Updated coverage criteria for asthma: - Clarified that maximally tolerated inhaled corticosteroid and long-acting inhaled beta-2 agonist therapy must have been tried. - Removed requirement for use of oral corticosteroids if exacerbations are present. - Revised definition of poor asthma control to include clarify requirement for two additional oral corticosteroid bursts or emergency department visits or hospitalizations.
4/25/2019	Updated and fixed incorrect references. No changes to policy criteria with this update.
1/31/2019	Clarified intent of trigger criteria.

Revision Date	Revision Summary
11/16/2018	Clarified intent of trigger, step therapy, quantity limit and reauthorization criteria.
3/16/2018	New policy: • The Xolair, Nucala, and Cinqair policies were combined. • Coverage criteria added for asthma for newly-approved Fasenra. • Coverage criteria added for EGPA for Nucala.

Medication Policy Manual | **Policy No:** dru539

Topic: Hemlibra, emicizumab-kxwh | **Date of Origin:** May 1, 2018

Committee Approval Date: June 20, 2024 | **Next Review Date:** 2025

Effective Date: September 1, 2024

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Hemlibra (emicizumab-kxwh) is a monoclonal antibody used for patients with hemophilia A with or without factor VIII (FVIII) inhibitors. It is used for routine prophylaxis to prevent or decrease the frequency of bleeding episodes.

Policy/Criteria

Most contracts require pre-authorization approval of Hemlibra (emicizumab-kxwh) prior to coverage.

I. Continuation of therapy (COT): Hemlibra (emicizumab-kxwh) may be considered medically necessary for COT when criterion A **AND** B below is met.

A. One of the following (1 or 2):

1. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

OR

2. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

AND

B. "Administration, Quantity Limitations, and Authorization Period" below applies, as well as "Not Medically Necessary" for combination therapy and "Investigational Uses."

Please note: *Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve): Hemlibra (emicizumab-kxwh) may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) confirming criterion A or B below are met.

A. **Hemophilia A with high titer FVIII inhibitors**, when criteria 1 and 2 below are met:

1. A diagnosis of **hemophilia A** (congenital FVIII deficiency), established by or in consultation with a hematologist.

AND

2. Documentation of a history of high anti-FVIII titer (≥5 Bethesda units).

OR

B. **Hemophilia A without FVIII inhibitors (also referred to "with low or no titer FVIII inhibitors")**, when criteria 1 and 2 below are met:

1. A diagnosis of **hemophilia A** (congenital FVIII deficiency), established by or in consultation with a hematologist.

AND

2. ONE of the following is met (a or b):

a. There is a documented objective clinical reason that all available lower-cost FVIII blood factor products are not appropriate (as listed in *Appendix 1*).

OR

b. Prophylactically administered lower-cost factor VIII products (as listed in *Appendix 2*) have been ineffective, as defined by the patient continuing to have documented (e.g., bleed diary or detailed provider notes) clinically significant bleeding events (such as target joint bleeds or other end-organ damage) despite adherent use doses of lower-cost factor VIII products (dose and dose frequency, as listed in *Appendix 2*).

PLEASE NOTE: On-demand ("PRN") use of a factor VIII product (short half-life or extended half-life) will not meet the intent of this efficacy criteria.

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers Hemlibra (emicizumab-kxwh) coverable under the medical benefit or pharmacy benefit. Determination of coverage under the pharmacy or medical benefit is based on group-specific benefits, as defined in the group and member contract (as determined by the member contract with the health plan, regardless of self- or provider-administration).

B. When pre-authorization is approved, Hemlibra (emicizumab-kxwh) will be authorized as follows:

1. In quantities up to 3 mg/kg per week for the first 4 weeks.

2. After the initial first four doses, quantities up to 1.5 mg/kg per week (based on dosing weekly 1.5 mg/kg every week, 3 mg/kg every two weeks, or 6 mg/kg every 4 weeks) may be authorized.

3. Doses authorized will be based on the closest available vial size.

4. Doses greater than listed above are considered investigational.

C. Authorization shall be reviewed as follows:

1. Hemlibra (emicizumab-kxwh) will be authorized for up to one year.

2. Authorization **shall** be reviewed at least annually to confirm that the medication continues to be effective.

IV. Hemlibra (emicizumab-kxwh) is considered investigational when used for all other conditions.

V. Use of Hemlibra (emicizumab-kxwh) in combination with prophylactic high-cost extended half-life (EHL) FVIII products (such as those *Appendix 3*) is considered "not medically necessary."

Position Statement

Summary

- Hemlibra (emicizumab-kxwh) is a humanized monoclonal modified antibody with a bispecific antibody structure binding factor IXa and factor X. It is indicated for routine prophylaxis to prevent or reduce the frequency of bleeding episodes in adult and pediatric patients with hemophilia A (congenital factor VIII deficiency) with or without FVIII inhibitors (also referred to "low or undetectable titer FVIII inhibitors"). [1]
- The intent of the policy is to allow for coverage for Hemlibra (emicizumab-kxwh) for patients with hemophilia A for up to the FDA-approved dose, in the following patients:
  * Patients with high titer FVIII inhibitors (such that FVIII blood products would not be effective) or
  * When lower- cost FVIII blood products ("blood factor concentrates") are used but ineffective, such that a higher-cost longer-acting prophylactic hemophilia product is needed as detailed in the coverage criteria.
- In addition, the intent of the policy is to ensure ongoing use of Hemlibra (emicizumab-kxwh) is effective for reduction of bleeding and used in doses up to the coverable amount.
- Hemlibra (emicizumab-kxwh) was studied in four phase 3 trials in adult and pediatric patients with hemophilia A with or without FVIII inhibitors. It was shown to be safe and effective for reduction of bleeding in both types of patients.[1-4]
- Therapy should be individualized based on age, bleeding phenotype, weight, inhibitor status, history of bleeding episodes, and availability of factor concentrates. Patients with a suboptimal response to factor concentrates should be assessed for inhibitors.
- The primary goal of factor replacement therapy (with blood products or emicizumab) is to prevent bleeding and treat bleeding (with blood products only). A reduction in bleeding events and subsequent sequalae demonstrate the efficacy of treatment.
- Patients who continue to have spontaneous clinically significant bleeds (such target joint bleeds or other end-organ damage) or cannot maintain optimal factor levels despite adherence to adequate (FDA-recommended) doses of lower-cost factor VIII products may see benefit from higher-cost EHL FVIII products or Hemlibra (emicizumab-kxwh).
- Hemophilia A **with** FVIII inhibitors:
  * There are a limited number of treatment options for hemophilia A **with** FVIII inhibitors.
  * The Medical and Scientific Advisory Council (MASAC) states that the choice of product depends on multiple factors, including titer of inhibitor, bleed history, and previous response to products.[5]
- Hemophilia A **without** FVIII inhibitors:
  * However, there are numerous FVIII concentrate products (blood factor repletion with FVIII replacement products) available for management of hemophilia A patients without FVIII inhibitors (See *Appendices 2 and 3*).
  * FVIII concentrate products are effective for achieving hemostasis in patients without FVIII inhibitors, based on years of clinical experience.

* There is no head-to-head evidence that emicizumab prophylaxis is safer or more effective than blood product prophylactic regimens (SHL or EHL FVIII) in terms of annualized bleed rates (ABR). However, emicizumab and higher-cost EHL FVIII product prophylactic regimens are more costly than the lower-cost FVIII product prophylactic regimens. Therefore, emicizumab is coverable only when lower-cost FVIII products are ineffective, or all are medically contraindicated.

- Recommendations by the Medical and Scientific Advisory Council (MASAC) for the treatment of hemophilia without inhibitors recommends that providers discuss the risks and benefits of emicizumab compared to their existing therapy with patients, but MASAC does not endorse one treatment over another. There are numerous treatment options in this population and no distinction is made between different factor products. [6]
- Hemlibra (emicizumab-kxwh) may be covered for the dosing shown to be safe and effective in trials (up to 1.5 mg/kg every week after titration, or consolidated dosing every two or four weeks). The safety and effectiveness of higher doses have not been evaluated.[1]
- The safety and effectiveness of Hemlibra (emicizumab-kxwh) in conditions other than hemophilia A (with or without inhibitors) have not been established.
- Hemlibra (emicizumab-kxwh) is used for "baseline" prophylaxis of bleeding and may be used in combination with on-demand lower cost FVIII products (as listed in *Appendix 2*) in patients without high-titer FVIII inhibitors. However, the use of Hemlibra (emicizumab-kxwh) in combination with prophylactic high-cost extended half-life (EHL) FVIII product (as listed in *Appendix 3*) is considered "not medically necessary". There is no evidence to support that the use of high-cost EHL FVIII products are safer or more effective than lower-cost FVIII products when used in combination with Hemlibra (emicizumab-kxwh).

Clinical Efficacy

Hemophilia A with FVIII Inhibitors:

Approval of Hemlibra (emicizumab-kxwh) in hemophilia A **with** FVIII inhibitors was based on two phase 3 studies. The trials were small and of fair quality overall. [1,2]

- In a randomized, open-label trial in patients with hemophilia A with high-titer FVIII inhibitors (≥5 Bethesda units), patients were randomized to receive emicizumab prophylaxis or to no treatment. Patients could receive episodic treatment with a bypassing agent for breakthrough bleeding. The annualized bleed rate (ABR) was significantly lower in patients who received treatment with Hemlibra (emicizumab-kxwh) compared to patients who received no treatment (2.9 vs. 23.3, respectively).
- A phase 3, randomized, single-arm, open-label trial evaluated Hemlibra (emicizumab-kxwh) in pediatric patients 2 to 12 years of age with hemophilia A and FVIII inhibitors. Treatment with Hemlibra (emicizumab-kxwh) demonstrated an ABR of 0.2.
- Hemlibra (emicizumab-kxwh) has not been directly compared to bypassing agents in any disease setting.

Hemophilia A WITHOUT FVIII Inhibitors:

Approval of Hemlibra (emicizumab-kxwh) in hemophilia A **without** FVIII inhibitors was based on two phase 3 studies. The trials were small and of low quality overall. [3,4]

- In HAVEN-3, emicizumab prophylactic therapy was more effective than on-demand therapy in terms of ABR. Emicizumab use resulted in an ABR (treated bleeds) of 1.5 and 1.3, compared for 38.2 for emicizumab weekly, emicizumab every 2 weeks, and on demand treatment with factor VIII product respectively. Patients could receive episodic treatment with a factor VIII product for breakthrough bleeding.
- In HAVEN-4, emicizumab dosed every 4 weeks resulted in a decrease in ABR (treated bleeds) to 2.4. The ABR prior to treatment with emicizumab was not reported. However, at baseline, 31.7% of patients in HAVEN-4 had ≥9 bleeds in the 24 weeks prior to the trial. Patients could receive episodic treatment with a factor VIII product or bypassing agent for breakthrough bleeding.
- Hemlibra (emicizumab-kxwh) has not been directly compared factor VIII replacement products in any disease setting.

Clinical Guidelines/Standard of Care Treatment

- Factor concentrate products (blood factor replacement products) are effective for the prevention and control of bleeding versus no treatment based on years of significant clinical experience, systematic reviews, and are endorsed by clinical practice guidelines. There is insufficient evidence that any factor concentrate or bypassing agent is superior to another due to a lack of comparative trial data.
- There are numerous SHL and EHL FVIII replacement products available for hemophilia A in patients without inhibitors. Whereas in patients with inhibitors, there are only a limited number of therapeutic options, including emicizumab, and FVIII inhibitor bypassing agents, such as rFVIIa (NovoSeven and SevenFact) and activated prothrombin complex concentrate (aPCC, FEIBA). [6]
- Prophylaxis is recommended as the optimal treatment modality for individuals with severe hemophilia by the National Hemophilia Foundation. The concept was conceived from the observation that moderate hemophiliacs (clotting factor level >1 IU/dL) seldom experience spontaneous bleeding and have much better preservation of joint function.[7]
- For hemophilia A patients with inhibitors on emicizumab, MASAC recommends appropriate education on management of breakthrough bleeds, caution with bypassing agent dose, and careful laboratory monitoring should occur. In addition, due to the emergence of anti-drug antibodies, careful monitoring of the continued efficacy of emicizumab is recommended.

Safety[1]

- Hemlibra (emicizumab-kxwh) has a Boxed Warning for thrombotic microangiopathy and thromboembolism when used concurrently with aPCC at >100 U/kg/day. Additional monitoring is recommended with concomitant use of the two agents.
- Hemlibra (emicizumab-kxwh) also has a warning and precaution for laboratory coagulation test interference. Intrinsic pathway clotting-laboratory tests (e.g., activated clotting time [ACT], activated partial thromboplastin time [aPTT]) should not be used to monitor Hemlibra (emicizumab-kxwh) activity.

- The most common adverse events reported include injection site reactions, headache, and arthralgia.
- There is no evidence to allow conclusion that Hemlibra (emicizumab-kxwh) is safer than FVIII products or bypassing agents.
- The recommended dose of Hemlibra (emicizumab-kxwh) is 3 mg/kg by subcutaneous injection once weekly for the first 4 weeks, followed by 1.5 mg/kg once weekly, 3mg/kg every 2 weeks, or 6mg/kg every 4 weeks. The safety and effectiveness of higher doses have not been established.

Appendix 1: Clinical Reasons Standard Half-Life (SHL) Factor Products Are Not Appropriate
Pharmacokinetic (PK) studies demonstrate an inability to maintain factor levels within the desired range with **all** recombinant SHL factor products, dosed at FDA-recommended doses.
History of bleeds despite adherence to FDA recommended doses of **all** recombinant SHL factor products.
Documented medical contraindications to **all** recombinant SHL factor products.
Inadequate venous access for prophylactic IV therapy due to comorbidities or age.
Unable to self-administer IV therapy.

Codes	Number	Description
HCPCS	J7170	Injection, emicizumab-kxwh (Hemlibra), 0.5 mg

Appendix 2: Lower-cost Factor VIII Products for Hemophilia A		
Medication	**Recombinant or Plasma-Derived**	**FDA-recommended Prophylactic Dosing**
Standard Half-Life (SHL) FVIII Products		
Advate[8]	Recombinant	Up to 40 IU/kg every other day.
Kovaltry[9]	Recombinant	>12 years old: Up to 40 IU/kg two to three times per week. <12 years old: Up to 50 IU/kg every other day.
NovoEight[10]	Recombinant	>12 years old: Up to 50 IU/kg every other day. <12 years old: Up to 60 IU/kg every other day.
Nuwiq[11]	Recombinant	>12 years old: Up to 40 IU/kg every other day. <12 years old: Up to 50 IU/kg every other day.
Xyntha[12]	Recombinant	See FDA label for specifics of maximizing dosing.
Kogenate[13]	Recombinant	Adults: Up to 25 IU/kg three times per week. Children: Up to 25 IU/kg every other day.
Recombinate[14]	Recombinant	See FDA label for specifics of maximizing dosing.
Helixate[15]	Recombinant	Adults: Up to 25 IU/kg three times per week. Children: Up to 25 IU/kg every other day.
Hemofil M[16]	Plasma	See FDA label for specifics of maximizing dosing.
Monoclate-P[17]	Plasma	See FDA label for specifics of maximizing dosing.
Alphanate[18]	Plasma	See FDA label for specifics of maximizing dosing.
Koate-DVI[19]	Plasma	See FDA label for specifics of maximizing dosing.
Humate-P[20]	Plasma	See FDA label for specifics of maximizing dosing.
Lower-cost Extended Half-Life (EHL) FVIII Products		
Afstyla [23]	Recombinant	>12 years old: Up to 50 IU/kg 2 to 3 times per week. <12 years old: Up to 50 IU/kg every other day.

Appendix 3: High- Cost Extended Half-life (EHL) Factor VIII Products for Hemophilia A		
Medication	**Recombinant or Plasma-Derived**	**FDA- recommended Prophylactic Dosing**
Adynovate[21]	Recombinant	>12 years old: Up to 50 IU/kg two times per week. <12 years old: Initially up to 55 IU/kg two times per week with a maximum of 70 IU/kg.
Eloctate[22]	Recombinant	>6 years old: Up to 65 IU/kg every 3 to 5 days. <6 years old: Up to 65 IU/kg every 3 to 5 days. More frequent or higher doses (up to 80 IU/kg) may be required.
Jivi[24]	Recombinant	>12 years old: Up to 40 IU/kg twice weekly. <12 years old: Not approved for use in this age group.
Esperoct[25]	Recombinant	>12 years old: Up to 50 IU/kg every 4 days. <12 years old: Up to 65 IU/kg twice weekly.

Revision History

Revision Date	Revision Summary
6/20/2024	• Updated COT language for operational consistency (no change to intent). • Simplified coverage criteria for "Hemophilia A without FVIII inhibitors" (removed requirement for documentation of "no inhibitors"). No change to intent. • Change step therapy requirement from "standard half-life factor products" to "lower-cost factor VIII products."
6/15/2023	No criteria changes with this annual update.
6/17/2022	No criteria changes with this annual update.
7/16/2021	No criteria changes with this annual update.
1/20/2021	• Updated COT language, no change to intent. • Made operational improvements to step therapy requirement language. • Extended auth period from 24 weeks to one year. • Simplified reauthorization requirements.
7/22/2020	Added continuation of therapy (COT) criteria. No other changes with this annual update.
10/23/2019	• Clarification of coverage criteria, for simplification and consistency of administration, including addition of a definition of "ineffectiveness to factor VIII" (no change to intent of coverage criteria). • Updated administration requirements to reflect coverage on either the pharmacy or medical benefit as dictated by group and member specific contract decisions. • Clarification of reauthorization criteria, to include documentation of efficacy and compliance with dosing regimen. • Clarification to include use of Hemlibra (emicizumab-kxwh) in combination with prophylactic doses of EHL FVIII products is "not medically necessary."
4/25/2019	No criteria changes with this annual update.
11/16/2018	Added coverage criteria for patients with hemophilia A without inhibitors, when prophylactic FVIII concentrate (blood factor replacement) therapy is ineffective.
3/19/2018	New policy (effective 5/1/18).

Drug names identified in this policy are the trademarks of their respective owners.

Medication Policy Manual

Policy No: dru540

Topic: CGRP Monoclonal Antibodies

- Aimovig, erenumab
- Ajovy, fremanezumab
- Emgality, galcanezumab
- Vyepti, eptinezumab

Date of Origin: May 1, 2018

Committee Approval Date: March 6, 2025

Next Review Date: 2025

Effective Date: April 15, 2025

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of medication policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

CGRP monoclonal antibodies are a type of medication used to prevent migraine and cluster headaches. They work by blocking calcitonin gene-related peptide (CGRP) or its receptor.

Policy/Criteria

Most contracts require pre-authorization approval of CGRP monoclonal antibodies prior to coverage.

I. Continuation of therapy (COT): CGRP monoclonal antibodies may be considered medically necessary for COT when criteria A AND B below are met.

A. One of the following (1, 2, or 3):

1. For diagnoses NOT listed in the coverage criteria below, full policy criteria below must be met for coverage.

OR

2. For diagnoses listed in the coverage criteria below, criteria a and b below must be met:

a. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

b. There is attestation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

3. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

AND

B. **For Vyepti (eptinezumab) only:** Site of care administration requirements are met [refer to Medication Policy Manual, Site of Care Review, dru408].

***Please note**: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): CGRP monoclonal antibodies may be considered medically necessary when attestation that criteria A AND B are met.

A. **One of the following is met (1 or 2):**

1. **Migraine headache prophylaxis** when criteria a through d below are met:

a. A diagnosis of **episodic or chronic migraine headaches**.

AND

b. Baseline headache days per month, including number of migraines and migraine frequency, severity, and characteristics.

AND

c. An adequate trial of at least one prophylactic therapy, as specified in criteria i through iii below was ineffective, not tolerated, or contraindicated:

i. Topiramate **OR** divalproex sodium (Depakote).

OR

ii. A beta blocker (such as propranolol, metoprolol, or atenolol).

OR

iii. Venlafaxine **OR** a tricyclic antidepressant (such as amitriptyline or nortriptyline).

AND

d. **For Vyepti (eptinezumab) only**, treatment with all the following (i through iii) have been ineffective, not tolerated, or are contraindicated:

i. Aimovig (erenumab).

AND

ii. Ajovy (fremanezumab).

AND

iii. Emgality (galcanezumab).

OR

2. **Episodic cluster headaches prophylaxis** for **Emgality (galcanezumab) only**, attestation that criteria a through d below are met:

a. The patient has a diagnosis of **episodic cluster headache** as confirmed by all the following (criteria i through iii):

i. The patient has had at least 5 cluster headache attacks.

AND

ii. The patient has at least two cluster periods lasting 7 to 365 days.

AND

iii. The patient's cluster periods are separated by a pain-free remission period of at least 3 months.

AND

b. Baseline cluster headache attacks per week and cluster headache frequency, severity, and characteristics.

AND

c. An evaluation has been performed to assess for rebound headaches caused by medication use [medication overuse headache (MOH)] and the patient does not suffer from rebound or MOH. Medications that may be associated with rebound headache include, but are not limited to, more than 12 doses per month of narcotics, triptans, caffeine, and NSAIDs.

AND

d. An adequate trial of at least one prophylactic therapy, as specified in criteria i through iv below, was ineffective, not tolerated, or contraindicated:

i. Verapamil.

OR

ii. Melatonin.

OR

iii. Corticosteroids [such as prednisone, methylprednisolone (Medrol Dose Pak, etc.)].

OR

iv. Lithium.

AND

B. **For Vyepti (eptinezumab) only:** Site of care administration requirements are met [refer to Medication Policy Manual, Site of Care Review, dru408].

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers Aimovig (erenumab) and Emgality (galcanezumab) coverable only under the pharmacy benefit (as self-administered medications).

B. Regence Pharmacy Services considers Vyepti (eptinezumab) coverable only under the medical benefit (as a provider-administered medication).

C. Regence Pharmacy Services considers Ajovy (fremanezumab) coverable under the pharmacy benefit (as a self-administered medication) OR coverable under the medical benefit (as a provider-administered medication).

D. When pre-authorization is approved, monoclonal antibodies for migraine prevention may be authorized as follows:

1. **Initial authorization**:

a. **Aimovig (erenumab):** Up to 140 mg once monthly for six months.

b. **Ajovy (fremanezumab):** Up to 225 mg once monthly OR up to 675 mg every three months for six months.

c. **Vyepti (eptinezumab):** Up to 100 mg once every 3 months for six months.

d. **Emgality (galcanezumab):**

i. Migraine: Up to 240 mg loading dose once, followed up to 120 mg once monthly for six months.

ii. Cluster Headache: Up to 300 mg loading dose, followed up to 300 mg once monthly for six months.

2. **Continued authorization**: Continued authorization **shall** be reviewed at least annually. Attestation is required to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, such as headache relief or symptom improvement. This includes an improvement in functional impairment, and at least a 50% reduction in migraine frequency or cluster headache attacks, or at least a 50% reduction in severity relative to baseline migraine frequency and severity, as measured by a reduction in the need for acute therapies, additional acute care, missed school/work, or ability to perform activities of daily living (ADLs).

a. **Aimovig (erenumab):** Up to 140 mg once monthly for twelve months.

b. **Ajovy (fremanezumab):** Up to 225 mg every month for twelve months (12 doses per 12 months) OR up to 675 mg every three month for twelve months (4 doses per 12 months).

c. **Vyepti (eptinezumab):** Up to 100 mg once every 3 months for twelve months. Up to 300 mg every 3 months may be authorized in patients who have had an inadequate response to the 100 mg dose after at least six months.

d. **Emgality (galcanezumab)**:

i. Migraine: Up to 120 mg once monthly for twelve months.

ii. Cluster headache: Up to 300 mg once monthly for twelve months.

IV. Investigational uses:

A. CGRP monoclonal antibodies are considered investigational for all other indications not specified in the coverage criteria above, including chronic daily headache (CDH), tension headache, cervicogenic headache, and menstrual migraines.

B. Coadministration or combination use of any two *prophylactic* CGRP receptor antagonists (oral or injectable agents).

Position Statement

- Medications in this policy are monoclonal antibodies which target calcitonin gene-related peptide (CGRP). They are approved for the prevention of chronic and episodic migraines. Emgality (galcanezumab) is also approved for episodic cluster headaches.
- The intent of the policy is to allow coverage of CGRP monoclonal antibodies for patients with episodic or chronic migraine headaches or cluster headaches who have failed other standard of care preventative ("prophylactic") measures. Coverage of certain CGRP products is restricted to use only when treatment with preferred CGRP products have been ineffective, not tolerated, or contraindicated.
- Frequent migraine headaches may be classified as either episodic or chronic. Episodic migraine is defined as having migraine headaches for up to 14 days per month. Chronic migraine is defined as having 15 or more headache days per month for at least 3 months. [1-3]
- The starting does of Vyepti (eptinezumab) is 100 mg intravenously (IV) every 3 months, but some patients may benefit from 300 mg every 3 months. In clinical trials, patients received placebo, 100 mg, or 300 mg every three months. Both doses were superior to placebo, but the 100 mg and 300 mg doses were not compared to each other. While the 300 mg dose did appear reduce migraine days slightly more than the 100 mg dose, the differences were small and may not have been clinically meaningful. Therefore, due to similar efficacy between both doses through at least 6 months, use of the higher dose 300 mg is limited to patients who have had an inadequate response to at least two doses of Vyepti (eptinezumab) 100 mg. Additional studies are needed to determine when dose escalation is necessary and to identify if certain patients would benefit from higher doses initially.[4]
- There is no evidence directly comparing monoclonal CGRP inhibitors to oral preventative medications for migraine or cluster headaches.
- Because no CGRP monoclonal antibody migraine medication has been shown to be more effective than another, the preferred products offer members the best value. The long-term safety and durability of effect for any of these medications has not been established in the medical literature.

Use of Oral Prophylactic Therapies

- Migraines [5]:
    * A recent update (2024) to the American Headache Society's (AHS) position statement on the prevention of migraines included the addition of anti-CGRP monoclonal antibodies, oral Nurtec (rimegepant) and Qulipta (atogepant) as first line agents to be considered *along with*, and *not* a replacement for, current, well-established, first-line prophylactic treatment options such as topiramate, divalproex sodium, certain beta blockers, certain tricyclic antidepressants etc. However, given the absence of direct comparison trials between anti-CGRP agents and currently recommended first line prophylactic therapies, and somewhat limited long-term safety and efficacy evidence of anti-CGRP agents relative to other first line treatments, it is currently unknown which of the above agents, if any, is more efficacious or safer than another. Therefore, the best value

for prophylactic treatment is with agents that have established long-term efficacy and familiar safety profiles, and that are less costly.

    * Carbamazepine and a variety of select antihypertensives (candesartan, lisinopril, clonidine, guanfacine, or pindolol) are possibly effective; however, the many other prophylactic alternatives with higher-quality evidence should be used first.
    * Many other medications, including but not limited to, selective serotonin receptor inhibitors (SSRIs; e.g., fluoxetine, fluvoxamine), other SNRIs (e.g. duloxetine), other AEDs (gabapentin, lamotrigine, and oxcarbazepine), calcium channel blockers (CCBs; e.g. nicardipine, nifedipine, verapamil), and clonazepam, have been studied in migraine prophylaxis, but evidence supporting their efficacy is conflicting, inadequate, or negative (i.e., support the therapy is ineffective).

- Episodic cluster headaches[6]
    * The AHS guidelines recognize suboccipital steroid injections, lithium, verapamil, warfarin, and melatonin as possible treatment options for the prevention of episodic cluster headaches.

Summary

CLINICAL EFFICACY - MIGRAINES

- Erenumab is approved for the prevention of episodic and chronic migraine headaches based on phase 2 and 3 trials at doses of 70 or 140 mg administered as a subcutaneous injection every 4 weeks. [7-11] While erenumab demonstrated a statistically significant reduction in migraine days per month compared to placebo, the magnitude of difference is small and limited to 12 to 24 weeks of efficacy data.
- Fremanezumab is approved for the prevention of episodic and chronic migraine headaches in phase 3 trials at doses of 225 mg administered as a subcutaneous injection every four weeks or 675 mg quarterly (every 12 weeks). Fremanezumab demonstrated a statistically significant, yet marginal reduction in migraine days per month compared to placebo in 12 weeks trials.[12 13]
- Galcanezumab has been studied for the prevention of episodic migraine headaches in a phase 3 trials at doses of 120 and 240 mg administered as a subcutaneous injection every 4 weeks. Galcanezumab demonstrated a statistically significant, yet marginal reduction in migraine days per month compared to placebo in 6-month trials.[14 15]
- [16]
- Eptinezumab is approved for the preventive treatment of migraine in adults based on two phase 3 trials at doses of 100 mg and 300 mg administered intravenously every 3 months. Eptinezumab demonstrated statistically significant, yet marginal reductions in monthly migraine days compared to placebo in patients with episodic and chronic migraine.[17 18]
- The starting does of Vyepti (eptinezumab) is 100 mg intravenously (IV) every 3 months, but some patients may benefit from 300 mg every 3 months. In clinical trials, patients received placebo, 100 mg, or 300 mg every three months. Both doses were superior to placebo, but the 100 mg and 300 mg doses were not compared statistically.
    * In a trial in episodic migraine the 100 mg and 300 mg doses reduced mean migraine days by 3.9 and 4.3 days at 3 months, respectively.[17]

    * In the CM study, 100 mg and 300 mg doses reduced mean migraine days by 7.7 and 8.2 at 3 months, respectively.[19]
    * In both trials, efficacy was also similar for months 3 to 6.
- While the 300 mg dose did appear reduce migraine days slightly more than the 100 mg dose, the differences were small and may not have been clinically meaningful. Therefore, due to similar efficacy between both doses through at least 6 months, use of the higher dose 300 mg is limited to patients who have had an inadequate response to at least two doses of Vyepti (eptinezumab) 100 mg. Additional studies are needed to determine when dose escalation is necessary and to identify if certain patients would benefit from higher doses initially.[4]

CLINICAL EFFICACY – CLUSTER HEADACHES

- Galcanezumab brings uncertain value to the treatment of cluster headaches.
    * Galcanezumab has been studied for the prevention of episodic cluster headache attacks in a phase 3 trial at a dose of 300 mg administered as a subcutaneous injection at the onset of the cluster headache and once monthly thereafter until the end of the cluster period.
    * While the galcanezumab trial demonstrated a statistically significant reduction in cluster headache attacks compared to placebo at 3 weeks the treatment effect was similar to placebo at week 8. Additionally, the magnitude of difference is small, there are significant limitations in the applicability of the data, and very limited experience beyond 8 weeks.[16]

INVESTIGATIONAL USES

- There are no published clinical trials evaluating the efficacy or safety of combination use of prophylactic oral or prophylactic injectable agents with each other.
- In clinical trials involving oral prophylactic agents [Nurtec (rimegepant) or Qulipta (atogepant)], the use of injectable prophylactic CGRP agents was not allowed. Therefore, it is uncertain if combination use of prophylactic agents (oral or injectable) provides cumulative benefit over a single medication alone. There is also limited safety data on combined use of injectable and oral CGRP inhibitors with each other.

SAFETY [4 20-22]

- The long-term safety of all CGRP-targeted therapies has yet to be established in large populations. Given the mechanism of action of CGRP inhibitors, long-term safety data is needed to assess any unknown risks of long-term inhibition of CGRP and its receptor.
- In 12- to 24-week clinical trials, the most reported reactions were injection site reactions, upper respiratory tract infections, nausea, nasopharyngitis, constipation, muscle spasms, and migraine.

DOSING CONSIDERATIONS

- For migraine prophylaxis:
    * Erenumab is dosed as 70 mg subcutaneous injection every 4 weeks. Some patients may benefit from a dosage of 140 mg once monthly.
    * Fremanezumab is dosed as 225 mg subcutaneous injection every month or consolidated to 675mg every three months.

* Eptinezumab is dosed as 100 mg intravenously every 3 months. Some patients may benefit from a dosage of 300 mg.
* Galcanezumab is dosed as 240 mg loading dose (administered as two consecutive injections of 120 mg each), followed by 120 mg every month.

- For cluster headache prophylaxis, galcanezumab is dosed as 300 mg at the onset of an attack (administered as three consecutive injections of 100 mg each), followed by 300 mg every month.

Appendix 1: International Headache Society Classification of Chronic Migraine Headache [3]

A. Headache (tension-type and/or migraine) on 15 or more days per month for at least 3 months.*

B. Occurring in a patient who has had at least 5 attacks fulfilling criteria for a migraine without an aura.

C. On 8 or more days per month for at least 3 months headache has fulfilled criteria for pain and associated symptoms of migraine without aura in either or both of criteria 1 or 2 below:

1. At least two of the following criteria a), b), c), and d) below are met:
   a) Unilateral location
   b) Pulsating quality
   c) Moderate or severe pain intensity
   d) Aggravation by or causing avoidance of routine physical activity (e.g., walking or climbing stairs)

   AND at least one of the following criteria e) or f) below are met:
   e) Nausea and/or vomiting
   f) Photophobia and phonophobia
2. Treated and relieved by triptan(s) or ergot before the expected development of the above symptoms.

D. No medication overuse and not attributed to another causative disorder.

* Characterization of frequently recurring headache generally requires a headache diary to record information on pain and associated symptoms day-by-day for at least one month. Sample diaries are available at HEADACHE-DIARY.pdf (headaches.org).

Appendix 2: International Headache Society Classification of Episodic Cluster Headache [3]

A. At least five attacks fulfilling criteria B-D

B. Severe or very severe unilateral orbital, supraorbital and/or temporal pain lasting 15-180 minutes (when untreated)

C. Either one or both of the following:

1. At least one of the following symptoms or signs, ipsilateral to the headache:
    a) conjunctival injection and/or lacrimation
    b) nasal congestion and/or rhinorrhea
    c) eyelid edema
    d) forehead and facial sweating
    e) miosis and/or ptosis
2. A sense of restlessness or agitation.

D. Occurring with a frequency between one every other day and 8 per day.

E. Not better accounted for by another diagnosis.

Episodic Cluster Headache Criteria:

A. Attacks fulfilling criteria for Cluster headache and occurring in bouts (cluster periods)

B. At least two cluster periods lasting from 7 days to 1 year (when untreated) and separated by pain-free remission periods of ≥3 months.

Revision History

Revision Date	Revision Summary
3/6/2025	Updated requirements from documentation to attestation. Removed specialist requirement for Emgality for cluster headaches.
12/12/2024	Updated investigational uses (combination use of any prophylactic agents with each other, oral or injectable).
12/07/2023	Updated criteria for migraine prophylactic therapy: removed specialist requirement for improved access and treatment of migraines by PCPs. Note: Kept specialist requirement for episodic cluster headache prophylaxis indication only for Emgality (galcanezumab).
9/14/2023	No criteria changes with this annual review. Updating to align with changes to dru635, Self-administered CGRP antagonists and 5-HT 1f agonists.
12/9/2022	• Added updated guideline consensus statement. • No criteria changes with this update
10/15/2021	• Added Site of Care requirements for Vyepti (eptinezumab). • Removed preferred product step therapy requirements for Ajovy (fremanezumab). • Updated benefit and administration language section.
1/20/2021	Updated Continuation of Therapy (COT) language. No change to intent of policy or COT.
10/28/2020	Removed migraine criterion related to medication overuse headache (MOH).
7/22/2020	• Add Continuation of Therapy (COT) language. • Added Vyepti (eptinezumab) to policy (effective 8/15/20).
10/23/2019	Added coverage criteria for Emgality (galcanezumab) use in episodic

Revision Date	Revision Summary
	cluster headaches. Limits use of Emgality (galcanezumab) for the prevention of episodic cluster headaches in patients that are refractory or have a contraindication to low-cost preventative therapy option (effective 1/1/2020).
1/31/2019	No criteria change with this annual update.
12/17/2018	Revised step therapy criteria.
11/16/2018	Clarified intent of policy.
10/19/2018	Emgality now FDA approved. Added FDA dosing and benefit coverage.
9/21/2018	• Ajovy now FDA approved. Added FDA dosing and benefit coverage. • Clarified intent of documenting baseline migraine headache frequency and severity in the criteria. No change to intent.
8/17/2018	Added criteria for use in episodic migraine.
4/20/2018	New policy.

Medication Policy Manual | **Policy No:** dru541

Topic: Supprelin LA, histrelin acetate implant | **Date of Origin:** November 1, 2018

Committee Approval Date: October 28, 2020 | **Next Review Date:** October 2021

Effective Date: January 1, 2021

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Histrelin implant (Supprelin LA) is a gonadotropin releasing hormone (GnRH) indicated for the treatment of children with central precocious puberty (CPP). It is available as a subcutaneous implant, which is inserted by a healthcare professional and dosed every 12 months.

Policy/Criteria

Most contracts require pre-authorization approval of histrelin implant (Supprelin LA) prior to coverage.

I. Continuation of therapy (COT): Histrelin implant (Supprelin LA) may be considered medically necessary for COT when full policy criteria below are met, including quantity limit.

Please note: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan

II. Histrelin implant (Supprelin LA) is considered not medically necessary for all indications.

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers histrelin implant (Supprelin LA) to be a self-administered medication. provider-administered medication.

B. When pre-authorization is approved, histrelin acetate (Supprelin LA) may be authorized in quantities of up to one implant every 12 months.

C. Authorization may be reviewed at least annually. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met and that the medication is providing clinical benefit, such as disease stability or improvement.

Position Statement

Summary

- Histrelin implant (Supprelin LA) is a GnRH product indicated for the treatment of children with central precocious puberty (CPP). [1]
- Vantas, another histrelin subcutaneous implant product dosed every 12 months, is available without pre-authorization review (as of the Effective Date of this policy). For details of other available GnRH agonists, see *Appendix 1*.
- Other GnRH products including leuprolide (Lupron Depot-Ped), nafarelin (Synarel), and triptorelin (Triptodur) are available for the treatment of CPP. These products vary by the route of administration, dosing, and duration of action (See *Appendix 1*).
- Consensus guidelines equally recommend treatment with the GnRH agonists, but do not recommend one specific option over another, including dosage form. [2]
- Other GnRH products are available that provide better value. Histrelin implant (Supprelin LA) has not been proven to be safer or more effective than other products, but may be more costly than other GnRH treatment alternatives.
- The recommended dose of histrelin acetate (Supprelin LA) is one implant every 12 months. The implant is inserted subcutaneously and provides continuous release of histrelin for 12 months.

Clinical Efficacy

- Approval of histrelin implant (Supprelin LA) in the treatment of CPP was demonstrated in two, single-arm, open label studies. In both trials, suppression of luteinizing hormone was induced in all treatment-naïve subjects and maintained in all pretreated subjects at month 1 after implantation and continued through month 12. [3,4]
- There are no clinical trials demonstrating that one GnRH is superior to another in the treatment of children with CPP, in terms of either safety or efficacy.
- Evidence-based recommendations for CPP have determined that GnRH agonists are all effective despite their differences in routes of administration, dosing, and duration of action. No one product is recommended over another; however, depot preparations are often preferred because of improved compliance. [2]

APPENDIX 1

Medication	FDA Approved Indication	Dosing	Route	Administration/ Benefit	Cost (AWP)
Histrelin acetate (Supprelin LA)	Central precocious puberty in children	One 50 mg implant every 12 months inserted SC in the inner aspect of the upper arm, delivering approximately 65 mcg histrelin per day over 12 months	SC implant	Provider/Medical	$47,000/year
Histrelin acetate (Vantas) [a]	Palliative treatment of advanced prostate cancer	One 50 mg implant for 12 months inserted SC in the inner aspect of the upper arm, delivering approximately 41 mcg histrelin per day over 12 months.	SC implant	Provider/Medical	$5,600/year
Leuprolide (Lupron Depot-Ped) [a]	Central precocious puberty in children	1-month suspension depot: 7.5 mg to 15 mg IM once every month based on weight 3-month suspension depot: 11.25 mg or 30 mg IM every 3 months	IM injection	Provider/Medical	1-month suspension depot: $24,200 to $48,400/year 3-month suspension depot: $43,900 to $48,400/year
Leuprolide (Fensolvi) *	Central precocious puberty in children	6-month suspension depot: 45 mg SC injection every 6 months	SC Injection	Provider/Medical	$54,000/year
Nafarelin (Synarel) [a]	Central precocious puberty in children	Two sprays (400 µg) into each nostril in the morning (4 sprays) and two sprays into each nostril in the evening (4 sprays), a total of 8 sprays (1600 µg) per day.	Nasal spray	Self-administered/ Retail	$122,000/year
Triptorelin (Triptodur) [a]	Central precocious puberty in children	22.5 mg IM injection once every 24 weeks	IM injection	Provider/Medical	$41,300/year

[a] Available without pre-authorization

IM: intramuscular; SC: subcutaneous

Medication Policy Manual | **Policy No:** dru545

Topic: Lutathera, lutetium Lu 177 dotatate | **Date of Origin:** August 1, 2018

Committee Approval Date: June 20, 2024 | **Next Review Date:** 2025

Effective Date: September 1, 2024

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Lutathera (lutetium Lu 177 dotatate) is a radioactive injectable drug that is used for the treatment of specific gastroenteropancreatic neuroendocrine tumors (GEP-NETs) (somatostatin receptor-positive).

Policy/Criteria

Most contracts require pre-authorization approval of Lutathera (lutetium Lu 177 dotatate) prior to coverage.

I. Continuation of therapy (COT): Lutathera (lutetium Lu 177 dotatate) may be considered medically necessary for COT when criterion A, B, or C, AND D below is met

A. For diagnoses NOT listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND there is documentation that the medication was covered by another health plan. Examples of documentation include the coverage approval letter from the previous health plan or paid claim.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

B. For diagnoses listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

2. There is documentation of clinical benefit, such as disease stability.

OR

C. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

AND

D. "Administration, Quantity Limitations, and Authorization Period" below applies.

Please note*: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New Starts (treatment-naïve patients): Lutathera (lutetium Lu 177 dotatate) may be considered medically necessary when there is clinical documentation (including, but not limited to chart notes) that criteria A, B, and C below are met.

A. A diagnosis of unresectable, locally advanced, or metastatic **gastroenteropancreatic neuroendocrine tumors** (GEP-NETs) of the gastrointestinal tract and pancreas (such as foregut, midgut, and hindgut).

AND

B. Documentation confirming all criteria (1, 2, and 3) below:

1. One of the following is met (a or b):

a. Low or intermediate grade GEP-NET, with a documented Ki67 index ≤20%.

OR

b. The GEP-NET is well-differentiated

AND

2. Positive somatostatin receptor expression of NETs, as detected by somatostatin receptor-based imaging, such as documented uptake on an octreotide scan (octreotide scintigraphy).

AND

3. Progressive disease despite treatment with a somatostatin analog (octreotide or lanreotide) for at least 12 weeks duration.

AND

C. Use in combination with a long-acting somatostatin analog (either Sandostatin LAR [octreotide LAR] or Somatuline [lanreotide]).

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers Lutathera (lutetium Lu 177 dotatate) coverable only under the medical benefit (as a provider-administered medication).

B. When pre-authorization is approved, Lutathera (lutetium Lu 177 dotatate) may be authorized in quantities of 7.4 GBq (200 mCi) for a total of 4 doses per lifetime.

IV. Lutathera (lutetium Lu 177 dotatate) is considered investigational when used for all other conditions including but not limited to:

A. Bronchial NETs.

B. Thymus NETs.

Position Statement

Summary

- Lutathera (lutetium Lu 177 dotatate) is a radiolabeled somatostatin analog indicated for the treatment of somatostatin receptor-positive GEP-NETs in adults. [1]
- The intent of this policy is to limit coverage of Lutathera (lutetium Lu 177 dotatate) to patients with GEP-NETs (low or intermediate grade or well-differentiated) with positive somatostatin receptor expression who have progressive disease despite treatment with a somatostatin analog.
- GEP-NETs are tumors originating in the neuroendocrine cells of the gastrointestinal system or pancreas including those arising from the foregut (stomach and pancreas), midgut (distal small intestine and proximal colon), and hindgut (distal colon and rectum). [2]
- Lutathera (lutetium Lu 177 dotatate) is a first-in-class peptide receptor radionuclide therapy (PRRT). In PRRT, a cell-targeting peptide is combined with a radionuclide to create a radiopeptide. When administered into the bloodstream, the radiopeptide travels and binds to the neuroendocrine tumor cells, delivering a high dose of radiation to the

cancer. [2]

- The safety and efficacy of Lutathera (lutetium Lu 177 dotatate) was established in a phase 3, multicenter, open-label trial, given in combination with octreotide LAR. [3]
- There are no clinical trials that have demonstrated a superior benefit of Lutathera (lutetium Lu 177 dotatate) in combination with somatostatin analogs as first-line therapy over somatostatin analogs alone.
- Serious adverse effects associated with Lutathera (lutetium Lu 177 dotatate) include risk from radiation exposure, myelosuppression, secondary myelodysplastic syndrome, renal toxicity, hepatotoxicity, neuroendocrine hormonal crisis, embryo-fetal toxicity, and risk of infertility. [1]
- The recommended dose of Lutathera (lutetium Lu 177 dotatate) is 7.4 GBq (200 mCi) every 8 weeks for a total of 4 doses. The safety and effectiveness of higher doses have not been established. [1]
- Lutathera (lutetium Lu 177 dotatate) is administered in addition to treatment with octreotide LAR and short-acting octreotide for symptom control. Patients treated with Lutathera (lutetium Lu 177 dotatate) are also recommended to receive intravenous (IV) amino acid solutions throughout the Lutathera (lutetium Lu 177 dotatate) infusion and premedication with antiemetics.
- The National Comprehensive Cancer Network (NCCN) guideline recommends the use of Lutathera (lutetium Lu 177 dotatate) as a treatment option for locoregional advanced and/or metastatic somatostatin receptor-positive gastrointestinal tumors (category 1 for mid-gut tumors), pancreatic neuroendocrine tumors, after disease progression on octreotide or lanreotide. [4]
- Evidence to support the safety and effectiveness of Lutathera (lutetium Lu 177 dotatate) in other neuroendocrine tumors is lacking.

Clinical Efficacy

- The efficacy of Lutathera (lutetium Lu 177 dotatate) was evaluated in a phase 3, multicenter, open-label trial. [3]
    * Patients with midgut GEP-NETs who had disease progression despite treatment with octreotide were randomized to receive treatment with Lutathera (lutetium Lu 177 dotatate) every 8 weeks for four doses plus long-acting octreotide for symptom control, or to receive treatment with long-acting octreotide every 4 weeks.
    * Patients treated with Lutathera (lutetium Lu 177 dotatate) also received IV amino acid solution throughout the Lutathera infusion.
- The primary endpoint was progression-free survival (PFS), defined as the time from randomization to disease progression or death from any cause. At the time of study publication, PFS was not reached in patients receiving treatment with Lutathera (lutetium Lu 177 dotatate) plus octreotide compared to 8.4 months in patients receiving octreotide alone. [3]
- PFS has not been shown to correspond with improvement in any clinically relevant outcome such as improved overall survival, symptom control, or quality of life in patients

with GEP-NETs.

- The clinical trial for the FDA approval only included patients with Ki67 index of less than 20%. However, “well-differentiated NET" and tumor somatostatin receptor expression are considered the key eligibility criteria for response to Lutathera (lutetium Lu 177 dotatate) therapy. [4]

Guidelines

- Current guidelines by the NCCN include Lutathera (lutetium Lu 177 dotatate) as a category 2A treatment option for locoregional advanced and/or metastatic somatostatin receptor-positive gastrointestinal tumors (category 1 for progressive mid-gut tumors), or pancreatic neuroendocrine tumors after disease progression on octreotide or lanreotide. [4]

Investigational Uses

- Early phase studies evaluating Lutathera (lutetium Lu 177 dotatate) included small numbers of patients with bronchial and thymus NETs. Further trials with larger patient populations are needed to establish a clinical benefit.

Regence Pharmacy Services performs independent analyses of oncology medication evidence, to establish coverability per the contracts with the health plan.

- Most contracts define coverability based on established clinical benefit in published, peer-reviewed literature, along with consideration of regulatory status.
- FDA approval does not in itself establish medical necessity, as unpublished, low-quality evidence, including exploratory analyses and unvalidated surrogate endpoints, may be used as the basis of approval. Regulatory approval may or may not reflect clinical benefit relative to standard of care and the recommendations of expert clinical advisors such as the Oncologic Drugs Advisory Committee (ODAC). FDA approvals generally do not consider cost compared to established therapies, or value to members.
- Likewise, NCCN clinical practice guidelines assignment of a recommendation (category 1, 2a, or 2b) does not necessarily establish medically necessity. NCCN recommendations are inconsistently supported by published, peer-reviewed literature and do not uniformly consider value of new therapies relative to existing potentially higher-value treatment options, considering effectiveness, safety, and cost.
- Medication coverage criteria are developed based on the ‘medical necessity’ assessment, as described above.

Regence Pharmacy Services analysis and coverage policy may differ from FDA labeled indication and/or NCCN clinical practice guidelines.

Safety [1]

- Serious adverse effects associated with Lutathera (lutetium Lu 177 dotatate) include risk from radiation exposure, myelosuppression, secondary myelodysplastic syndrome, renal toxicity, hepatotoxicity, neuroendocrine hormonal crisis, embryo-fetal toxicity, and risk of infertility.

Dosing [1]

- The recommended dose of Lutathera (lutetium Lu 177 dotatate) is 7.4 GBq (200 mCi) every 8 weeks for a total of 4 doses. There is no high-quality evidence to support more frequent or more than 4 doses per lifetime.
- Before initiating treatment, long-acting somatostatin analogs should be discontinued for at least 4 weeks and short-acting octreotide at least 24 hours prior to each Lutathera (lutetium Lu 177 dotatate) dose.
- During Lutathera (lutetium Lu 177 dotatate) treatment, long-acting octreotide is administered intramuscularly after each dose and short-acting octreotide is used for symptomatic management.
- Following treatment, long-acting octreotide is given every 4 weeks after completing Lutathera (lutetium Lu 177 dotatate) until disease progression or for up to 18 months following treatment initiation.
- Intravenous amino acid solutions are administered before Lutathera (lutetium Lu 177 dotatate) and continued after infusion. Antiemetics are recommended before the amino acid solution.

Medication Policy Manual | **Policy No:** dru547

Topic: Crysvita, burosumab-twza | **Date of Origin:** August 1, 2018

Committee Approval Date: September 19,2024 | **Next Review Date:** 2025

Effective Date: December 1, 2024

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of medication policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Crysvita (burosumab-twza) is a medication used to treat specific bone conditions [X-linked hypophosphatemia (XLH) and tumor-induced osteomalacia (TIO)]. Crysvita (burosumab-twza) is given by subcutaneous (SC) injection.

Policy/Criteria

Most contracts require pre-authorization of Crysvita (burosumab-twza) prior to coverage.

I. Continuation of therapy (COT): Crysvita (burosumab-twza) may be considered medically necessary for COT when criterion A, B, or C below is met.

A. For diagnoses NOT listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND there is documentation that the medication was covered by another health plan. Examples of documentation include the coverage approval letter from the previous health plan or paid claim.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

B. For diagnoses listed in the coverage criteria below, criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

2. There is documentation of clinical benefit, such as disease stability as detailed in the reauthorization criteria.

OR

C. The medication was initiated for acute disease management, as part of an acute unscheduled, inpatient hospital admission.

Please note*: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment naïve): Crysvita (burosumab-twza) may be considered medically necessary when there is clinical documentation (including chart notes) that criterion A or B below is met:

A. A diagnosis of **tumor-induced osteomalacia** (TIO) when the diagnosis is established by or in consultation with an endocrinologist or other specialist with experience with metabolic bone health.

OR

B. A diagnosis of **X-Linked Hypophosphatemia** (XLH) when criteria 1 through 4 below are met:

1. The diagnosis is established by or in consultation with an endocrinologist or other specialist with experience with metabolic bone health.

AND

2. The diagnosis of XLH is confirmed by:

a. Clinical documentation of genetic testing showing a mutation in the phosphate-regulating endopeptidase homolog X-linked (PHEX) gene.

OR

b. Elevated FGF23 levels AND biochemical findings consistent with XLH including all the following:

1. Hypophosphatemia.

2. Low-normal 1,25(OH)2D.

3. Elevated serum alkaline phosphatase (Alk phos).

4. Normal serum calcium.

AND

3. Documented clinical manifestations of symptomatic XLH, including, but not limited to, at least one of the following symptoms:

a. Radiographic evidence of active bone disease, including active fractures.

b. **Pediatric only:** Short stature, defined as two standard deviations (3rd percentile) or more below for height by age and gender, or declining growth rate (as documented with provided standard growth charts).

c. Skeletal pain or deformities.

d. Tooth abscesses.

AND

4. Activated vitamin D and phosphate supplements are ineffective (as defined by symptomatic XLH) after use for at least 12 months, unless the use of both are not tolerated or are contraindicated (see *Appendices 1, 2, and 3*). If unable to tolerate phosphate supplements, dose lowering attempts must be made to achieve the maximally tolerated therapeutic doses.

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers Crysvita (burosumab-twza) coverable only under the medical benefit (as a provider-administered medication).

B. When pre-authorization is approved, Crysvita (burosumab-twza) may be authorized in quantities defined in *Tables 1* and *2* below.

Table 1: Tumor-Induced Osteomalacia (TIO) Authorization Quantity Limits (QL) and Review Criteria

	Initial Authorization	Continued Authorization
Pediatric QL	• Doses up to 0.4 mg/kg every two weeks (minimum of 10 mg and not to exceed 180 mg per dose). • Doses up to 2 mg/kg every two weeks (not to exceed 180 mg per dose) may be authorized if there is clinical documentation of an inadequate response to 0.4 mg/kg every two weeks. Inadequate response is defined as not achieving a normal serum phosphorus.	
	6 doses in 12 weeks	26 doses per 52 weeks
Adult QL	• Doses up to 0.5 mg/kg every four weeks (minimum of 10 mg and not to exceed 180 mg per dose). • Doses up to 2 mg/kg every four weeks (not to exceed 180 mg per dose) may be authorized if there is clinical documentation of an inadequate response to 0.5 mg/kg every four weeks. Inadequate response is defined as not achieving a normal serum phosphorus.	
	3 doses in 12 weeks	13 doses per 52 weeks
Reauthorization Review Criteria	**Initial Authorization: Shall** be reviewed at 12 weeks. Ongoing coverage of Crysvita (burosumab-twza) requires clinical documentation, including chart notes, that there is normalization of serum phosphorus (within laboratory's normal range, or see *Appendix 1*). If there are persistently low serum phosphorus levels after 12 weeks, no further Crysvita (burosumab-twza) will be authorized.	**Continued Authorization: Shall** be reviewed at least annually. Ongoing coverage of Crysvita (burosumab-twza) requires clinical documentation, including chart notes, that there is ongoing disease improvement defined by 1 and 2 below: **1.** Normalization of serum phosphorus (within laboratory's normal range, or see *Appendix 1*). **AND** **2.** At least one of the following: **a.** Improvement of skeletal deformities. **b.** Improvement in growth velocity. **c.** Radiographic evidence of reduced bone disease activity and/or epiphyseal healing. **d.** Reduction in tooth abscesses. **e.** Reduction in bone pain (as documented by a validated pain scale, functional improvement in ADLs, and a reduction in the use of pain medication).

Table 2: X-Linked Hypophosphatemia (XLH) Authorization Quantity Limits (QL) and Review Criteria

	Initial Authorization	Continued Authorization
Pediatric QL	• Doses up to 0.8 mg/kg every two weeks (minimum of 10 mg and not to exceed 90 mg per dose). • Doses up to 2 mg/kg every two weeks (not to exceed 90 mg per dose) may be authorized if there is clinical documentation of an inadequate response to 0.8 mg/kg every two weeks. Inadequate response is defined as not achieving a normal serum phosphorus.	
	6 doses in 12 weeks	26 doses per 52 weeks
Adult QL	Doses up to 1 mg/kg every 4 weeks (minimum of 10 mg and not to exceed 90 mg per dose).	
	3 doses in 12 weeks	13 doses per 52 weeks
Reauthorization Review Criteria	**Initial Authorization: Shall** be reviewed at 12 weeks. Ongoing coverage of Crysvita (burosumab-twza) requires clinical documentation, including chart notes, that there is normalization of serum phosphorus (within laboratory's normal range, or see *Appendix 1*). If there are persistently low serum phosphorus levels after 12 weeks, no further Crysvita (burosumab-twza) will be authorized.	**Continued Authorization: Shall** be reviewed at least annually. Ongoing coverage of Crysvita (burosumab-twza) requires clinical documentation, including chart notes, that and there is ongoing disease improvement defined by 1 and 2 below: **1.** Normalization of serum phosphorus (within laboratory's normal range, or see *Appendix 1*). **AND** **2.** At least one of the following: **a.** Improvement of skeletal deformities. **b.** Improvement in growth velocity. **c.** Radiographic evidence of reduced bone disease activity and/or epiphyseal healing. **d.** Reduction in tooth abscesses. **e.** Reduction in bone pain (as documented by a validated pain scale, functional improvement in ADLs, and a reduction in the use of pain medication).

IV. Crysvita (burosumab-twza) is considered investigational when used for all other conditions.

Position Statement

Summary

- Crysvita (burosumab-twza) is a recombinant human IgG1 monoclonal antibody used for the treatment of patients with X-linked hypophosphatemia (XLH) and tumor-induced osteomalacia (TIO).
- Intent of this policy is to allow for coverage of Crysvita (burosumab-twza) for confirmed diagnoses of TIO, as well as symptomatic XLH (when standard of care step therapy is ineffective), for up to the doses shown to be safe and effective in clinical trials, as detailed in the coverage criteria.

XLH

- XLH is a hereditary phosphate wasting condition, caused by inactivating mutations in the phosphate-regulating endopeptidase homolog X-linked (PHEX) gene. This leads to an increase in fibroblast growth factor 23 (FGF23 levels), which then causes renal wasting and decreased intestinal absorption of phosphate.
- The diagnosis is confirmed with genetic testing for the PHEX mutation. Hypophosphatemia, low-normal 1,25(OH)2D, elevated serum alkaline phosphatase (in children), and normal serum calcium are common biochemical features of XLH.
- Historically, the standard of care for XLH is treatment with activated vitamin D and phosphate supplements (conventional therapy) when pharmacologic treatment is warranted. In children, height velocity commonly improves during the initial year of conventional therapy. Crysvita (burosumab-twza) is the only medication that treats the underlying cause of XLH, elevated FGF23 levels. [1]
- XLH is a variable disease. For patients with mild disease and an absence of symptoms, the risk of adverse events from treatment does not outweigh the potential benefit. Asymptomatic and mildly symptomatic adults are often not treated with activated vitamin D or phosphate supplements, as these patients are unlikely to receive benefit from treatment. Children are started on therapy as soon as the diagnosis of XLH is confirmed.
- The safety and efficacy of Crysvita (burosumab-twza) was established based on 4 clinical trials in patients with symptomatic XLH, despite adequate trials of activated vitamin D and phosphate supplements. There is currently no data on the safety and efficacy of burosumab-twza in XLH patients that are naïve to conventional therapy with activated vitamin D and phosphate supplements.
- There is insufficient evidence to establish that Crysvita (burosumab-twza) is more effective than vitamin D and phosphate supplements at this time. In addition, no published studies have demonstrated superiority of Crysvita (burosumab-twza) as compared to activated vitamin D and phosphate supplementation in the treatment of XLH in adult patients (closed epiphyseal plate).

- Clinical trials demonstrated that Crysvita (burosumab-twza) improves serum phosphorus levels during treatment, but did not demonstrate any clinically relevant outcomes over conventional therapy. Thus, patients with serum phosphorus within the normal range may not see any additional benefit and would see an increased risk of developing adverse events due to hyperphosphatemia.
- In patients without a normalization of serum phosphorus after 12 weeks of Crysvita (burosumab-twza) treatment, continued use of Crysvita (burosumab-twza) is considered not medically necessary.
- Crysvita (burosumab-twza) may be covered in the doses shown to be safe and effective in XLH trials (up to 90 mg subcutaneously every two to four weeks depending on age). Doses higher than 90 mg per injection have not been adequately studied in XLH.

TIO

- TIO is a rare condition caused by small tumors that produce high levels of FGF23. This results in phosphate wasting and impaired vitamin D synthesis.
- Symptoms of TIO include osteomalacia, bone fractures, bone pain, and reduced mobility.
- Crysvita (burosumab-twza) may be covered in the doses shown to be safe and effective in TIO trials (up to 180 mg subcutaneously every two to four weeks depending on age). Doses higher than 180 mg per injection have not been adequately studied in TIO.
- Although Crysvita (burosumab-twza) is FDA-approved in the adult setting up to every 2 weeks, clinical trials only evaluated every 4-week dosing. Therefore, more frequent dosing than every 4 weeks is considered not medically necessary for adult TIO patients.
- It is not recommended that Crysvita (burosumab-twza) be administered concomitantly with activated vitamin D and phosphate supplements, due to the potential for hyperphosphatemia.

Clinical Efficacy

X-linked Hypophosphatemia

- The safety and efficacy of burosumab-twza in XLH was established based on four trials, one adult trial and three pediatric trials. Patients were not allowed to be on activated vitamin D or phosphate supplements during the published adult or pediatric trials, but greater than 92% of children receiving burosumab-twza had received prior activated vitamin D and phosphate therapy.
    * One adult phase 3, randomized, placebo-controlled trial found a significant difference in proportion of adult XLH patients achieving a serum phosphorus level ≥LLN in the burosumab-twza treated group (94.1%) vs placebo (7.6%) ($p<0.0001$) at 24 weeks. [2]
        - The improvement in the WOMAC stiffness scores at week 24 was also better in the burosumab-twza group versus placebo ($p<0.01$).
            - The reliability, validity and responsiveness of the WOMAC stiffness subscale has very limited data associated with its use.
        - There was no statistically significant improvement in pain or WOMAC physical function scores between the burosumab-twza and placebo groups at 24 weeks. Data after week 24 was unblinded and has not been published in any peer reviewed journal.

- An exploratory endpoint of fracture healing at 24 weeks showed a higher percentage of patients had fractures heal (43.1% and 7.7%) in the burosumab-twza versus placebo groups, respectively. After week 24, the placebo arm began receiving burosumab-twza. At week 48, fracture healing improved to 63.1% and 35.2%, in the burosumab-twza and placebo-burosumab-twza arm, respectively. [3]
- Serum phosphorus level is a surrogate endpoint that does not correlate to an improvement of clinical outcomes. In practice, response to therapy is determined by symptomatic responses, such as a decrease in bone pain, reductions in fractures, and an improvement of osteomalacia.

* One phase 3, open label, active-controlled trial (n=61) in pediatric patients with XLH (age 1-12) found a greater improvement in the Radiographic Global Impression of Change (RGI-C) in the burosumab-twza-treated group compared to the conventional therapy group. Both burosumab-twza and conventional therapy resulted in an improvement in RGI-C, however, burosumab-twza had a greater improvement (+1.9 vs +0.8) at week 40. The long-term clinical relevance and benefit of burosumab-twza versus conventional therapy is unknown at this time. [4]
* One phase 2, open label, dose-finding trial in pediatric patients with XLH (age 5-12) found an improvement in Rickets Severity Score (RSS) and RGI-C score with burosumab-twza every two weeks (at week 40). [5]
* One phase 2, open label, single arm trial in pediatric patients (age 1-4) found an improvement in serum phosphorus at week 40. [6]

<u>Tumor-induced Osteomalacia</u> [7]

- The safety and efficacy of burosumab-twza in TIO is based on the results of an ongoing, single arm, open-label, phase 2 trial (n=14). Burosumab-twza was dosed up to 2mg/kg every 4 weeks. More frequent dosing was not studied.
  * An improvement in the surrogate endpoints of serum phosphorus and other measures of osteomalacia (osteoid thickness, mineralization lag time) were improved at week 144 compared to baseline.
  * In addition, there was an improvement in reported pain scores and fracture healing at week 144, compared to baseline.

Clinical Guidelines/Standard of Care Treatment [1 8]

- Evidence-based XLH guidelines were published in 2019 and recommend the following:

  <u>Pediatric XLH</u>
  * Treat children with XLH with conventional therapy (activated vitamin D and phosphate supplementation) as soon as the diagnosis of XLH is established.
  * Most pediatric patients are treated with activated vitamin D and phosphate supplements from diagnosis until the epiphyseal plate has fused, and growth stops.
  * If available, consider burosumab-twza treatment in children with XLH ≥1 year and in adolescents with growing skeletons in the following situations: radiographic evidence of overt bone disease and disease that is refractory to conventional therapy; or complications related to conventional therapy; or

patient's inability to adhere to conventional therapy, presuming that adequate monitoring is feasible.

* Treatment goals in the pediatric population include improvement in height velocity and overall growth, correction of rickets, improvement of radiographic abnormalities, and healing of skeletal deformities.

Adult XLH

* Unlike in the pediatric population, use of activated vitamin D and phosphates supplements in the adult population is not always required. Use of these agents is associated with high burden and potentially toxic side effects. Therefore, many adults do not receive treatment for their XLH after the epiphyseal plate has fused
* Treat symptomatic adults with XLH with conventional therapy (activated vitamin D and phosphate supplementation).
* If available, consider burosumab-twza treatment in adults with XLH (XLH) with the following features: persistent bone or joint pain due to XLH, osteomalacia that limits daily activities, pseudofractures or osteomalacia-related fractures, and an insufficient response to conventional therapy.
* Treatment goals for adults include a reduction in bone pain, improvement of osteomalacia, and improvement in fracture healing or surgical recovery time.

Safety

- Several cases of hyperphosphatemia occurred in the phase 3 adult XLH trial, and subsequently required dose reduction.
- The Crysvita (burosumab-twza) prescribing information contains warnings about the risk of hypersensitivity, injection site reactions, hyperphosphatemia and nephrocalcinosis. [9]
- The most common side effects observed in patients receiving Crysvita (burosumab-twza) in clinical trials include: headache, injection site reactions, vomiting, pyrexia, pain in extremity, hyperphosphatemia, decreased vitamin D levels, tooth abscess, muscle spasms, dizziness, constipation and rash.

Dosing and administration

- Crysvita (burosumab-twza) is administered as a subcutaneous injection at doses up to every 14 days or every 28 days in the pediatric and adult XLH settings, respectively. The maximum doses are 90mg for XLH and 180 mg in TIO. The safety and efficacy of Crysvita (burosumab-twza) at higher doses or a greater frequency has not been adequately evaluated.

Appendix 1: Serum Phosphorus Levels by Age (years) [10]	
Male 1-4: 4.3-5.4mg/dL	Female 1-7: 4.3-5.4mg/dL
Male 5-13 3.7-5.4mg/dL	Female 8-13: 4.0-5.2mg/dL
Male 14-15: 3.5-5.3mg/dL	Female 14-15: 3.5-4.9mg/dL
Male 16-17: 3.1-4.7mg/dL	Female 16-17: 3.1-4.7mg/dL
Male ≥18: 2.5-4.5mg/dL	Female ≥18: 2.5-4.5mg/dL

Revision History

Revision Date	Revision Summary
9/19/2024	No criteria changes with this annual review.
9/14/2023	No criteria changes with this annual review.
12/9/2022	Removed from site of care (SOC) program (effective 1/15/2023).
6/17/2022	No criteria updates with this annual review.
7/16/2021	No criteria updates with this annual review.
7/22/2020	• Added continuation of therapy (COT) criteria. • Added coverage criteria for symptomatic adult XLH patients (closed epiphyseal plate) based on evolving evidence. • Added coverage criteria for tumor-induced osteomalacia (TIO), a new FDA approved indication.
7/24/2019	The covered Quantity Limitations (QL) in Section II were clarified to state "pediatric authorization." Addition of criterion to re-auth language to cover reduction in bone pain. Added to SOC program (effective 11/1/2018).
7/20/2018	New policy, effective 8/1/2018.

Medication Policy Manual | **Policy No:** dru548

Topic: Non-preferred testosterone replacement therapy products | **Date of Origin:** September 1, 2018

Committee Approval Date: September 19, 2024 | **Next Review Date:** 2025

Effective Date: December 1, 2024

IMPORTANT REMINDER

This Medication Policy has been developed through consideration of medical necessity, generally accepted standards of medical practice, and review of medical literature and government approval status.

Benefit determinations should be based in all cases on the applicable contract language. To the extent there are any conflicts between these guidelines and the contract language, the contract language will control.

The purpose of Medication Policy is to provide a guide to coverage. Medication Policy is not intended to dictate to providers how to practice medicine. Providers are expected to exercise their medical judgment in providing the most appropriate care.

Description

Testosterone replacement therapy (TRT) products are used in the treatment of hypogonadism (testosterone deficiency), as well as gender dysphoria, delayed puberty, and metastatic breast cancer. The effectiveness of TRT is monitored by assessing serum testosterone levels, as well as improvement in symptoms, such as mood, fatigue, bone mineral density, and well-being.

Please note the following:

Not subject to pre-authorization (PA): generic testosterone injection (cypionate or enanthate),generic testosterone 1.62% gel pump bottle, and Testopel (testosterone implant pellet).

Subject to PA and included in the Compounded Medications policy (dru135): Any compounded testosterone product (such as non-FDA approved creams, gels, and implants).

Policy/Criteria

Most contracts require pre-authorization approval of non-preferred testosterone replacement therapy (TRT) products as listed in *Table 2*, prior to coverage.

I. Continuation of therapy (COT): Non-preferred testosterone replacement therapy (TRT) products (as listed in Table 2) may be considered medically necessary for COT when criterion A below is met.

A. For all non-preferred testosterone replacement therapy products (as listed in *Table 2*), criteria 1 and 2 must be met:

1. The patient was established on therapy prior to current health plan membership AND attestation that the medication was covered by another health plan.

AND

2. One of the following applies:

a. Diagnosis of gender dysphoria, delayed puberty, or metastatic breast cancer.

OR

b. Diagnosis of hypogonadism and at least one lower cost preferred TRT product (see *Appendix 1*) has been ineffective, not tolerated or is contraindicated.

***Please note**: Medications obtained as samples, coupons, or promotions, paying cash for a prescription ("out-of-pocket") as an eligible patient, or any other method of obtaining medications outside of an established health plan benefit (from your insurance) does NOT necessarily establish medical necessity. Medication policy criteria apply for coverage, per the terms of the member contract with the health plan.*

II. New starts (treatment-naïve patients): Non-preferred testosterone replacement therapy (TRT) products (as listed in *Table 2*) may be considered medically necessary when criteria in *Table 1* below is met:

Table 1: New to therapy (treatment-naïve) members:

Diagnosis	Criteria Requirements
Gender dysphoria or Hypogonadism	Treatment with **at least two** lower cost preferred TRT products (including one generic injectable TRT; see *Appendix 1*) has been ineffective, not tolerated or is contraindicated.
Metastatic breast cancer or Delayed puberty	Treatment with injectable testosterone cypionate (generic) or testosterone enanthate (generic) has been ineffective, contraindicated, or not tolerated.

III. Administration, Quantity Limitations, and Authorization Period

A. Regence Pharmacy Services considers oral, nasal, topical, transdermal testosterone replacement therapy (TRT) products, and Xyosted coverable only under the pharmacy benefit (as self-administered medications).

B. Pharmacy Services considers Aveed coverable only under the medical benefit (as a provider-administered medication).

C. When pre-authorization is approved, TRT products will be authorized as follows in *Table 2*.

D. Quantities above the listed quantity limits are considered not medically necessary.

E. Authorization **may** be reviewed at least annually. Clinical documentation (including, but not limited to chart notes) must be provided to confirm that current medical necessity criteria are met, and that the medication is providing clinical benefit, such as disease stability or improvement.

Table 2: Non-Preferred Testosterone Replacement Therapy (TRT) Products

TRT Products	Quantity Level Limitation (per month, unless noted)
Transdermal	
Testosterone gel*, solution (generics, AndroGel, Fortesta, Testim, Vogelxo)	60 packets/tubes or 2 pump bottles
Brand Androderm testosterone transdermal patch	2-mg/24 hour: 60 patches 4-mg/24 hour: 30 patches
Oral/Buccal	
Jatenzo, Kyzatrex, Tlando (testosterone undecanoate)	120 capsules
Methyltestosterone (generics, Methitest)	150 tablets/capsules
Nasal gel	
Natesto metered-dose pump bottle (testosterone nasal gel)	3 pump bottles (60 actuations per bottle)
Injection	
Xyosted (testosterone enanthate)	Up to 4 injections per 28 days (50 mg, 75 mg, or 100 mg per injection)
Aveed (testosterone undecanoate)	750 mg at initiation, 4 weeks, and every 10 weeks thereafter

* Generic testosterone 1.62% gel bottle pump does not require pre-authorization.

IV. TRT products are considered investigational when used for all other conditions, including but not limited to:

A. In women when used for post-menopausal symptoms, including but not limited to, infertility, sexual dysfunction, cognitive dysfunction, metabolic dysfunction, bone health or general well-being.

Position Statement

- Testosterone replacement therapy (TRT) is commonly used for treatment of documented primary (testicular) or secondary (hypothalamic) hypogonadism in men, delayed puberty in males, or as part of gender dysphoria therapy. All products are considered effective for increasing serum testosterone levels.
- There is no evidence demonstrating that any one TRT product is safer or more effective than the least costly generic injectable TRT options. There are no studies that directly compare the clinical effects of different TRT products.
- The intent of this policy is to encourage the use of best value (lower cost) TRT products.

Cost

- While branded TRT products are comparable in price, generic testosterone cypionate and generic testosterone enanthate offer members the best value and they are available at preferred copayments.
- Due to the availability of many testosterone formulations, quantities above the quantity limits listed above in *Table 2* are considered not medically necessary. The quantity limits listed correspond with the manufacturer's prescribing information for each medication. There is a lack of literature showing improved health outcomes and safety when the maximum dosing is exceeded.

Clinical Efficacy

- No single testosterone replacement therapy (TRT) product has been proven in reliable clinical studies to be more effective than another TRT product.
- All TRT products appear to be similarly effective based on pharmacokinetic data. There is pharmacokinetic evidence that all topical testosterone products replete testosterone levels in men with hypogonadism. [9]
- There are no trials comparing any branded TRT formulation, therefore there is no evidence that one branded TRT product is superior to another.
- Long-term health outcomes of TRT, such as decreased incidence of fracture or cardiovascular risk, are uncertain. [8,10]
- Clinical guidelines recognize TRT as standard of care and effective for treatment of hypogonadism in men. All products are considered effective in raising testosterone levels. Choice of TRT product is based on pharmacokinetics, patient preference, and cost. However, oral TRT is not recommended due to poor absorption and liver toxicity. [1]
- The efficacy of TRT has not been established in men with age-related hypogonadism.
- There are no valid, reliable, clinically relevant endpoints for studies assessing the effect of testosterone on desire, frequency of sexual activity, erectile function, mood, energy, cognitive dysfunction, metabolic dysfunction, overall quality of life, body composition (lean and fat body mass), and bone mineral density in men with age-related hypogonadism.

Safety

- Overall, testosterone topical replacement (TRT) is well tolerated. Common adverse effects (≥ 3%) include acne, gynecomastia, oral irritation (buccal formulation), headache, and enlarged prostate. The most reported adverse event with topical TRT is application site reactions. However, testosterone transdermal patch (Androderm) is associated with a significantly higher rate of skin reactions, including blistering of the skin. [7,9]

- TRT may be associated with increased risk of adverse cardiovascular outcomes (increased mortality, myocardial infarction, and stroke). Although findings in several large observational studies and meta-analyses are inconsistent, the FDA's Bone, Reproductive and Urologic Drugs Advisory Committee concluded that there is a small signal of risk. Based on conclusions reached in the advisory committee, the FDA subsequently released a drug safety communication related to the CV risk and will require labeling changes for all prescription testosterone products. [8,10-13]
- TRT is contraindicated in men with known or suspected prostate cancer. [1]
- Testosterone undecanoate (Aveed) has boxed warnings for pulmonary oil microembolism (POME) reactions and anaphylaxis. POME reactions may be life threatening; symptoms include cough, dyspnea, throat tightening, chest pain, dizziness, and syncope. Patients who received testosterone undecanoate (Aveed) must be monitored in a healthcare setting for 30 minutes post-dose in case of serious POME reactions or anaphylaxis. [7]
- Testosterone has been subject to abuse, typically at doses higher than recommended for the approved indication and in combination with other anabolic androgenic steroids. [14]
- In March 2015, the FDA released a drug safety communication clarifying that the benefits and safety of TRT have not been established for the treatment of low testosterone levels due to aging ("age-related hypogonadism"), even if a man's symptoms seem related to low testosterone. The communication also stated that there is a possible increased cardiovascular risk associated with testosterone use. [8]
- Since the initial drug safety communication, a limitation of use has been added to the prescribing information for multiple testosterone replacement products. The updated labeling states that safety and efficacy has not been established for age-related hypogonadism (also referred to as late-onset hypogonadism).
